Business statistics - coordination and registers

EuroGroups register

With the EuroGroups Register (EGR) project, Eurostat is currently creating a network of [business registers](#) used for statistical purposes in [European Union \(EU\)](#) Member States, focused on [multinational enterprise groups](#).

A multinational enterprise group (MNE) is defined as an enterprise group composed of at least two enterprises or legal units located in different countries.

In order to create the EuroGroups Register, Eurostat collects enterprise group information from commercial sources and the national statistical business registers of the EU Member States and participating [EFTA](#) countries.

After the consolidation and validation process the register contains the global structure of the enterprise group. National register staff and statistics compilers receive access to all units of the multinational enterprise group, if at least one unit of the group is located in their national territory. These populations can be used for survey frames at national level.

The necessary data exchange between the national business registers and Eurostat is defined in Article 11 of the [business registers Regulation 2186/1993](#) and implemented through two regulations on exchange of confidential data.

To facilitate the identification of statistical entities (i.e. the enterprises) of large and complex multinational enterprise groups, a project was launched with the aim to develop a common method for 'profiling'.

Main findings

Development of the EuroGroups Register

- The 2008 EGR cycle was carried out in 2009 and produced data for 6350 multinational enterprise groups.
- The second EGR cycle processed data for reference year 2009 and was carried out in 2010 and extended the coverage to 8185 multinational enterprise groups.
- The 2010 and 2011 EGR cycles were implemented respectively in 2011 and 2012 and produced data for more than 10 thousand multinational enterprise groups.
- From 2013 onwards EGR will be developed in the direction that it will be able to cover all relevant multinational enterprise groups acting in Europe.

Data

The following units of a multinational enterprise group and their characteristics are in the EuroGroups register:

- **legal units** : identity, demographic, control and ownership characteristics;
- **enterprises** : identity and demographic characteristics, activity code ([NACE](#)), number of persons employed, turnover, institutional sector;
- **enterprise groups** : identity, demographic characteristics, the structure of the group, the group head, the country of global decision centre, activity code (NACE), consolidated employment and [turnover](#) of the group.

The EGR is foreseen to become the platform that supports the production of micro based statistics on globalisation in Europe. The data will serve national statistical institutes and national central banks to compile statistics and will not be disseminated by Eurostat to the public.

The EGR should serve as a unique survey frame for these and other statistics and thereby form the basic tool for improving these statistics, while also reducing the reporting burden.

Context

The fragmented picture, the EU Member States currently have of multinational enterprise groups operating in the European market, is causing increasing harmonisation problems for several statistics affected by globalisation (including [foreign affiliates statistics \(FATS\)](#) , [foreign direct investment](#) and external trade).

The development of the EGR is part of the programme for [modernisation of European enterprise and trade statistics \(MEETS\)](#) .

MEETS programme

This article provides an overview of the [European Commission](#) programme called 'Modernisation of European Enterprise and Trade Statistics', or 'MEETS' for short.

Business and trade statistics are facing major challenges: the world economy has become more integrated, and statistics have to respond to reflect the new phenomena adequately. At the same time there is strong pressure to cut red tape and reduce the burden on business. New ways of producing business statistics, taking advantage of technological progress, have to be explored.

To address this, the MEETS programme was adopted by the [European Parliament](#) and the [Council](#) in December 2008. The programme, which is to run over a period of five years from 2009 to 2013, will help to adapt business statistics to new needs and also adjust the system for the production of statistics to reduce the burden on [enterprises](#). It will provide substantial financial resources- an overall amount of 42.5 million euros is envisaged- to support development in several areas in the [European Union \(EU\)](#) Member States.

The strategy is fully in line with the vision of European statistics for the next decade as defined in [Communication COM\(2009\) 404](#) on the production method of EU statistics: a vision for the next decade; its legal basis [Decision 1297/2008/EC](#) of 16 December 2008 on a Programme for the Modernisation of European Enterprise and Trade Statistics (MEETS).

Objectives and work programmes

The programme should contribute to achieving the following general objectives:

(1) Review priorities and develop target of indicators for new areas

It is important to identify and agree on the new areas to be portrayed. Together with all stakeholders, target sets of indicators need to be defined and underpinned by agreements on methodology, so that comparable data sets can be produced. Very often these indicator sets will cut across the boundaries between statistical domains. In the context of entrepreneurship in a globalised economy, [structural business statistics](#) have to intersect with trade statistics, statistics on [innovation](#), etc. It goes without saying that a changing environment creates not only new requirements, but also the need for permanent review of old requirements.

(2) Achieve a streamlined framework for business-related statistics

Efforts are needed to progress with the integration of the different areas of business statistics. The integration of statistics will include: coordination of legal acts, harmonisation of methodologies, and linking and harmonising statistical classifications, business registers and related sources. It also calls for the inclusion of [multinational enterprise](#) groups in an appropriate way and the introduction of reporting on such groups.

(3) Support the implementation of a more efficient way of producing enterprise and trade statistics

Integration is also needed on the data collection and data processing side. Either by integrating all collected data into a single system or by using microdata linking techniques, it should be possible to make much more effective use of already existing statistical information. In addition, the use of administrative data needs to be increased. However, guaranteeing data quality requires considerable effort, because very often the administrative data are not available in the form needed. Other issues addressed under this objective are the harmonisation of accounting standards and standard estimation techniques.

(4) Modernise Intrastat

Simplification of the Intrastat system will continue along traditional lines (thresholds, [ICT](#) improvements, nomenclatures, etc.). Furthermore, switching to a single flow system will be investigated. This could considerably reduce the burden while at the same time maintaining the most important information. To make sure that the transition is carried out effectively and to safeguard the quality of statistical information, this process needs to be handled carefully.

For all the objectives, broad actions have been defined in the legal basis. They will be implemented through annual work programmes adopted by the Commission after consultation of the relevant technical bodies.

For more information on the annual work programmes see:

- [Commission Decision](#) of 25 October 2012 on the annual work programme for 2013 for the implementation of Decision 1297/2008/EC on a Programme for the Modernisation of European Enterprise and Trade Statistics (MEETS);
- [Commission Decision](#) of 28 October 2011 on the annual work programme for 2012 for the implementation of Decision 1297/2008/EC on a Programme for the Modernisation of European Enterprise and Trade Statistics (MEETS);
- [Commission Decision](#) of 26 November 2010 on the annual work programme for 2011 for the implementation of Decision 1297/2008/EC on a Programme for the Modernisation of European Enterprise and Trade Statistics (MEETS);
- [Commission Decision](#) of 30 November 2009 on the annual work programme for 2010 for the implementation of Decision 1297/2008/EC on a Programme for the Modernisation of European Enterprise and Trade Statistics (MEETS);
- [Commission Decision](#) of 24 April 2009 on the annual work programme for 2009 for the implementation of Decision 1297/2008/EC on a Programme for the Modernisation of European Enterprise and Trade Statistics (MEETS).

MEETS – part of an overall strategy

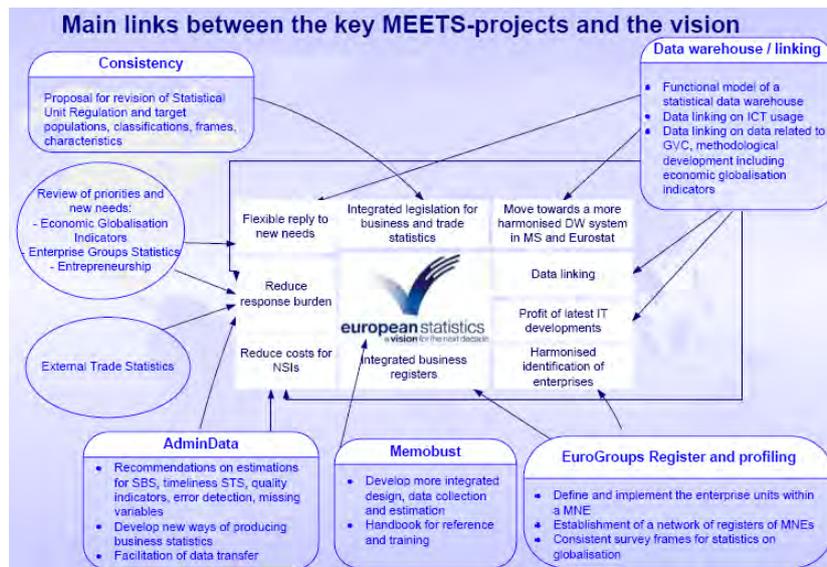

The 'Communication from the Commission to the European Parliament and the Council on the production methods of EU statistics: a vision for the next decade' provides a comprehensive and holistic approach to changing the way European statistics are produced. The objective is to increase the overall efficiency and effectiveness of the system and to ensure that new user demands can be met in the future. It describes the fundamental dilemma posed by increasing demands, resource constraints and the need to reduce burden on respondents. It also calls for close cooperation within the [European statistical system \(ESS\)](#) to achieve the necessary efficiency gains.

The MEETS programme is the application of this vision to the area of business and trade statistics. ESS-nets are a way to develop new projects where a few Member States interested in a specific domain actively collaborate on a common task and then disseminate the results to those not participating. This helps to harness synergies, to save costs and to share best practice while developing specific actions beneficial for the whole of the ESS. ESSnets have been set up for the main projects:

- Consistency of concepts and methods for business and trade-related statistics;
- [EuroGroups register](#) methodology and profiling;
- Use of administrative data, data warehouse and linking;
- Methodology for modern business statistics.

These projects are described in more detail below.

The following figure shows the main links between the MEETS programme and the 'Vision':

Main Projects

Consistency of concepts and methods for business and trade-related statistics

This ESSnet on the consistency of concepts and methods for business and trade-related statistics is part of objective 2. An external study was carried out to evaluate the legal acts in the areas of statistics identified by Member States as needing revision. The study serves as a basis for the work programme of the ESSnet which was launched in 2010.

The aim of the ESSnet is to provide recommendations and detailed suggestions for improving consistency between the legal acts and methodologies analysed. In order to do this, the work is divided into three work packages concerning:

- statistical units;
- target population, frames, reference period, classifications and their applications (breakdowns, special aggregates);
- characteristics and their definition.

For more information see:

- [Consistency on ESSnet portal](#)
- [External study on detail evaluation of the legal acts in the areas of statistics which were identified by member states as areas to revision](#)

EuroGroups register (EGR)

The EGR project comes under MEETS objective 2 and is organised around three sub-projects:

- EGR methodology (ESSnet);
- Support for national implementation (individual grants);

- Methodology for profiling of large and complex enterprises (ESSnet).

Its main objectives are:

- To become the common coordination framework for all European statistical authorities, national statistical institutes and national central banks in sampling populations for the production of statistics on globalisation. The EGR should contain all information on multinational enterprise groups (MNE) with an interest in Europe and their constituent statistical units. This information can then be used in a coordinated manner by the European statistical authorities for identifying survey populations, sampling, linking to other available data sources, etc.
- To develop of a methodology for and implement a network between business registers on MNEs (the EGR network).
- To develop and test a methodology to analyse the legal, operational and accounting structure of an enterprise group in order to establish the statistical units within that group and their links and to determine the most efficient structures for the collection of statistical data (profiling).

For more information see the [EGR article](#) , as well as:

- [ESSnet - EGR](#) ;
- [ESSnet - Profiling](#) ;
- [EuroGroups Register](#) (dedicated website);
- [Eurostat - Business registers](#) ;
- [Eurostat - EuroGroups register](#) .

Use of already existing data in the statistical system

The following MEETS projects under objective 3 deal with data linking:

- Data warehousing and data linking in statistical data production (ESSnet). The aim of the ESSnet is to define a functional model for a data warehouse to serve as basis for assessing all issues raised in the ESSnet in a generic and standardised way.
- Linking of micro data on international sourcing (ESSnet and individual grants). The measurement and analysis of international sourcing and its consequences for European economies is one of the key objectives of this project. Another important objective is to develop a methodology for measuring the global value chain (GVC).
- Linking of micro-data on international trade and business statistics. The main objective of the project is to develop indicators that combine variables from external trade and business statistics.
- Linking of microdata on ICT usage (ESSnet). This ESSnet addresses the development of a micro-data linking approach to analyse the impact of ICT on the economic performance of enterprises. It also investigates in more detail how to adjust national survey strategies to optimise the results of microdata linking in the future.
- Methodology for modern business statistics- Memobust (ESSnet). The overall objective is to identify best practices and develop a common methodology and ESS guidelines for the efficient and integrated production of business statistics.

For more information see:

- [ESSnet - Data Warehouse](#) (data warehousing and data linking on ESSnet portal);
- [ESSnet - Memobust](#) (methodology for modern business statistics).

Use of already existing data in the economy

The following activities under objective 3 aim to improve the use of existing data in the economy:

- ESSnet on the use of administrative and accounts data for business statistics (ESSnet AdminData): its main objective is to investigate the possibilities of making wider use of administrative data for business statistics, to make best practices available to NSIs and to prepare some recommendations in this area. The ESSnet focuses on the common problems arising from the use of different data sources for producing business statistics.
- Individual grants to national statistical institutes for the use of administrative data: the aim is to support national statistical institutes in implementing more efficient ways of producing enterprise statistics and in improving the quality of statistical data.
- Facilitation of data transfer from enterprises to national statistical institutes: grants will be provided to national statistical institutes to introduce data collection systems that could simplify the reporting burden on businesses and to continue investigating the possibilities of using XBRL for statistical purposes.

For more information see:

- [ESSnet - AdminData](#) (use of administrative and accounts data for business statistics);
- [Admin Data Wiktionary - The Use Of Administrative And Accounts Data For Business Statistics](#) .

Modernisation of international trade statistics

The following projects aim to meet objective 4 of the MEETS programme:

- Harmonising methods to improve quality in [intra-EU](#) trade statistics (procurement and individual grants). The aim is to improve the quality of Intrastat data by defining a list of quality items and precise quality requirements and by providing recommendations.
- Better use of administrative data in Intrastat (individual grants). Support is provided for Member State actions to increase and improve the use of administrative data for the compilation of Intrastat data, resulting in better data quality while reducing the response burden for enterprises.
- Development of tools and methods for data exchange (former XT-NET) (procurement and individual grants). The objective of the project is to consolidate and further develop tools and standards in order to facilitate the supply of data on multinational enterprises and improve data quality to enable automated data exchange among Member States and Eurostat.
- Improvement of data exchange systems in external trade statistics (procurement).

Competitiveness of European businesses

Structural business statistics introduced

Summary

What are structural business statistics?

Structural business statistics (SBS) cover industry, construction, distributive trades and services. Presented according to the NACE activity classification, they describe the structure, conduct and performance of businesses across the [European Union \(EU\)](#). These statistics can be broken down to a very detailed sectoral level (several hundred economic activities). A subset of the SBS information is also available for European regions, as well as according to the size of enterprises.

The main indicators within SBS are generally collected and presented as monetary values, or as counts (for example, numbers of enterprises or persons employed); this is in contrast to short-term business statistics, where the data are presented as indices (generally in relation to a base year of 2005=100). Generally SBS does not collect information on products. The external trade and the production of specific products are covered by external trade statistics and/or PRODCOM. The exceptional presentation of products statistics within SBS concern for example multi-yearly data for products sold in distributive trades, or information on certain financial products (such as life assurance).

How are SBS measured?

SBS are based upon data for [enterprises](#) or parts of enterprises, such as local units which are often used for regional SBS data. Enterprises or other units are classified according to a classification of economic activities called [NACE](#). An enterprise carries out one or more activities at one or more locations and may comprise one or more legal units. When an enterprise is active in more than one economic activity, then the value added and turnover that it generates, the persons it employs, and the values of all other variables will be classified under the enterprise's principal activity; the principal activity is normally the one that generates the largest amount of value added.

Which parts of the economy does SBS cover?

SBS covers the 'business economy' (NACE Rev. 2 Sections B to N and Division 95) which includes:

- industry;
- construction;
- distributive trades;
- services.

Note that financial services (NACE Rev. 2 Section K) are generally kept separate because of their specific nature and the limited availability of most types of business statistics in this area. As such, the term 'non-financial business economy' is often used to refer to economic activities covered by NACE Rev. 2 Sections B to J and L to N and Division 95.

SBS do not cover agriculture, forestry and fishing, nor public administration and (largely) non-market services such as education and health. For information on these areas of the economy, refer to national accounts by branch or other sector specific statistics.

Use and examples

SBS may be used to answer such questions as:

- how much wealth is created in an activity and how many persons are employed?;
- is there a shift from the industrial sector to the services sector and in which specific activities is this trend most notable?;
- which countries are relatively specialised in the manufacture of a particular activity - for example, the manufacture of aerospace equipment?;
- how productive is a particular activity, such as the chemicals sector, and how does it fare in terms of its operating profitability?

Legislation

SBS are compiled under the legal basis provided by Parliament and Council [Regulation 0295/2008](#) and Council [Regulation 0058/1997](#) (and later amendments) on structural business statistics, and in accordance with the definitions, breakdowns, deadlines for data delivery, and various quality aspects specified in their implementing regulations.

SBS consists of a horizontal module (Annex I), including a limited set of basic statistics for all market activities. Seven sector-specific annexes cover a more extended list of sector-specific characteristics. The sector-specific annexes are: industry (Annex II), distributive trades (Annex III), construction (Annex IV), insurance services (Annex V), credit institutions (Annex VI), pension funds (Annex VII) and business services (Annex VIII). Annex IX covers business demography statistics for all market activities.

SBS may be broken down by [NUTS](#) region or by enterprise size-class. In SBS, size-classes are defined by the number of persons employed, except for specific data series within retail trade activities where turnover size-classes are also used. A limited set of the standard SBS variables (for example, the number of enterprises, turnover, persons employed and value added) is available, mostly down to the three-digit (group) level of the NACE classification. The [European Commission Recommendation \(2003/361/EC\)](#), adopted on 6 May 2003, classifies SMEs according to their number of persons employed, annual turnover, and independence. For statistical purposes, SMEs are generally defined as those enterprises employing fewer than 250 persons. The number of size-classes available varies according to the activity under consideration. However, the main groups that are often used for analytical purposes and presenting the data include:

- small and medium-sized enterprises (SMEs): with 1 to 249 persons employed, further divided into;
- micro enterprises: with less than 10 persons employed;
- small enterprises: with 10 to 49 persons employed;
- medium-sized enterprises: with 50 to 249 persons employed;
- large enterprises: with 250 or more persons employed.

Current legislation

Given the large number of revisions and amendments that have been made over time to the SBS Regulation, a process of recasting the legislation was concluded in March 2008.

- [Regulation 0295/2008](#)

The key implementing legislation includes the following:

- [Regulation 0251/2009](#)
- [Regulation 0250/2009](#)

Previous legislation

There have been considerable changes to the initial legislation adopted with respect to structural business statistics (SBS). The legislative history of the Regulation may be followed by referring to:

- [Consolidated SBS Regulation, prior to the recast](#)

Although the following links have no legal value, they provide consolidated versions of the main implementing legislation prior to the recasting exercise:

- [Data series: list of variables collected by sector](#)
- [Definitions](#)

Methodology

- [Basic summary of the methodology employed for structural business statistics](#)
- [More detailed methodological information relating to structural business statistics](#)
- [Detailed methodological information relating to national methodologies and quality reports relating to structural business statistics for the Member States](#)

Classifications

As noted above, the enterprises which are surveyed for SBS are classified according to their principal activity and assigned to a particular NACE code. The revised [NACE Rev. 2](#) classification was adopted at the end of 2006, and has since been progressively introduced. By 2010, the vast majority of SBS data were available according to the NACE Rev. 2 classification. Changes in the classification have allowed a broader and more detailed collection of information to be compiled on services, as well as providing the possibility to better identify new areas of economic activity (such as technology-producing sectors). The first reference year for which SBS data were collected under NACE Rev. 2 was 2008 (when some data were also collected using [NACE Rev. 1.1](#)). Starting with data for the 2009 reference year the information presented within SBS is displayed only in terms of NACE Rev. 2.

Historical data for the reference years until 2007 in NACE Rev. 1.1 remain available on Eurostat's website in separate tables. Member States are not legally obliged to send backcasts of SBS data in NACE Rev. 2 for reference years prior to 2008; NACE Rev. 2 data for these years transmitted on a voluntary basis will be included in the NACE Rev. 2 tables.

Policy context

The statistics collected within SBS are of use for following a number of policy areas which are generally under the auspices of the Directorate-General for Enterprise and Industry. The European Commission's enterprise policies aim to create a favourable environment for business to thrive within the EU, creating higher productivity, economic growth, jobs and wealth. Many of the policies that have been introduced in recent years have been aimed at reducing administrative burdens, stimulating innovation, encouraging sustainable production, and ensuring the smooth functioning of the EU's internal market.

At the European Council meeting of 26 March 2010, EU leaders set out their plan for Europe 2020, a strategy to enhance the competitiveness of the EU and to create more growth and jobs. The latest revision of the integrated economic and employment guidelines (revised as part of the Europe 2020 strategy for smart, sustainable and inclusive growth) includes a guideline to improve the business and consumer environment and modernise Europe's industrial base. Additional information about the Europe 2020 strategy can be found on the [Europe 2020 website](#) . In October 2010, the European Commission presented a Communication on 'An industrial policy for the globalisation era', establishing a strategic agenda and proposing some broad cross-sectoral measures, as well as tailor-made actions for specific industries, mainly targeting so-called 'green innovation' performance of

various sectors.

The central principles governing the [internal market](#) for services guarantee EU enterprises the freedom to establish themselves in other Member States, and the freedom to provide services on the territory of another EU Member State other than the one in which they are established. These central principles governing the internal market were set out in the [EC Treaty](#). The objective of the Services [Directive 0123/2006](#) of 12 December 2006 is to eliminate obstacles to trade in services, thus allowing the development of cross-border operations. It is intended to improve [competitiveness](#), not just of service enterprises but also of European industry as a whole. In December 2006, the Directive was adopted by the [European Parliament](#) and the [Council](#) with transposition by the Member States required by the end of 2009.

Enterprise policy on small and medium-sized enterprises (SMEs) is centred upon screening all new EU laws for their friendliness to smaller enterprises, with an attempt to reduce red-tape. SMEs are often referred to as the backbone of the European economy, providing a potential source for both jobs and economic growth. In June 2008 the European Commission adopted a Communication on SMEs referred to as the 'Small business act for Europe'. This aims to improve the overall approach to entrepreneurship, to irreversibly anchor the 'think small first' principle in policymaking from regulation to public service, and to promote SMEs' growth by helping them tackle the remaining problems which hamper their development. The Communication sets out ten principles which should guide the conception and implementation of policies both at EU and national level to create a level playing field for SMEs throughout the EU and improve the administrative and legal environment to allow these enterprises to release their full potential to create jobs and growth. It also put forward a specific and far reaching package of new measures including four legislative proposals which translate these principles into action both at EU and Member State level.

The Regional Policy Directorate-General is responsible for measures to assist the economic and social development of the less-favoured regions within the EU. Its aim is to promote a high level of competitiveness and employment by helping the least prosperous regions and those facing structural difficulties.

- Comprehensive and structured listing of the [legislative acts in force relating to industrial policy](#).

Indicator definitions for key structural business statistics

SBS contain a comprehensive set of basic variables describing business demography and employment characteristics, as well as monetary variables (mainly concerning operating income and expenditure, or investment). In addition, a set of derived indicators has been compiled: for example, ratios of monetary characteristics or per head values.

- [Number of enterprises](#)
- [Local unit](#)
- [Turnover](#)
- [Value added at factor cost](#)
- [Total purchases of goods and services](#)
- [Gross investment in tangible goods](#)
- [Number of persons employed](#)
- [Employee](#)
- [Personnel costs](#)
- [Apparent labour productivity](#)
- [Wage-adjusted labour productivity ratio](#)
- [Gross operating surplus](#)
- [Gross operating rate](#)

This article presents [structural business statistics \(SBS\)](#) ; these data describe the structure, main characteristics and performance of economic activities across the [European Union \(EU\)](#) . While the statistics presented in this article are generally analysed at the level of [NACE](#) sections readers should note that structural business statistics are available at a much more detailed level (several hundred sectors).

Structural business statistics can provide answers to questions on the wealth creation ([value added](#)), [investment](#) and labour input of different economic activities. The data can be used to analyse structural shifts, for example from industry to services, country specialisations, sectoral [productivity](#) and [profitability](#) , as well as a range of other topics. Because they are available broken down by [enterprise size](#) -class, structural business statistics also permit a detailed analysis of [small and medium-sized enterprises \(SMEs\)](#) , which is of particular use to EU policymakers and analysts wishing to focus on entrepreneurship and the role of SMEs. Furthermore,

structural business statistics provide useful background information on which to base an interpretation of [short-term statistics](#) and the [business cycle](#) .

Main statistical findings

Sectoral analysis

Services activities accounted for the two largest shares of the [enterprise population](#) within the EU-27 's [non-financial business economy](#) (industry, construction, distributive trades and non-financial services) when analysed at the NACE section level: slightly fewer than three in every ten (29.1%) of the 20.8 million enterprises in the non-financial business economy were classified to distributive trades, while just under one in six (16.5%) were in professional, scientific or technical activities – see Figure 1. Many of these business services have benefitted from the outsourcing phenomenon, which may explain, in part, the structural shift towards services.

In 2009 a total of EUR5585 800 million of gross value added at factor cost was generated in the EU-27's non-financial business economy; the non-financial business economy accounted for 69.6% of the whole economy's value added at basic prices in 2009. The non-financial business economy workforce reached 134.3 million [persons employed](#) , around three fifths (63.1%) of those employed in the EU-27.

Among the NACE Rev. 2 sections in the non-financial business economy, manufacturing was the largest in terms of value added: 2.0 million manufacturing enterprises generated EUR1400 000 million of value added in 2009, whilst providing employment for about 31 million persons. Distributive trades enterprises (motor trades, wholesale trade, and retail trade) had the largest share of [employment](#) : these enterprises provided employment to 33 million persons and generated EUR1109 600 million of value added. Construction had the third largest workforce and the fourth highest level of value added, just behind professional, scientific and technical activities.

Figure 2 contrasts the value added and employment contributions of the various sectors to the non-financial business economy. The industrial activities of mining and quarrying; manufacturing; electricity, gas, steam and air conditioning supply; water supply, waste and remediation contributed more in terms of value added than employment to the overall non-financial business economy, indicating an above average [apparent labour productivity](#) . This was also the case in some of the service activities, namely information and communication services, real estate activities, as well as professional, scientific and technical activities. In contrast, the construction sector and a number of services, notably distributive trades activities, accommodation and food services, and administrative and support services (which includes cleaning and security services, as well as employment services such as the provision of temporary personnel) reported relatively low levels of apparent labour productivity. It should be noted that the employment data presented are in terms of head counts and not, for example, [full-time equivalents](#) , and there may be a significant proportion of persons working part-time in some of the activities covered; this may explain, at least to some degree, the relatively low levels of apparent labour productivity.

Varying rates of part-time work also help explain, in part, the considerable differences in average [personnel costs](#) within the non-financial business economy of the EU-27, as shown in Table 3. Average personnel costs in the EU-27's information and communication sector and the electricity, gas steam and air conditioning supply sector were around EUR50000 per employee in 2009, a level that was around three times that for accommodation and food services, two and a half times that for administrative and support services and twice that for distributive trades. The variation in average personnel costs was even more marked between EU Member States. For example, within the manufacturing sector average personnel costs ranged (among those EU Member States for which data are available) by a factor of 15, from a high of EUR58400 per employee in Denmark to a low of EUR3800 per employee in Bulgaria.

The influence of part-time employment is largely removed in the [wage adjusted labour productivity ratio](#) , which shows the relation between average value added per person employed and average personnel costs per employee (see Figure 3). This was particularly high for electricity, gas, steam and air conditioning supply as well as for mining and quarrying activities (mainly due to a very high ratio for the extraction of crude petroleum and natural gas); it was also high for the capital-intensive sector of real estate activities. The wage adjusted labour productivity ratio fell below 100% in the small activity of the repair of computers, personal and household goods, indicating that average personnel costs per employee were higher than average value added per person employed.

The [gross operating rate](#) shown in Figure 4 relates the [gross operating surplus](#) (value added less personnel

costs) to the level of [turnover](#) and in this way indicates the extent to which sales are converted into gross operating profit (operating profit before accounting for depreciation or taxes). Due to the very high level of sales inherent in wholesaling and retailing, the distributive trades sector displayed the lowest gross operating rate. Capital-intensive activities (such as real estate activities) tend to have a high gross operating rate as the gross operating surplus by definition does not take account of financial or extraordinary costs related to capital expenditure.

Size class analysis

Structural business statistics can be analysed by enterprise size class (defined in terms of the number of persons employed). The overwhelming majority (99.8%) of enterprises active within the EU-27's non-financial business economy in 2009 were micro, small and medium-sized enterprises (SMEs) – some 20.7 million – together they contributed 58.7% of the value added generated within the EU's non-financial business economy. More than nine out of ten (92.2%) enterprises in the EU-27 were [micro enterprises](#) (employing less than ten persons) and their share of value added within the non-financial business economy (excluding mining and quarrying) was considerably lower at 21.3%. The relative importance of SMEs was particularly high in the southern Member States of Italy, Portugal and Spain (incomplete data for Greece). Some of these differences may be explained by the relative importance of particular sectors in each national economy or by cultural and institutional preferences for self-employment and/or family-run businesses.

