

Excess nitrogen deposition - 2000

Percentage of total ecosystems area receiving nitrogen deposition above the critical loads for eutrophication for the emissions of the year 2000. Calculation results for the meteorological conditions of 1997, using grid-average deposition.

Source: IIASA

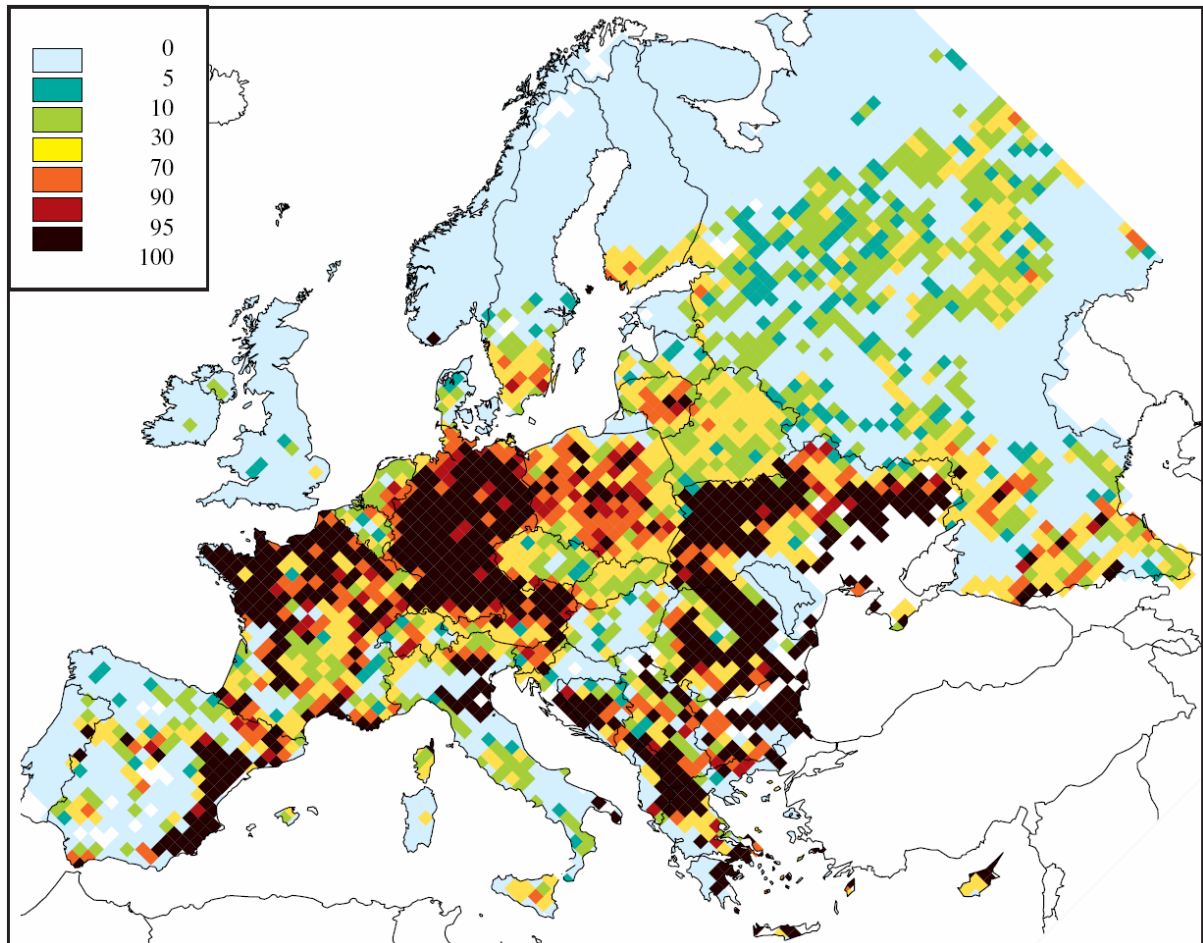

Excess nitrogen deposition – Baseline 2020

Percentage of total ecosystems area receiving nitrogen deposition above the critical loads for eutrophication for the emissions of the current legislation case of the “Climate policy” scenario in 2020. Calculation results for the meteorological conditions of 1997, using grid-average deposition.

