

CLIMATE CHANGE & the EU

Greenhouse gases (GHG) emitted by human activities are warming the Earth and causing changes in the global climate. These changes are having increasingly severe human, economic and environmental impacts and will continue to do so over the coming decades.

Many activities contribute to these GHG emissions: burning fossil fuels, cutting down trees, farming of livestock, placing household waste in landfill to rot.

The EU has been taking action. The Europe 2020 strategy supports the shift towards a low-carbon, resource-efficient economy, with targets for reducing GHG emissions, increasing the use of energy from renewable sources and improving energy efficiency.

At COP21, the 21st Conference of the Parties to the United Nations Framework Convention on Climate Change, the EU will be part of a worldwide effort to achieve a new international agreement on climate change, applicable to all, to keep global warming below 2°C.

Greenhouse gas emissions

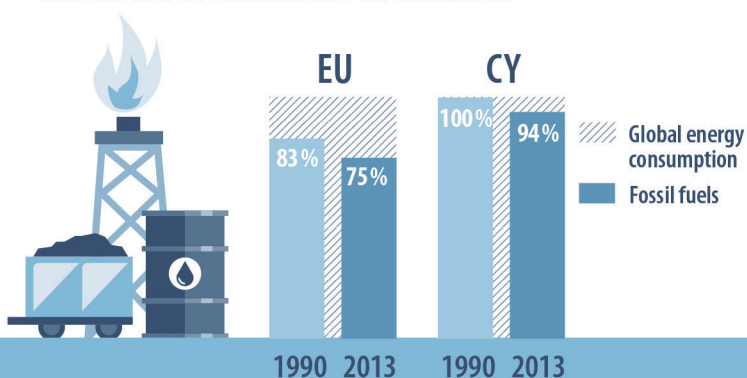

Who is contributing to greenhouse gas emissions?

2012 data

Fossil fuels energy consumption

While in 2013 we consumed around the same amount of energy as in 1990, the share of fossil fuels has fallen and the use of renewables has increased.

Waste

Municipal waste per capita in 2013 (kg/capita)

There has been a significant decrease in the proportion of waste sent to landfill in the EU.

Forests

Today's share (2010) of forests in total area

Change of forest area from 1990 to 2010

With the increase of forests and other land use changes in the EU more CO₂ has been removed from the atmosphere, equivalent to 7% of total emissions.

Climate change and the European Union

December 2015

Definitions

Greenhouse gases are a group of gases that contribute to global warming and climate change, among which are carbon dioxide (CO₂), nitrous oxide (N₂O) and methane (CH₄). Converting the amount of each gas to its CO₂ equivalent makes it possible to compare them and to determine their individual and total contributions to global warming.

Emitters of greenhouse gases are classified here according to the NACE Rev. 2 classification of economic activities. In particular, 'transport' is the transport industry, including aviation. Transport emissions by other economic activities such as energy, agriculture, services, etc. are classified under those activities. Energy consists of electricity, gas, steam and air conditioning supply. Households emit greenhouse gases through heating, private transport and other activities.

Energy consumption refers to gross inland energy consumption, which is the total energy demand of a country or region. It covers consumption by the energy sector itself, distribution and transformation losses and final energy consumption by end users.

Waste refers to municipal waste - the waste collected by or on behalf of municipal authorities and disposed of through waste management systems. It consists to a large extent of waste generated by households, but may also include similar wastes generated by small businesses and public institutions and collected by the municipality.

Landfill is the deposit of waste into or onto land, including specially engineered landfill and temporary storage of over one year.

Removal of CO₂ from the atmosphere: Forests are natural carbon stores, and as they increase in density or area more carbon dioxide can be stored.

Forests refer to the total area of forests and other wooded land. The share is calculated out of the total land area excluding inland water such as lakes and rivers.