Perhaps the most striking phenomenon of SMEs is their contribution to employment. No less than two thirds (66.7%) of the EU's non-financial business economy workforce was active in an SME in 2008. Some 23.3 million persons worked in SMEs in the distributive trades sector, 19.5 million in manufacturing and 13.2 million in construction; together, these three activities provided work to 61.9% of the non-financial business economy workforce in SMEs. Micro enterprises employed more people than any other size class in a number of service sectors. This pattern was particularly pronounced for the repair of computers, personal and household goods where an absolute majority of the workforce worked in micro enterprises. In contrast, a range of activities characterised by network supply and minimum efficient scales of production (such as mining, air or rail transport, postal and courier services) reported a considerably higher proportion of their respective workforces occupied within [large enterprises](#) .

The contribution of SMEs to non-financial business economy value added was lower than their contribution to employment, resulting in a lower level of apparent labour productivity. This pattern was particularly prevalent among activities such as manufacturing or information and communication services. However, it was also observed across most other activities and across most EU Member States. As a result, large enterprises tended to record higher apparent labour productivity ratios than SMEs.

Foreign-controlled enterprises

In general, [foreign-controlled enterprises](#) are few in number, but have a significant economic impact due to their larger than average size. Foreign-controlled enterprises generated substantial shares of value added in the non-financial business economy in many EU Member States – see Figure 7. The highest percentage contributions of foreign-controlled enterprises to non-financial business economy value added in 2009 were registered in Ireland and Hungary (almost 50%), while shares in excess of 40% were also recorded for Malta (2008 data), Luxembourg, Slovakia, the Czech Republic, Estonia and Romania. Employment shares of foreign-controlled enterprises were generally lower than their value added shares, but nevertheless exceeded one quarter in the Czech Republic, one third in Slovakia and Estonia and reached as high as two fifths in Luxembourg (39.4%).

Business demography

Business demography statistics are presented in Table 4, which shows [enterprise birth](#) and death rates as well as the average size of newly born enterprises in terms of their employment. There are significant changes in the stock of enterprises within the business economy from one year to the next, reflecting the level of competition, entrepreneurial spirit and the business environment. Among the countries providing data to [Eurostat](#) , enterprise birth rates in 2009 ranged from 3.0% in Cyprus to 15% or more in Bulgaria, Latvia, Slovakia and France. Since most new enterprises are small, the share of newly born enterprises among the whole business

enterprise population is much higher than the corresponding proportion of the workforce accounted for by these enterprises. The average employment size ranged from 2.6 persons in the United Kingdom to 0.9 in Ireland, with Finland below this range at 0.5. In 2008, enterprise death rates were also lowest in Cyprus (2.4%) and generally ranged between 4% and 15%, with Portugal (17.0%) just above this range and Lithuania (32.1%) far above it.

Data sources and availability

Eurostat's structural business statistics describe the structure, conduct and performance of economic activities, down to the most detailed activity level (several hundred sectors). Without this structural information, short-term data on the economic cycle would lack background and be hard to interpret.

Coverage, units and classifications

Structural business statistics cover the 'business economy', which includes industry, construction and many services (NACE Rev. 2 Sections B to N and Division 95); financial and insurance activities (NACE Section K) are treated separately within structural business statistics because of their specific nature and the limited availability of most types of standard business statistics in this area. As such, the term 'non-financial business economy' is generally used in business statistics to refer to those economic activities covered by NACE Rev. 2 Sections B to J and L to N and Division 95 and the units that carry out those activities. Structural business statistics do not cover agriculture, forestry and fishing, nor public administration and (largely) non-market services, such as education or health.

Structural business statistics describe the business economy through the observation of units engaged in an economic activity; the unit in structural business statistics is generally the enterprise. An enterprise carries out one or more activities, at one or more locations, and it may comprise one or more legal units. Enterprises that are active in more than one economic activity (plus the value added and turnover they generate, the people they employ, and so on) are classified under the NACE heading according to their principal activity. This is normally the one which generates the largest amount of value added.

NACE Rev. 2 was adopted at the end of 2006, and implemented in structural business statistics from the 2008 reference year. This allows a broader and more detailed collection of information to be compiled on services, while also updating the classification to identify new areas of activity better.

Structural business statistics are compiled under the legal basis provided by Parliament and Council [Regulation 295/2008](#) on structural business statistics, and in accordance with the definitions, breakdowns, deadlines for data delivery, and various quality aspects specified in the regulations implementing it.

The structural business statistics data collection consists of a common module (Annex 1), including a set of basic statistics for all activities, as well as six sector-specific annexes covering a more extensive list of characteristics. The sector-specific annexes are: industry, trade, construction, insurance services, credit institutions, and pension funds. There were two further annexes added in 2008 covering business services and business demography.

Size class and regional analysis

Structural business statistics are also available with an analysis by region or by enterprise size class. In structural business statistics, size classes are defined by the number of persons employed, except for specific data series within retail trade activities where turnover size classes are also used. A limited set of the standard structural business statistics variables (for example, the number of enterprises, turnover, persons employed and value added) is analysed by size class, mostly down to the three-digit (group) level of NACE. For statistical purposes, SMEs are generally defined as those enterprises employing fewer than 250 persons. The number of size classes available varies according to the activity under consideration. However, the main groups used in this publication for presenting the results are:

- small and medium-sized enterprises (SMEs): with 1 to 249 persons employed, further divided into;
 - micro enterprises: with less than 10 persons employed;
 - small enterprises: with 10 to 49 persons employed;
 - medium-sized enterprises: with 50 to 249 persons employed;
- large enterprises: with 250 or more persons employed.

Structural business statistics contain a comprehensive set of basic variables describing business demographics and employment characteristics, as well as monetary variables (mainly concerning operating income and expenditure, or investment). In addition, a set of derived indicators has been compiled: for example, ratios of monetary characteristics or per head values.

Business demography

Statistics that relate to the birth, survival (followed up to five years after birth) and death of enterprises within the business population are referred to as business demography statistics. Within this context the following definitions apply.

- An enterprise birth amounts to the creation of a combination of production factors, with the restriction that no other enterprises are involved in the event. Births do not include entries into the business population due to mergers, break-ups, split-offs or restructuring of a set of enterprises, nor do the statistics include entries into a sub-population that only result from a change of activity. The birth rate is the number of births relative to the stock of active enterprises.
- An enterprise death amounts to the dissolution of a combination of production factors, with the restriction that no other enterprises are involved in the event. An enterprise is only included in the count of deaths if it is not reactivated within two years. Equally, a reactivation within two years is not counted as a birth.

Foreign-controlled enterprises

Statistics on foreign affiliates (FATS) provide information that can be used to assess the impact of foreign-controlled enterprises on the European business economy. The data may also be used to monitor the effectiveness of the internal market and the integration of economies within the context of globalisation. A foreign affiliate, as defined in inward FATS statistics, is an enterprise resident in a country which is under the control of an institutional unit not resident in the same country. Control is determined according to the concept of the 'ultimate controlling institutional unit' which is the institutional unit, proceeding up a foreign affiliate's chain of control, which is not controlled by another institutional unit.

Context

In October 2010 the European Commission presented a Communication on a renewed industrial policy. ' [An industrial policy for the globalisation era](#) ' provides a blueprint that puts industrial competitiveness and sustainability centre stage. It is a flagship initiative that forms part of the [Europe 2020 strategy](#) , and sets out a strategy that aims to boost growth and jobs by maintaining and supporting a strong, diversified and competitive industrial base in Europe offering well-paid jobs while becoming less carbon intensive. The initiative establishes a strategic agenda and proposes some broad cross-sectoral measures, as well as tailor-made actions for specific industries, mainly targeting the so-called 'green innovation' performance of these sectors.

The [internal market](#) remains one of the EU's most important priorities. The central principles governing the internal market for services were set out in the [EC Treaty](#) . This guarantees EU enterprises the freedom to establish themselves in other Member States and the freedom to provide services on the territory of another EU Member State other than the one in which they are established. The objective of the [Services Directive 2006/123/EC](#) of 12 December 2006, on services in the internal market, is to eliminate obstacles to trade in

services, thus allowing the development of cross-border operations. It is intended to improve [competitiveness](#) , not just of service enterprises but also of European industry as a whole. In December 2006, this Directive was adopted by the [European Parliament](#) and the [Council](#) with transposition by the Member States required by the end of 2009. It is hoped that the Directive will help achieve potential economic growth and job creation. By providing for administrative simplification, it also supports the better regulation agenda.

In April 2011, leading up to the twentieth anniversary of the beginning of the single market, the European Commission released a Communication titled ' [Single Market Act – twelve levers to boost growth and strengthen confidence](#) ' (COM(2011) 206 final), aimed at improving the single market for businesses, workers and consumers – see the introductory article for [industry, trade and services](#) for more information.

SMEs are often referred to as the backbone of the European economy, providing a potential source for both jobs and economic growth. In June 2008 the European Commission adopted a Communication on SMEs referred to as the ' [Small business act for Europe](#) ' (SBA). This aims to improve the overall approach to entrepreneurship, to irreversibly anchor the ' [think small first](#) ' principle in policymaking from regulation to public service, and to promote SMEs' growth by helping them tackle problems which hamper their development. The Communication sets out ten principles which should guide the conception and implementation of policies both at EU and national level to create a level playing field for SMEs throughout the EU and improve the administrative and legal environment to allow these enterprises to release their full potential to create jobs and growth. It also put forward a specific and far reaching package of new measures including four legislative proposals which translate these principles into action both at EU and Member State level.

A [review of the SBA](#) was released in February 2011: it highlighted the progress made and set out a range of new actions to respond to challenges resulting from the financial and economic crisis. In doing so, it is hoped that the updated SBA will contribute towards delivering the key objectives of the Europe 2020 strategy – namely, smart, sustainable and inclusive growth.

Structural business statistics at regional level

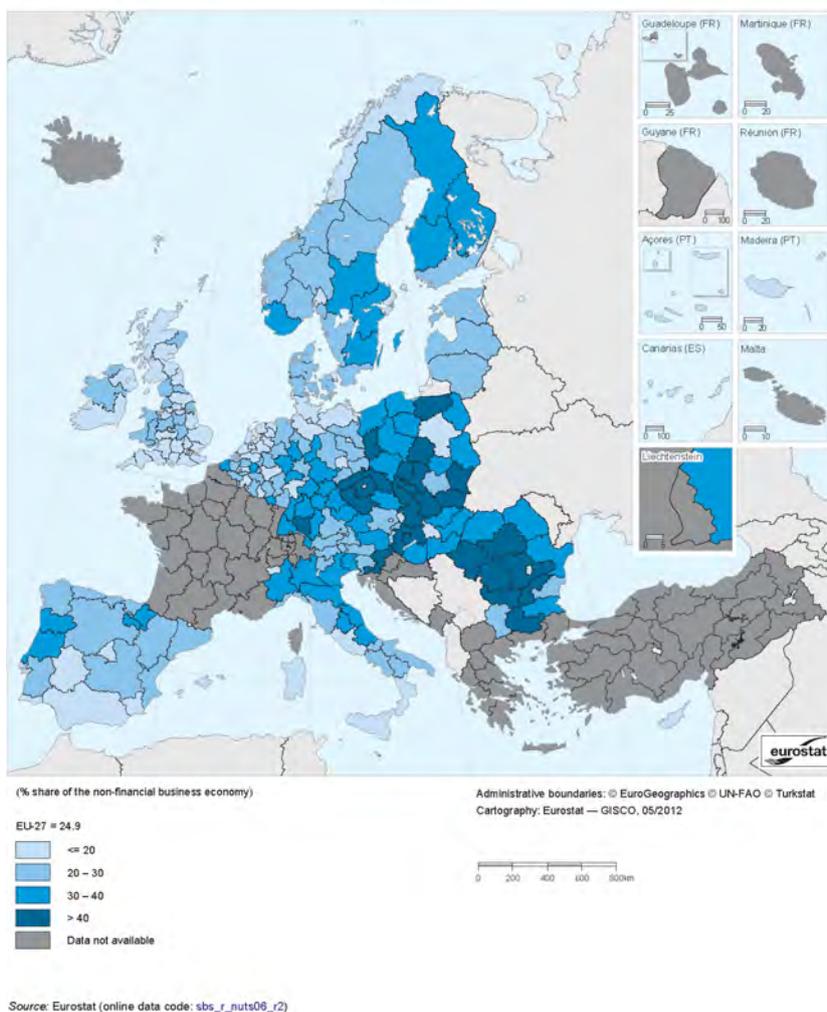

Data from February 2012. Most recent data: Further Eurostat information, Main tables and Database .

Structural business statistics (SBS) cover industry, construction and **non-financial services** . Presented according to the activity classification **NACE** , they describe the structure, conduct and performance of businesses. These statistics can be analysed at a very detailed sectoral level (several hundred economic activities), by enterprise size class or by region.

There are significant disparities between **European Union (EU)** regions in terms of the importance of different activities within the **non-financial business economy** . While some activities are distributed relatively evenly across most regions, many others exhibit a considerable variation in their level of regional specialisation, often with a few regions having a particularly high degree of specialisation.

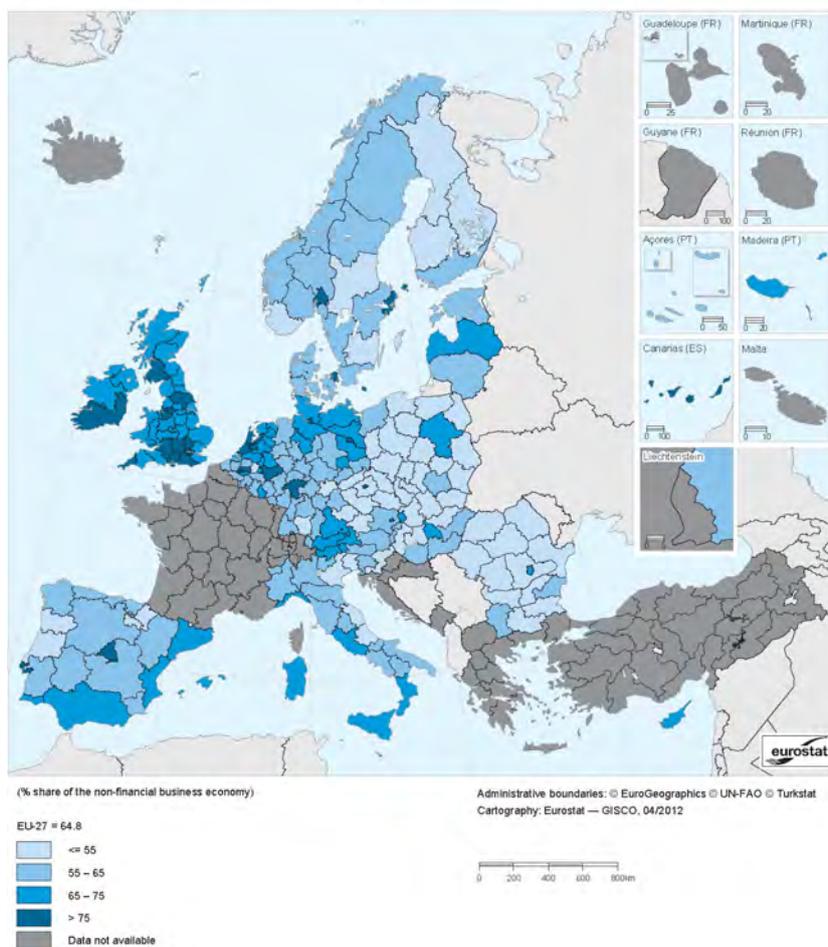

The share of a particular activity within the non-financial business economy gives an idea of which regions are the most or least specialised in that activity, regardless of whether the region or the activity is large or small. The reasons for regional specialisation are varied and include the availability of natural resources (for example, for mining and quarrying and forest-based manufacturing), the availability of skilled employees, costs, infrastructure, legislation, climatic and topographic conditions (particularly regarding tourism-related activities) and the proximity to markets.

Employment in the industrial economy, by NUTS 2 regions, 2009

Main statistical findings

In 2009 more than 20 million enterprises were active in the EU-27's non-financial business economy: this covers industrial, construction and services other than financial intermediation. Together these enterprises generated approximately EUR 5500 billion¹ of gross value added and employed around 175 million persons. According to national accounts data, industry accounted for 18.3% of value added (at basic prices) in the whole economy, construction 6.7%, and non-financial services around 44.2%; in employment terms the shares were 16.5% for industry, 7.4% for construction and 39.2% for non-financial services.

Industrial and services specialisation

The shares of the non-financial business economy workforce working in the industrial sector and in the non-financial services sector in 2009 are shown in Maps 1 and 2; no data are available for Greece, France or Malta. When analysing the data for 2009 it is important to bear in mind that the impact of the financial and economic crisis was particularly strong at this time: GDP fell in 2009 by 4.3% in the EU-27 and employment fell by 1.8%. Among the EU Member States, only Poland recorded an increase in employment and GDP (in real terms) in 2009; the largest contraction in GDP among the Member States was in Latvia (-17.7%) which also recorded the

¹Billion is 1 000 million.

largest fall in employment (-13.2%).

In 26 regions the share of the industrial workforce in the non-financial business economy workforce exceeded 40%: all of these regions, aside from Tübingen (Germany), were located in those Member States that joined the EU in 2004 or 2007. By this measure the most industrialised workforces were in the Czech Republic and Poland (each with six regions above 40%), Romania (four regions) Bulgaria, Slovakia (three regions each), Hungary (two regions) and Slovenia (one region). The highest regional share of the industrial workforce was 58.2% in the Slovak region of Západne Slovensko, the only region where more than half of the non-financial business economy workforce was active in an industrial activity. The regions where less than 10% of the non-financial business economy workforce was active in an industrial sector were the capital city regions of the Netherlands and the United Kingdom, as well as Utrecht (Netherlands), the Algarve (Portugal), and the Spanish island regions and overseas territories of the Canarias, Illes Balears, Ceuta and Melilla. Within Norway, the capital city region of Oslo og Akershus stood out for its relatively low share of industrial employment, just 8.7%; this ratio was just below 20% in Nord-Norge, which was the Norwegian region with the next lowest share.

The most service oriented non-financial business economy workforces were mainly in or bordering major urban areas such as London and the surrounding south east of England, Hamburg and Berlin in Germany, Noord-Holland (including Amsterdam) in the Netherlands, and Bruxelles-Capitale/Brussels Hoofdstedelijk Gewest in Belgium. The highest share of non-financial services in the non-financial business economy workforce was 93.2% in Inner London. Non financial services accounted for more than 75% of the non-financial business economy workforce in a total of 35 regions in the EU Member States, among which were 11 capital city regions. Alongside these, the remaining 24 regions with a high proportion of employment in non-financial services included a further 12 regions in the United Kingdom, three more in each of Germany, Spain and the Netherlands, one more in Belgium and one in Finland; the Norwegian capital city region of Oslo og Akershus also recorded in excess of 75% of its non-financial business economy workforce employed within the non-financial services sector.

In total there were 57 regions in the EU where the non-financial services share of employment was 55% or less, and in 12 of these regions the share was 45% or less. The lowest shares were mainly in Slovakia (three of the four Slovak regions) and the Czech Republic (five of the eight Czech regions), as well as in Romania, Bulgaria and Slovenia. The Norwegian region of Agder og Rogaland also reported that the non-financial services share of employment was 55% or less.

The remaining share of non-financial business economy employment that is not represented either in Map 1 or Map 2 was in construction. The share of construction in non-financial business economy employment ranged across the EU from less than 5% in the urban regions of Darmstadt, Bremen, Köln, Hamburg (all Germany) and Inner London (United Kingdom), to more than 18% in the Regiões Autónomas of the Açores and Madeira (Portugal), the territories of Melilla and Ceuta, regions of Extremadura and Castilla-La Mancha (Spain), the Province/Provincie Luxembourg (Belgium) as well as Valle d'Aosta/Vallée d'Aoste and Molise (Italy).

Detailed specialisation within the non-financial business economy

Table 1 presents a more detailed activity analysis, at the NACE section and division levels. For each of these activities the table indicates the median and mean share of that activity in the non-financial business economy workforce for all regions. The final two columns in the table show which region was the most specialised for each activity in 2009, as well as the relative importance of the most specialised region within the total workforce for that activity in the EU (for reasons of data availability the share in the EU is based on an aggregate of all Member States except Greece, France and Malta).

Mining and quarrying activities of energy-producing and metallic minerals tend to be very concentrated as a consequence of the geographical location of deposits, and therefore only a small number of regions tend to be highly specialised in these activities. The most notable case was the mining of coal and lignite where Slaskie (Poland) was the most specialised region in 2009 and alone accounted for 40.5% of the EU employment in this activity. In a similar manner, North Eastern Scotland (United Kingdom) was the most specialised in mining support services as this region provides support for the offshore extraction of crude petroleum and natural gas for which it was also the most specialised region; furthermore it was the most specialised region for two services divisions that also support oil and gas extraction, namely architectural and engineering activities and rental and leasing activities. In contrast, for many other activities the most specialised regions accounted for a relatively small share of total EU employment: this was particularly the case for construction activities, distributive trades and real estate which are activities commonly found in most regions, where there is little specialisation.

Manufacturing activities which involve the primary processing stages of agricultural, fishing or forestry products tend to be concentrated in areas close to the source of the raw material. The regions most specialised in food manufacturing (NACE Division 10) were often located in rural areas or close to agricultural production centres: Podlaskie (the most specialised of all the regions) and other regions in the eastern part of Poland, Dél-Alföld in Hungary, Alentejo in Portugal, Severen tsentralen in Bulgaria and Lincolnshire in the United Kingdom. Heavily forested **Nordic** and **Baltic** regions were the most specialised regions in the manufacture of wood and wood products (NACE Division 16) and in the related manufacturing of paper and paper products (NACE Division 17). Itä-Suomi (Finland) was the most specialised region in wood and wood products and Norra Mellansverige (Sweden) was the most specialised for pulp and paper.

Construction activities (NACE Divisions 41–43) accounted for the highest shares of the workforce in Região Autónoma dos Açores in Portugal; these activities were also historically one of the main employers in some Spanish regions, however, the financial and economic crisis is likely to have resulted in a reduction in employment levels in recent years (data for the 2009 reference year are not available for construction at the Division level for Spain).

Transport services are also influenced by location, with water transport (NACE Division 50) naturally being important for coastal regions and islands, while air transport (NACE Division 51) is generally important for regions with or close to major cities, but also for island regions (especially those focused on tourism). The small island region of Åland (Finland) is a centre for the ferry services between Sweden and Finland and other Baltic Sea traffic. Åland was very highly specialised in water transport, which accounted for over 40% of the total number of persons employed in this region's non-financial business economy in 2009, many times more than the next most specialised region. Outer London was the region most specialised in air transport; other regions with a high share of their non-financial business economy workforce in air transport included Noord-Holland (the Dutch region including Amsterdam), Köln in Germany and Niederösterreich in Austria. The German region of Köln (which includes the city of Bonn) is home to Deutsche Post DHL and was particularly specialised in postal and courier activities.

Regions in Member States traditionally associated with tourism, for example in Portugal, Spain and Italy, were the most specialised in accommodation (NACE Division 55) and food service activities (NACE Division 56). Accommodation services accounted for more than 10% of the non-financial business economy workforce in the Alpine regions of the Provincia Autonoma Bolzano/Bozen (Italy) and Tirol (Austria), the island regions of Illes Balears (Spain) and the Região Autónoma da Madeira (Portugal), the Scottish Highlands and Islands (United Kingdom) and the German coastal region of Mecklenburg-Vorpommern. The Algarve in Portugal was the most specialised region in terms of its employment share for food and beverage service activities.

Specialisation in information and communication activities (NACE Divisions 58–63), real estate activities (NACE Division 68), professional scientific and technical activities (NACE Divisions 69–75) and administrative and support service activities (NACE Divisions 77–82) may be based on access to a critical mass of clients (enterprises or households) or access to a specific knowledge base (external researchers and/or qualified staff).

Inner London in the United Kingdom was the most specialised region for publishing activities and multi-media publishing (Divisions 58 and 59), while Köln was the most specialised in telecommunications boosted by the presence of Deutsche Telekom's headquarters in Bonn. Latvia was the most specialised region for real estate activities in 2009, ahead of Inner London (United Kingdom), Rheinhessen-Pfalz (Germany) and Közép-Magyarország (the capital city region of Hungary). British regions were the most specialised in nearly all of the professional scientific and technical activities: Inner London for legal and accounting activities, activities of head offices and other professional, scientific and technical activities; East Anglia (which includes Cambridge) in scientific research and development; Cumbria for veterinary services and North Eastern Scotland (which provides services for the North Sea oil and gas platforms) for architectural and engineering activities. The Slovakian capital city region of Bratislavský kraj was the most specialised region for advertising and market research.

The Portuguese capital city region of Lisboa was most specialised in administrative and support service activities (NACE Section N). At a more detailed level, Groningen (Netherlands) was particularly specialised in employment activities (Division 78).

Range of specialisation

Figure 1 provides an overview of the relative importance among the EU regions of various activities (at the NACE section level) in the non-financial business economy workforce. For each activity, the horizontal lines indicate the spread from the region with the lowest share of its non-financial business economy workforce in that activity to the region with the highest share; the region with the highest share is named in the figure. The extremes of the highest and lowest shares can be influenced by a single region, and the coloured box shows a narrower range, defined to cover half of the regions (the inter-quartile range), with one quarter of all regions having a higher employment share in that activity and one quarter of the regions having a lower share. The central bar within the coloured box shows the value of the median region. The activities are ranked from the largest employer (distributive trades) to the smallest (mining and quarrying).

The situation in manufacturing is particular in several ways. The range between least and most specialised is very large for manufacturing as is the width of the coloured box, indicating a very varied importance of manufacturing. In contrast, the employment spread for large, basic activities, like construction and distributive trades, which tend to serve more local clients, was much narrower, both in terms of the spread of the extreme values (shown by the horizontal lines) and in terms of the spread of the inter-quartile range (the coloured box containing half of the regions).

Manufacturing accounted for only 1.8% of the total number of persons employed in the non-financial business economy in the region where it had its smallest share, however, in *Západné Slovensko* (Slovakia) it accounted for 52.3% of non-financial business economy employment; manufacturing also exceeded a 40% share in *Strední Morava* and *Severovýchod* (Czech Republic), *Stredné Slovensko* and *Východné Slovensko* (Slovakia), *Severozápadní území* (Bulgaria), *Közép-Dunántúl* (Hungary) and *Vzhodna Slovenija* (Slovenia).

In contrast, the spread of employment was much narrower in distributive trades (NACE Section G), which was the activity displaying the highest median employment share, and was present on a relatively large scale in all regions as it often serves local clients. Employment shares for distributive trades ranged from 15.3% to close to two fifths (38.8%) in the *Ciudad Autónoma de Melilla* (Spain).

Transport and storage (NACE Section H) and mining and quarrying (NACE Section B) are also activities where a few regions are very highly specialised. The highest specialisation for transport and storage was in the small Finnish island region of *Åland*, where more than two fifths of the workforce (42.3%) was employed in this sector, far ahead of *Köln* in Germany (18.8%); the specialisation in *Åland* is due almost exclusively to the importance of water transport. Natural endowments play an important role in mining and quarrying and, as such, many regions record little or no such activity, with only very few regions being highly specialised on account of deposits of metallic ores, coal, oil or gas. Mining and quarrying accounted for 0.1% or less of the total number of persons employed in the non-financial business economy workforces of a quarter of all regions, and between 0.1% and 0.5% of employment in half of all the regions. However, this activity did account for over 4% of the non-financial business economy workforce in five regions, while its share rose to around 10% of the total in *North Eastern Scotland* (United Kingdom) and *Slaskie* (Poland). In *Agder og Rogaland* (Norway) mining and quarrying accounted for 17.2% of non-financial business economy employment.

Business concentration

The analysis of specialisation (above) shows the relative importance of an individual activity in a region, regardless of the size of the region or the activity. Figure 2 shows the extent to which a particular activity is concentrated in a small number of regions or more widely spread. Four of the five mining and quarrying divisions topped the rankings in terms of having the most concentrated number of persons employed within the ten largest regions across the EU. By this measure the most concentrated activity was the mining of metal ores (NACE Division 07): the entire workforce of the EU in this sector was concentrated in less than one quarter of all regions, with no employment in this activity in the remaining three quarters.

Air transport (NACE Division 51) and leather and leather products manufacturing (NACE Division 15) were also highly concentrated in the ten largest regions, which together accounted for 59% and 56% of their total employment respectively. In the case of air transport, this dominance is due to a concentration within large metropolitan regions where main airports tend to be situated: chief among these were the regions of Paris, Outer London, *Köln*, Amsterdam and Madrid. Leather and leather products manufacturing, on the other hand, is a relatively small activity in the EU that was heavily concentrated in Italy, Portugal and Romania.

In contrast to the energy and metals related types of mining and quarrying, the activity of other mining and quarrying (NACE Division 08) was among the activities in which the ten largest regions were least dominant, as they accounted for 18.5% of EU-27 sectoral employment. This is due to the widespread availability and local sourcing of many construction materials, such as sand, clay and stone, which dominate this type of mining and quarrying activity in most regions. Of all the activities (NACE divisions), motor trades and repair (NACE Division 45), retail trade (NACE Division 47), and veterinary activities (NACE Division 75) had the lowest levels of concentration in 2009; the two distributive trades activities are both major activities in terms of their overall contribution to the level of non-financial business economy employment in the EU.

Map 3 presents a different aspect of concentration, namely the extent to which a region is dependent on a small number of large activities, or, alternatively, whether it displays the characteristics of being more diversified. The map is based on an indicator that combines the shares of the five largest activities (NACE divisions) in the total non-financial business economy workforce in each region: the five largest activities are selected independently for each region, although there are several that are found in nearly all regions, such as retail trade. As a result, the level of concentration tends to be highest in regions where construction, distributive trades or other services dominate the business economy, as industrial activities are more fragmented. By this measure, the most concentrated regions were generally in Member States traditionally associated with tourism, in particular Spain, Italy, Cyprus, Austria and Portugal, underlining the importance of construction, trade, transport, and accommodation and food service activities in tourism-oriented regions. There were 23 regions at the [NUTS](#) level 2 that reported in excess of 47% of their non-financial employment spread across their five largest activities.

