Time Spent: Over a month

IP Address:

PAGE 2: Part I – General Information about Respondents

Q1: Address

Contact name	Sylvia Maurer
Organisation/company	BEUC
Country	Belgium
Email Address	

Q2: If you have a Transparency Register ID number, please provide it below. If your organisation is not registered, you have the opportunity to register now by following this link. If your entity responds without being registered, the Commission will consider its input as that of an individual/private person and, as such, will publish it separately.

9505781573-45

Q3: Received contributions may be published on the Commission's website, with the identity of the contributor. Please state your preference with regard to the publication of your contribution. Please note that regardless of the option chosen, your contribution may be subject to a request for access to documents under Regulation 1049/2001 on public access to European Parliament, Council and Commission documents. In such cases, the request will be assessed against the conditions set out in the Regulation and in accordance with applicable data protection rules.

My contribution may be published under the name indicated; I declare that none of it is subject to copyright restrictions that prevent publication

Q4: We might need to contact you to clarify some of your answers. Please state your preference below:

I am available to be contacted

Q5: Please indicate whether you are replying to this questionnaire as:

A consumer association

Q6: If a business or industry association, please indicate your field(s) of interest or activity(ies) - the letters in between brackets correspond to NACE codes [multiple choice]:

Manufacture of pesticides and other agrochemical products (C20.2)

Q7: For businesses, please indicate the size of your business: The definition of small and medium-sized enterprises depends on the staff headcount and either the annual turnover or the balance sheet of the company. Please consult the following website: http://ec.europa.eu/growth/smes/business-friendly-environment/sme-definition/index_en.htm

Respondent skipped this question

Q8: Please indicate the level at which your organisation is active: EU

PAGE 3: Part II – General Questions

Q9: How important is it in your view that there is chemical and chemical-related legislation* at EU-level in order to achieve the following objectives? (1 = not important; 5= very important)*This comprises the chemical-related provisions in all legislation within the scope of this fitness check. It encompasses legislation governing hazard identification and classification, as well as risk management measures, including chemical-related aspects of legislation on worker safety, transport, environmental protection, chemicals controls and supporting legislation, excluding REACH. The full list of legislation can be found here.The internal market of the European Union (EU) is a single market in which the goods, services, capital and persons can move freely across borders. One of the key objectives of chemical and chemical-related legislation is to have a single market for chemical substances and mixtures, as well as products containing chemicals.**

Protecting human health	5
Protecting the environment	5
Ensuring a well-functioning internal market**	5
Stimulating competitiveness and innovation	5

Q10: Do you think the EU chemical and chemical-related legislation has been effective in achieving the following objectives? (1= not effective, 5= very effective). Please only consider chemical-related provisions in the legislation.

Protecting human health	3
Protecting the environment	3
Ensuring a well-functioning internal market	3
Stimulating competitiveness and innovation	3

Q11: If you think the EU chemical and chemical-related legislation is not effective (1) or only somewhat (2,3) effective, please indicate what you believe are the main reasons for this limited effectiveness in the following table:

Protecting human health	The legislation is not adapted to the issues at stake
Protecting the environment	The legislation is not adapted to the issues at stake
Ensuring a well-functioning internal market	The legislation is not adapted to the issues at stake
Stimulating competitiveness and innovation	No opinion or not applicable

Q12: To what extent do you consider that EU chemical and chemical-related legislation has had an added value above what could have been achieved through action at a national level? (1= no value, 5= a very high added value)

EU-level legislation adds value to national level action	4
--	---

PAGE 4: Part III - Specific Questions

Q13: For businesses and industry associations - Please select the legislation that regulates or otherwise affects your sector's or your company's activities. For other stakeholders - Please select the legislation you are familiar with.