Source: IIASA

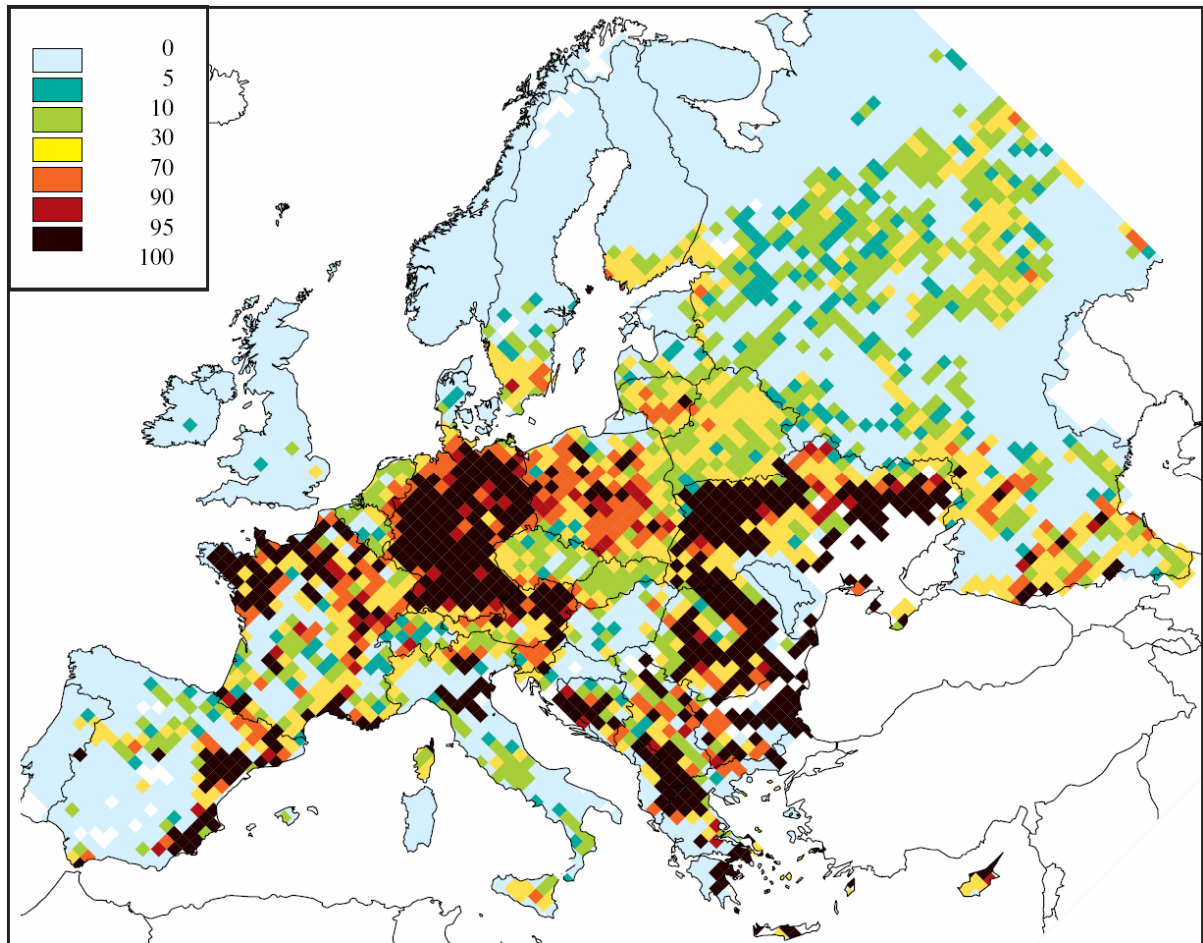

Excess nitrogen deposition – Scenario A

Percentage of total ecosystems area receiving nitrogen deposition above the critical loads for eutrophication for the emissions of the D23 (A) scenario in 2020. Calculation results for the meteorological conditions of 1997, using grid-average deposition.