In contrast, the lowest concentrations were recorded mainly in regions with a relatively small services sector and a relatively large manufacturing activity; this was often the case in eastern Europe, in particular in Slovakia, the Czech Republic, Estonia, Hungary, Slovenia and Slovakia. The five largest activities accounted for as little as one third of non-financial business economy employment in five regions in the Czech Republic and in the Comunidad Foral de Navarra in Spain.

Data sources and availability

Regional SBS are collected under a regulation of the European Parliament and of the Council, using the definitions and breakdowns specified in Commission implementing regulations. Data available for the reference year 2009, at the time of writing, cover most of the EU Member States, Norway and Croatia; data series are continuously updated and revised where necessary.

The regional SBS data presented in this article are restricted to the non-financial business economy, which includes NACE Sections B (mining and quarrying), C (manufacturing), D (electricity, gas, steam and air conditioning supply), E (water supply, sewerage and waste management), F (construction), G (distributive trades), H (transport and storage), I (accommodation and food service activities), J (information and communication), L (real estate activities), M (professional, scientific and technical activities) and N (administrative and support service activities), as well as NACE Division 95 (repair of computers and personal and household goods). The aggregate for the non-financial business economy therefore excludes agricultural, forestry and fishing activities and public administration and other non-market services (such as education and health, which are not covered by SBS), as well as financial services (NACE Section K). Regional SBS are presented by sectors of activity, available down to the NACE 2-digit (divisions) level.

The type of statistical unit used for regional SBS data is normally the [local unit](#), which is an enterprise or part of an enterprise situated in a geographically identified place. Local units are classified into sectors (by NACE) normally according to their own main activity, but in some Member States the activity code is assigned on the basis of the principal activity of the enterprise to which the local unit belongs. The main SBS data series are presented at national level only, and for this national data the statistical unit is the enterprise. It is possible for the principal activity of a local unit to differ from that of the enterprise to which it belongs. Hence, national SBS data from the main series are not necessarily directly comparable with national aggregates compiled from regional SBS.

The main variable used for analysis in this article is the number of persons employed. For SBS, this is defined as the total number of persons who work (paid or unpaid) in the observation unit, as well as persons who work outside the unit but who belong to it and are paid by it. The number of persons employed includes working proprietors, unpaid family workers, part-time workers and seasonal workers.

Context

Regional SBS offer users who want to know more about the structure and development of the regional business economy a detailed, harmonised data source, describing for each activity the number of workplaces, number of persons employed, wage costs and investments made. This article shows how some of these data can be used to analyse different regional business characteristics, for example, the focus, diversity and specialisation of regional business economies.

Notes

Business demography statistics

This article presents statistical data on [business demography](#) in the [European Union \(EU\)](#) , treating aspects such as the total number of [active enterprises](#) in the [business economy](#) , their [birth](#) and [death rates](#) , and the [survival rate](#) .

The 2009 data show that the business economy of the 24 Member States for which information was available consisted of some 23.8 million active enterprises and that the services sector was dominant in every country, with the highest proportion of enterprises.

The proportion of newborn enterprises compared to 2008 went up slightly, by 3.4%. Both birth and death rates of enterprises tend to be around 10% of the total number. In 2008 there were more enterprise births than deaths both at EU level and in the majority of Member States for which final data were available. In 2009 the opposite seems to be the case, when preliminary death data are compared with final birth data. The one-year survival rate for enterprises created in 2008 was 81%; the five-year survival rate of enterprises born in 2004 and still active in 2009 was 47.5%.

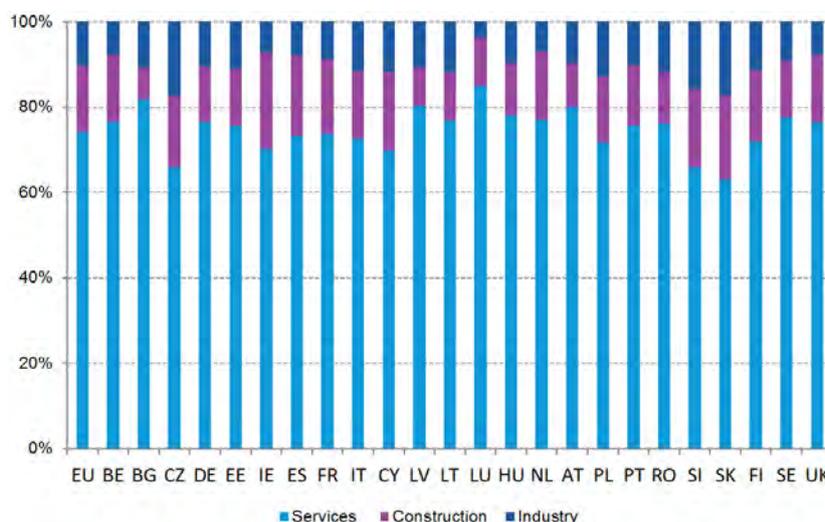

Figure 1: Structure of active enterprises by sector, business economy, 2009 (%) (DK, EL and MT not available - see country codes) Source: Eurostat (bd_9a_1_form_r2)

Main statistical findings

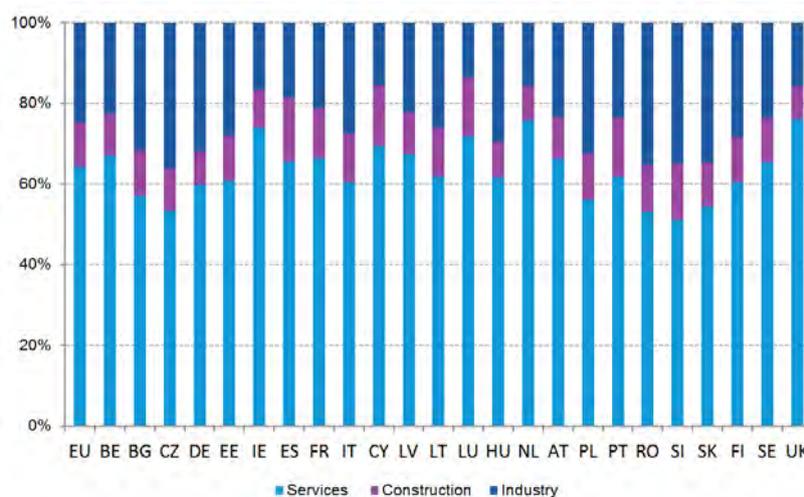

Figure 2: Structure of employment by sector, business economy, 2009 (%) (DK, EL and MT not available) Source: Eurostat (bd_9a_1_form_r2)

Highlights

- About 23.8 million active enterprises made up the business economy of the 24 Member States for which information was available in 2009.
- In each of the countries the services sector was dominant, with the highest proportion of active enterprises in the business economy.
- The proportion of newborn enterprises in the total number of active enterprises increased slightly by 3.4% from 2008 to 2009.
- For any given year the birth and death rates of enterprises tend to be around 10% of the number of active enterprises.
- There were more enterprise births than deaths in 2008 at EU level and also in the majority of the Member States for which final data were available; 2009 shows the opposite, more deaths than births, when comparing preliminary death data with final birth data.
- The one-year survival rate for enterprises created in 2008 was 81%; the five-year survival rate of enterprises born in 2004 and still active in 2009 was 47.5%.

Active enterprises in the business economy

This section provides a general overview of the business enterprise population. It concentrates on aggregated data for industry (Sections B to E), construction (Section F) and services (Sections G to N, excluding activities of holding companies – K64.2), according to NACE Rev 2. The data presented for the EU aggregate were created from the 24 Member States which sent the data for 2009 (data are not currently available for DK, EL and MT). On average, more than three quarters (76.4%) of all business economy enterprises (NACE Rev. 2 Sections B to N, excluding K64.2) were active within the services sector in 2009, providing work for 64.3% of the total number of persons employed (see Figures 1 and 2). Services accounted for between 63.1% of all enterprises in the business economy in Slovakia and 85.0% of the total in Luxembourg. In terms of its contribution to employment, the services sector accounted for between 53 and 54% of the workforce in Romania and Czech Republic, while Luxembourg and the Netherlands had the highest shares, at 71.9% and 75.7% respectively.

By contrast, only 10.2% of active enterprises were found in industry for the EU aggregate, even though these enterprises provided work for 24.9% of the total number of persons employed. The difference between these shares provides evidence that the average size of industrial enterprises (as measured in terms of the number of persons employed) was considerably higher than for services. Indeed, industrial enterprises employed 14 persons

on average across the 24 Member States that compile the EU aggregate, compared to an average of five persons for services. The average number of persons employed in construction was similar to that in services, at four persons per enterprise.

Birth rate

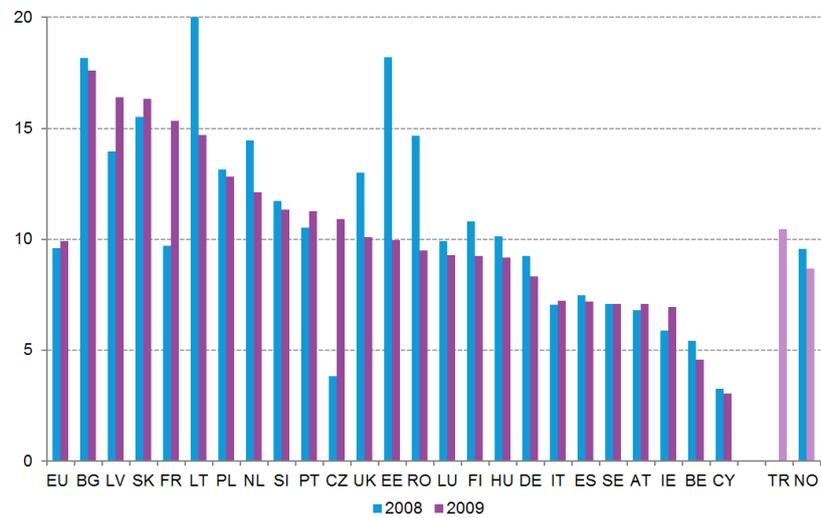

Figure 3: Enterprise birth rates, business economy, 2008 - 2009 (%) (DK, EL and MT not available) Source: Eurostat (bd_9a_1_form_r2)

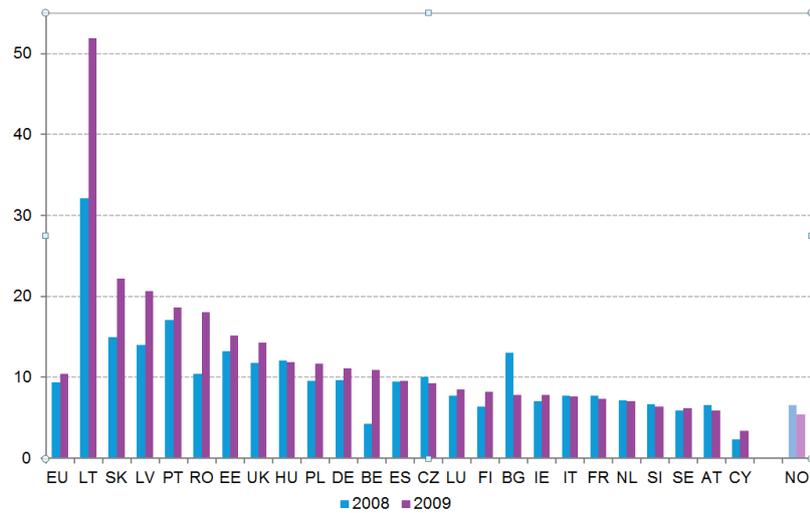

Figure 6: Trend of enterprise death rates, business economy, 2008 - 2009(DK, EL and MT not available; 2009 - preliminary data)Source: Eurostat (bd_9a_1_form_r2)

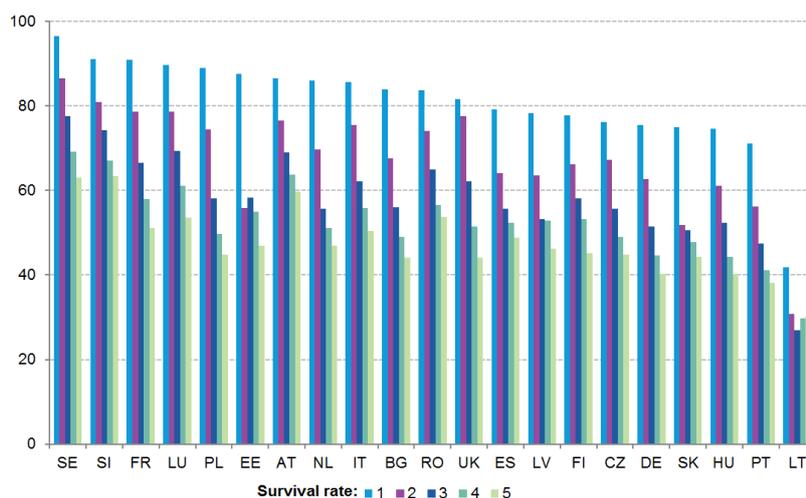

Figure 7: One - to five-year survival rates of enterprises born in 2004 and still active in 2009, business economy, (%) (DK, EL and MT not available) Source: Eurostat (bd_9b_sz_cl_r2)

The birth of new enterprises is often seen as one of the key determinants of job creation and economic growth. Enterprise births are thought to increase the competitiveness of enterprises, by obliging them to become more efficient. As such, they stimulate innovation and facilitate the adoption of new technologies, while helping to increase overall productivity within an economy.

Looking at birth rates in the EU (based on the data available for 24 Member States), the number of newly born enterprises as a proportion of the total number of active enterprises slightly increased by 3.4% in 2009 compared with 2008. In 2009, birth rates range from 3% in Cyprus and around 7% in Austria, Sweden, Spain and Italy to 16% or more in Slovakia, Latvia and Bulgaria. Estonia and the United Kingdom were close to the EU average for 2009, as were France and Germany in 2008. The birth rate was consistently lowest in Cyprus and Belgium for both years. At the other end of the scale, Bulgaria and Latvia recorded the highest birth rates in 2009 and Lithuania and Estonia the highest birth rates in 2008.

The comparison of the two years reveals, a steep decrease of 45% in Estonia, while the Czech Republic posted the opposite trend, recording the biggest increase of all, at 187%. (Figure 3) While the study of enterprise birth rates provides useful information on the dynamism in the economy, the effect on the labour market is an important aspect too.

Figure 4 shows the share of newly born enterprises in total employment of active enterprises, in terms of number of persons employed. In the total business economy, the employment share ranges from 0.9% to 5.5%. The EU average employment birth rate remained stable between the two years in question. The highest share in 2008 and 2009 was above 5% in Bulgaria and Slovakia, whereas the lowest share was below 1% for Finland and Ireland.

Considering the similarity between the birth rates of enterprises and their employment share, those countries with relatively low/high birth rates also tended to report relatively low/high employment share. In contrast, the birth rate of new enterprises in Finland was considerably close the EU average, whereas employment share was significantly below the average.

Death rate

From a theoretical point of view, enterprise birth is related to the expectation of making a profit. If the main objective of newly born enterprises is to make a profit, enterprise births are most likely to occur where profits are consistently high, whereas among loss making activities enterprise deaths will be relatively more frequent.

Figure 5 shows that there were slightly more enterprise births than deaths looking at the EU average, and also in majority of the Member States for which final data were available in 2008. The average enterprise death rate for the business economy in 2008 was 9.4% (0.2 percentage points lower than the birth rate). This situation was completely reverse in Lithuania, Portugal, Ireland, Italy, Spain, Hungary and Germany. The most

dramatic negative change was reported in Czech Republic, where death rates were 163% higher than birth rates respectively.

Looking at the preliminary result showing the trend of death rates in 2009 compared to the final numbers in 2008 (although in many countries - provisional, due to an impossible check of reactivation, at the time of reporting the data), an average increase of 11% was expected (Figure 6). Enterprise death rate was expected to have risen in a majority of the Member States; this rise was most significant in Belgium, Lithuania and Romania. Although the situation was set to remain fairly stable in Spain, the Netherlands, Italy and Hungary, the enterprise death rate was likely to decrease in Austria, Slovenia, France, and Czech Republic, with the biggest falls in Bulgaria.

Enterprise survival rate

The focus is to present information about the life cycle of newly born enterprises and their ability to survive up to five years after their creation. The collection of data for the 2009 reference year has, for the first time, enabled the tracking of newly born enterprises over a five-year period, tracing how many of them have survived during that period. Figure 7 shows the one- to five-year survival rates of enterprises born in 2004 only for those Member States for which the information was available for the whole five-year life cycle.

Looking at the data it appears that, for the business economy, roughly 82% of the enterprises born in 2004 survived in 2005. Subsequently, year-on-year survival rates posted a gradual fall in the majority of the countries, and less than half of the enterprises actually survive their first 5 years.

The highest one-year survival rates – 96.5% – were recorded for the Swedish business economy and were also above 90% for France and Slovenia. It would appear that newly born enterprises in Portugal, Slovakia and Hungary generally are less likely to survive one year than newly born enterprises in other countries, although the lowest rates were reported in Lithuania.

Enterprises in Sweden, Slovenia and Austria were most likely to survive up to the fifth year after their birth, while Hungary, Portugal and Lithuania ran the greatest risk of non-survival. Non-survivals may be due to actual deaths, but also to mergers and take-overs.

Data sources and availability

Business demography data has been collected on a voluntary basis since 2002. Currently 27 countries participate in the data collection exercise.

After the recently adopted amendment of the SBS Regulation, the business demography data collection has become part of the regular annual collection of structural business statistics.

Annex IX of the recast structural business statistics Regulation provides for a detailed module for the collection of statistics on business demography. It requires the national statistical institutes (NSIs) to produce statistics on enterprise births, deaths and survival rates using common definitions and methodology, which should ensure greater comparability in this field of statistics from the reference year 2008 onwards. Note that up to 2007, the statistics presented for this subject have been produced and provided by most of the NSIs on the basis of informal, gentlemen's agreements.

Some 15 countries participated in the factors of business success development project, when enterprises that were born in 2002 and survived to 2005 were surveyed to obtain more information on the factors supporting or hampering the successful start-up of an enterprise.

Context

Business demography is an important subject for policymaker's discussion about increasing the level of [employment](#), since it is one of the main priorities of the EU growth strategy.

Enterprise demography reflects, to some degree, the dynamism of the EU economy through the adaptation of economic structures to changing market conditions. The potential contribution that [enterprise creation](#) can make to employment is also one of the most important aspects drawing the attention of policy makers to the subject of enterprise demography. In this context, enterprise creation can be seen as an indicator of [competitiveness](#) , as a factor of economic growth and as a vital means of creating jobs.

Business demography provides information for [births](#) , deaths and survival rates of enterprises, as well as information on related employment data. The demography of the business population is represented by data on:

- the [active population of enterprises](#) ;
- their birth;
- their survival (followed up to five years after birth);
- their death.

Particular attention is paid to the impact that these demographic events have on employment levels. Business demography data can be used to analyse the dynamics and innovation of different markets, such as:

in terms of the propensity to start a new business;

- entrepreneurship in terms of the propensity to start a new business, such as analysed in the joint OECD/Eurostat [Entrepreneurship](#) Indicators Programme;
- how newly-born enterprises can contribute to the creation of jobs.

Small and medium-sized enterprises

This article takes a look at [small and medium-sized enterprises \(SMEs\)](#) in the [European Union \(EU\)](#) . SMEs are often referred to as the backbone of the European economy, providing a potential source for jobs and economic growth.

SMEs are defined by the [European Commission](#) as having less than 250 persons employed. They should also have an annual [turnover](#) of up to EUR 50 million, or a balance sheet total of no more than EUR 43 million according to [Commission Recommendation](#) of 6 May 2003 (see the 2005 [user guide](#) (PDF file) for the complete definition).

		Number of enterprises	Turnover	Value added
		million	EUR million	EUR million
	All enterprises	20.8	22,098.1	5,575.9
	All SMEs	20.7	12,682.6	3,273.4
	Micro	19.2	4,160.7	1,186.5
	Small	1.4	4,134.7	1,054.9
	Medium-sized	0.2	4,387.3	1,032.0
	Large	0.043	9,415.9	2,302.7
		Number of enterprises	Turnover	Value added
		Share in total (%)		
	All enterprises	100.0	100.0	100.0
	All SMEs	99.8	57.4	58.7
	Micro	92.2	18.8	21.3
	Small	6.5	18.7	18.9
	Medium-sized	1.1	19.9	18.5
	Large	0.2	42.6	41.3

Table 3: Number of small and medium-sized enterprises with 10 to 249 employees, 2007 and 2010[1][2][3]

Political reasoning for SME policies

It is important to use a precise definition of SMEs and to have data on them, for example when assessing which enterprises may benefit from EU funding programmes aimed at promoting SMEs, or for certain policies such as SME-specific competition rules. European Commission policy in relation to SMEs is mainly concentrated in five priority areas, covering:

- the promotion of entrepreneurship and skills;
- the improvement of SMEs' access to markets;
- cutting red tape;
- the improvement of SMEs' growth potential;
- strengthening dialogue and consultation with SME stakeholders.

To provide SMEs with a "spokesperson", a special SME envoy has been set up in the European Commission [Directorate-General Enterprise and Industry](#) with the objective of better integrating the SME dimension into EU policies. Special [legislation](#) of which the implementation is regularly being assessed guarantees SMEs a special focus in enterprise policy.

Annual [structural business statistics \(SBS\)](#) with a breakdown by size class are the main source of data for an analysis of SMEs' contribution to the economy. A limited set of the standard structural business statistics variables (number of enterprises, turnover, persons employed and employees, value added, etc.) is available mostly down to the 3-digit (group) level of the [NACE](#) activity classification based on criteria that relate to the number of persons employed in each enterprise. The number of size classes available varies according to the activity under consideration. However, the main classes used for presenting the results are:

- micro enterprises: with less than 10 persons employed;
- small enterprises: with 10-49 persons employed;
- medium-sized enterprises: with 50-249 persons employed;
- the first three size classes aggregated: small and medium sized enterprises (SMEs): with 1-249 persons employed;
- large enterprises: with 250 or more persons employed.

Latest available size-class data (reference year 2009)

It is of the utmost importance to point out that statistics presented here are based on figures relating to the [non-financial business economy](#) . Deviating figures from other sources may result from different coverage of the economy or from different statistical [units](#) used. The delay in providing figures for [reference years](#) is a result from the availability of necessary source data from national administrative sources, national legal provisions, and data checking and aggregation by [Eurostat](#) . As a general rule, and as foreseen in the legal basis for structural business statistics, final data are to be transmitted 18 months after the end of the reference year. That means that it is not currently possible to publish any data on reference year 2010 before July 2012 (plus the necessary time for data treatment at Eurostat – a matter of weeks). Some data are available as preliminary data, with a lesser quality and subject to revision.

Additional data from specific surveys

Some additional data on SMEs may be derived from specific surveys. To shed light on SMEs' [access to finance](#) Eurostat, in consultation with its users for business statistics, the [OECD](#) , EIF and the [ECB](#) , has organised a business survey in 2010 to obtain information on the access to various types and source of finance of small and medium-sized enterprises (10 to 250 employees). That survey allowed a breakdown of SMEs in the size band 10-249 employees into high-growth firms (with 20% averaged annualised employment growth over 3 years) and [gazelles](#) , the politically interesting young (3 to 5 years old) high-growth firms. Figures of the number of those subpopulations and their employment are provided in Table 3 (in this table growth by employment was used).

Business economy overview. Employment characteristics, EU-27, 2007 (% share of total number of persons employed)

Source: Eurostat (LFS)

Source: Eurostat (LFS)

Source: Eurostat (LFS)

The present article is part of the business economy overview, and covers employment characteristics of the business economy.

Main statistical findings

The EU-27's labour force is characterised by considerable differences in terms of its gender profile (see Table 1). Across the whole of the business economy (NACE Sections C to K, and therefore including financial and insurance services), almost two thirds (64.1%) of those employed in the EU-27 in 2007 were male. The imbalance between the sexes was most evident in the construction sector, where men outnumbered women by a ratio of more than nine to one (92.1%), while 69.9% of the industrial workforce was male, and 55.6% of those working in non-financial services were men. All but one of the industrial sectoral aggregates that are used as structural business statistics article headings reported a majority of their respective workforce was composed of men, the exception being the textile, clothing, leather and footwear manufacturing sector where women represented 69.4% of those employed. Among the articles that cover the services economy, women outnumbered men in three activities, namely: retail trade and repair; accommodation and food services; and financial and insurance services.

Some 14.3% of those persons employed within the EU-27's business economy in 2007 worked on a part-time basis. The rate of part-time employment across industrial activities (7.3%) was about half the business economy average, and this rate fell further still to 5.7% for the construction sector, while part-time employment accounted for in excess of one in five persons (20.3%) within non-financial services. At a more detailed level (the structural business statistics article headings) there was a clear link between those activities with relatively high levels of part-time employment and those with relatively high female employment rates. Upwards of one in five persons worked on a part-time basis within retail trade and repair, accommodation and food services, and business services, as well as in the real estate, renting and leasing sector.

The age profile of employment across Member States reflects, to some degree, demographic trends such as ageing populations and baby-boom cohorts, as well as opportunities to remain within higher education, the average length of higher education courses, and the availability of work and job placements. At the other end of the age range, the proportion of older workers may be influenced, among other factors, by pension rights, age-related wage schemes, and the availability of lifelong learning programmes. Within the EU-27's business economy almost one quarter (24.2%) of the total workforce were aged between 15 and 29 years old, slightly more than half (53.9%) were aged 30 to 49, and the remaining 21.9% were aged 50 or more. The age profile was relatively stable across the three main activity aggregates of industry (56.1% of the workforce were aged 30 to 49), construction (53.6%), and non-financial services (52.4%). Those differences that did exist largely reflected education/skills levels and/or experience requirements of particular sectors. For example, accommodation and food services (35.7%) and retail trade and repair (31.2%) reported relatively high proportions of young workers. In contrast, there were relatively few young workers employed within mining and quarrying (12.9%), perhaps reflecting that this is a declining industry where there is less of a need to engage new staff.

Employment characteristics tend to be relatively similar across the activities within a particular country, which may be explained by structural factors. For example, the proportion of women working was high (40% or above) in the business economies of the Baltic Member States, Bulgaria and Romania, whereas it was generally low in the Mediterranean Member States – in particular, Italy, Greece and Malta (see Figure 1). This pattern was often repeated at different levels of activity breakdown. Indeed, the likelihood that a woman works probably reflects, to some degree, socio-economic policies regarding family allowances, the availability of crèches and after school care, part-time employment opportunities, as well as cultural differences with respect to the interdependence and/or independence of (extended) family units.

The Netherlands stood out as having by far the highest part-time employment rate for the whole of the business economy in 2007 (38.4%), while more than one in five persons in Germany and the United Kingdom also worked on a part-time basis. This contrasted vividly with the situation in Slovakia and Bulgaria, where no more than 1 in 50 persons worked on a part-time basis (see Figure 2). None of the Member States that joined the EU in 2004 or 2007 reported a particularly high rate of part-time employment; the highest being Malta (10.1%), below the EU-27 average.

According to SBS data, across the EU-27's non-financial business economy the average share of paid employees in the total number of persons employed was 86.5% in 2006. This share was generally highest within industrial activities (94.2%), falling to 83.7% for non-financial services. The activities where employees accounted for the

smallest share of total employment in 2006 (in other words, where there was the highest proportion of working proprietors and unpaid family workers) included real estate, renting and leasing (72.9% of those employed in 2005 were employees), retail trade and repair (79.7%), accommodation and food services (82.1%) and construction (82.2%) – all of which are characterised by a high proportion of small, often family-run enterprises.

Data sources and availability

The information that is presented within this section is largely derived from the [Labour force survey \(LFS\)](#) which collects information from individual households (rather than from [enterprises](#)). Note that the data pertain to an annual average for each reference year, which marks a change from previous presentations of the statistics where LFS data has generally been presented in relation to the second quarter of a particular reference year.

Other data sources include structural business statistics (SBS), including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Context

Article 39 of the EC Treaty lays down a fundamental freedom that entitles persons from within the EU to look for a job, work, and at the same time live, in any other EU country, while enjoying equal treatment in terms of access to [employment](#) , working conditions and all other social and tax regimes.

Table 2: Business economy overview. Enterprise birth and two-year survival rates, 2006 (%)

Main statistical findings

Business demography

Annex IX of the recast [structural business statistics](#) Regulation provides for a detailed module for the collection of statistics on business demography. It requires the national statistical institutes (NSIs) to produce statistics on [enterprise births](#), deaths and survival rates using common definitions and methodology, which should ensure greater comparability in this field of statistics from the reference year 2008 onwards. Note that for the moment, the statistics presented for this subject have been produced and provided by most of the NSIs on the basis of informal, gentlemen's agreements.

The starting point for business demography statistics is the concept of the population of [active enterprises](#). These are defined as businesses that had either [turnover](#) or [employment](#) at any time during the reference period. Data on births and deaths of enterprises, as well as their life expectancy form part of the structural indicators that are used to measure the progress being made towards the European Union's goals set out in the Growth and Jobs Strategy.

Business demography statistics are also a key source of information for analysing entrepreneurial activity. The creation of a new enterprise generally leads to new products or services being offered in a marketplace. In this context, new enterprises can be seen as disturbing market equilibrium and they are therefore often cited as being drivers of competitiveness, as they force existing enterprises to improve their efficiency, while driving inefficient enterprises out of business.