Classification, labelling and packaging (Regulation No (EC) 1272/2008)
,
Plant protection products (Regulation (EC) No 1107/2009)
,
Biocidal products (Regulation (EU) No 528/2012),
REACH, Annex XIII (Regulation (EC) No 1907/2006)
,
Waste framework (Directive 2008/98/EC) and List of Waste
,
Water Framework (Directive 2000/60/EC),
Persistent organic pollutants (Regulation (EC) 850/2004)
,
Contaminants in food and feed (Regulation (EEC) No 315/93 and Directive 2002/32/EC)
,
Residues of pesticides (Regulation (EC) No 396/2005)
,
EU Ecolabel (Regulation (EC) 66/2010),
Safety of toys (Directive 2009/48/EC),
Cosmetic products (Regulation (EC) No 1223/2009),
Detergents (Regulation (EC) No 648/2004),
Drinking Water (Directive 98/83/EC),
Medical devices (Directive 93/42/EEC regarding medical devices, Directive 90/385/EEC regarding active implantable medical devices, and Directive 98/79/EC regarding in vitro diagnostic medical devices, under revision)
,
Explosives (Directive 93/15/EEC),
Pressure equipment (Directive 2014/68/EU),
Food contact materials (Regulation (EC) No 10/2011 and Regulation (EC) No 450/2009)
,
General Product Safety (Directive 2001/95/EC),
Good Laboratory Practice (Directives 2004/9/EC and 2004/10/EC)

Q14: In the EU legislative framework for chemicals, risk management measures are, in some cases, determined directly based on the identified hazard using generic risk considerations (e.g. widespread exposure or exposure of vulnerable groups), which justify the automatic adoption of such measures. In other cases, the risk management measures are determined by a specific risk assessment that assesses the probability of adverse health and environmental effects resulting from the specific exposure scenarios associated with the proposed use(s) of the chemical. In your view, do you think EU chemical and chemical-related legislation should, in general:

b. Be more oriented towards generic risk considerations (i.e. take more cautious approaches, despite the possibility that certain uses of a chemical that are in the interest of society might be restricted)

If you answered a or b, please explain
The EU should apply a hazard based approach to all consumer relevant chemicals legislation as this would allow the EU to ban certain groups of chemicals at once based on their harmful properties, such as for instance being CMRs or other categories of chemicals which are of equal concern. This would speed up the adoption and implementation of legislation. Most risk based management methods by contrast falls short to provide a sufficient level of safety and we therefore strongly object to answer "a".

Q15: In your view, apart from the hazard and/or risk of a chemical substance or mixture, are all relevant considerations taken into account in regulatory decision making on risk management (e.g. whether there will be combined effects of chemicals, whether there are certain vulnerable groups, whether there will be impacts on jobs or on the competitiveness of EU industry, etc.)? Please explain your answer.

No,

If you answered no, please explain which considerations are not (sufficiently) taken into account and, if relevant, explain which legislation you are referring to.

The EU's current system of evaluating and managing chemicals hazards is outdated and not in line with the latest scientific findings in particular with regard to mixture toxicity, hormone-disrupting chemicals and nanomaterials. We are very disappointed that 1) there has been no concrete follow-up to the Commission's Communication on mixture toxicity from 2012, that 2) despite legal requirements to define scientific criteria for endocrine disrupters the Commission has still not set such criteria and focuses on the economic impact rather than societal benefits in its current impact assessment and that 3) the EU is reluctant and late in regulating nanomaterials despite such materials being used in a large and growing number of consumer products.

Q16: In your view, to what extent are the following elements of the overall EU legislative framework for chemicals satisfactory? (1= not satisfactory, 5= very satisfactory)

Transparency of procedures	2
Speed with which hazards/risks are identified	2
Speed with which identified risks are addressed	1
Time to allow duty holders to adapt	I don't know
Predictability of the outcomes	2
Stability of the legal framework	3
Clarity of the legal texts	3
Guidance documents and implementation support	2

Consultation on the regulatory fitness of chemicals legislation (excluding REACH)

Effective implementation and enforcement across Member States	2
Consistent implementation and enforcement across Member States	2
Public awareness and outreach	2
International collaboration and harmonisation	2

Consultation on the regulatory fitness of chemicals legislation (excluding REACH)

Please explain your answers and list any other aspect you consider relevant. If you have specific legislation in mind, please specify it.