Source: IIASA

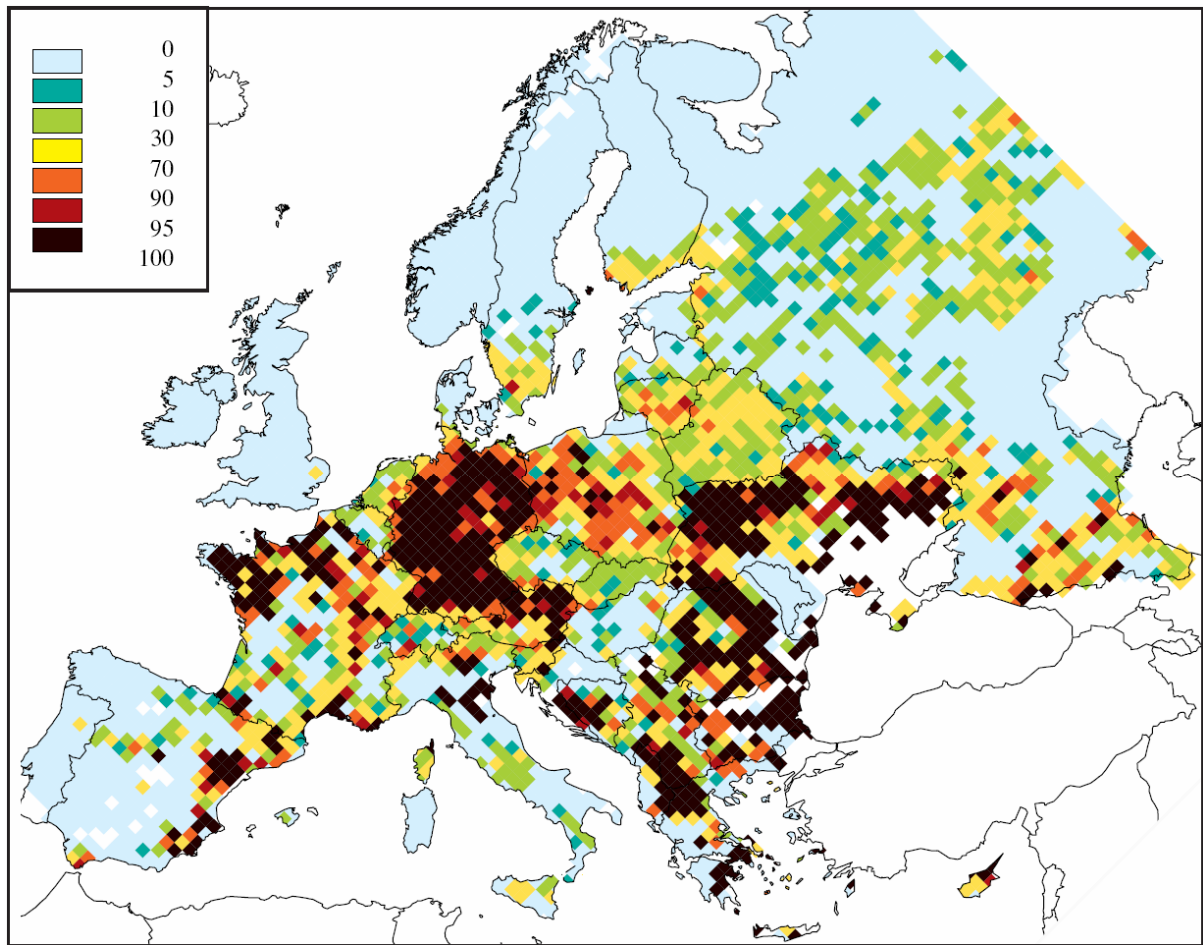

Excess nitrogen deposition – Scenario B

Percentage of total ecosystems area receiving nitrogen deposition above the critical loads for eutrophication for the emissions of the D23 (B) scenario in 2020. Calculation results for the meteorological conditions of 1997, using grid-average deposition.