SBS business demography statistics focus on so-called real enterprise births and deaths. Under the definitions employed, births (and deaths) do not include entries into (or exits from) the business enterprise population due to mergers, break-ups, splits or the restructuring of enterprises, nor do they include changes resulting from a change in the enterprise's principal (main) activity.

A birth is defined as an enterprise that was present in year t , but did not exist in the two preceding years. An enterprise is deemed to have survived if, having been a birth in year t or having survived to year t , it is active in terms of employment and/or turnover in any part of year $t+1$; an enterprise is considered to have survived if it is active in any part of the survival year under consideration. An enterprise death is defined as an enterprise that was active in year t but was no longer present among the active enterprises in the two following years (after checking for any reactivations). It is often quite difficult, statistically, to determine the exact date of cessation of activity with respect to an enterprise death. Indeed, this may well be detected only after a lengthy period (of several years); as such, information presented on enterprise deaths is often provisional in nature and sometimes

lags other indicators.

Economic theory suggests that relatively low numbers of enterprise births are likely to be recorded for those activities where high barriers to entry exist, perhaps because a greater level of initial investment in production factors is required to reach a minimum efficient scale of production. Consequently, where barriers to entry (and exit) are lower, as is the case for many services and construction activities, there are generally higher levels of enterprise birth and deaths.

There were approximately 1.75 million newly born enterprises in the business economies of 21 countries for which data are available for 2005 (see Figure1 for details of the country coverage). To put this into perspective, newly born enterprises accounted for roughly one in every ten (10.1%) of the stock of active enterprises. Enterprise birth rates were higher for construction (10.9%) and for services (10.5%) than for industry (6.4%).

Figure1 shows enterprise birth rates and preliminary death rates across a range of NACE sections based on averages compiled from those Member States for which data are available. Real estate, renting and business activities, financial intermediation and construction reported the highest enterprise birth rates (12.6%, 11.2% and 10.9% respectively) and were the only activities (at the NACE section level of detail) to report birth rates above the business economy average.

Based on the available information, a comparison between enterprise birth and death rates can provide some evidence as to net changes in the business enterprise population (note that the number of enterprises may also change as a function of mergers, take-overs, split-offs and break-ups). The birth rate for enterprises within the services sector was 1.5 percentage points higher than the corresponding death rate, whereas for total industry the opposite was observed as the death rate exceeded the birth rate by 1.4 percentage points. The largest difference (5.4 percentage points) between birth and death rates was recorded for electricity, gas and water supply, where the provisional death rate was only 4.7%. This relatively large difference might, among other reasons, be explained by a recent period of liberalisation within these activities, resulting in the creation of a relatively high number of new energy and water distribution companies.

Among the 21 Member States for which data are available (see Tables 1 and 2), those countries with relatively low/high birth rates also tended to report relatively low/high death rates. Italy, Cyprus (2005), Slovakia (2005) and Sweden were among those countries with the lowest levels of renewing their enterprise populations in 2006, while Bulgaria (2005), Denmark (2005), Portugal, Romania (2005) and the United Kingdom (2005) reported some of the highest rates.

Table2 also presents information on two-year survival rates. Enterprises born in Slovenia, Sweden and the United Kingdom reported some of the highest rates, as upwards of 80% of all enterprises born in industry, construction or services survived two years.

Table 3: Business economy overview. Impact of foreign-controlled enterprises, non-financial business economy, 2005 (% share of total)

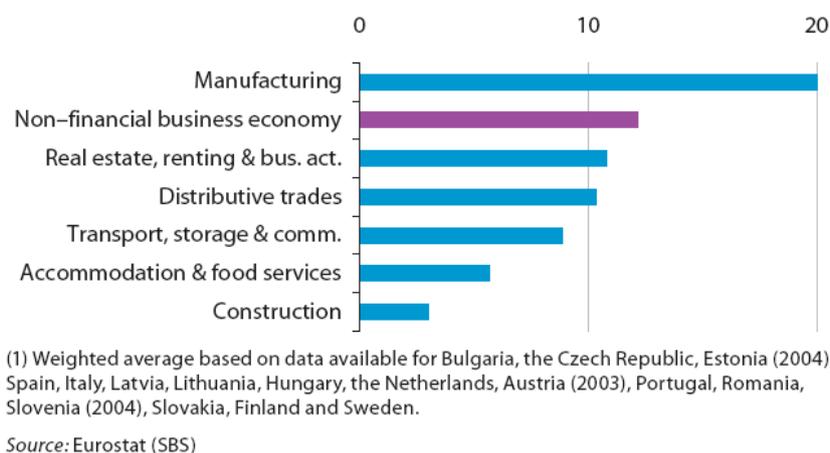

Figure 2: Business economy overview. Share of employment generated by foreign-controlled enterprises, average for available Member States, 2005 (%) (1)

Globalisation has had a considerable impact on the location of production. Many enterprises have extended their operations beyond national borders in an attempt to (amongst other things) increase proximity to customers, circumvent trade or taxation barriers, reduce costs (labour, transportation or material inputs), guarantee the supply of material inputs, or avoid regulation. Groups of (predominantly large) enterprises are at the core of the globalisation process and may be seen as agents of cross-border transactions, as they control decisions, information flows and strategies across a range of countries.

The qualitative nature of information required to define a group's perimeter can often make it difficult to obtain reliable statistical information on these economic actors. One of the main constraints when trying to measure their activities is that global enterprises make their decisions against a worldwide backdrop, while their decisions continue to be analysed using national data collections.

Aside from exporting goods and services or setting-up a new enterprise, there are a number of other alternative actions that enterprises wishing to diversify into new markets can take – one of the main options is to take control of an enterprise in the new market. Information on foreign-controlled enterprises is covered by [inward foreign affiliates' statistics \(inward FATS\)](#). For the purpose of the inward FATS data collection, the concept of control is defined as the ability to determine general corporate policy; however, in practice, a share of ownership is often used as a proxy. Inward FATS statistics show that the number of foreign affiliates tends to be relatively low. However, given their comparatively large average size, these enterprises often exercise significant economic influence.

Figure 2 shows that foreign-controlled enterprises accounted for 12.2% of the workforce in the non-financial business economies of the 16 Member States for which data are available in 2005. The relative importance of foreign-controlled enterprises (using this measure) was considerably higher for the manufacturing sector, rising to 20.0%. Manufacturing was the only activity (at the NACE Section level) to report that foreign-controlled enterprises provided a higher share of total employment than the non-financial business economy average. In contrast, less than 3% of the construction sector's workforce was employed by a foreign-controlled enterprise.

More detailed country information is provided in Table 3, supporting the view that foreign-controlled enterprises had a relatively large average size. Across the countries for which data are available, the share of foreign-controlled enterprises in the total number of enterprises was (with the exception of Estonia) always below 6% of the total enterprise population, and more generally below a threshold of 2%. Nevertheless, foreign-controlled enterprises often reported a double-digit share of the [non-financial business economy](#) workforce (Cyprus, Italy, Portugal and Spain were exceptions to this rule). Cyprus was also the only country where foreign-controlled enterprises did not create at least 10% of the total value added generated in the non-financial business economy.

Foreign-controlled enterprises consistently reported a higher share of value added than employment in each of the 17 countries for which data are available for the non-financial business economy – suggesting they were more productive than nationally-owned enterprises. Note that these differences in productivity levels may, at least in part, be due to the larger average size of foreign-controlled enterprises, rather than any inherent difference in productivity levels between nationally-controlled and foreign-controlled enterprises.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include Eurostat statistics on DEMO.

Source: Eurostat (STS)

Figure 7: Business economy overview. Average annual growth rates, index of employment for services activities, gross data, EU-27, 2002-2007 (% per annum)

Main statistical findings

The long-term evolution of the EU-27 index of production for industry rose rapidly during two distinct periods between 1997 and 2007, interspersed by a three-year period of stagnation from 2000 to 2003 (see Figure 1). The working-day adjusted EU-27 index of production rose on average by 2.7% per year between 2003 and 2007, with the fastest rates of growth being registered in 2006 and 2007 (3.9% and 3.3% respectively).

EU-27 output for construction followed a similar path – although overall growth was slightly lower – despite unbroken, positive year-on-year rates of change. As with industrial output, the fastest expansion in construction activity was recorded towards the end of the time-series in 2006 and 2007.

Among the service sectors (see Figure 2), the EU-27 index of turnover for business services (NACE Divisions 72 and 74) and for transport, storage and communication (NACE Section I) rose particularly strongly in the period between 2000 and 2007, on average by 7.0% and 6.7% per year. The remaining four services that are presented also reported a positive evolution to their respective current price sales indices, averaging between 5.1% and 3.5% per year.

The EU-27 index of employment for industrial activities showed a steady decline during the period 1997 to 2007, with reductions averaging 1.2% per year. In contrast, there was employment growth within the construction sector, which accelerated from 2005 onwards. Each of the services that are presented in Figure 3 reported an expansion in their respective numbers of persons employed between 1998 and 2007. There was relatively fast average growth recorded for business services (4.6% per year), as well as for accommodation and food services (2.2% per year), while employment levels for transport, storage and communication remained almost unchanged.

Evolution within industrial activities

On average, the index of production for total industry rose by 2.1% per year during the period 1997 to 2007. This measure of output grew for the majority of the NACE subsections that appear in Figure 4. Indeed, there were only three exceptions, the extraction of energy producing materials (NACE Subsection CA), the manufacture of textiles and clothing (NACE Subsection DB) and the manufacture of leather and footwear (NACE Subsection DC). In contrast, the highest average rates of growth were recorded for electrical machinery and optical equipment (NACE Subsection DL), transport equipment manufacturing (NACE Subsection DM) and the manufacture of chemicals, chemical products and man-made fibres (NACE Subsection DG).

While output generally rose across industrial activities, the same could not be said for the number of persons employed. The [employment](#) index for total industry fell in the EU-27 by an average of 1.2% per year during the period from 1997 to 2007 – see Figure 5 – reinforcing the notion of productivity gains. The only industrial subsection that reported any substantial increase in its workforce during the period under consideration was rubber and plastic products manufacturing, while there were larger employment gains in the construction sector.

Evolution within service sectors

During the five-year period from 2002 to 2007, the EU-27 index of turnover increased for each of the NACE divisions within the non-financial services sector for which data are available – see Figure 6. The highest rates of sales growth tended to be reported for transport services, with average growth of 8.3% per year for water transport, 7.6% per year for land transport and transport via pipelines, and 7.3% per year for air transport services. The slowest rates of turnover growth were registered for accommodation and food services (3.5% per year) and retail trade and repair (3.4% per year).

In contrast to the industrial economy, the evolution of employment within services tended to show that the number of persons employed rose for the majority of activities across the EU-27. The sharpest rate of increase between 2002 and 2007 was registered for other business activities (NACE Division 74), where the workforce expanded, on average, by 4.0% per year. There were two service activities – air transport services and post and telecommunications – that reported reductions in their respective workforces between 2002 and 2007 (see Figure 7).

Recession at the end of 2008 and start of 2009

The information presented in the [structural business statistics](#) articles does not include annual short-term business statistics for reference year 2008, as these were unavailable at the time that data was extracted. As such, the annual time-series that are presented fail to show the downturn in economic fortunes that occurred during

the second half of 2008, as the credit crisis in sub-prime markets, falling stock market indices and a reduction in consumer and business confidence led to recession.

In order to put the recession into some context, the EU-27's seasonally adjusted index of production for total industry peaked in May 2008. However, only six months later in November 2008, industrial output was 8.2% lower than it had been a year before. Most industrial activities reported a turning point in their respective levels of production in either late 2007 or the first half of 2008. One of the largest contractions was recorded for the motor vehicles manufacturing activity, where production fell by 21.0% during the period November 2007 to November 2008.

Other areas of the non-financial business economy were generally less affected by the contraction in activity. Nevertheless, the EU-27 index of production for construction fell by 4.3% between November 2007 and November 2008. Among services, while there was evidence of a slowdown in activity, this was rarely translated into an absolute reduction. The main exceptions were the motor trades sector, where current price sales fell by 8.1% during the period October 2007 to October 2008, while EU-27 sales for accommodation and food services as well as for post and telecommunication services stagnated. There was also a slight downturn in the volume of sales within the retail trade and repair sector, down by 0.4% between November 2007 and November 2008.

Data sources and availability

The main part of the analysis in this article is derived from [short-term statistics \(STS\)](#) .

Context

The index of [production](#) for industrial activities and that for construction shows the development of [value added](#) at constant prices. This indicator provides information on the speed and direction of change, in particular showing the cyclical evolution of activity (which is often related to general economic developments within the whole economy).

As no production index exists for services, an index of [turnover](#) is used instead to analyse the evolution of [output](#) . Note that this is generally based on a current price series (and as a result includes the effects of price increases) – the retail trade sector is the only exception, as an index is available to measure the volume of retail sales.

Main statistical findings

Operating expenditure

There are two components to [operating expenditure](#) which can provide an insight into the capital/labour intensities of different sectors and the extent to which they convert or distribute products. Figure 1 shows the expenditure structures of different activities, with a breakdown of operating expenditure into purchases of goods and services and [personnel costs](#).

On average, some 83.9% of EU-27 operating expenditure in the non-financial business economy was allocated to purchases of goods and services in 2006; the remaining 16.1% was accounted for by personnel costs. Break-downs for industry and [non-financial services](#) were both situated very close to these averages for the whole of the [non-financial business economy](#), as 83.6% of total operating expenditure within the industrial economy was devoted to purchases of goods and services, while the corresponding figure for non-financial services was 84.9%. Construction was more labour-intensive, as 77.2% of its total operating expenditure was accounted for

by purchases of goods and services.

There were, however, considerable differences as regards the structure of operating expenditure between the aggregates used for the [structural business statistics](#) article headings. The three distribution activities of wholesale, motor and retail trade each reported that the proportion of operating expenditure allocated to purchases of goods and services was relatively high (upwards of 92% for both wholesale and motor trades), no surprise, given that these activities are characterised by purchases for resale without transformation.

In contrast, all of the remaining non-financial services aggregates – with the exception of real estate, renting and leasing – were relatively labour-intensive, with personnel costs accounting for a higher than average proportion of total operating expenditure (when compared with the non-financial business economy average). There were two activities that stood out as being particularly labour-intensive, namely, business services and research and development, where personnel costs accounted for around 40% of total operating expenditure. In the latter case, the relatively high share of personnel costs may, at least in part, be explained by the high costs associated with employing personnel with enough qualifications to carry out research and development.

Equally, the relative importance of personnel costs in total operating expenditure may, to some degree, reflect the average wages paid within each country. Many of the EU-27 Member States reported personnel costs accounting for a relatively high share of their total operating expenditure in 2006, with the highest proportion (19.0%) recorded in France, while shares of 17% or more were also recorded in the United Kingdom, Sweden, Germany, Austria and Denmark (see Table 1). This ratio was generally lower in the southern Member States where average personnel costs per employee were usually at lower levels. However, it was Cyprus that registered the highest proportion of total operating expenditure being devoted to personnel costs (22.0% in 2005), largely reflecting the importance of the labour-intensive accommodation and food services sector in this popular tourist destination. Slovenia (15.5% of operating expenditure accounted for by personnel costs) reported a cost structure that was similar to the EU-27 average (16.1%), while the relative importance of personnel costs was considerably lower than average for the remaining Member States that joined the EU in 2004 or 2007 (no data for Malta).

Energy and raw material costs

For some activities a considerable proportion of purchases of goods and services are accounted for by energy and raw material costs, the EU displays a high degree of import dependency for many of these products.

The prices of energy and mineral products have fluctuated considerably in recent years – often as a reaction to market imbalances linked to increased demand from emerging economies (such as China, India or Brazil). Despite recent price reductions for products like petroleum, many raw material prices are still very high from a historical perspective. Relatively high oil prices are often used to explain fluctuations in gas prices, as the price of gas is often set in long-term contracts that are linked to the price of oil. Oil price increases are also generally passed down the production chain in the form of higher electricity prices, thus affecting a wide range of downstream activities, in particular, activities which are energy-intensive (such as the manufacture of iron and steel, aluminium, concrete or ceramics), or those industries that use oil and its derivatives as inputs in their own manufacturing processes (for example, the manufacture of chemicals, synthetic rubber and plastics).

The uncertainty faced by European businesses with respect to price developments of key, raw materials has been further magnified by concerns relating to the security of supply. Reliable deliveries of key, raw materials (including energy) are considered to be essential for the competitiveness of the European economy, as many products cannot be sourced from indigenous supplies (they either do not exist or they exist in such small volumes that it is not economically viable to mine/extract them).

The distribution of some of these essential raw materials is often concentrated in a limited number of countries: for example, China produces 95% of all rare earth concentrates (needed for the manufacture of LCD's), Brazil has 90% of all niobium (needed for steel alloys in pipelines) and South Africa produces 79% of all rhodium (used in car catalysts).

In November 2008, the European Commission proposed a new strategy – the Raw Materials Initiative ([COM \(2008\) 699](#)), which recommends that the EU defines a raw materials strategy based on three main pillars:

- access to raw materials on world markets at undistorted conditions;
- a framework to foster sustainable supply of raw materials from EU sources, and;
- the promotion of resource efficiency and recycling in the EU.

Figure 2 provides an insight into the main energy products that are purchased by EU-27 manufacturers. By far the most important energy product (in terms of its share of total energy expenditure) was electricity, accounting for 47.0% of the total in the EU² in 2005, while natural and derived gas accounted for a further quarter (24.4%).

A breakdown of purchases of energy products by selected industrial activities gives an indication of the importance of these energy products with respect to total purchases of goods and services. The data shown are presented for averages that are constructed on the basis of available data for the EU³ in 2006. Figure 3 confirms that the most energy-intensive activities included non-energy mining and quarrying and the manufacture of other non-metallic mineral products, where energy costs accounted for around 10% of all expenditure on goods and services. These ratios were more than double those recorded in the next most energy-intensive activities, namely, the production of pulp and paper, and the manufacture of basic metals.

Personnel costs

European [personnel costs](#) are generally quite high in relation to most other regions of the world. As some enterprises have switched their [output](#) to lower labour cost regions, those that remain based in Europe have tended to specialise in high value products, proximity services, niche markets, as well as integrated products and services. Some of these strategies often require a more educated workforce, which is more likely to raise the efficiency of labour, for example, through promoting the integration of new ideas and technologies, thus raising [productivity](#). As such, many European governments have, in recent years, focused on investing in skills, training and education, with the hope that this investment in human capital can fill job vacancies in key areas of the economy.

Personnel costs are defined as the total remuneration, in cash or in kind, payable by an employer to an employee (permanent and temporary employees as well as home workers) in return for work done by the latter, including taxes and employees' social security contributions that are retained by the unit, and employer's compulsory and voluntary social contributions. Note that there may be costs associated with employing staff that are not covered by personnel costs, for example, training, recruitment costs, or the provision of working clothes.

Personnel costs accounted for 16.1% of the total operating expenditure of the EU-27's non-financial business economy in 2006. Average personnel costs per employee were EUR 28.8 thousand in the EU-27's non-financial business economy, rising somewhat higher for industrial activities (EUR 33.6 thousand per employee) than for construction (EUR 27.9 thousand) or non-financial services (EUR 26.4 thousand).

Across the aggregates that are used to define the structural business statistics sectoral articles, average personnel costs per employee were relatively high for: fuel processing and chemicals manufacturing (2005); research and development activities; the network supply of electricity, gas and steam; and transport equipment manufacturing. They rose to over EUR 46.0 thousand per employee for each of these activities, peaking at EUR 54.1 thousand per employee for fuel processing and chemicals manufacturing (see Figure 4).

For most of the other activities, EU-27 average personnel costs remained within the range of +/-EUR 10 thousand of the non-financial business economy average. Below this threshold there were accommodation and food services as well as retail trade and repair (two activities that reported the highest proportions of part-time employment), as well as textiles, clothing, leather and footwear manufacturing. It is important to note that the ratio of average personnel costs per employee is calculated on the basis of headcounts for employees (as opposed to full-time equivalents), which is particularly important with respect to some services, where the propensity to employ persons on a part-time basis is often quite high (see [Business economy - employment characteristics](#) for more details).

Figure 5 provides a breakdown of personnel costs. Wages and salaries represented 78.0% of total personnel costs in the EU-27's non-financial business economy in 2006, leaving the remaining 22.0% attributed to social security costs. These latter charges correspond to the costs incurred by employers in order to secure for their

² Average for EU-27 Member States excluding Bulgaria, Belgium, Luxembourg, Malta, Poland and Slovenia; the Czech Republic, 2004; Italy, Latvia, the Netherlands and the United Kingdom, 2003.

³ Average for EU-27 Member States excluding Bulgaria, Malta, Poland and Slovenia; the Netherlands, 2005.

employees entitlements to social benefits, including schemes for pensions, sickness, maternity, disability, unemployment, occupational accidents and diseases, and family allowances, regardless of whether these are statutory, collectively agreed, contractual or voluntary in nature.

The proportion of total personnel costs that is accounted for by social security costs tends to be relatively uniform across activities within a single Member State, as employers' contributions are often set on a statutory basis for the whole economy. As such, the main differences observed for this ratio tend to be across countries. Social security costs accounted for a low share of total personnel costs in Denmark (8.4%), Cyprus (2005), Ireland, Luxembourg, the United Kingdom and Slovenia (all between 11.9% and 14.5%), while their relative importance rose to upwards of 30.0% in France and Sweden. These costs are often cited (by employers) as impinging on the competitiveness of their enterprises.

Tangible investment

Aside from human capital, enterprises may choose to make other (non-human) tangible investments. **Gross investment in tangible goods** is defined as investment in new and existing tangible capital goods, whether bought from third parties or produced for own use, having a useful life of more than one year. It should be noted that the level of investment in a particular year is often a volatile measure, in particular at a detailed level, as one year with relatively high investment could be followed by a period with little or no investment.

Figure 6 shows a breakdown of EU-27 investment within the non-financial business economy in 2006 according to the structural business statistics sectoral article headings. Some of the activities at the top of the ranking are characterised by the fact that they rely on networks to function efficiently – for example, some of the transport services, pipelines, the network supply of electricity, gas and steam, or communications. However, the single largest contributor to total EU-27 investment was the real estate, renting and leasing sector (2005): this is perhaps not surprising as many enterprises within these activities are owners of the capital goods that they rent and lease to clients. The other end of the ranking was characterised by relatively small activities (in terms of their contributions to EU-27 value added in the non-financial business economy), in particular, the most labour-intensive manufacturing activities, such as textiles, clothing, leather and footwear as well as furniture and other manufacturing.

Table 2 shows that the highest level of investment in the non-financial business economy was made in France (15.4% of the EU-27

total), slightly above the shares recorded for the United Kingdom (15.1%) or Germany (14.4%). Italy and Spain reported similar levels of investment (just over 10% of the EU-27 total) and were the only other Member States to register double-digit shares. There was then a considerable gap before the next country in the ranking, namely, Sweden (3.7%). Poland and Romania (latest data for both countries are for 2005) reported the highest levels of investment among the Member States that joined the EU in 2004 or 2007; both of these countries were over the threshold of 2% of the EU-27 total.

The **investment rate** (which is defined as investment divided by **value added at factor cost**) can be used to identify activities and/or countries that invest relatively high proportions of their added value; this usually occurs when operating margins are relatively wide, perhaps as a result of personnel costs accounting for a relatively low proportion of operating expenditure. Table 3 shows that the average investment rate in the EU-27 in 2006 was 18.4% for the whole of the non-financial business economy, ranging from a high of 20.9% for non-financial services, through 16.6% for industrial activities, to 9.4% for construction. Investment rates tended to be relatively high in the Member States that joined the EU in 2004 or 2007, in particular Romania (2005), Slovakia and Bulgaria (2005) – where rates rose to above 50%. Among the EU-15 Member States the highest investment rates were recorded for Denmark and Portugal (just above 28%).

Productivity

Productivity is often considered as one of the key measures of economic efficiency, showing how effectively economic inputs are converted into output. Apparent **labour productivity** is defined as the value added generated by each person employed (measured by headcounts): this measure is therefore limited insofar as it does not consider differences in the extent of part-time work across activities. Figure 7 shows that, on average, each person

employed in the EU-27's non-financial business economy generated EUR 43.5 thousand of value added in 2006; with apparent labour productivity higher for industrial activities (EUR 54.5 thousand) than for non-financial services (EUR 39.7 thousand) or for construction (EUR 36.2 thousand). Labour productivity tended to be highest among those sectors that are characterised as being capital-intensive, for example, the network supply of electricity, gas and steam, mining and quarrying, fuel processing and chemicals manufacturing (2005), or real estate, renting and leasing (2005). It was lowest among labour-intensive activities, such as the manufacture of textiles, clothing, leather and footwear or accommodation and food services, where labour productivity levels were less than half the non-financial business economy average.

Another measure of productivity is the [wage-adjusted labour productivity ratio](#), defined as value added divided by personnel costs and subsequently adjusted by the share of paid employees in the total number of persons employed, or more simply, apparent labour productivity divided by average personnel costs (expressed as a ratio in percentage terms). Given that this indicator is based on expenditure for labour input rather than a headcount of labour input, it is more relevant for comparisons across activities (or countries) with very different incidences of part-time employment or self-employment. The wage-adjusted labour productivity ratio for the EU-27's non-financial business economy stood at 151.1% in 2006 (see Figure 8). Among the activity aggregates used for the structural business statistics sectoral articles, the highest ratios were recorded for capital-intensive activities (as was the case for apparent labour productivity), with mining and quarrying and the real estate, renting and leasing sectors at the top of the ranking. At the other end of the range, the wage-adjusted labour productivity ratio was 110% for research and development (2005).

The ranking of the sectoral articles was generally similar whether based on apparent labour productivity or wage-adjusted labour productivity. However, transport equipment manufacturing moved down from sixth most productive to below the non-financial business economy average, once apparent labour productivity was adjusted for average personnel costs (which were among the highest). On the other hand, motor trades, food, beverage and tobacco manufacturing, and textiles, clothing, leather and footwear manufacturing all moved up the ranking considerably (largely due to the fact that they recorded some of the lowest average personnel costs).

Across the Member States (see Table 4) there were wide ranging differences in apparent productivity levels and average personnel costs; both these ratios tended to be higher among the EU-15 Member States. Ireland reported the highest level of apparent labour productivity for the non-financial business economy, slightly more than 15 times as high as in Bulgaria (data for both of these countries is only available for 2005). The difference in average personnel costs across the Member States were also considerable, as an employee working in the non-financial business economy in Belgium cost almost 17 times as much as someone working in Bulgaria (2005). However, once average personnel costs are used to adjust apparent labour productivity, many of the EU-15 Member States reported relatively low wage adjusted productivity ratios. This was particularly the case in Greece (122.6%), Italy (133.1%), France (133.5%) and Sweden (135.3%). In contrast, Latvia, Slovakia, Poland (2005) and Bulgaria (2005) each reported wage-adjusted labour productivity ratios of more than 200% for their respective non-financial business economies in 2006.

Profitability: the gross operating rate

The [gross operating rate](#) is defined as the [gross operating surplus](#) (value added at factor cost less personnel costs) divided by [turnover](#); it is expressed as a percentage. The gross operating surplus measures the operating revenue that is left to compensate the capital factor input, after labour input has been recompensed. The operating surplus can be used to recompense the providers of funds, to pay taxes, or for self-financing investment. Although not always the case, the gross operating surplus will generally be higher for capital-intensive activities and lower for those activities which have a relatively high proportion of their costs accounted for by personnel. The gross operating rate can be considered as one measure of [profitability](#) and is also used as an indicator for measuring competitiveness and enterprise success.

The EU-27's gross operating rate for the non-financial business economy was 10.8% in 2006 (see Figure 9), with the rates for industry (10.5%), non-financial services (10.9%) and construction (12.0%) all closely grouped around this broader average. In terms of the activity aggregates used for the sectoral articles, the highest level of profitability in the EU-27 was recorded for real estate, renting and leasing (39.2% in 2005), followed by mining and quarrying (28.1%) and media and communications (22.6%). The lowest EU-27 gross operating rates in 2006 were recorded for distributive trades (in particular, the motor trade and wholesale trade) and for the manufacture of transport equipment.

Across countries, the lowest gross operating rates tended to be recorded among those countries with relatively high personnel costs. Gross operating rates for the non-financial business economies of Belgium, Luxembourg and France did not rise above 8.0% in 2006, while at the other end of the ranking, gross operating rates exceeded 13% in Cyprus (2005), Latvia, Poland (2005) and the United Kingdom.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Context

Competitiveness at the micro-economic or meso-economic (sectoral level) is often defined as the ability of a particular enterprise or activity to improve its position in (global) markets. Cost structures, investment, as well as productivity levels, may all play a role in determining competitiveness. A high degree of prominence is often given to productivity gains when trying to explain how particular activities or enterprises become more competitive. Productivity levels (or the added value generated by each unit of input) are likely to increase when production factors are re-organised and re-allocated, through the introduction of new processes (in particular those that make use of [information and communication technologies \(ICT\)](#)), increasing the quality of labour inputs (through renewed training and skills development), and making tangible investment in plant and machinery.

Table 3: Business economy overview. Three most specialised Member States, 2007 (%), specialisation relative to the EU-27)

External trade data (see Figure 1) shows that after having stagnated at the start of the decade – during the previous economic slowdown – there was growth in the level of EU-27 imports and exports through to 2007 as economies strengthened. The EU-27 trade balance (the value of exports minus imports) for industrial goods became a progressively larger deficit through to 2006, reflecting to some degree buoyant demand, changes in exchange rates, and the relative price of imports (in particular, higher prices of oil and gas imports). The widening trade deficit for industrial goods reached EUR 169.3 billion by 2006, before falling slightly in 2007 to EUR 167.9 billion.

