20th set of Questions and answers call for proposals
29/G/ENT/CIP/12/N05S00 - Promotion of electric vehicles technologies.

Question 53:

As developer and inventor I seek support for implementation of a super-high-speed universal energy-transport system XXXX. The system succeed the most favorable features of aviation, railroad and motor transport in the absence their typical drawbacks. The system has double role: transport system and energy production.

Could you provide me an information how I can present this project for consideration?.The problem is that I am only developer of this project without any support from institutions or companies. I am experienced design-engineer and have rich experience in aviation, automobile industry, railway vehicles (carriages and locomotives) and gas-turbine design for 26 years with using advanced 3D CAD design.

On the one part - there is a perspective technology that can brings big financial profit and solve modern problems in transport and energy supply; on the other part - it is very difficult to bring any attention to the project at early stage. The XXXXX system represent itself a new technical system, which is actually a new industry and I suppose that the first commercial start is possible at 2018 year.

* * *

Let me explain shortly the main features: .etc.

Having financial support I can start practical work immediately and provide full cycle of design according to contemporary requirements.