Source: IIASA

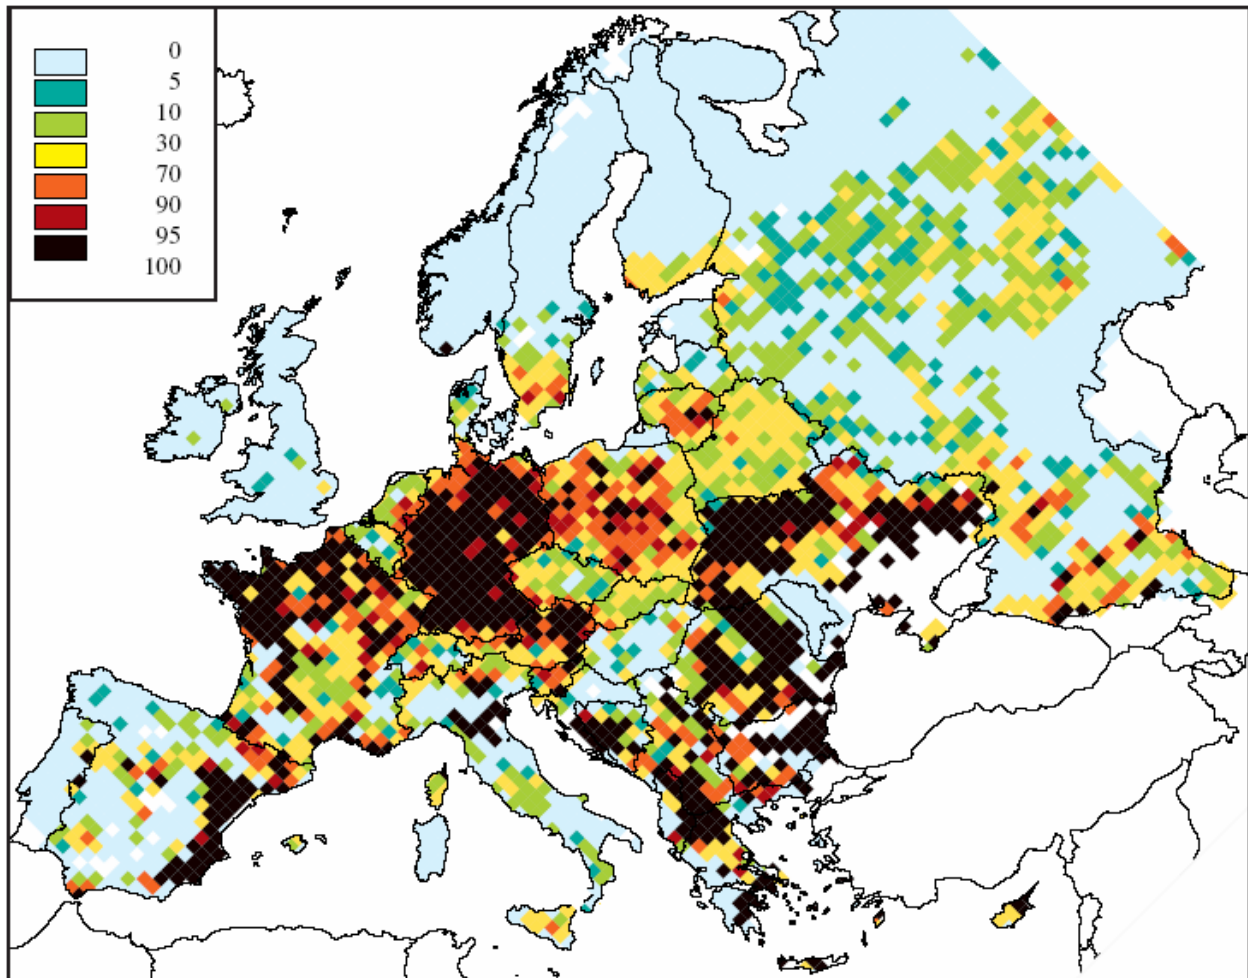

Excess nitrogen deposition – Scenario C

Percentage of total ecosystems area receiving nitrogen deposition above the critical loads for eutrophication for the emissions of the D23 (C) scenario in 2020. Calculation results for the meteorological conditions of 1997, using grid-average deposition.

Source: IIASA

Excess nitrogen deposition – Thematic Strategy 2020

Percentage of total ecosystems area receiving nitrogen deposition above the critical loads for eutrophication for the emissions of the Thematic Strategy on Air Pollution in 2020. Calculation results for the meteorological conditions of 1997, using grid-average deposition. Source: IIASA
