

- 1- A biofuel sustainable system should be designed as:  
PRIORITY ITEM BY THE GOVERNMENT .
- 2- Overall effects on land use should aim at increasing, obviously in all European countries, favorable economic conditions for the cultivation of oil seeds.
- 3- The use of second-generation biofuels should be encouraged through consistent fiscal benefits and adequate annual contingents.
- 4- Further action to achieve a 10% biofuel share consists mainly in a government favorable fiscal policy on two sides, id est: farmers should be treated with priority attitude and biofuels should not suffer heavy limitations.
