LINKING
BIODIVERSITY AND CLIMATE CHANGE

Causes:
- Greenhouse gas emissions
- Rising pollution
- Increased traffic
- Intensive land uses
- High consumption patterns
- Unsustainable development

Impacts:
- Global warming
- Increased floods and droughts
- Extreme weather events
- Sea level rise
- Loss of wildlife
- Loss of ecosystems

Solutions:
- Reduction in greenhouse gases
- Protection of ecosystems
- Greater ecological connectivity
- Sustainable development
- Pollution control
- International cooperation

Biodiversity is our life insurance for the future:

healthy ecosystems are essential to cope with the devastating effects of climate change.
