

How can Catholic schools contribute to supporting economic growth in Europe

Europe is shrinking. The countries in the EU are connected in a way they have never been before. We have a European parliament, we make a lot of decisions together and so we also have European economics. Today people all over the EU can work in other countries of the EU members and the EU is becoming like a big family. We all help each other so Catholic schools must be aware of the European needs, professions needed to compete with the rest of the world.

These days every profession is getting wider so you can not know everything. What Catholic schools should do is firstly to introduce professions especially the most important ones for economics and make it possible to choose a type of studies that prepare you for a certain profession. For example, should you deal with programming in the future your major subjects should be math, informatics, physics and more subjects of the similar nature. In addition, you should be able to choose among extra subjects such as geography and biology and choose the ones you want.

Secondly I believe that it helps a lot if you get a chance of visiting a company that gives you an insight view of what you are to expect in life so you know something besides the things they tell you about college.

Thirdly and finally, student exchange programs should be better supported considering that a visit in a foreign country gives you a lot of experience for future.

This I believe would contribute to economic growth because employees would have much more experience and that is what gives you success.