Trade partners

The most important destination for EU-27 industrial exports in 2007 was the United States which accounted for a little more than a fifth (21.2%) of the total – see Figure 2. The proportion of exports that were destined for the United States fell gradually in recent years, while a similar pattern was observed for the second largest market for EU-27 exports of industrial goods, namely Switzerland, which accounted for a 7.3% share of total exports in 2007. The declining share of EU-27 exports to established, industrialised trading partners was offset by the growing importance of trade with the Russian Federation and China, whose combined market share rose to 12.9% by 2007.

The relatively slow change in the structure of EU-27 exports by partner was in contrast to more rapid developments as regards the origin of EU-27 imports. The relative importance of the United States has diminished considerably in recent years, as imports from America accounted for 12.2% of the total in 2007 (approximately half their share of a decade before). There was also a considerable reduction in the relative share of imports from Japan, declining to 5.8% of EU-27 imports in 2007. In contrast, the share of EU-27 imports that originated from China and the Russian Federation increased rapidly to reach 17.1% and 8.9% respectively by 2007.

Trade by product

Table 1 shows information relating to EU-27 external trade flows in 2007, broken down according to the aggregates used for the structural business statistics industrial articles. These figures provide evidence of why concerns are often raised with respect to the EU's dependence on external supplies of energy: one third of all EU-27 imports concerned mining and quarrying products (22.1%) or processed fuel products and chemicals (13.3%). Electrical machinery and optical equipment products were the only other article aggregate to report a double-digit share of EU-27 industrial imports in 2007, accounting for slightly more than a fifth (20.1%) of the total.

With relatively low levels of exports of mining and quarrying products, the EU-27 recorded by far its largest trade deficit for these products (EUR 273.8 billion in 2007). The magnitude of the deficit for mining and quarrying products was more than four times as high as the second largest deficit – that registered for electrical machinery and optical goods (EUR 67.8 billion).

Many EU exporters face competition from producers in emerging economies, resulting in some EU producers trying to shift their output to higher value, specialist products. The majority of the EU-27's exports tend to be concentrated among medium-high technology products. Table 1 shows that there were four groups of products that together accounted for 70.5% of EU-27 exports in 2007: processed fuel products and chemicals; electrical machinery and optical equipment; machinery and equipment; and transport equipment. Three of these groupings reported the highest EU-27 trade surpluses in 2007: namely, machinery and equipment (EUR 108.5 billion), transport equipment (EUR 81.2 billion) and processed fuel products and chemicals (EUR 57.8 billion).

Figure 3 presents information on the changing composition of industrial exports and imports for the EU-27. These relative shares reflect, to some degree, differences in prices between 2002 and 2007, as revealed by the growing share of EU-27 imports accounted for by mining and quarrying products, metals and metal products, and processed fuel products and chemicals. Increased prices of raw material imports may well be passed on by EU manufacturers, as the relative importance of downstream exports, such as metal products and processed fuel products and chemicals rose, their relative share of EU-27 industrial exports increasing by 4.7 percentage points between 2002 and 2007.

On the other hand, falling prices were also evident for products such as textiles, clothing, leather and footwear, and hence, despite considerable volume increases in imports, the overall share of these products in total EU-27 imports fell in value terms. In a similar vein, technology gains may result in falling prices for some products, such as electrical machinery and optical equipment – for example, a plasma or LCD television is considerably cheaper today than it was five years ago. As such, despite the volume of trade in these goods increasing, their share of total imports and exports in value terms fell too.

Trade by Member State

While external trade statistics relating to the EU-27 are presented by treating the EU as a single trading entity, and cover only trade flows between the EU and non-member countries, the external trade data reported for each of the Member States concerns both trade flows with non-member countries (extra-EU trade) and that with other Member States (hereafter referred to as intra-EU trade).

Germany recorded by far the largest [trade surplus](#) in industrial goods (EUR 178.7 billion) in 2007; with exports covering imports by 125.2% (see Table 2). Much of the German trade surplus in industrial goods reflected the export performance of machinery and equipment and transport equipment, areas in which German manufactur-

ers are particularly specialised. Ireland was the only Member State to report a cover ratio above that registered in Germany, as exports covered imports by 149.9% in 2007, largely as a result of a relatively large trade surplus for basic chemicals and pharmaceuticals.

Spain and the United Kingdom recorded the largest trade deficits for industrial goods in 2007 (EUR 102.1 billion and EUR 121.6 billion), although Greece and Cyprus had by far the lowest cover ratios (28.2% and 11.9% respectively). It is important to remember that the data presented only refer to the external trade of industrial goods and countries such as Spain, Greece and Cyprus (tourism) or the United Kingdom (financial and business services) may have considerable net exports from various services.

Relative export and import specialisation ratios reflect, to some degree, the importance and size of domestic output in relation to international and domestic demand. These specialisation ratios are defined in terms of the share of a country's exports (or imports) of a certain product in its total exports (or imports). The ratio for each country is then divided by the same ratio for the sum of the EU Member States and expressed as a percentage; as such, any values over 100% represent country-product pairings where the economy in question is relatively specialised in exporting (or importing).

Given most of the large Member States produce, export and import a wide range of products, it is more likely that specialisation ratios are high in relatively small countries or countries whose industrial activities are concentrated among relatively few activities – see Table 3. The main exception to this rule is the export of machinery and equipment (where Italy and Germany were the most specialised producers and exporters) and transport equipment products (where Spain and Germany were among the most specialised exporters). Although not always the case, there was often a relationship between countries specialised in producing and exporting certain products, for example, exports of textiles, clothing, leather and footwear products from Romania, Bulgaria and Portugal, or exports of wood and paper products from Finland, Latvia and Estonia.

Data sources and availability

The main part of the analysis in this article is derived from the [COMEXT](#) database for external trade.

Context

External trade statistics presented in the [structural business statistics](#) articles relate to the [classification of products by activity \(CPA\)](#). More specifically, the data included refer to CPA Sections C to E, covering imports and exports of industrial products.

The world economy is increasingly inter-related, with foreign-controlled enterprises and globalisation making the distinction between domestic and non-domestic production less clear. The successive removal of trade barriers (particularly those under the auspices of the [World Trade Organization](#)) has also led to a notable increase in world trade, which has expanded to cover services. However, the recent economic slowdown has seen concerns rise over the possibility that some countries will adopt protectionist policies (barriers to trade and capital flows) in an attempt to cushion themselves from the impact of the economic slowdown.

There have been rapid changes in trade patterns in recent years, associated with emerging economies such as China and India accounting for a growing share of world trade, in particular in areas that are price-sensitive. There have also been structural changes in the origin of EU imports, for example, the growth in energy imports originating from the Russian Federation (an important global supplier of energy), as indigenous EU supplies dwindle.

Main statistical findings

Gross domestic product (GDP)

The most common indicator for measuring a nation's economic activity is [gross domestic product \(GDP\)](#). This indicator covers the production activity of resident producers, calculated as the sum of [gross value added](#) from all activities/industries within an economy.

It is important to consider the cyclical changes in GDP over the past decade when reading [structural business statistics](#) articles, as the evolution of [output](#) or sales in many activities follows closely the [economic cycle](#) of the whole economy. GDP growth in the EU-27 rose at a relatively fast pace during the late 1990s, with annual rates of growth peaking in 2000 at 3.9%, after which there was a slowdown in the pace at which economic activity expanded, in particular for 2002 and 2003. The EU-27's GDP growth thereafter accelerated with rapid expansions in 2006 (3.1%) and 2007 (2.9%). At the time of writing, latest forecasts for 2008 show a considerable slowdown in activity, with the rate of GDP growth almost halving between 2007 and 2008, while forecasts for 2009 from a range of international organisations point to global growth rates close to zero.

Figure 1 shows the evolution of constant price GDP (at fixed 2000 exchange rates) between 1998 and 2008 in the Triad economies of the EU-27, Japan and the United States (forecasts are included for 2008). GDP rose on average by 2.3% per year in the EU-27 during the period concerned, which was below the rate recorded for the United States (2.8% per year), but higher than that for Japan (1.6% per year).

The level of GDP, per se, says little about the economic performance of a country. In order to normalise GDP, one of the most common approaches is to use GDP **per capita** (obtained by dividing GDP by the number of inhabitants in a country/region). This indicator is often used as a measure of living standards. For international comparisons, GDP per capita should ideally be calculated in terms of GDP per capita in **purchasing power standards (PPS)**⁴. Figure 2 shows that Luxembourg had by far the highest level of GDP per capita in PPS terms in 2007, at just over three times the EU-27 average, well above the next highest figures that were recorded for Ireland and Denmark (where GDP per capita was 76% and 67% above the EU-27 average). At the other end of the range, the 12 Member States that joined the EU in 2004 or 2007, as well as Spain, Greece and Portugal, all reported GDP per capita below the EU-27 average. The lowest standard of living (using this measure) was recorded in Romania and in Bulgaria, where this ratio was less than a quarter of the EU-27 average.

Structure of the EU economy – an overview

According to national accounts, the group of activities covered in structural business statistics sectors – hereafter referred to as the business economy (NACE Sections C to K) – accounted for 75.8% of the total **value added** generated in the EU-27 in 2007 (see Figure 3). This marked an increase of 0.9 percentage points when compared with the corresponding share of a decade before.

The largest sector (in terms of value added generated) was financial, real estate, renting and business activities (NACE Sections J and K), which accounted for 28.1% of the EU-27 total in 2007. Distribution, hotels, restaurants and catering (HORECA), communications and transport services (NACE Sections G to I) and industry (NACE Sections C to E) both accounted for slightly more than a fifth of the EU-27's economic output. Construction (NACE Section F) registered a 6.5% share, while among those activities not covered within structural business statistics sectors, the lion's share of the remaining added value (22.4% of the EU-27 total) was generated by public administration, health, education, other services and households (NACE Sections L to P); the outstanding 1.8% of value added was attributed to agriculture, hunting, forestry and fishing (NACE Sections A and B).

The structure of economic output within the EU-27 has generally shifted away from traditional economic sectors such as agriculture or industry, towards services. This trend may, at least in part, be attributed to the **outsourcing** phenomenon, as supporting and ancillary operations which were previously done in-house are awarded to outside contractors (for example, transport services or logistics, information technology, accounting and payroll services, or industrial cleaning). **International outsourcing** implies that an **enterprise** contracts out work to external suppliers from another country, whereas **off-shoring** is when an enterprise maintains control/ownership of a production/service facility that moves abroad. These phenomena are examples of how structural changes may take place in the European business economy, as enterprises relocate in the face of relatively high wages and increased global trade that have driven out (in particular) price sensitive segments of the EU-27 economy to lower **labour cost** regions. As such, some industrial enterprises have sought to invest in production facilities in emerging economies to benefit from relatively low unit labour costs and/or to improve their chances of market entry in an untapped region. However, the process is not restricted to industrial activities, as several services have followed a similar pattern, for example, call centres, financial and computer services, or research and development activities. These changes in the way that enterprises do business may, at least in part, explain why the share of industry in EU-27 total value added declined by 3.2 percentage points between 1997 and 2007, while the largest relative gains were concentrated among financial, real estate, renting and business activities, where a 3.3 percentage point increase was registered.

Just under two thirds (65.3%) of the EU-27's workforce were **employed** within the business economy in 2007 (see Figure 4); this was more than 10 percentage points lower than the corresponding share of the business economy in total value added. The difference could be largely attributed to the relatively low share of persons employed in financial, real estate, renting and business activities (15.1% of the total workforce, compared with a 28.1% share of total value added). In contrast, agriculture, hunting, forestry and fishing; construction; distribution, HORECA, communications and transport services; as well as public administration, health, education, other services and households were all relatively labour-intensive. Indeed, the largest employer in the EU-27 in 2007 (on the basis of national accounts data) was public administration, health, education, other services and households, accounting for almost three out of every ten persons (28.9%). Just over a quarter (25.3%) of the EU-27's workforce was employed in distribution, HORECA, communications or transport services.

⁴Note that EU-27 values are unchanged in euro and PPS terms.

Structural differences between the Member States

Figure 5 shows the relative contribution of the six **national accounts** activity aggregates to total value added in 2007. The structural differences observed between the Member States should be borne in mind when reading the structural business statistics sectoral articles. In particular, it is important to consider the relative weight of those sectors that are not included in the structural business statistics articles, as agriculture, hunting, forestry and fishing, and more particularly, public administration, health, education, other services and households can often account for a relatively high share of economic activity. However, the relative weight of these two activities does not have a direct impact on the calculation of shares and ratios that are presented throughout the structural business statistics sectors as the **non-financial business economy** is often used as the denominator when creating indicators for analysis.

On average, agriculture, hunting, forestry and fishing and public administration, health, education, other services and households accounted for 24.2% of total value added in the EU-27 in 2007. Their share of total value added peaked at 30.6% in Malta, falling to almost half this level in Luxembourg (16.6%). The relative importance of agriculture, hunting, forestry and fishing was particularly high in Romania and Bulgaria (7.5% and 6.2%), while upwards of 25% of total value added was generated by public administration, health, education, other services and households in Malta, Denmark, Portugal, Sweden and France.

Among the activities covered by the structural business statistics sectoral articles, Luxembourg, France and the United Kingdom were all relatively specialised in financial, real estate, renting and business activities, as these activities accounted for upwards of 30% of their total value added (rising to 47.3% in Luxembourg). Industrial activities were particularly concentrated within central Europe, with the highest shares of industry in total value added being recorded in the Czech Republic, Slovakia, Germany, Romania and Slovenia. In contrast, the tourism-rich economies of Greece, Cyprus and Malta were joined by the **Baltic States** and Poland, where distribution activities accounted for a relatively high share of value added, as the Member States that displayed the highest degree of specialisation in distribution, HORECA, communications and transport services. The most specialised Member States within the construction sector were Spain (12.3% of total value added), Romania (10.3%) and Lithuania (10.2%).

Figure 6 shows a similar breakdown for employment: the main difference is the striking number of persons employed within agriculture, hunting, forestry and fishing activities in Romania (2006), Bulgaria and Poland (2006), a share that rose to 30.6% in Romania. The relative importance of public administration, health, education, other services and households was also generally higher in relation to employment when compared with value added. Indeed, as many as 39.0% of the Swedish workforce were occupied in these activities in 2007, and upwards of one third of the total in France (2006), Denmark, Belgium and Finland.

Future challenges; information technology and climatic change

In its mid-term review of industrial policy (COM(2007) 374), the European Commission identified some key challenges facing European business, in particular, the intensified impact of globalisation and technological change, the challenges posed by climate change, and the possibilities for exploring opportunities relating to new low-energy and resource-saving processes and products.

One basic indicator to measure the take-up of information technology is the Internet penetration rate. The proportion of EU-27 enterprises having access to the Internet in 2008 was 93%⁵, while 81% of all enterprises had a broadband connection (see Figure 8). This latter share ranged from 92% in France, Spain and Finland, to less than two thirds of all enterprises in Bulgaria, Latvia, Poland, Lithuania and Romania (where the lowest share of 44% was registered).

Aside from its potential for making business more productive and efficient, the Internet also offers a range of opportunities for e-commerce, both with other businesses (B2B), as well as final consumers (B2C). A relatively small proportion of enterprises (16%) in the EU-27 received orders on-line in 2008, with this latest figure representing a gain of four percentage points in relation to 2005 (see Figure 9). The likelihood that an enterprise

⁵Information covers enterprises with 10 or more persons employed in NACE Sections D, F, G, I and K, as well as Groups 55.1, 55.2, 92.1 and 92.2.

received orders on-line rose as a function of its average size, from 15% for [small enterprises](#) to 33% for [large enterprises](#) .

Some 28% of enterprises in the EU-27 in 2008 made on-line purchases, which was also four percentage points higher than in 2005. As with sales through the Internet, the highest proportion of enterprises making purchases over the Internet was recorded among large enterprises (42%). Note, however, that the pace at which Internet sales and purchases grew between 2005 and 2008 was fastest among small enterprises.

The EU has set ambitious environmental goals to increase energy efficiency, to reduce greenhouse gas emissions (by at least 20% by 2020), to promote renewable energy sources, and to invest in a range of environmental industries. Figure 10 shows that there have been sizeable reductions in national emissions across the EU-27, on the basis of a comparison with 1990 – in particular for ozone precursors, particulate matter and acidifying pollutants. Figure 11 presents more detail in relation to the main sources of emissions, with fuel consumption for transport and within energy-producing industries generally accountable for the highest levels. Energy-producing industries and transport accounted for almost one third and one fifth (31% and 19%) of all greenhouse gas emissions in 2006. Between 1990 and 2006 there was a general trend for EU-27 emissions from energy-producing industries and from industrial and construction activities to fall (as a share of total emissions), while the share of emissions from transport tended to rise.

Data sources and availability

The main part of the analysis in this article is derived from Eurostat statistics on economy and finance, on information society, and on air pollution/climate change.

SMEs may be viewed as important players in the well-being of local and regional communities, with considerable potential for employment creation. As such, they can play an important role in [Europe's 2020 strategy](#), contributing to the economic health of the European economy; this numerous and disparate subpopulation of

enterprises is the focus of this special feature.

Main statistical findings

SME overview

The overwhelming majority (99.8%) of enterprises active within the EU-27's non-financial business economy in 2008 were SMEs – some 20.9 million – together they accounted for two out of every three jobs (66.7%) and for 58.6% of value added within the non-financial business economy – see Table 1.

More than nine out of ten (92.0%) enterprises in the EU-27 were micro enterprises; their relative share of the non-financial business economy workforce and value added was considerably lower at 29.0% and 21.8%.

The relative importance of SMEs was particularly high in the southern Member States of Italy, Portugal and Spain (no data available for Greece). Some of these differences may be explained by the relative importance of particular sectors in the national economy or by cultural and institutional preferences for self-employment and/or family-run businesses – see Table 2.

While large enterprises only accounted for 0.2% of the total enterprise population within the EU-27's non-financial business economy in 2008, mining and quarrying, network energy supply as well as water supply, sewerage, waste and recycling each reported that more than 1% of their enterprises were large; the same three activities also recorded the highest proportion of medium-sized enterprises (between 4.1% and 5.5% of the enterprise population) – see Table 3.

The number of SMEs across the EU-27's non-financial business economy was particularly concentrated within distributive trades (6.1 million enterprises); this was almost twice the number of SMEs within professional, scientific and technical activities or construction – see Figure 1.

Focus on employment and self-employment

Perhaps the most striking phenomenon of SMEs is their contribution to employment. No less than two thirds of the EU-27's non-financial business economy workforce was active in an SME in 2008.

Some 23.3 million persons worked in SMEs in the distributive trades sector, 19.5 million in manufacturing and 13.2 million in construction; together, these three activities provided work to 61.9% of the non-financial business economy workforce in SMEs – see Figure 2.

Micro enterprises employed more people than any other size class in a number of service sectors – see Figure 3. This pattern was particularly pronounced for real estate services and the repair of computers, personal and household goods, where an absolute majority of the workforce was found working in micro enterprises.

Table 4 provides a more detailed breakdown of employment by size class, confirming the prominent role of SMEs as employers within many service sectors. In contrast, a range of activities characterised by network supply and minimum efficient scales of production (such as mining, air transport, postal and courier services, and the manufacture of motor vehicles or pharmaceuticals) reported a considerably higher proportion of their respective workforces occupied within large enterprises.

Business demography statistics provide information on the dynamics of the enterprise population and its workforce. Entrepreneurship and rapidly growing SMEs are often cited as drivers of job creation with particular attention paid to the potential for employment growth among enterprises with no paid employees (size class zero). These accounted for just over half (51.2%) of all EU enterprises in industry, construction and services in 2007 and for 63.4% of all new born enterprises – predominantly in deregulated service sectors with relatively low fixed costs for starting a business as a self-employed person. A total of 3.8 million persons were employed by newly born enterprises in 2007, with over a third (38.1%) of these working on their own – see Table 5.

The relative contribution of size class zero enterprises to the industry, construction and services workforce was highest in Italy (20.4%), the Czech Republic (15.9%), Spain (12.4%), Sweden (11.9%) and Slovakia (11.3%)

– none of the remaining Member States reported self-employed entrepreneurs accounting for more than 10% of the workforce – see Figure 5.

Focus on value added and apparent productivity

As with the employment analysis, SMEs within the EU-27's distributive trades, manufacturing and construction sectors generated the highest levels of added value in 2008 – see Figure 1.6. Across the whole of the EU-27's non-financial business economy, SMEs accounted for 58.6% of the EUR 6176 thousand million of value added generated in 2008.

The contribution of SMEs to total value added was lower than their contribution to employment (66.7%), resulting in a lower level of [apparent labour productivity](#). This pattern was particularly prevalent among activities such as manufacturing or information and communication services. However, it was also observed across most other activities and across most Member States – suggesting inherent characteristics of SMEs played a role (for example, their inability to benefit from economies of scale, their relatively low level of capital intensity, or their inability to adopt or develop [innovations](#)). As a result, large enterprises tended to record higher labour productivity ratios than SMEs (Figure 9).

Data sources and availability

Structural business statistics are compiled under the legal basis provided by [Parliament](#) and [Council Regulation 295/2008](#) on structural business statistics, and in accordance with the definitions, breakdowns, deadlines for data delivery, and various quality aspects specified in the regulations implementing it.

[Eurostat](#)'s structural business statistics describe the structure, conduct and performance of economic activities, down to the most detailed activity level (several hundred sectors).

Structural business statistics now cover the 'business economy', which includes industry, construction and many services ([NACE Rev. 2](#) Sections B to N and Division 95); financial and insurance activities (NACE Section K) are treated separately within structural business statistics because of their specific nature and the limited availability of most types of standard business statistics in this area. As such, the term 'non-financial business economy' is generally used in business statistics to refer to those economic activities covered by NACE Rev. 2 Sections B to J and L to N and Division 95 and the units that carry out those activities. Structural business statistics do not cover agriculture, forestry and fishing, nor public administration and (largely) non-market services, such as education or health.

SBS are available with an analysis by enterprise size class. In structural business statistics, size classes are defined by the number of persons employed, except for specific data series within retail trade activities where [turnover](#) size classes are also used. A limited set of the standard structural business statistics variables (for example, the number of enterprises, turnover, persons employed and value added) is analysed by size class, mostly down to the three-digit (group) level of NACE. For statistical purposes, SMEs are generally defined as those enterprises employing fewer than 250 persons. The number of size classes available varies according to the activity under consideration. However, the main groups used for presenting the results are:

- small and medium-sized enterprises (SMEs): with 1 to 249 persons employed, further divided into:
 - micro enterprises: with less than 10 persons employed;
 - small enterprises: with 10 to 49 persons employed;
 - medium-sized enterprises: with 50 to 249 persons employed;
- large enterprises: with 250 or more persons employed.

Context

In June 2008, a Communication titled the [Small Business Act \(SBA\) for Europe](#) was adopted. This recognised 'the central role of SMEs in the EU economy' and aimed to strengthen the role played by SMEs and to promote

their growth and job creating potential through alleviating a number of problems which are thought to hamper the development of SMEs. These included: alleviating administrative burdens; facilitating SMEs' access to finance; supporting SMEs in their bid to access new markets; ensuring fair competition; promoting education and skills for entrepreneurship; protecting intellectual property; encouraging research and development; or supporting SMEs in a regional and environmental context. This 'mainstreaming' of SME policy is based upon a premise to 'think small first'.

A [review of the SBA](#) was released in February 2011: it highlighted the progress made and set out a range of new actions to respond to challenges resulting from the financial and economic crisis. In doing so, it is hoped that the updated SBA will contribute towards delivering the key objectives of the Europe 2020 strategy – namely, smart, sustainable and inclusive growth.

Table 6: Relative specialisation by Member State in terms of value added, 2009Source: Eurostat (sbs_sc_ind_r2), (sbs_sc_con_r2), (sbs_sc_dt_r2), (sbs_sc_1b_se_r2)

This article focuses on the [non-financial business economy](#) and belongs to a [set of statistical articles](#) which analyse the structure and characteristics of the economic activities within the non-financial business economy of the [European Union \(EU\)](#) .

Main statistical findings

Size and structure of the non-financial business economy

In 2009 a total of EUR5577522 million of gross [value added](#) was generated in the [EU-27](#) 's non-financial business economy and the non-financial business economy workforce reached 134.1 million [persons employed](#) .

The sectors that make up the non-financial business economy are shown in Figure1 which provides an overview of their contribution in terms of labour input (employment), output (value added), and the [enterprise](#) population. In broad terms, manufacturing and distributive trades were the largest sectors, combining for 45% or more of the non-financial business economy value added and employment totals.

[Apparent labour productivity](#) averaged EUR41.6 thousand per person employed in the EU-27's non-financial business economy in 2009, ranging from EUR19 thousand per person employed in accommodation and food services to EUR180 thousand per person employed for network energy supply. [Average personnel costs](#) were also lowest for the accommodation and food services sector (EUR15.9 thousand per employee) and highest in network energy supply (EUR50.0 thousand per employee); the non-financial business economy average was EUR30.0 thousand per employee. It should be noted that both of these indicators are based on a simple head count of employment and so are influenced, at least in part, by the extent of part-time employment. The influence of part-time employment is largely removed by combining these two measures into the [wage-adjusted](#)

labour productivity ratio : for the non-financial business economy this ratio was valued at 138.8% in 2009, indicating that average labour productivity was 38.8% higher than average personnel costs. This indicator was below 100% for the small sector of repair of computers, personal and household goods and rose to above 300% for the network energy supply sector and the mining and quarrying sector.

As can be seen from Figure2, a Member State's share of the EU-27's non-financial business economy varies substantially depending whether it is measured in terms of value added or employment. Those with higher shares of EU-27 value added than their respective shares of the EU-27 workforce (such as Germany, the United Kingdom and France) had above average apparent labour productivity ratios.

National specialisation and concentration

The share of the five largest Member States in the EU-27's value added gives an impression of geographical concentration; the average share for the non-financial business economy was 71.5% in 2009. An analysis at the level of detail shown in Figure3 indicates that the highest concentration was for mining and quarrying and the lowest for construction and distributive trades; the network energy supply sector as well as the water supply, sewerage, waste and recycling sector had lower levels of concentration by this measure, but it should be noted that German data is not available for these sectors, thus strongly influencing the results. Generally, in each sector the five largest Member States were the five Member States with the largest economies overall (Germany, Spain, France, Italy and the United Kingdom), with the mining and quarrying sector the main exception.

The most specialised Member State in an activity is the one where that activity's share of the non-financial business economy is highest, regardless of whether the Member State is large or small. In contrast to concentration measures that typically highlight the largest Member States, measures of specialisation often identify smaller or medium-sized Member States. In only two of the activities presented in Tables4 or5 were large Member States the most specialised Member State; in both cases this concerned specialisation in value added terms for services activities, once each for France and the United Kingdom. Some specialisations are due to the availability of natural resources, for example specialisation in mining and quarrying in Denmark and Poland.

Table6 shows the activity in which each Member State is most specialised, relative to the EU-27 as a whole - this is based on value added shares in the non-financial business economy. For just over half of the Member States the activity in which they were most specialised was an industrial activity. Spain and Portugal were relatively most specialised in construction, Cyprus and Austria in accommodation and food services, and Germany, Finland and Sweden in real estate activities. Belgium was most specialised in administrative and support services, France in the repair of computers, personal and household goods, Latvia in transportation and storage and Luxembourg in professional, scientific and technical activities. It should be noted that some activities are relatively small across the whole of the EU-27, which means that even in a Member State with a high specialisation relative to the EU-27 average this activity may in fact only contribute a small proportion of non-financial business economy value added, as is the case for France. None of the Member States were highly specialised in water supply, sewerage, waste and recycling, nor in distributive trades, nor information and communication services.

Data sources and availability

Structural business statistics are compiled under the legal basis provided by [European Parliament and Council Regulation 295/2008](#) on structural business statistics, and in accordance with the definitions, breakdowns (level of analysis), deadlines for data delivery, and various quality aspects specified in the regulations implementing it.

Eurostat 's structural business statistics describe the structure, conduct and performance of economic activities, down to the most detailed activity level (several hundred sectors).

Structural business statistics cover the 'business economy', which includes industry, construction and many services ([NACE Rev.2 Sections B to N and Division 95](#)); financial and insurance activities (NACE Section K) are treated separately within structural business statistics because of their specific nature and the limited availability of most types of standard business statistics in this area. As such, the term 'non-financial business economy' is generally used in business statistics to refer to those economic activities covered by NACE Rev.2 Sections B

to J and L to N and Division 95 and the units that carry out those activities. Structural business statistics do not cover agriculture, forestry and fishing, nor public administration and (largely) non-market services, such as education or health.

Structural business statistics contain a comprehensive set of basic variables describing business demographics and employment characteristics, as well as monetary variables (mainly concerning operating income and expenditure, or [investment](#)). In addition, a set of derived indicators has been compiled: for example, ratios of monetary characteristics or per head values.

Context

In October 2010 the [European Commission](#) presented a Communication on a renewed industrial policy. ' [An industrial policy for the globalisation era](#) ' provides a blueprint that puts industrial competitiveness and sustainability centre stage. It is a flagship initiative that forms part of the [Europe 2020 strategy](#) , and sets out a strategy that aims to boost growth and jobs by maintaining and supporting a strong, diversified and competitive industrial base in Europe offering well-paid jobs while becoming less carbon intensive. The initiative establishes a strategic agenda and proposes some broad cross-sectoral measures, as well as tailor-made actions for specific industries, mainly targeting the so-called 'green innovation' performance of these sectors.