Speed of hazard identification and management: Timelines for hormone disrupters and nanomaterials are unacceptably slow. The Commission let various legal deadlines pass without taking satisfactory action on hormone disrupters for biocides, pesticides, cosmetics, waste water and is not taking sufficient action to address hormone disrupters in other consumer products. Despite having published a recommendation for a definition for the term "nanomaterial" in 2011, this has never consistently been implemented in sector specific legislation such as food and cosmetics. The implementation of the General Product Safety Directive with regard to chemicals provisions has slowed down since the current Commission took office: despite an agreement in the GPSD Committee to address tattoo-inks, the Commission blocks progress. In addition, the European Commission refuses to address chemical issues adequately in the development of safety requirements and related standardisation requests (e.g. of consumer products are candles and children's shoes). The overhaul of the EU's General Product Safety Directive and Market Surveillance system is unacceptably slow: the Commission started to discuss a revision in 2010, but published only 3 years later a legislative package which is blocked already for the last 3 years in Council related to a political question (country of origin labelling) which is irrelevant for product safety. Therefore also enforcement and consistency of enforcement are insufficient. The points above are also the reason why outcomes are partly unpredictable for consumers: political and industry interests are placed regularly above societal interests in the area of chemicals management. While "stability" of the legal framework is beneficial in some cases, there is also a risk that the regulatory framework will become outdated and prevent progress. Clarity of the legal texts: Definitions and requirements are often not used consistently across legislation, e.g. nanodefinition & requirements for EDCs. With regard to TTIP & chemicals, we are not reassured that the EU will do its best to keep the safety level of the EU at its highest possible level. The transparency of these negotiations is also unacceptable as too little is known about the negotiations in general and the US demands in particular.

Q17: In your view, to what extent are the following elements of risk management satisfactory? (1= not satisfactory, 5= very satisfactory)

Hazard identification criteria	3
Risk assessment and characterisation	3
Hazard and risk communication measures to consumers (e.g. labels, pictograms, etc.)	2
Hazard and risk communication measures to workers (e.g. labels, pictograms, safety data sheets etc.)	I don't know
Risk management measures restricting or banning the use of chemicals	1
Risk management measures regulating the safe use of chemicals (e.g. packaging requirements or requirements for the use of personal protective equipment)	1

If you answered 1, 2 or 3 above and would like to provide further information (in particular on specific pieces of legislation), please explain your answers.

Communication: ECHA, some Member States (e.g. NL) and some consumer organisations have undertaken a lot of efforts to familiarise consumers with the new CLP pictograms. However, the new pictograms as such are partly less clear and not familiar to consumers and more efforts are needed. Hazard categories for PBTs and vPvB have not been defined in the CLP Regulation. In addition, criteria for endocrine disrupting chemicals are overdue. To conduct a (sophisticated) risk assessment according to the established guidelines is often an impossible task in view of lacking data and the enormous resources needed for this. Risk management: See also answers to Q 14-16.

Q18: Safety data for chemicals is subject to quality requirements, notably Good Laboratory Practice (GLP), aimed at ensuring the reliability and reproducibility of the data. Do you consider these requirements to be appropriate?

No,

If you answered no, please explain your answer
All peer reviewed and published scientific literature should be taken into account. Studies done under good laboratory practice (GLP) certification should not be considered to be of higher value compared to well-conducted and well-reported studies, which are not done in GLP certified laboratories. Conformity to GLP does not necessarily mean intelligent study design nor compliance with state-of-the-art science. Some EU agencies such as EFSA tend to ignore non-GLP studies in their risk assessment without looking into their content even though they could contribute to an appropriate assessment based on a weight of evidence approach.

Q19: In your view, what are the most significant benefits generated for EU society by the EU chemical and chemical related legislation? (one or more answers possible)

Reducing the exposure of consumers and of citizens in general to toxic chemicals and, therefore, avoiding healthcare costs, lost productivity, etc.

,

Reducing the exposure of workers to toxic chemicals and, therefore, avoiding healthcare costs, lost productivity, etc.

,

Reducing the damage to the environment and to ecosystems and, therefore, avoiding the costs of treating contaminated water, restoring impacted fisheries, cleaning-up of contaminated land, compensating for reduced crop pollinisation, etc.

,

Encouraging research and innovation, generating new jobs, and improving the competitiveness of the EU chemicals industry by encouraging/supporting a shift towards green, sustainable chemistry and a circular economy

Q20: In your view, what are the most significant costs incurred by EU society due to EU chemical and chemical related legislation? (one or more answers possible)

Costs for society in general

Q21: In your view, do any of the following requirements in the legislative framework lead to significant costs for companies?