The [internal market](#) remains one of the EU's most important priorities. The central principles governing the internal market for services were set out in the [EC Treaty](#) . This guarantees EU enterprises the freedom to establish themselves in other Member States and the freedom to provide services on the territory of another EU Member State other than the one in which they are established. The objective of the [Services Directive 2006/123/EC](#) of 12 December 2006, on services in the internal market, is to eliminate obstacles to trade in services, thus allowing the development of cross-border operations. It is intended to improve [competitiveness](#) , not just of service enterprises but also of European industry as a whole. In December 2006, this Directive was adopted by the European Parliament and the Council with transposition by the Member States required by the end of 2009. It is hoped that the Directive will help achieve potential economic growth and job creation. By providing for administrative simplification, it also supports the better regulation agenda.

Business registers

This article briefly presents characteristics and uses of statistical business registers in the [European Union \(EU\)](#) .

[Eurostat](#) does not publish business register data for the EU Member States.

Population and records

Business registers include information on the active population of:

- [enterprises](#) carrying on economic activities contributing to the [gross domestic product \(GDP\)](#) ;
- their [local units](#) ;
- the legal units of which those enterprises consist;
- enterprise groups (association of enterprises bound together by legal and/or financial links).

Recorded characteristics

The characteristics recorded in the registers for the units are, for example:

- identification characteristics: ID numbers, names, addresses;
- demographic characteristics: date of [commencement](#) /cessation of the unit;
- economic/stratification characteristics: economic activity ([NACE](#)), employment, [turnover](#) , legal form;
- information on control and ownership relations: parent/subsidiary legal unit, minority shareholder information, country of global decision centre.

Use of business registers

Statistical business registers are used:

- as a tool for the preparation and co-ordination of surveys;
- as a source of information for statistical analysis of the business population and its demography;
- to establish links with administrative sources;
- for the identification and construction of [statistical units](#) .

Business register data are mainly used for supporting surveys and the analysis of statistical units, as well as their relations.

Context

The availability of statistical business registers is key to the compilation of consistent and comparable [short-term](#) and [structural business statistics](#) .

Business registers are crucial for establishing efficient statistical survey frames which aim to reduce reporting burden on enterprises.

Business services

This article presents [business services](#) in the [European Union \(EU\)](#) , here defined as [NACE Rev. 1.1 Divisions 72 and 74](#). Business services are a driver of a knowledge-based economy and their labour-intensive nature suggests their potential importance as providers of new jobs in the future.

Context

Contributing to the recent increase in the demand for business services, the growing trend in [outsourcing](#) has seen many [enterprises](#) use service providers for [non-core](#) professional activities.

Technological progress and the internet are also important factors which have provided new production possibilities and new modes of supply.

Beyond the establishment of the framework of the [General Agreement on Trade in Services \(GATS\)](#) and greater openness of international markets, the [European Services Directive 123/2006](#) should further strengthen the business services sector on the international stage. It seeks to:

- promote an [internal market](#) in services through the removal of legal and administrative barriers that have prevented enterprises from one Member State providing similar services in another Member State;
- make it easier for businesses to provide and use cross-border services within the EU, increasing cross-border competition.

Given the flexibility and dynamics of the business services sector, it is important for analysts to have a detailed knowledge of both clients and products (which are becoming increasingly non-standard and customised according to client needs) in order to further their understanding of market forces in this domain.

Data collection

In order to improve statistical coverage and respond to user needs, [Eurostat](#) has developed statistics on these dynamic areas of the economy since early 2000 with participating countries providing statistics on a voluntary basis.

From the [reference year](#) 2008 onwards, the business services data collection has become part of the regular annual data collection of SBS. Business services statistics are now based on Annex VIII of the [recast SBS Regulation 295/2008](#) .

Main findings

- In 2006, 4.4 million enterprises in the [EU-27](#) had as their main activity the provision of business services. They employed 22.2 million persons and generated total gross [turnover](#) of EUR 1763 billion, equivalent to 17.1% of the [non-financial business economy workforce](#) and to 7.9% of total turnover.
- Legal, accounting, auditing and business management services accounted for 29.8% of business services turnover in the EU-27, computer and related activities for 21.0%, architecture, engineering and consultancy (15.3%), advertising (8.2%), and labour recruitment and provision of personnel (7.3%).
- An analysis based on the location of clients gives information on the exports of business services to residents in other Member States or outside of the EU. In 2005, domestic clients accounted for upwards of 90% of the turnover that was generated in the business services sectors of Germany, Spain, Greece and Portugal; at the other end of the range, Latvia was the only country where more than 20% of sales were accounted for by exports.

- The activities with the highest proportion of their sales coming from exports in 2005 were technical testing and analysis (21.0%), business and management consulting (16.5%) and market research and public opinion polling (16.3%).

PRODCOM statistics

Data from October 2012, most recent data: Further Eurostat information, Main tables and Database .

This article analyses recent data on industrial production in the European Union (EU), based on results of the PRODCOM survey. In 2011 the sold value by products covered by PRODCOM survey amounted to EUR 4709 billion. Even if data are collected in current price in the survey, some considerations are based on constant price (see methodology on calculation of constant price). After the 2008 crisis, the value generated by European production was reduced dramatically. The recovering process is now well engaged and even if the level of 2008 is not yet reached it gets closer to the highest value ever reached.

Note: The numbers in the country columns indicate the rank of each country; e.g. for CPA 291023 Germany is the biggest producer and Czech Republic is the 5th biggest. Countries not taking any of the top 5 places are not shown.

Table 3: Top 5 producing countries of each of the top 30 products at CPA level by value of sold production, EU-27, 2011

Map 1: Production, share of sold production value, EU-27, 2011

As shown in Figure 1, the value of 2011 sold production is still smaller than the one of 2008 (7% to be caught up). After a consolidation in 2010 (+9.15% compare to 2009), the increase in 2011 is more limited (about 1%).

Results by activities

The analysis that follows refers to the division breakdown (first 2-digit level of the [Statistical classification of economic activities in the European Community \(NACE\)](#)).

Table 1 show the evolution of sold value in constant price from 2008 to 2011.

If the evolution in constant price for the overall production has slightly decrease since 2008 (-7.68%), some divisions have recovered already the level of 2008. if we put aside divisions that contribute only marginally to the manufacturing total ('Metal ores' and 'Coke and refined petroleum products'), only two divisions have a net progression in constant price 'Basic pharmaceutical products and pharmaceutical preparations' (Division 21: +4.76%) and 'Leather and related products' (Division 15: +1.63%).

Three divisions have still more than 25% decrease compare to 2008:

- Wearing apparel (-32%)
- Tobacco products (-28%)
- Printing and recording services (-27%)

The share of each sector remains quite stable between years (see details in attached Excel workbook). There is no sector for which its share of European production varied for more than 1% in the last 4 years.

Results by top product groups

The analysis that follows refers to the breakdown at 6-digit level of the [Classification of products by activity \(CPA\)](#) .

Figure 2 and Table 2 show the 30 CPA product groups with the highest value of production sold in 2011. Five product groups have each a total share representing more than 1% of the total sold value:

- vehicles with compression-ignition internal combustion piston engine (diesel or semi-diesel);
- vehicles with spark-ignition engine of a cylinder capacity \geq 1500 cm³;
- parts and accessories n.e.c., for motor vehicles;
- medicaments, containing alkaloids or derivatives thereof, but not hormones or antibiotics;
- other structures and parts of structures, plates, rods, angles, shapes and the like, of iron, steel or aluminium.

Looking at the economic activities in which products are classified, it can be noted that almost half of them belong to only two divisions and almost two thirds of them fall into only three divisions. Seven products belong to 'Manufacture of food products' (Division 10), seven to 'Manufacture of motor vehicles, trailers and semi-trailers' (Division 29), and five to the 'Manufacture of fabricated metal products, except machinery and equipment' (Division 25).

The list of top product groups is quite stable. The top-10 product groups of 2011 were already in top-14 group in 2007.

In 2011, 'Goods vehicles, with compression-ignition internal combustion piston engine (diesel or semi-diesel), new' (ranked 14 in 2010) instead of 'Other non alcoholic beverages' (ranked 10 in 2010, 11 in 2011). The difference in term of sold value is quite limited between those 2 groups (less than EUR 100 million).

When looking to top-30 product groups, one group had a significant increase in its sold value in 2011 and entered in top 30 product groups: 'Compression-ignition internal combustion piston engines for vehicles' (+30% compare to 2010). The group 'Television receivers, whether or not combined with radio-broadcast receivers or sound or video recording or reproduction apparatus' which appeared in 2010 in the top 30 product groups was reduced by 23% and is 2011 ranked 45.

Products with steady increase since 2008

243 products of the 2011 list have a sold production greater than EUR 4 billion in 2011 (more than 1‰). On this subset 17 have their sold production values increasing every year since 2008. On those 17, 14 products have 10% increase between 2010 and 2011. The NACE class that are most represented in this list are 20.21 "Manufacture of pharmaceutical preparations" (3 products) and 30.30 "Manufacture of air and spacecraft and related machinery" (3 products).

- 10.39.17.90 Vegetables and mixtures of vegetables, n.e.c. (excluding prepared vegetable dishes and frozen vegetables and mixtures of vegetables)
- 10.85.19.00 Other prepared dishes and meals (including frozen pizza)
- 20.30.11.50 Paints and varnishes, based on acrylic or vinyl polymers dispersed or dissolved in an aqueous medium (including enamels and lacquers)
- 21.20.12.60 Medicaments containing insulin but not antibiotics, for therapeutic or prophylactic uses, put up in measured doses or for retail sale

- 21.20.12.70 Medicaments containing corticosteroid hormones, their derivatives and structural analogues, put up in measured doses or for retail sale
- 21.20.21.40 Vaccines for human medicine
- 24.41.10.30 Silver, unwrought or in powder form (including plated with gold or platinum)
- 28.11.23.00 Gas turbines (excluding turbojets and turboprops)
- 30.20.20.00 Self-propelled railway or tramway coaches, vans and trucks, except maintenance or service vehicles
- 30.30.12.00 Turbo-jets and turbo-propellers, for civil use
- 30.30.34.00 Aeroplanes and other aircraft of an unladen weight > 15 000 kg, for civil use
- 30.30.50.90 Parts for all types of aircraft excluding propellers, rotors, under carriages, for civil use
- 33.11.19.00 Repair and maintenance of non-domestic central heating boilers
- 33.12.11.00 Repair and maintenance of engines and turbines (excluding aircraft, vehicle and cycle engines)

List of product with steady increase since 2008

Top product groups: main producer countries

Table 3 shows the five main producer countries of each of the top groups for 2011. Thirteen countries appear in the list of main producers.

Five countries are appearing more often in the top-5 list of main producer: Germany appears 30 times. France appears 26 times. Italy appears 22 times (being main producer 3 times). United Kingdom and Spain appear 20 times (never being the main producer). Germany is the only country appearing in top 5 producer countries for all products.

Considering the ranking of the countries Germany is the main producer for 20 product groups and the main producer for 4 of 5 top groups (the top 3 that are linked to car industry). France is main producers for 6 product groups. Italy is main producers for 3 product groups. The Netherlands is main producers for one product group.

European industrial production main producer countries

The five main producing countries of the top 30 product groups are also the five main producers in the European Union in terms of total value of sold production.

Three countries (Cyprus, Luxembourg and Malta) are not shown. According to the terms of the [PRODCOM Regulation](#), these countries are exempted from reporting PRODCOM data to Eurostat and zero production is recorded for them for all products. The regulation stipulates that zero can be reported for any [NACE](#) class where the reporting country has less than 1% of Community total and this is true for all NACE classes of these three countries.

Germany accounts for about a third of all [EU-27](#) sold industrial production. France is the only other Member states that contributes more than 10% of total production. Italy, The United Kingdom and Spain contribute between 5 and 10% of EU production. The five countries produce over 70% of all EU production.

Data sources and availability

The earliest data published are for 1995, for [EU-15](#) Member States. As new countries have [joined the EU](#) , the data published by [Eurostat](#) has been extended to include the new Members. The survey is conducted during the first 6 months of each year in order to get the production levels for the previous year. Member States are required to send this data to Eurostat by 30 June. Eurostat normally publishes it for the first time in mid-July. However, countries may send revised figures at a later date and then the statistics published by Eurostat are refreshed.

Context

The evolution of PRODCOM dates back to 1985 when there were the first meetings of the working party on "Production Statistics", whose objective was to harmonise the various ways industrial production statistics were collected in the Member States.

Although statistics on production were collected in most countries, these covered the national situation, national nomenclatures were used and different survey methods were applied.

The purpose of the PRODCOM regulation is to enable these national statistics to be compared and where possible [aggregated](#) to give a picture of the developments of an industry or product in the European context. This aim became more urgent with the creation of the [single market](#) in 1992 and, with rapid changes occurring in Europe, the statistical system had to adapt to these changes.

Before data collection could begin, it was necessary to draw up a common list of products to be covered. Drawing up the PRODCOM list was a unique opportunity for Eurostat, thenational statistical institutesand the European trade associations (FEBIs) to work together to produce a classification that would work on the micro, national and European level. The two principal aims were to measure production and to enable the calculation of apparent consumption by linking production statistics to international trade statistics.

In most cases, the statistics show the amount produced and sold of each product. However, for some products the total production is given: this includes not only what is sold, but also what is retained by the producer for use in the production of another product.

Production statistics are used by the [European Commission](#) and national administrations for policy-making, and by enterprises. An increasing use of the data is in climate change and other environmental statistics.

The production statistics in PRODCOM relate to two other statistical areas:

[Structural business statistics](#) give details of [enterprises](#) and their activities, so there is a link between enterprise statistics such as turnover and the sum of production measured in PRODCOM. However, the correlation between the goods produced by an enterprise and the sector in which they are registered is not always very strict, so this can affect comparisons of this kind. In addition, producers engage in other activities besides production (installation, repair and maintenance, finishing etc.) that contribute to turnover but not to the value of production. Production statistics are an important measure of sales and consumption of goods. But in order to give an accurate picture, they must be linked to import and export figures. For this reason, the production statistics published by Eurostat are accompanied by the related trade data. However trade data is collected independently using a different nomenclature (the [Combined nomenclature](#)), so there can be discrepancies between the two sets of figures.

PRODCOM survey on production of manufactured goods

Data from July 2011, most recent data: Further Eurostat information, Database and Data in MS Excel format

This article gives a brief overview of PRODCOM, the European Union (EU) survey providing statistics on the production of manufactured goods. It is based on a list of products; for each product in the list, the statistics show the amount produced in each year, for individual countries and for the EU as a whole. The list aims to include all manufactured products. But to keep it manageable, similar products are grouped into single items. The list is updated every year – it currently contains just under 4000 items.

PRODCOM Code	Product description	Value (EUR million)	Rounding Base (million) (1)
29102230	Motor vehicles with a petrol engine > 1500 cm ³ (including motor caravans of a capacity > 3000 cm ³) (excluding vehicles for transporting >= 10 persons, snowmobiles, golf cars and similar vehicles)	113 175	
29102330	Motor vehicles with a diesel or semi-diesel engine > 1500 cm ³ but <= 2500 cm ³ (excluding vehicles for transporting >= 10 persons, motor caravans, snowmobiles, golf cars and similar vehicles)	100 000	29 102
21201360	Other medicaments of mixed or unmixed products, p.r.s., n.e.c.	75 591	
10000021	Prepared and preserved meat, meat offal or blood, including prepared meat and offal dishes	48 575	
29323090	Other parts and accessories, n.e.c., for vehicles of HS 87.01 to 87.05; parts thereof	45 000	29 323
10901020	Preparations for animal feeds (excluding dog or cat food, p.r.s.)	38 382	
29102100	Vehicles with spark-ignition engine of a cylinder capacity <= 1 500 cm ³ , new	34 024	
11051000	Beer made from malt (excluding non-alcoholic beer, beer containing <= 0.5% by volume of alcohol, alcohol duty)	32 000	11 051
25112360	Other structures of iron or steel	28 274	
29322090	Parts and accessories of bodies (including cabs), n.e.c.	28 098	

(1) Indicates the magnitude of the rounding employed to protect confidential cell (in case of 29102330, the true value lies within the range +/- EUR 29 102 Million of the value shown)

Table 1: High-value products in 2010

Statistical results

PRODCOM Code	Product description	Quantity (1000)	Rounding base (1000)	Unit
24102210	Flat semi-finished products (slabs) (of stainless steel)	126 569		kg
23631000	Ready-mixed concrete	583 283 048		kg
11021130	Champagne (important, excluding alcohol duty)	242 398		l
20421150	Perfumes	14 283		l
20111170	Oxygen	30 540 455		m3
16101033	Coniferous wood, sawn or chipped lengthwise, sliced or peeled, of a thickness > 6 mm, end-jointed, sanded or planed	150 060	60 (1)	m3
12001150	Cigarettes containing tobacco or mixtures of tobacco and tobacco substitutes (excluding tobacco duty)	691 236 046		p/st
26522200	Clock movements, complete and assembled	700	50	p/st

(1) Indicate the magnitude of the rounding employed to protect confidential cell (in the case of 1610103, the true value lies within the range of 60 000 m3 of the value shown)

Table 2: Selected products by volume with various units in 2010

For most products, the statistics show the amount produced by value in euro and by volume (in kg, litres etc., depending on the product). The statistics can be looked at in many different ways:

- to compare manufacturing in different countries;
- to measure the growth or decline in different manufacturing sectors;
- to look at the production levels for individual products.

Product coverage

It is important for production statistics to identify all the producers of each product so that they can be surveyed. Statistical checks are made to ensure that full coverage of each product is achieved.

Territorial coverage

The data are obtained by the statistical office of each Member State by conducting surveys of manufacturers – usually by means of a paper or electronic questionnaire. The enterprises must match each of the products they actually produce to one of the products on the list. The statistical offices then sum up the production of all manufacturers of each product and send a national total to [Eurostat](#) .

Data availability

The earliest data published are for 1995, for [EU-15](#) Member States. As [new countries have joined the EU](#) , the data published by Eurostat has been extended to include the new Members. The survey is conducted during the first 6 months of each year in order to get the production levels for the previous year. Member States are required to send this data to Eurostat by 30 June. Eurostat normally publishes it for the first time in mid-July. However, countries may send revised figures at a later date and then the statistics published by Eurostat are refreshed.

Data completeness

Sometimes the data for some products cannot be reported, for instance if an enterprise cannot report the volume in the required measurement unit. In these cases, either the national statistical office or Eurostat makes estimates so that complete EU totals can be published.

In some cases the national statistical authority requests that the data for a particular product be kept confidential. This can happen, for instance, if there is only one producer in the country so that the published data refers directly to that producer. Eurostat is legally bound to respect such confidentiality, but may use the confidential amount in EU totals, as long as it is not revealed by doing so. If this is not possible, the EU total is rounded so that an approximate figure can be given without revealing the confidential data. The rounding base is also shown in order to indicate the range of possible true values of the total.

Context

The evolution of PRODCOM dates back to 1985 when there were the first meetings of the working party on "Production Statistics", whose objective was to harmonise the various ways industrial production statistics were collected in the Member States.

Although statistics on production were collected in most countries, these covered the national situation, national nomenclatures were used and different survey methods were applied.

The purpose of the PRODCOM regulation is to enable these national statistics to be compared and where possible aggregated to give a picture of the developments of an industry or product in the European context. This aim became more urgent with the creation of the [single market](#) in 1992 and, with rapid changes occurring in Europe, the statistical system had to adapt to these changes.

Before data collection could begin, it was necessary to draw up a common list of products to be covered. Drawing up the PRODCOM list was a unique opportunity for Eurostat, the NSIs and the European trade associations (FEBIs) to work together to produce a classification that would work on the micro, national and European level. The two principal aims were to measure production and to enable the calculation of apparent consumption by linking production statistics to international trade statistics.

In most cases, the statistics show the amount produced and sold of each product. However, for some products the total production is given: this includes not only what is sold, but also what is retained by the producer for use in the production of another product.

Production statistics are used by the [European Commission](#) and national administrations for policy-making, and by enterprises. An increasing use of the data is in [climate change](#) and other environmental statistics.

The production statistics in PRODCOM relate to two other statistical areas:

- [Structural business statistics](#) give details of enterprises and their activities, so there is a link between enterprise statistics such as [turnover](#) and the sum of production measured in PRODCOM. However, the correlation between the goods produced by an enterprise and the sector in which they are registered is not always very strict, so this can affect comparisons of this kind. In addition, producers engage in other activities besides production (installation, repair and maintenance, finishing etc.) that contribute to turnover but not to the value of production.
- Production statistics are an important measure of sales and consumption of goods. But in order to give an accurate picture, they must be linked to import and export figures. For this reason, the production statistics published by Eurostat are accompanied by the related trade data. However trade data is collected independently using a different nomenclature (the [Combined Nomenclature](#)), so there can be discrepancies between the two sets of figures.

Entrepreneurship indicators

[Eurostat](#) is a partner in the [OECD](#) entrepreneurship indicators programme (EIP) which collects internationally-comparable statistics. The aim of the EIP is to develop a list of indicators, standard definitions and concepts, to facilitate the collection of statistics in this domain.

The challenge is to provide data that not only allows policy-makers and academics to understand better the rate and types of entrepreneurial activity, but also its impact (especially wealth creation, employment and productivity gains).

Main findings

Measuring entrepreneurship – a three-pronged approach

- Performance – may, at least in part, be linked to the underlying business environment, conditioned by many economic, environmental and sociological factors, as well as the attributes of individual entrepreneurs. The indicators designed to measure performance comprise a basket of variables that generally reflect entrepreneurship, some of which have been collected for several years, while others will require new data collection exercises.
- Impact - can be measured not just in monetary terms, but via a range of variables, e.g. [GDP](#) growth, employment creation, income distribution.
- Determinants - entrepreneurial activity is likely, at least in part, to be self-fuelling, i.e. increased GDP means more money and thus easier access to finance for new businesses, while success stories encourage other potential entrepreneurs to convert their ideas into a real business. However, there may also be negative correlations (push factors), i.e. more people (thinking of) setting up their own business in times of economic hardship, e.g. high [unemployment](#) .

Data

The empirical basis for work on entrepreneurship is still being developed. However, initial data grouped according to the draft indicator matrix are available. More information on different aspects of entrepreneurship can be found in several SBS domains:

- the size-class series within structural business statistics are a main source of data for analysing [small and medium-sized enterprises \(SMEs\)](#) , including so-called micro enterprises with fewer than 10 persons employed;
- business demography statistics – data on the active population of enterprises, their birth, survival and death – with a focus on how these events affect employment levels;
- a pilot survey on the factors of business success.

Factors of business success

The survey on factors of business success is a follow-up to the data collection exercise for [business demography](#). While the business demography project provides data on [enterprise births](#), survivals, deaths and related changes in [employment](#), the purpose of this survey is to shed more light on factors that support or hamper the success of newly born enterprises.

Information is presented on the motivations for starting-up a business, barriers and risks encountered during the first years of existence, the current situation of the enterprise, and business plans for future development.

The population surveyed in this project was enterprises born in 2002, that had survived to 2005, and that were still managed by their founders at the time of the survey. Data are available from 15 countries that participated on a voluntary basis.

Main findings

- Experience of having worked in the activity and in running an enterprise help, but are not essential, in becoming a successful entrepreneur.
- Entrepreneurs consider contacts with customers and administrative problems as their main start-up difficulties.
- Dealing with outstanding invoices to customers is one of the start-up difficulties more often perceived as problematic for men than for women; men are more optimistic about the profitability of their enterprise.
- The degree to which entrepreneurs consider their enterprises to be innovative increases with their educational level.
- The most often-cited motivations for starting-up an enterprise are the desire to be one's own boss and the prospect of making more money.

Data sources and availability

There are seven tables covering the same countries, variables, and activity ([NACE](#)) breakdowns, broken down by characteristics of the enterprise or the entrepreneur.

Enterprise characteristics:

- size class (employees) in the year of birth (2002);
- size class (employees) in the year 2005.

Entrepreneur characteristics:

- age;
- gender;
- activity;
- experience managing an enterprise;
- education.

Access to finance

This article presents the collection, uses and availability of statistics on access to finance for [small and medium-sized enterprises \(SMEs\)](#) in the [European Union \(EU\)](#) .

Uses

Affordable and appropriate access to finance is an important issue not only for newly-starting and growing companies, but also existing ones who wish to expand their operations. It is thus significant for all businesses who strive to gain productivity, foster innovation, and hence create employment and wealth for wider national and international benefit.

Access to finance is crucial especially for small and medium-size firms, due to their large share in terms of number of enterprises, turnover and employment in the business economy. In recent years some evidence has shown that lenders tended to shy away from financing these enterprises because of the nature of their assets.

To shed light on these issues [Eurostat](#) , in consultation with its users for business statistics, the [OECD](#) , [EIF](#) and the [ECB](#) , organised a business survey to obtain information on the access to various types and sources of finance of small and medium-sized enterprises.

The purpose of this survey was to examine where there may be constraints on the availability of finance, and how those may be changing; the need for finance (loans, equity and other) in the future, for example to promote growth, and the sources from which businesses would wish to obtain this finance, and an outlook on barriers to business growth in the future.

The purpose of the survey was to:

- examine where there may be constraints as regards the availability of finance, and how those may be changing;
- provide evidence on the need for finance (loans, equity and other) in the future, for example to promote growth;
- identify the sources from which businesses would wish to obtain this finance;
- obtain business leaders' perceptions where they see development constraints in the years to come.

The results give information on important financing issues such as development of finance need, range of finance types and sources sought, success rates in obtaining finance, reasons for choosing a particular financial institution, reasons for lack of success in obtaining finance, envisaged finance sources in the future, and the most important factor limiting business growth.

Main findings

Data broken down by [NACE](#) and by type of firm ([high-growth](#) versus [gazelle](#) versus other SMEs) show that

- more than half of surveyed companies did not seek finance of any type in 2007 and 2010, although a significant increase of finance need is perceived for the next three years;
- loans remain the most requested finance type for the whole period 2007-2013;
- success rate in obtaining finance severely decreased when comparing 2010 to 2007, indicating a credit crunch;
- reasons given for partial success or failure to obtain loans diverge: lack of own capital of loan seekers according to banks, too steep interest rates according to loan seekers themselves;

- 'being already a client' was the main reported reason for choosing a particular bank for a loan in both 2007 and 2010;
- need of a guarantee in obtaining loan finance is rare;
- 35% of all surveyed companies considered the financial situation of the business unchanged between 2007 and 2010, yet success rates for finance sought severely declined;
- banks remain the most envisaged finance source for the period 2011-2013;
- companies cite the general economic outlook as the most likely factor limiting business growth between 2011 and 2013 – despite an optimistic view on future access to finance.

Data collection

The Eurostat survey on access to finance was conducted in 2010 and comprised a sample of about 25000 enterprises in the 20 participating countries: Belgium, Bulgaria, Cyprus, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Poland, Slovakia, Spain, Sweden, and the United Kingdom.

The survey covered small and medium-sized enterprises in terms of employment (with 10 to 249 persons employed).

Information was collected for two significant observation moments:

- 2007 - considered a reference point before the financial crisis;
- 2010 – considered a year signalling the end of the financial crisis, at least in some [Member States](#) .

Data about the perception of finance need, envisaged finance types and sources, purpose of the finance and potential obstacles to business growth was also compiled for the coming three years (period from 2011 to 2013).

The target population for the survey was the population of enterprises that fits all of the following characteristics:

- classified to NACE Rev 2 codes B to N, but not to code K (financial services);
- independent, i.e., not a subsidiary of another business, either in the same Member State or foreign;
- has existed at least since 2005;
- had between 10 and 249 persons employed in 2005;
- active in 2008;
- has at least 10 persons employed at the reference period in 2010 – there is thus an inherent bias on surviving firms.

Access to finance statistics

Data from September 2011.

Authors: *Elisaveta Ushilova and Manfred Schmiemann (Eurostat - Structural business statistics Unit)*

This article discusses recent statistics on access to finance for [small and medium-sized enterprises \(SMEs\)](#) in the [European Union \(EU\)](#) collected by a survey coordinated by [Eurostat](#) . It analyses the consequences of the crisis by comparing data for 2007 and 2010 and sketches the outlook for the coming period, 2011 to 2013. External finance is essential for all [enterprises](#) to increase [productivity](#) , [innovate](#) , conquer new markets or, more generally, to create employment and wealth; easy access to finance is especially crucial, however, for SMEs.

Data broken down by [NACE](#) and by type of firm ([high-growth](#) versus [gazelle](#) versus other SMEs) show that

- more than half of surveyed companies did not seek finance of any type in 2007 and 2010, although a significant increase of finance need is perceived for the next three years;
- loans remain the most requested finance type for the whole period 2007-2013;
- success rate in obtaining finance severely decreased when comparing 2010 to 2007, indicating a credit crunch;
- reasons given for partial success or failure to obtain loans diverge: lack of own capital of loan seekers according to banks, too steep interest rates according to loan seekers themselves;
- 'being already a client' was the main reported reason for choosing a particular bank for a loan in both 2007 and 2010;
- need of a guarantee in obtaining loan finance is rare;

TIME GEO/GRADE	2007			2010		
	Successful	Partially successful	Unsuccessful	Successful	Partially successful	Unsuccessful

Table 1: Success rate in obtaining bank loans by country (%)

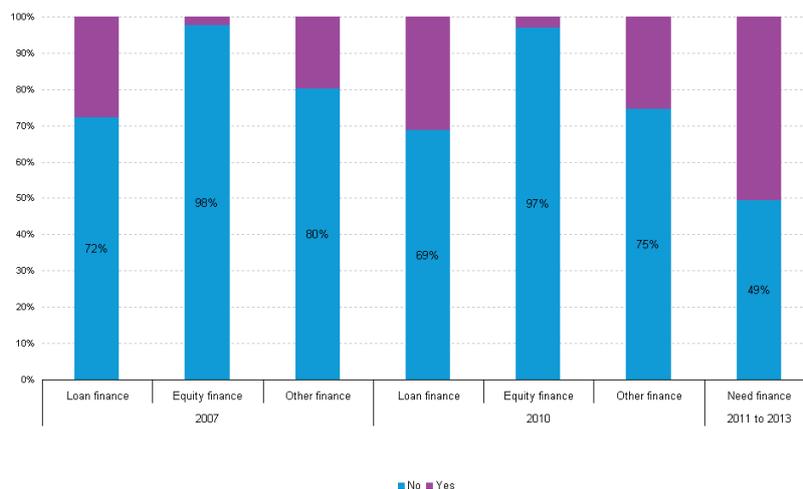

Figure 1: Percentage of firms seeking finance by type, 2007, 2010 and 2011- 2013[1]

- 35% of all surveyed companies considered the financial situation of the business unchanged between 2007 and 2010, yet success rates for finance sought severely declined;
- banks remain the most envisaged finance source for the period 2011-2013;
- companies cite the general economic outlook as the most likely factor limiting business growth between 2011 and 2013 – despite an optimistic view on future access to finance.