I don't know,

Other (please specify)

Questions 20 and 21 should also look into which significant costs are created for companies because of an absence of adequate chemicals management. (See also our comments to question 20 under additional comments.) These costs include both direct and indirect costs for human health, the environment and society related to the exposure to and dispersion of chemicals, such as: costs related to human diseases resulting in e.g. productivity loss, increased sick leave, morbidity, health care costs etc.; costs related to the degradation of natural resources (e.g. water supplies); or costs arising as a result of a need for remediation, restoration and compensation as well as business loss due to unacceptable pollution or other financial risks in case of liability claims. Moreover, as society bears many of these costs (e.g. increased health care costs) fewer public resources are available to fund and support research in safer chemicals, potentially placing the EU chemicals industry at competitive disadvantage with its international competitors. For the consumer, inadequate chemicals provisions could result in lower disposable income (either as a direct consequence of health damages or through the need for private health insurance), thus depressing private consumption and demand for the industry's products. Absence of adequate chemicals provisions also contributes to diminished consumer trust in the chemicals industry, potentially resulting in significant intangible or reputational costs and an eventual business loss. Finally, the European industry can only survive when the bar is raised - it will not be competitive on a cost basis. Absence of adequate chemical provisions in the EU can therefore also contribute to competitive disadvantage for the European industry (favouring industries outside the EU) as the industry faces fewer incentives to invest in safer alternatives and, as a consequence, the industry risks losing global market shares.

Q22: Are there specific requirements in the EU chemicals legislative framework which lead to particularly significant costs for authorities?

I don't know,

If you answered yes, please indicate what these are. Given that chemical provisions - particularly for consumer products - are widely absent it is difficult for us to identify excessive costs for market surveillance. However, the current market surveillance system is ineffective and inefficient and the EU must urgently unblock the product safety and market surveillance package to create a EU-based and more harmonised system which equips market surveillance authorities with better financial and human resources.

Q23: To what extent has the EU legislative framework for chemicals contributed to a reduction in the number and/or use of hazardous chemicals and/or their substitution with safer alternatives? (1= no contribution, 5= a large contribution)

Framework has led to a reduction in the number and/or use of hazardous chemicals and/or their substitution with safer alternatives 3

Q24: To what extent does the existing EU legislative framework sufficiently address emerging areas of concern, e.g. arising from advances in science and technology? (1= emerging areas of concern are not sufficiently addressed, 5 = emerging areas of concern are sufficiently addressed)

Novel areas of concern sufficiently addressed by framework 1

Please comment

Mixture toxicity, hormone disrupters, non-monotonic dose response relationships and nanomaterials are not sufficiently addressed based on the advances in science. Scientific research also demonstrated that numerous chronic diseases which are linked to environmental exposure to chemicals are increasing constantly such as cancer, cardiovascular problems, allergies, obesity, fertility problems and autism which shows that the EU approach to chemicals management is insufficient.

PAGE 8: Coherence

Q25: Please indicate the extent to which you agree with the following statements relating to the EU chemicals legislation framework overall

The EU chemicals legislation framework contains gaps and missing links Strongly Agree

The EU chemicals legislation framework has overlaps Disagree

The EU chemicals legislation framework is internally inconsistent Agree

Q26: Please indicate any incoherence (gaps or missing links, overlaps, inconsistencies etc.) between the different pieces of legislation which are under the scope of this fitness check. Please only consider aspects related to hazard identification, risk assessment and risk management of chemicals. The legislation covered by this fitness check can be found here.

Consultation on the regulatory fitness of chemicals legislation (excluding REACH)

Gaps or missing links

See comments on EDCs, nano and cocktail effect. Chemicals in textiles need to be regulated - In the food contact materials regulation EC/10/2011 only plastics are comprehensively regulated even though with significant gaps related to colorants, solvents or printing inks. EU rules for more materials are urgently needed. Moreover, the provisions for plastics need to be improved. In directive 93/42/EEC there are no clear limit values for the content of chemicals in medical devices which is a severe shortcoming for consumer safety as patients are in particular vulnerable. The toy safety directive 2009/48 lacks appropriate level of protection as the CLP values are not suitable to set safe levels for chemical use in toys and as not all relevant chemicals have been regulated with specific limit values. As a consequence, market surveillance authorities have not enough clarity which toys should be taken off the market despite the fact that they are harmful to children. Moreover many consumer articles lack almost completely regulatory provisions for chemicals (child care articles, tattoo inks, packaging, construction products, clothing, furniture, floor coverings, sports equipment, car interiors...) The drinking water directive needs to be enhanced to improve chemical safety of water supply materials. Similarly existing legislation has serious gaps in addressing products that emit hazardous substances in the indoor air should be tackled. Please also refer to ANEC position paper 'Hazardous chemicals in products - The need for enhanced EU regulations'

Overlaps

A study to assess overlaps in EU chemicals legislation carried out by Milieu Ltd. for the European Commission in the context of the 2012 REACH review (http://ec.europa.eu/environment/chemicals/reach/studies/study8_review_2012_en.htm) could not identify many instances of double regulation. The study conclusion states: "Overall, REACH's various in-built mechanisms for avoiding overlap seem to work well. Moreover, the large number of synergies identified between REACH and the various sector-specific legislative acts also demonstrates a high level of coherence. Nonetheless, some instances of double regulation have been identified where legislative changes or – in some cases – guidance could lead to greater legal certainty and reduced confusion on the part of duty holder."