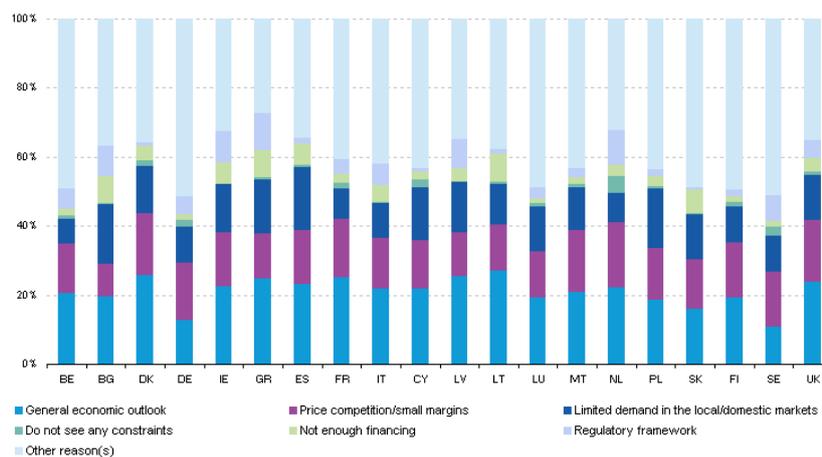

Figure 12: Most important factors limiting business growth between 2011 and 2013, by country

Survey results highlight the challenges in obtaining funds for small businesses during a financial and economic crisis. They may also provide ideas for policy makers and other decision takers on more innovative and flexible ways of providing financial services for SMEs. The information could also be used to identify growth obstacles, in particular financing gaps for small and young high growth enterprises.

Seeking finance

Most SMEs do not need external finance, but some sectors in the economy have higher needs than others, and the overall finance need will significantly increase in coming years

In 2007 and 2010 a majority of SMEs did not seek external finance, but in 2010 there was a slight increase of seeking all finance types. The projection for 2011-2013 showed that more than half of all surveyed enterprises are likely to need finance. For the same period, gazelles and other high-growth firms are more likely to seek funding, respectively 59% and 57% (Figure 1). Enterprises in industry and construction are the most likely to request funding in the next three years; 55% for Sections B to E and 54% for Section F, followed by those in Sections G to N, except J, K, M (services) – 48% and Section J (ICT services) – 46% (Figure 2).

Finance types sought

Loans remain the most important finance type, and high-growth firms will likely need more loans than equity finance in coming years

Over the entire observation period (reference point in 2007 and perceptions for 2011-2013) loans remain the most desired finance type, and their need will increase in the years to come. 'Other finance' was the next important finance type sought, but need for it will decrease considerably, by 15 percentage points comparing statements about the year 2007 and projections for 2011-2013. Projections for the period 2011-2013 also indicate an increase of 10 percentage points in the need for loans by gazelles and other high growth enterprises, and for such fast growing firms the projected need for 'Equity finance' will nearly double (Figure 3).

Success rate in obtaining finance

Dramatic decrease between 2007 and 2010

In 2007, 84% of firms were successful in obtaining loans, while for equity finance the success rate was 67%. However, by 2010 the success rate decreased substantially, respectively by 19 percentage points for loans, 15 percentage points for equity and 10 percentage points for other finance. In the same year, the combined rate of only partially and unsuccessful finance requests dramatically increased for every finance type, and especially for loans (Figure 4). Data on the success rates for the various finance types provide evidence that in 2010

small firms often struggled or failed to convince financial institutions to invest in them or lend to them. As a whole, the rate for partially successful and unsuccessful requests doubled in 2010 compared with 2007. This was especially true for gazelles and other high growth enterprises, where the rate increased from 11% and 9%, respectively, in 2007, to 20% for both groups of firms in 2010 (Figure 5). Banks were the most targeted finance source in obtaining loan finance, and had the most significant success rate, which, however, decreased by 16 percentage points in 2010 compared with 2007 (Figure 6).

Reasons for partial success or failure to obtain loan finance

Lenders look for security, loan seekers for low interest rates

For both reporting years the main reasons given by banks to refuse requested loans from SMEs were: 'Poor credit rating', 'Lack of own capital' or 'Insufficient collateral'. Other lenders, next to 'No reason given' and 'Other reason', also indicated the same rejection reasons as banks.

In the opinion of the loan-seeking businesses, in 2007 the most cited reason for not obtaining a loan at all, or for obtaining it at less desirable conditions than sought, was 'High interest rates', accounting for almost half (45%) of the cited reasons for not being fully successful in loan applications, which fell by 10 percentage points in 2010 – perhaps indicating lowered interest rates in the crisis (Figure 7).

Reasons for choosing a particular bank for a loan

Being a client already was by far the most important reason for loan seekers to resort to their finance source

Banks were the most common source to obtain loan finance in every participating Member State. Survey respondents cited 'Business is already a client' in almost half of all cases, making it by far the most important reason to choose a particular bank: 47% in 2007, and 48% in 2010 (Figure 8).

Guarantee needs and guarantor types in obtaining loan finance

Only seldom guarantees are needed, but if so, owners/directors of the loan seeker usually guarantee

Despite the challenges in obtaining finance, especially in 2010, evidence showed that the need for a guarantee was not the main reasons for small businesses failing to get finance. Almost three quarters of the surveyed companies reported no need of a guarantee in obtaining loan finance in 2007, and the percentage slightly decreased by 2 percentage points in 2010. As for who guaranteed, nearly three in four of the respondents indicated 'The owners/directors of the businesses' as the most common guarantors (Figure 9).

Perceived changes in the financial situation between 2007 and 2010

A mixed picture

For the period between 2007 and 2010, 35% of all surveyed enterprises reported the financial situation of the business as 'Unchanged'. The willingness of banks to provide finance was deemed to be "Much worse" by 14% of respondents for the period between 2007 and 2010 (Figure 10). This is a very subjective impression, since this question was replied by all surveyed enterprises, the majority of which did not seek finance at all – but it correlates positively with the decline in success rates for those that did.

Envisaged finance sources between 2011 and 2013

Banks and leasing companies need to be prepared to be addressed as financiers for SMEs

For all type of enterprises the most important finance source for the next years remains 'Banks', interestingly followed by 'Leasing companies'. 'The owner(s)/director(s) of the business' are likely to be another possible source. Relatively a few businesses expect to receive finance from 'A local government body' - only 5% cited it as a possible finance source (Figure 11).

Most important factors limiting business growth between 2011 and 2013

Access to finance is not the biggest concern for enterprises: price competition and limited demand worry many businesses

After passing through the credit crunch in 2008 and 2009 (notwithstanding the fact that it might not be over in all countries), access to finance does not seem to be the biggest concern for small businesses. Only 4% of companies cited 'Not enough financing' among the factors that should limit the growth until 2013 (this respondent population again includes those that did not, and will not, seek external finance). About one-fifth (22%) of enterprises cited the 'General economic outlook' as a constraint, whereas 16% cited 'Price competition/small margins', and 12% 'Limited demand in the local/domestic markets'. (Figure 12)

Data sources and availability

The Eurostat survey on access to finance was conducted in 2010 and comprised a sample of about 25000 enterprises in the 20 participating countries: Belgium, Bulgaria, Cyprus, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Poland, Slovakia, Spain, Sweden, and the United Kingdom.

The survey covered small and medium-sized enterprises in terms of employment (with 10 to 249 persons employed).

Information was collected for two significant observation moments:

- 2007 - considered a reference point before the financial crisis;
- 2010 – considered a year signaling the end of the financial crisis, at least in some Member States.

Data about the perception of finance need, envisaged finance types and sources, purpose of the finance and potential obstacles to business growth was also compiled for the coming three years (period from 2011 to 2013).

The target population for the survey was the population of enterprises that fits all of the following characteristics:

- classified to NACE Rev 2 codes B to N, but not to code K (financial services);
- independent, i.e., not a subsidiary of another business, either in the same Member State or foreign;
- has existed at least since 2005;
- had between 10 and 249 persons employed in 2005;
- active in 2008;
- has at least 10 persons employed at the reference period in 2010 – there is thus an inherent bias on surviving firms.

Context

Access to finance is crucial to business success and an important factor for economic growth in Europe, especially in view of any past or future economic crisis and the ensuing possible credit crunch. The purpose of this survey was to examine where there may be constraints on the availability of finance, and how those may be changing; the need for finance (loans, equity and other) in the future, for example to promote growth, and the sources from which businesses would wish to obtain this finance, and an outlook on barriers to business growth in the future.

Data are collected under [Regulation 97/2009](#) of 2 February 2009. [Regulation 295/2008](#) made provision for a flexible module “for the conduct of a specific and limited ad hoc data collection of enterprise characteristics”.

Political backdrop

External finance is essential for all businesses that strive to increase productivity, foster innovation, conquer new markets, or, in general, seek to create employment and wealth for the wider national and international benefits. Affordable and appropriate access to finance is an important issue not only for start-ups and growing companies, but also for existing ones, expanding their operations or staying competitive in their markets. Easy, burden-free access to finance is therefore a crucial political goal, especially benefitting small and medium-sized enterprises (SMEs) with their specific finance needs, due to their shares in terms of number of enterprises, turnover and employment in the business economy.

To shed light on these issues Eurostat, in consultation with its users for business statistics, i.e., [European Commission](#) policy departments, the [OECD](#), the [European Investment Fund \(EIF\)](#) and the [European Central Bank \(ECB\)](#), has coordinated a business survey to obtain information on the access to finance of small and medium-sized enterprises (10 to 249 persons employed – thus excluding [micro enterprises](#), for burden reasons and in order not to create a bias towards businesses that may mainly finance themselves internally). Data on reference years 2007 and 2010 plus an outlook of businesses what to expect for the years 2011 to 2013 were obtained and can be broken down by NACE and by type of firm: high-growth, gazelle, and other SMEs.

Purpose of the survey

The purpose of the survey was to:

- examine where there may be constraints as regards the availability of finance, and how those may be changing;
- provide evidence on the need for finance (loans, equity and other) in the future, for example to promote growth;
- identify the sources from which businesses would wish to obtain this finance;
- obtain business leaders’ perceptions where they see development constraints in the years to come.

The results give information on important financing issues such as development of finance need, range of finance types and sources sought, success rates in obtaining finance, reasons for choosing a particular financial institution, reasons for lack of success in obtaining finance, envisaged finance sources in the future, and the most important factor limiting business growth.

Notes

Global value chains

This article takes a look at global value chains (GVC) from the perspective of [European Union \(EU\) structural business statistics](#) produced and disseminated by [Eurostat](#) .

When the [EU 2020](#) strategy for growth was first communicated to the [European Parliament](#) and the [Council](#) , it was stated that "success in the intensively interacting new world economy depends on enterprises' ability to access international markets and exploit global value chains." (more information in this [PDF file](#) -) Part of the strategy is an industrial policy for the globalisation era, and the Commission sees a need to cover "every part of the increasingly international value chain – from access to raw materials to after-sales service" ([see](#)).

Globalisation - © M. Schmiemann

Economic globalisation – policy needs, statistical evidence and links Challenges to the traditional view

Patchwork - © M. Schmiemann

The traditional statistical image of economic globalisation is patchwork, for several reasons. The compilation of [national accounts](#) and other economic and business statistics is complicated by globalisation. Traditionally,

official statistics have focused on measuring the economy by domestic activities. With a more globalised economy, cross-border production arrangements have become more common and influence the economies of most countries. It has thus been, and continues to be, a very challenging task for national statistical institutes and their respondents alike, to compile and provide information on international activities and affiliates and contractors abroad. The issue of measuring global value chains is further complicated, in several dimensions, by the increased economic importance of [multinational enterprises](#) . First, there is the issue of multiple international legal and organisational domains. Second, there is the challenge of defining GVCs in statistically measurable elements and terms; going from theory to practice. Third, there is the complexity in measuring processes, as statistics traditionally conceptualise and measure tangible phenomena in terms of inputs and outputs opposed to processes and forms of organisation in between these two.

There is thus a clear need to go beyond the domestic view/approach and the patchy image of available information, and move towards a holistic framework as enterprises are increasingly transferring parts of their production processes to other countries.

Traditional statistical units and trade and business statistics give only a limited national perspective and do not provide a comprehensive analytical framework for users.

The problems for relevant statistics on global value chains are therefore that:

- there is no consistent framework for a narrative for users;
- there is no coordinated measurement approach;
- the currently available data of interest is patchy at best and produced with a "domestic" view at national level within national boundaries (as in *GDomestic P*)

Prior work by stakeholders

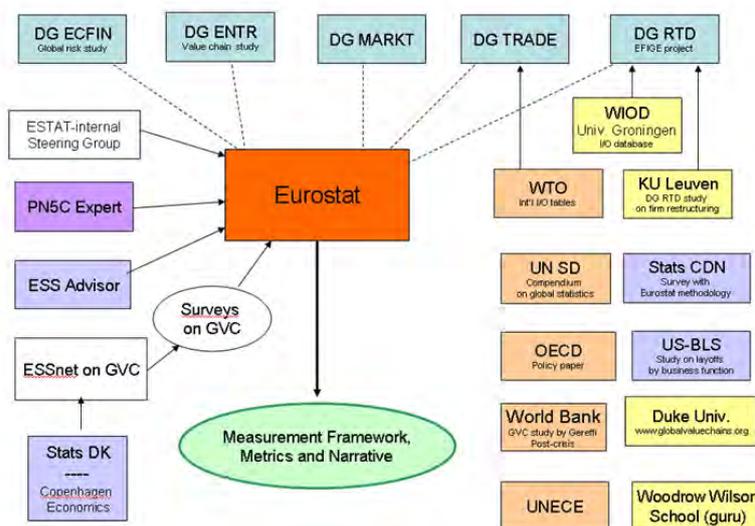

Figure 1: Stakeholders

Early work by Eurostat on extending business statistics to account for trans-national activities included the development projects on [inter-enterprise relations](#) , on [demand for services](#) , and on [business services](#) , now part of mandatory data collections in Eurostat's business statistics framework.

Much additional relevant data is available within Eurostat, e.g.:

- the comprehensive list of [globalisation indicators](#) ;

- data on * [international trade in goods and services](#) ;
- [foreign affiliates statistics \(FATS\)](#) (see also [here](#));
- [balance of payments \(BoP\)](#) ;
- [EuroGroupsRegister \(EGR\)](#) ;
- information on European multinationals and proposals from [the ESSnet on profiling](#) ;
- [trade by enterprise characteristics](#) with its direct link to international activities;
- [foreign direct investment \(FDI\)](#) .

For a short summary see [here](#) .

A particular pivotal role is played by the data collections on [international sourcing](#) , which are currently being extended to provide more data on global value chains and sourcing by enterprise function.

Workshop - © M. Schmiemann

In June 2011, a **workshop** bringing together experts from all relevant stakeholders was held in Luxembourg – for the presentations delivered at the event click [here](#) . In addition, a multitude of documents have been drafted and studies are being done. Just to mention a few, the OECD has hosted related [events](#) and drafted [stock taking papers](#) , there is the European Commission-sponsored [world input/output tables \(WIOD\) project](#) , other Commission activities on the internationalisation of value chains and security of supply, on trade in value added and the framework of [the European Competitiveness report](#) . Other international organisations may provide inputs, such as the UNECE Guide ' [Impact of Globalization on National Accounts](#) '; the [World Trade Organization \(WTO\)](#) has set up a [Made in the World Initiative \(MIWI\)](#) to support the exchange of projects, experiences and practical approaches in measuring and analyzing trade in value added etc. There are several case studies on global value chains, such as the [iPod example](#) , the [Barbie doll](#) , the [iPhone](#) and [Boeing's dreamliner](#) .

These initiatives all shed light (often circumstantial, especially the product/case studies) on different dimensions of global value chains and international production and sourcing, yet the overall framework is missing.

Eurostat's approach

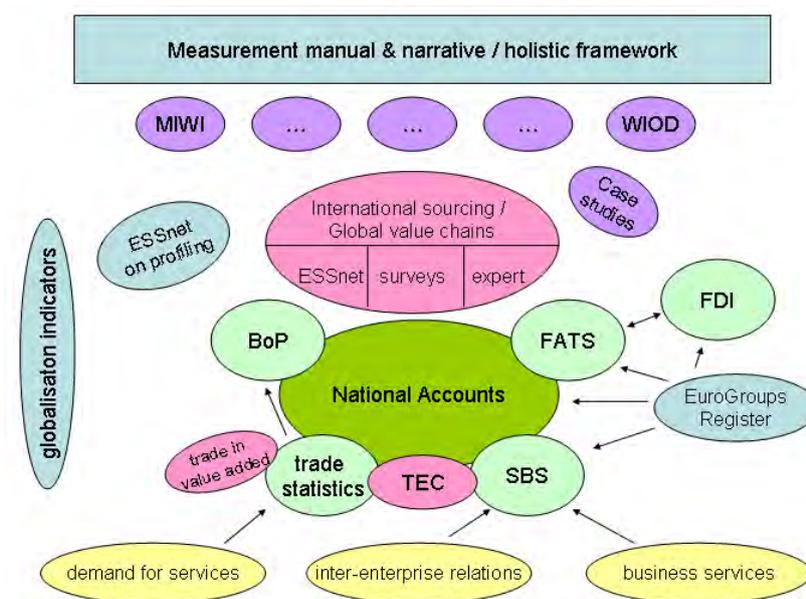

Figure 2: Sketch of GVC projects

Eurostat has recently embarked upon an ambitious project to address some of those shortcomings with the following objectives:

- Establish a reference framework which will be internationally accepted, a manual providing a conceptual frame, metrics and a narrative for users to describe the data framework around international sourcing, global value chains, and economic globalisation in general;
- Provide a draft set of indicators for global value chains and economic globalisation in general;
- Describe the extent of international sourcing – status quo and future plans: How many enterprises source internationally and establish global value chains;
- Investigate the importance of a number of motivation factors for the enterprise to carry out international sourcing activities and value chain structuring: Cost reductions, and the reduction of labor costs in particular, figure as prominent motives in the literature on sourcing and global value chains;
- Identify the destinations of international sourcing – in particular the destinations for the international sourcing of core vis-à-vis support functions using the business function approach;
- Evaluate the impacts of international sourcing activities on enterprises – especially the impact on domestic employment;
- Describe the establishment and structuring of value chains and ways and strategies of going global;
- Decompose existing value chains beyond available circumstantial evidence (iPods, cell phones, aircrafts) and analyze the usefulness for the collection of statistical evidence;
- Identify correlations to the productivity/profitability of enterprises and to the domestic employment situation; The core of the project is built by an [ESSnet](#) on measuring global value chains and international sourcing, followed by [micro-data linking](#) , and by international expertise procured under contract, with a view to developing and promoting a manual by 2013.

Timetable of milestones in the approach

Tentative timetable of major milestones in the project:

- End-2011: Contract for external expertise concluded
- 2011: ESSnet on GVCs and renewed GVC survey ongoing
- Oct 2012: International workshop on global value chains
- End-2012: Deliverables from external contract: draft conceptual framework and indicators (manual-style with narrative and data sources) 2012: Start of micro-data linking in National Statistical Institutes
- 2013: Enlargement of the conceptual framework and its promotion Results from the ESSnet, survey with micro-data linking, framework established Participation in a session in the 2013 ISI conference

Global value chains - international sourcing to China and India

Data from March 2011.

Authors: Pekka Alajääskö (Eurostat), Peter Boegh Nielsen (Statistics Denmark), Samuli Rikama and Johanna Sisto (Statistics Finland)

This article analyses [European Union \(EU\) international sourcing](#) to China and India, more particularly in [knowledge-intensive services](#), providing insight into global value chains i.e. the parts of a value chain that are internationally sourced. The patterns observed may be valid for any global value chain.

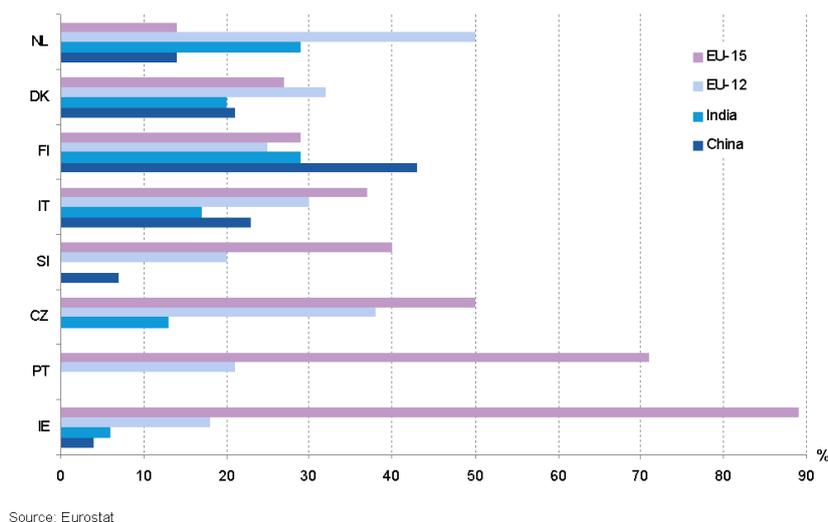

Figure 16: Destinations for sourcing engineering functions; share of enterprises sourcing those functions (%)

A new and important feature of globalisation is that **enterprises** split their production processes into a number of **business functions** which they then move around the world to gain efficiency and/or new markets. This subscribes to the well known concepts of global value chains and international sourcing. Eurostat has, with its partners in the **European statistical system**, embarked upon an ambitious project to capture data on global value chains and on those parts that are internationally sourced. Voluntary data collections with more than a dozen European countries have been performed at a moment that would clearly be known to be "before the crisis", i.e. in 2007. Plans to move forward with another set of data collections in the EU in 2011/2012 are well advanced, with results on global value chains and international sourcing expected for end 2012.

International sourcing is not only about moving manufacturing core functions from **old to new Member States** of the EU. It is increasingly about moving these functions out of the EU to new emerging markets such as China and India.

Service providers, too, sourced both their core and support functions to China and in particular to India.

Main statistical findings

Analysis of sourcing to China and India and of **knowledge-intensive functions** shows that:

- European **manufacturing** enterprises source to China while those providing services tend to source to India;
- By far the most important motive for sourcing to China and India is to cut costs;
- **R&D** functions are mainly insourced, i.e. moved abroad within the same enterprise group, because knowledge-intensive functions are strategically important;
- Engineering functions are largely sourced to the EU's **new Member States** and to China and India — reflecting the sourcing pattern for core production functions.

In 2009 Eurostat published the overall results of the first large-scale survey of international sourcing in 2001–2006 in 13 European countries. These results show that European enterprises still mainly source their core and/or support functions internationally within the EU and elsewhere in Europe.

However, for enterprises in many European countries – e.g. in Denmark, Finland, Germany, Italy, Norway and Sweden – the second most frequent destination for international sourcing is China; see Figure 1. India is also an important sourcing destination for many European enterprises.

International sourcing to Asia

The remainder of this analysis provides detailed information on how European **business functions** are moving to China and India. It also focuses on the international sourcing of knowledge-intensive business functions. This information is a result from an on-going project, which links and analyses international sourcing survey results at enterprise level. Czech Republic, Denmark, Finland, Ireland, Italy, the Netherlands, Portugal, Slovenia and Norway participate in the project.

Overall, Ireland and Denmark have the largest share of firms that have sourced to Asia – closely followed by Italy, Finland and the Netherlands; cf. Figure 2. Asia attracts far fewer firms from the new EU Member States. This is probably because labour is cheaper in these countries – and saving **labour costs** is the main motivation for sourcing to Asia; cf. Figure 9.

China is the most important sourcing destination in Asia for enterprises in all countries included in this analysis except for the Netherlands and Norway. In Ireland, Denmark, Italy and Finland, roughly a quarter of all companies sourcing internationally did so to China.

European businesses also frequently source functions to India – though not as often as to China. India especially attracts Danish, Irish, Dutch and Finnish companies, of which more than 15% have been sourcing to India. Other Asian countries as a group are the most popular sourcing destination for Danish, Irish, Dutch and Portuguese enterprises. In the case of the Dutch and Portuguese, this is probably partly due to their historical ties with certain parts of Asia.

China's importance as the "world's factory" is confirmed by the fact that manufacturing companies in particular have been sourcing there; cf. Figure 3. This pattern is clear in all European countries, and in most of them the share of manufacturing enterprises sourcing to China was more than double the share of service enterprises.

Furthermore, the functions which manufacturing companies source to China are mainly their core production activities, and much less frequently their support functions. This pattern confirms that the main motivation for sourcing to China is to cut costs rather than to gain access to new markets.

The profile for sourcing to India is different. India is used as a sourcing destination more frequently by service providers than by manufacturers, cf. Figure 4. This underlines the popular notion of India as the "world's service centre". The pattern is particularly clear for enterprises in the Netherlands and Denmark, where service providers sourced to India more than twice as often as manufacturers.

The division of tasks between China and India is also underlined by the different patterns of sourcing for core and support functions. Typically, a larger percentage of firms sourcing to India source their support functions there. These functions consist of different types of services (see Data sources and availability), cf. Figure 6.

It should be noted that manufacturing firms from the Northern European countries (Denmark, the Netherlands and Finland) source their support functions to India more frequently than their core production.

Insourcing rather than outsourcing

When sourcing business functions abroad, enterprises need to decide whether to source to an affiliate belonging to the same enterprise group (i.e. insourcing) or to an external supplier (i.e. outsourcing). The advantage of insourcing is that full control over production of that good or service remains within the enterprise group.

In general, insourcing was clearly the preferred option for enterprises sourcing their business functions abroad. Some 60 to 80% of the firms that carried out international sourcing say they used insourcing, while typically around a third used outsourcing. However, in Denmark and Ireland the pattern was different. In these countries, insourcing and outsourcing appeared to be equally popular forms of sourcing abroad.

The pattern for sourcing to India is less clear. The percentages of companies insourcing and outsourcing to India are much more even than for sourcing in general. In Ireland, Denmark and the Czech Republic, outsourcing is used even more frequently than insourcing; cf. Figure 8.

The relatively high share of outsourcing may be because there are more obstacles to foreign investment in India and China than in many of the most frequent destination countries within the EU. The percentage of companies outsourcing to China is rather high, especially in view of concerns over intellectual property rights in these countries; cf. Figure 11.

The 60-80% figure for international insourcing in general also applies to insourcing to China in particular. However, the share of enterprises outsourcing there (40-60%) is somewhat larger than for outsourcing in general. Again, Danish and Irish firms follow a different pattern: more of them outsource than insource, cf. Figure 7.

Cutting labour costs is the main motivation for international sourcing

It is often said that the main reason for moving production or support functions abroad is to increase efficiency – for example by cutting labour costs. The survey confirmed this. For cost-cutting purposes, Asia appears to be a particularly attractive destination. Clearly, enterprises which source to Asia are motivated by cost considerations more often than enterprises which source to other regions.

This is particularly true of companies sourcing to China rather than India; cf. Figure 9. Around 60 to 80% of enterprises sourcing to China considered labour cost reduction very important. Labour cost savings were considered particularly important by enterprises in countries such as the Netherlands, Denmark, Finland and Norway, where labour is expensive.

This is hardly surprising, given that China is the largest emerging market in the world.

Market access is a less important motivation for firms sourcing to India. Part of the explanation is probably that the functions sourced to India are often support functions not intended for direct consumption on local or regional markets. Danish and Norwegian firms rarely mention access to new markets as a motivation for sourcing internationally. In these countries, only 10-15% of enterprises considered access to new markets a very important factor for sourcing.

Another key factor driving globalisation is access to new markets. Enterprises that source to China rate market access as an important motivating factor much more often than those engaged in international sourcing in general; cf. Figure 10.

Concern over patents and intellectual property rights is judged to be an important barrier in the way of sourcing to China; cf. Figure 11. This concern was expressed much more frequently by enterprises sourcing to China than by those sourcing internationally in general. This pattern is seen in all the countries surveyed.

This survey also asked enterprises what they saw as the impact of international sourcing. Most said they had largely succeeded in cutting their labour costs by sourcing their production or their support business functions abroad.

In almost all countries, 50-70% of firms reported that they had reduced labour costs by international sourcing; cf. Figure 12. In the Netherlands, Norway and Finland, around 90% said they had cut labour costs by sourcing to China.