Inconsistencies

Definitions for nano and requirements on EDCs

Q27: Please indicate any incoherence (gaps or missing links, overlaps, inconsistencies etc.) between legislation which are covered by this fitness check and any other legislation you consider relevant as regards the regulation and risk management of chemicals.

When considering the above gaps regarding water supply materials and products leading to indoor emissions, the Construction Products Regulation should also be considered. This does not set performance requirements - so (construction) products producing indoor emissions or these are - in theory - subject of the GPSD. Today, water supply materials are covered by the Construction Products Regulation. The Construction Products Regulation does not set performance requirements and therefore there are no specific provisions on chemical safety for water supply materials. As a consequence, consumers might be exposed to harmful chemicals in drinking water through chemicals which are leaking from the distribution pipes. To ensure better chemicals safety, we propose to urgently set specific requirements under the drinking water directive.

Moreover, the Construction Products Regulation does not take adequate measures to effectively control indoor air pollution stemming from construction products. Today, potential measures could only be taken in case consumer health and safety is at risk because of harmful emissions into the indoor air through the General Product Safety Directive (GPSD). However, as the GPSD does usually not stipulate limits for chemicals in products either, consumers are left without adequate protection from harmful indoor air pollution. We believe that neither the Construction Products Regulation nor the GPSD would be the adequate legal instrument to set requirements for indoor air quality. However, we urge the Commission to develop an adequate regulatory framework specifically with regard to controlling emissions to the indoor air coming from different sources including from construction products and other consumer products present in consumers' homes.

PAGE 9: Part IV: Specific questions on the CLP Regulation

Q28: CLP communicates hazards to workers and consumers through various label elements, including danger words, pictograms, hazard statements and precautionary statements. (1= not effective; 5= very effective)

To what extent are CLP labels effective in communicating hazards to workers?	I don't know
--	--------------

To what extent are CLP labels effective in communicating hazards to consumers?	2
--	---

Q29: Do the hazard classes in the CLP Regulation cover all relevant hazards?

Environmental	No
---------------	----

Physical	I don't know
----------	--------------

Human health	No
--------------	----

Please list any hazard classes that are not covered	The EU should adopt a classification and labelling system for hormone-disrupting chemicals and also include a hazard class for PBTs and vPvBs - or similar - covering persistent substances.
---	--

Q30: How effective is the support to companies through formal guidance documents and national helpdesks? (1= not effective; 5= very effective)

Guidance documents	2
Helpdesks	No experience
Industry association guidance and materials	1
Other (training, conferences, etc.)	No experience
Please add further details as necessary	On important issues, the EU never compiled guidance documents. For instance, the definition for nanomaterials in cosmetics contains unclear terms such as "insoluble" and "bio-accumulative". A guidance to clarify manufacturers labelling obligations has never been published leading to uncertainty. Industry association guidelines are of no use. On the contrary, these documents often seek to interpret legislation in the most unambitious manner (such as for instance labelling "nano" in the ingredients list of food.

Q31: To what extent is CLP enforced in a harmonised manner across Member States?

I don't know

Q32: To what extent are the current elements relating to the CLP classification criteria satisfactory? (1= not satisfactory; 5= very satisfactory)

Ease of implementation for duty holders	I don't know
Appropriateness of classification criteria and methods for substances	2
Appropriateness of classification criteria and methods for mixtures	2
International harmonisation through the Globally Harmonised System (GHS)	I don't know
If you answered 1, 2 or 3 and would like to provide further information, please explain your answer	See answer to Q 29.

Q33: CLP is revised on a regular basis through adaptations to technical progress. Do transitional periods allow sufficient time to implement new or revised classification criteria?

I don't know or have no opinion

Q34: To what extent are the current elements of the procedures for harmonised classification & labelling (CLH) satisfactory? (1= not satisfactory; 5= very satisfactory)

Respondent skipped this question