International sourcing of knowledge-intensive business functions

International sourcing has been seen as an issue mainly in the context of European firms moving non-skilled manufacturing jobs to countries abroad. The Eurostat survey confirmed that international sourcing is mainly carried out by manufacturing companies. Around 20-25% of manufacturing enterprises employing 100+ persons have sourced internationally, compared to only 10% of similar-sized companies in other sectors of the economy; cf. Figure 13.

Results from the on-going project on micro data linking indicate that Europe should be concerned not only about job losses in manufacturing but also about the risk of losing knowledge-intensive jobs and thus hollowing out the knowledge base in European industries. The following analysis focuses on the business functions sourced,

not on the activity of the enterprises which source them (see methodological notes for more information). It shows that the knowledge-intensive functions most closely related to the production process – functions such as engineering and research and development – are quite often sourced internationally.

These results underpin the need – even in our global information society – for close proximity between production and the engineering and R&D functions which support it.

Around 10-15% of the companies which sourced internationally are sourcing R & D functions; cf. Figure 14.

The most frequent destination for R&D sourcing is the old Member States ([EU-15](#)). This is the case for all the countries surveyed: around 40-60% of all enterprises sourcing R&D internationally source to [EU-15](#) Member States; cf. Figure 15. However, China and India are also frequent destinations for R&D sourcing, especially for Danish, Dutch and Finnish firms. China and India each account for around 10-20% of enterprises sourcing R&D functions internationally.

The EU's new Member States were the destination for around 20% of the R&D functions sourced from the majority of countries.

The results show that around 10-20% of firms sourcing internationally are sourcing engineering functions; cf. Figure 14.

The destinations for sourcing engineering functions are more diverse than for R&D. The old EU Member States are still the most important destination for companies based in Ireland, Portugal, the Czech Republic, Italy and Slovenia; cf. Figure 16. On the other hand, the new Member States are the most frequent destination for Dutch and Danish enterprises.

When sourcing engineering functions abroad, China is the most frequent destination for Finnish companies (40%) and also an important destination for Danish and Italian firms (around 20%). In addition, India attracted business from around 20-30% of the Danish, Dutch, Italian and Finnish enterprises that sourced engineering functions abroad.

The geographical pattern of sourcing destinations for engineering functions underlines the importance of keeping these functions in close proximity to the firm's core production operations, which are often already sourced abroad. This may be necessary in order to stay competitive. The EU's new Member States and China are important destinations to which European enterprises source their manufacturing operations.

Strategic decisions often lie behind international sourcing

A large majority of all enterprises – except in Denmark – has chosen to use insourcing. Typically more than 80% of those surveyed source their R&D functions within the same enterprise group; cf. Figure 17. By comparison, the average figure for all functions and all enterprises sourcing internationally in the countries surveyed is between 60 and 80%.

Insourcing is also the preferred option when sourcing engineering functions, though it is used less frequently than for R&D. The dominance of insourcing, especially for R&D functions, is related to the strategic importance of knowledge-intensive business functions. The enterprises want to keep control of the research within the group, even if the research activity itself is relocated.

The strategic importance of knowledge-intensive business functions – and especially R&D – is underlined by the relatively high share of businesses whose international sourcing is reportedly based on a strategic decision by the group head; cf. Figure 18. In all countries – except Denmark – this factor is more frequently mentioned by enterprises which source R&D functions than in general by enterprises sourcing internationally.

Data sources and availability

Data source

The data presented in this article refer to enterprises which carried out international sourcing during 2001-2006 and which employ at least 100 persons. They cover eight EU Member States (the Czech Republic, Denmark, Ireland, Italy, the Netherlands, Portugal, Slovenia, Finland) and Norway.

The data relate only to those enterprises which responded to the survey. They are therefore not comparable with previously published results derived from "raised" (i.e. extrapolated) data. Only Figures 1 and 13 are based on such data. Please note that, in the detailed analysis of sourcing to Asia and of R&D and engineering sourcing, the number of observations is often rather limited. This should be borne in mind when interpreting the results.

In the following figures observations are missing due to confidentiality/low frequencies (see [list of country codes](#)):

- Figure 3: NO services;
- Figure 4: NO manufacturing and SI;
- Figure 6: CZ and SI;
- Figure 8: SI, Figure: 9 SI India;

- Figure 11: NO;
- Figure 12: SI India;
- Figure 16: NO.

Definitions

Sourcing activities

International sourcing

Some or all of an enterprise's business (core or support) functions are transferred from in-house or domestic operators to a firm located abroad – whether an external supplier or an affiliated enterprise.

International insourcing

Some or all of an enterprise's business functions are performed within the group to which the enterprise belongs, but abroad (by affiliated enterprises)

International outsourcing

Some or all of an enterprise's business functions are performed outside the firm or enterprise group, and outside the compiling country, by non-affiliated enterprises. This involves foreign subcontracting.

Business functions

Core business function

Production of final goods or services intended for the market/for third parties, carried out by the enterprise and yielding income. The enterprise's core business function is, in most cases, its primary activity. The core function may also include other (secondary) activities if the enterprise considers them to be a part of its core business.

Support business functions

Ancillary activities which enable or help the enterprise to produce goods or services intended for the market/for third parties. The outputs of the support business functions are not themselves intended directly for

the market/for third parties. The support business functions are a) Distribution and logistics, b) Marketing, sales and after sales services, c) ICT services, d) Administrative and management functions, e) Engineering and related technical services and f) Research and development.

In our analysis of the international sourcing of R&D and engineering functions, the data relate partly to enterprises which have sourced their core function, i.e. their main R&D activity (NACE Rev 1.1 section 73) or their engineering and related technical services (NACE Rev. 1.1 group 74.2) and partly to enterprises which have sourced R&D or engineering as support business functions.

Classifications

Activity of the enterprise

On the basis of their main activity, enterprises are classified as either manufacturing or service enterprises. 'Manufacturing' covers section D of the NACE Rev. 1.1 classification system, whereas 'services' covers sections C (mining and quarrying), E (electricity, gas and water supply), F (construction), G (wholesale and retail trade), H (hotels and restaurants), I (transport, storage and communication) and K (real estate, renting and business activities).

Avg.: average over the countries surveyed.

Context

A new and important feature of globalisation is that enterprises split their production processes into a number of business functions which they then move around the world to gain efficiency and/or new markets. This is called international sourcing. International sourcing is not only about moving manufacturing core functions from old to new Member States of the EU. It is increasingly about moving these functions out of the EU to new emerging markets such as China and India.

Service providers, too, sourced both their core and support functions to China and in particular to India.

Globalised businesses

Globalisation is not a new phenomenon, but this subject area has gained a lot of public interest as a result of:

- growing international competition within increasingly globalised markets;
- the lowering of customs duties and tariffs, and;
- the internationalisation of financial transfer options.

Main statistical findings

The statistical capture of aspects relating to the globalisation phenomenon is not always straightforward, as the underlying activities are trans-national or multinational, and statistics are usually bound to national boundaries or to the aggregation of national data (in the [European Statistical System](#) , or in the [OECD](#) , for example).

The globalisation of the world economy therefore creates new needs for statistics and, at the same time, it changes the conditions for the production of business statistics. Activities of multinational enterprise groups, the outsourcing of activities, [foreign direct investment \(FDI\)](#) , and other forms of foreign engagement are key elements in this regard.

While some existing statistics can already be used to analyse different aspects of globalisation, [Eurostat](#) is currently implementing a programme ([MEETS](#)) to modernise business and trade statistics to make sure that official statistics are capable of reflecting all these phenomena in the changing [EU](#) economy. Actions foreseen under this programme will include:

- a review of priorities;
- the development of key characteristics and indicators in fields like globalisation;
- work on harmonised definitions;
- pilot projects to test the feasibility of new indicators, and;
- supporting the Member States to develop statistics on globalisation in a harmonised way.

In addition, a new development project on international sourcing has been launched, where the objective is to provide policy-makers with relevant statistical information on the motivations, extent and consequences of international sourcing ([off-shoring](#) , [near-shoring](#) , [delocalisation](#) , relocalisation, [outsourcing](#) or insourcing).

A business registers Regulation entered into force in the spring of 2008. It makes the recording of enterprise groups compulsory, as well as the exchange of data on multinational enterprises (MNEs) and their constituent units within the European Statistical System (for statistical purposes only). The exchange of data implies the creation of a Community register of MNEs, the so-called EuroGroups register (EGR).

Data

Existing statistical domains within structural business statistics (SBS) which could be used to analyse globalisation include:

- statistics on the structure and activity of [foreign affiliates](#) which show the impact of foreign-controlled enterprises on the European economy;
- business services statistics, where information on the location of clients shows the relative size of exports of business services to residents in other Member States or outside of the EU;
- a development project on the demand for services which provides information on trans-border purchases and deliveries of services.

Aside from SBS, information from balance of payments (BoP) statistics can be used to analyse different economic transactions between residents and non-residents of a country or of a geographical region.

Data on international trade in services, a component of the BoP current account, and data on foreign direct investment, a component of the BoP financial account, can also be used to monitor the external commercial performance of different economies. [Outward FATS](#) measure the commercial presence through affiliates in foreign markets.

Construction sector statistics

Data from December 2009, most recent data: Further Eurostat information, Main tables and Database .

This article presents recent statistical data on the construction sector in the [European Union \(EU\)](#) , using data from both structural as short-term business statistics.

Construction activities in the [EU-27](#) provided employment to an estimated 14.8 million persons in 2007 (some 11.5% of the [non-financial business economy workforce](#)), while generating an estimated EUR 562 billion of [value added](#) (9.3% of the non-financial business economy's total value added).

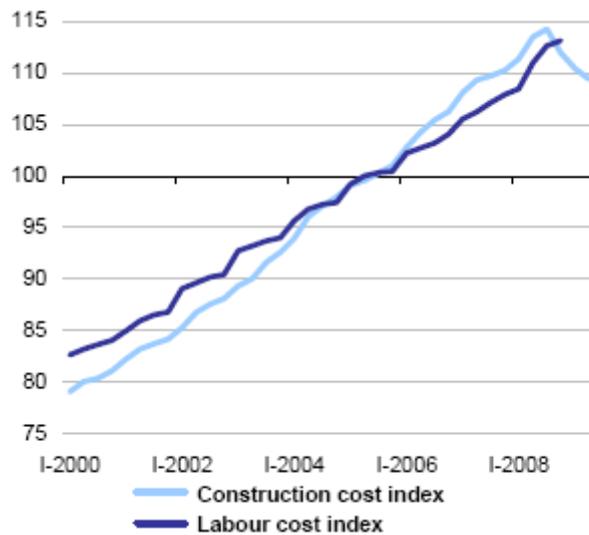

Figure 6: Development in construction and labour cost indices, gross data, new residential buildings, EU-27 (2005=100)

Main statistical findings

In recent years the construction industry has been highly concentrated in Spain, while this sector has also been of major importance for the Polish and Cypriot economies. Around one quarter of all persons employed in the Polish non-financial business economy (NACE Rev. 1.1 Sections C to I and K) were employed within construction activities in 2007.

Against this backdrop, the recent credit crisis and economic downturn have had some serious implications for the EU-27 construction sector. Employment has fallen sharply in many of the Member States, particularly in Spain and the [Baltic countries](#) . This downsizing of the workforce is reflected in declining output, as the EU-27 index of production for construction fell 14.2% between the first quarter of 2008 and the third quarter of 2009.

Structural profile of construction sector

Table 1 provides more detailed information on construction activities within the EU-27 in 2007. There were an estimated 3.1 million construction [enterprises](#) across the EU-27, which generated an estimated EUR 1 665 billion of [turnover](#) .

The largest of the five construction subsectors (NACE Rev. 1.1 groups) in the EU-27, both in terms of employment and value added, was the building of complete constructions or parts thereof and civil engineering (NACE Group 45.2, hereafter referred to as general construction). This subsector alone accounted for more than half of the value added (about 58%) and employment (about 55%) within the EU-27 construction sector in 2007.

Building installation (NACE Group 45.3) and building completion (NACE Group 45.4) were the next largest subsectors, accounting for about 22% and 15% respectively of EU-27 value added in construction, and slightly larger shares of employment. The two smallest subsectors were site preparation (NACE Group 45.1) and the renting of construction or demolition equipment with an operator (NACE Group 45.5).

Each person employed within the EU-27 construction sector generated an average EUR 38 000 of value added in 2007. Among the construction subsectors, the highest apparent labour productivity was recorded for the renting of construction equipment (EUR 54 000 per person employed), where labour productivity was about two thirds higher than for building completion activities.

In terms of the number of persons employed, the construction sector in Spain was the largest among the Member States in 2007; the 2.9 million persons employed in these activities represented a little less than one fifth (19.5%) of the construction workforce in the EU-27. In terms of value added generated, however, the construction sector in the United Kingdom was largest (19.2% of EU-27 value added), despite having a workforce that was about half the size of that in Spain.

The resulting apparent [labour productivity](#) of the construction workforce in the United Kingdom (EUR 75 500 per person employed) was about twice as high as the average in Spain and, among all Member States, only behind that of Ireland (EUR 112 100 per person employed) in 2007.

In comparison to average personnel costs, the value added generated per person employed in construction activities was highest in Bulgaria, where wage adjusted labour productivity was 277.5%, about two and a half times the ratio of construction workers in Sweden, Germany, the Netherlands and France.

The [gross operating rate](#) (the relation between gross operating surplus and turnover) is a measure of [profitability](#) . The gross operating rate of the construction sector in 2007 was highest in Ireland (22.8%) and Cyprus (19.9%) but lowest in Hungary (6.3%) and France (7.2%).

When the 2008 and 2009 structural business statistics become available the impact of the economic downturn on these productivity and profitability ratios will become clear, and it is likely that these will show a significant reduction.

The relative contribution made by the construction sector to the value added of the non-financial business economies of Cyprus (19.4%), Poland (18.1%) and Spain (17.6%) was notably higher than for other Member States. This was also the case for employment, where Luxembourg was also relatively specialised in construction

activities.

In value-added terms, the least specialised Member States for construction were Germany (reflecting a rebound following the post reunification boom years), Slovakia and Hungary, the construction sector contributing between 4.7% and 5.5% of the value added of their respective non-financial business economies in 2007.

High contribution of micro and small enterprises

Most construction enterprises serve a local market and, consequently, the construction sector is characterised by a high number of **small enterprises**, and relatively few **large ones**. **Micro** and **small enterprises** (with less than 50 persons employed) together employed 72.1% of the EU-27 construction sector workforce in 2006, a much higher share than the average (50.2%, 2005) for the non-financial business economy. These enterprises also provided about two thirds (64.7%) of sectoral value added in 2006, compared with two fifths (39.8%, 2005) for the whole of the non financial business economy.

Development of short-term indices for construction

The specialisation of regions and countries in any one type of activity increases their vulnerability in a downturn. The squeeze on the availability and affordability of credit for construction in the recent economic downturn, as well as the broader downturn in business and consumer confidence has made the construction sector particularly vulnerable.

It is interesting to note (see Figure 1) that the reduction in construction activity has been largely concentrated within the building subsector, while the index of production for civil engineering remained relatively untouched; this possibly reflects decisions made at a governmental level to maintain expenditure on public infrastructure projects.

Confidence indicators (based on the opinions of the main actors involved in economic decision making) provide a subjective view about the position of the economy in an economic cycle. Figure 3 shows the sharp and rapid loss of both consumer and construction confidence since September 2007. The loss of construction confidence was even sharper than the overall loss of consumer confidence, hinting at the particular vulnerability of this sector in the economic downturn.

With caution, it appears as though these two confidence indicators bottomed out in the spring of 2009, since when they have begun to rebound, more clearly in the case of consumer confidence.

Another indicator that may be used to gauge future construction activity is the index of new orders for construction. Figure 4 shows clearly the decline in demand for new constructions since the end of 2007/beginning of 2008. For the EU as a whole, the index for new construction orders declined by almost one third between the final quarter of 2007 and the first quarter of 2009 to levels last recorded at the beginning of 2000 (which is another period associated with a slowdown in economic activity, in particular, relatively high interest rates and a loss of confidence following a crash in global stock markets as the dot-com bubble came to an end).

The new orders index for building peaked in the third quarter of 2007, whereas that for civil engineering peaked later, in the second quarter of 2008. Between those peak levels and the latest index levels (first quarter of 2009) the index for building fell by 37.2% and that for civil engineering fell by 21.3%. In some Member States, the decline in the index of new orders in construction has been particularly strong; in Spain there was a reduction of two thirds (-68.9%) from the relative peak in the third quarter of 2007 to the third quarter of 2009, and in Latvia the index halved between the final quarters of 2007 and 2008.

The downturn in construction activity has inevitably had an impact on the number of persons employed. The EU-27 employment index for construction fell sharply (-8.8%) between the first quarter of 2008 and the second quarter of 2009.

There were much stronger rates of decline in some Member States, particularly in the Baltic Member States and Spain. The construction workforces of Latvia and Spain shrank by about one third between the first quarter of 2008 and the third quarter of 2009. There were a few Member States, however, where the size of the

construction workforce remained relatively stable or even expanded comparing the latest index level with that at the beginning of 2008. In particular, the construction workforce in Slovakia was almost 6% higher in the third quarter of 2009 than the first quarter of 2008 and growth in Poland was only slightly less.

During this economic downturn one might expect some enterprises to reduce working hours before making cuts in employment. There is only a slight amount of evidence to support this theory of labour retention within the construction sector (maybe the precarious nature of employment contracts – for example, temporary and seasonal work – plays a role). The index of the number of hours worked in construction in the EU declined by a slightly larger amount (-10.4%) than that of the employment index (-8.8%) between the first quarter of 2008 and the second quarter of 2009. The retention of labour was more marked in Germany, as the index of hours worked declined by 15.1%, at a rate that was much greater than that registered for the index of employment (-3.3%).

Despite the downturn in construction activity and the loss of employment, it is interesting to note that, at least by the final quarter of 2008, there had been little change in the upward development of the EU labour cost index for new residential buildings. Nevertheless, there was a decline in the overall construction cost index (which includes material and labour costs) for new residential buildings from the third quarter of 2008.

In some of the Member States, there were noticeable downturns in these cost indices; as the construction cost indices of Lithuania, the United Kingdom, Estonia and Ireland fell by between 9% and 16% in the period between the third quarter of 2008 and the second quarter of 2009. In the [Baltic Member States](#), the labour cost index of new residential buildings declined by between 10% and 27% over the same period.

Data sources and availability

Structural business statistics

The **number of enterprises** is a count of enterprises active during at least a part of the reference period.

The **number of persons employed** includes all persons who work in the observation unit (inclusive of working proprietors and unpaid family workers), as well as persons who work outside the unit who belong to it and are paid by it. Part-time, seasonal and home workers on the payroll are included, as well as apprentices.

Turnover comprises the totals invoiced by the observation unit during the reference period, and this corresponds to market sales of goods or services supplied to third parties.

Value added (at factor cost) can be calculated from turnover, plus capitalised production, plus other operating income, plus or minus the changes in stocks, minus the purchases of goods and services, minus other taxes on products which are linked to turnover but not deductible, minus the duties and taxes linked to production.

Gross tangible investment includes new and existing capital goods bought or produced for own use having a useful life of more than one year, and includes also land.

Apparent labour productivity is calculated as value added divided by the number of persons employed.

Average personnel costs are calculated as personnel costs divided by the number of (paid) employees.

The **wage-adjusted labour productivity ratio** is calculated by dividing the apparent labour productivity by average personnel costs, and is expressed as a percentage.

The **gross operating rate** is the gross operating surplus (value added less personnel costs) divided by turnover, expressed as a percentage.

The **investment rate** is gross tangible investment divided by value added expressed as a percentage.

Short-term business statistics (STS)

The **production index** is a business cycle indicator and aims to show the development of the volume of value added at factor cost.

The **employment index** shows the development of the number of persons employed. The **hours worked index** shows the development in the volume of work done.

The **construction cost index** shows the development of costs incurred by the contractor to carry out the construction process. Costs that constitute components of the construction costs include material costs, labour cost, plant and equipment costs, transport and energy costs.

The basic form of an index is its gross (also known as unadjusted) form but in this publication the seasonally adjusted form is used, whereby seasonal factors have been removed.

Classifications

NACE Rev. 1.1	
Construction	Section F
Site preparation	45.1
Building of complete constructions	45.2
Building installations	45.3
Building completion	45.4
Renting of construction or demolition equipment	45.5

Table 4: NACE classifications

European statistics are undergoing a transition from one generation of the activity classification (**NACE**) to another, from Rev. 1.1 to Rev. 2. In this publication structural business statistics data use the NACE Rev. 1.1 classification, while short-term business statistics uses NACE Rev. 2. The non-financial business economy presented in this publication is defined as NACE Rev. 1.1 Sections C to I and K. The construction sector is defined as NACE Rev. 1.1 Section F.

The table on the right is an extract of the NACE Rev. 1.1 headings for construction.

: (in tables): data not available.

Context

The construction sector has historically witnessed cyclical patterns to its developments. These may be linked to consumer confidence, the availability of **credit** (often in the form of mortgages), political events (such as a construction boom in Germany following reunification), or general economic cycles. The peaks and troughs in construction activity tend to be more amplified than those for the whole economy, perhaps as a result of large projects being postponed and/or cancelled during periods when economic output slows or contracts.

Services introduced

The internal market is one of the most important and continuing priorities of the [European Union](#) . The central principles governing the internal market for services are set out in the [EC Treaty](#) , which guarantees EU companies the freedom to establish themselves in other Member States, and the freedom to provide services on the territory of another Member State other than the one in which they are established.

In 2007, in the EU, the services sector accounted for 71.6% of gross value added and a similar (but increasing) proportion of overall employment. Business services have a particularly important role in the services economy. Business activities in this economic sector include:

- computer services;
- real estate;
- research and development;
- other business activities including legal services, accounting, market research, advertising, industrial cleaning and security services.

The objective of the [Services Directive \(123/2006\)](#) is to eliminate obstacles to trade in services, thus allowing the development of cross-border operations. It is intended to improve [competitiveness](#) , not just of service enterprises, but also of European industry as a whole. The Directive was adopted by the [European Parliament](#) and the [European Council](#) in December 2006 and was due to be transposed by the Member States by the end of 2009. It is hoped that this legislation will help achieve potential economic growth and job creation, and it is for this reason that the Directive is seen as a central element of the renewed [Lisbon Strategy](#) for growth and jobs. Moreover, by providing for administrative simplification, it also supports the better regulation agenda.

Short-term business statistics (STS) collected and collated by [Eurostat](#) , cover all business sectors and include many of the key short-term indicators that are vital for analysis of recent economic developments and the development of monetary and economic policy. The data series cover all the European countries together with totals for the euro area and the EU.

Demand for services

The importance of services in the [European Union \(EU\)](#) economy has risen, while the EU's industrial sector has been characterised by [outsourcing](#) and subcontracting as well as the globalisation of production.

Since services are an important and growing area of the EU economy, they have attracted increasing political and economic interest, as a current and future motor for growth.

Context

One reason why the services sector has grown in importance is the outsourcing phenomenon that has seen the demand for services increase, as many enterprises use service providers either for:

- [non-core activities](#) (such as transport or marketing services), or;
- for part of their [core activities](#) to increase flexibility (for example, through the use of labour recruitment services).

Other reasons include technological developments – particularly in relation to [information and communication technologies \(ICT\)](#) – which may allow services to be delivered over considerable distances (for example, internet sales or call centres).

The objective of the development project on the demand for services was to collect information on the functioning of the [internal market](#) for services, allowing a more profound understanding of the extent of the use of services in the European economy. It provides information on:

- service providers;
- types of service purchased;
- the location of the main service provider;
- barriers to purchasing services;
- the level of expectations for future purchases;
- information on service related investments in intangibles (such as tradable rights, [ICT](#), [R & D](#) , marketing and sales).

The [European Services Directive 123/2006](#) seeks to promote an internal market in services through the removal of legal and administrative barriers that have prevented enterprises from one Member State providing similar services in another Member State. The Directive aims to make it easier for businesses to provide and use cross-border services within the EU, increasing cross-border competition.

Main findings

- Purchases of transport, logistics and postal services and marketing and sales related services accounted for the largest shares of the total purchases of services.
- For the clear majority of [enterprises](#) in all participating countries the main service provider was external, as opposed to internal from within the same enterprise/enterprise group.
- Main external service providers were usually from the same region.
- Location stands out as the main barrier to enterprises in search of services outside of their own country.
- In each participating Member State, the proportion of respondents that envisaged their demand for services rising clearly outweighed those that thought their level of demand would decrease, this was particularly true for future purchases of IT, transport, logistics, postal and advertising services.

Accommodation and food service statistics - NACE Rev. 2

Data from April 2012, most recent data: Further Eurostat information, Main tables and Database

This article presents an overview of statistics for the [European Union's \(EU's\)](#) accommodation and food services sector, as covered by [NACE Rev. 2](#) Section I. These activities make up a significant part of tourism supply, although they also serve local clients and business customers. The provision of accommodation services (Division 55) covers hotels and other provision of short-stay accommodation; activities related to the provision of long-term primary residences are excluded and are covered by [real estate activities](#) (Section L). The food and beverage services subsector (Division 56) provides complete meals or drinks fit for immediate consumption, regardless of the type of facility supplying the service; sit-down and take-away restaurants are included, as well as bars, canteens and catering services. Note that these activities do not cover the provision of food or drinks that are sold through independent distribution channels, in other words through [wholesale or retail trade activities](#) (Section G).

It is important to bear in mind (in keeping with all structural business statistics) that only [enterprises](#) for which the provision of accommodation, food or beverages is the principal activity are covered by the statistics presented in this article. Enterprises offering food and drink as a complement to their core business are not included and in some cases meals and beverages may represent a significant secondary activity – for example, the sale of food and beverages in stadiums, cinemas or recreation parks (if these are not operated by separate enterprises).

Table 4b: Key indicators, accommodation and food service activities (NACE Section I), 2009 - Source: Eurostat (sbs_na_1a_se_r2)

Main statistical findings

Structural profile

The accommodation and food services sector recorded **value added** of EUR 186800 million in the **EU-27** in 2009 and employed 9.9 million persons, many of them part-time; its workforce was also characterised by a large number of working proprietors and unpaid family workers. This sector's contribution to **non-financial business economy** (Sections B to J and L to N and Division 95) employment was therefore much higher (7.4%) than its contribution to value added (3.3%), while it accounted for an even larger share (8.4%) of the number of enterprises, reflecting the small average size of the 1.8 million enterprises in the accommodation and food services sector.

Apparent labour productivity of EUR 19 thousand per person employed was recorded in 2009 for the EU-27's accommodation and food services sector alongside **average personnel costs** of EUR 15.9 thousand per employee, in both cases the lowest among the NACE sections included within the non-financial business economy. However, both of these indicators are pulled downwards by the traditionally high incidence of part-time employment in the accommodation and food services sector. The **wage-adjusted labour productivity ratio** is not directly affected by part-time employment as it shows the ratio between value added and total personnel costs without relating this to the number of persons producing the output or receiving wages and salaries. This ratio is also adjusted for the relative importance of unpaid working proprietors and family workers which is somewhat higher (17.4%) in the accommodation and food services sector than in the non-financial business economy as a whole (14.5%). The combination of low productivity and personnel costs in the EU-27's accommodation and food services sector led to a wage-adjusted labour productivity ratio of 118.1% in 2009, which was the third lowest value across the NACE sections within the non-financial business economy and was also higher than the wage-adjusted labour productivity ratio for the repair of computers and personal and household goods (Division 95). In contrast, the **gross operating rate** which shows the share of **turnover** that remains after paying for purchased goods and services and personnel costs (in other words, the **gross operating surplus**) was 12.6% for the EU-27's accommodation and food services sector in 2009; which was almost one third higher than the non-financial business economy average (9.7%).

Sectoral analysis

According to most indicators the food and beverages subsector (Division 56) is larger than the accommodation subsector (Division 55). The food and beverages subsector accounted for 85.0% of all enterprises in the EU-27's accommodation and food services sector, 76.8% of the persons employed and 66.9% of the value added.

The low apparent labour productivity figure for the EU-27's accommodation and food services sector in 2009 was pulled downwards by the food and beverages subsector where an average of EUR 16 thousand of value was added per person employed, compared with EUR 27 thousand within the accommodation subsector. Equally, average personnel costs were lower for the food and beverages subsector (EUR 14.6 thousand) than for the accommodation subsector (EUR 19.7 thousand). As already noted, many activities in this sector have a high incidence of part-time employment and wage-adjusted labour productivity is an indicator that is less influenced by this characteristic. The accommodation subsector recorded a wage-adjusted labour productivity ratio of 135.5%, relatively close to the non-financial business economy average (138.8%), while the food and beverages subsector recorded a ratio of 112.1%.

For the gross operating rate the above average value for the whole of the EU-27's accommodation and food sector (12.6% in 2009) was pulled up by the 16.1% rate recorded for the accommodation subsector, although the gross operating rate for the food and beverages subsector (11.1%) was also above the non-financial business economy average (9.7%).

Country analysis

In Cyprus, 17.6% of the non-financial business economy workforce was active in accommodation and food services in 2009, while this sector accounted for 11.0% of Cypriot non-financial business economy value added. As such, Cyprus was by far the most specialised Member State in the accommodation and food services sector; this pattern was repeated for both subsectors, although the Cypriot specialisation was particularly high for the accommodation subsector. Note that there is no data available for Greece or Malta for accommodation and food services and that these two holiday destinations are traditionally highly specialised in this sector. In value added terms, Spain, Austria and Portugal were the next most specialised Member States for these activities, with Spain and Portugal specialised in both subsectors, while Austrian specialisation was concentrated within the accommodation subsector. Italy, Ireland, France, the United Kingdom and Slovenia were also relatively specialised in the accommodation and food services sector: France and the United Kingdom due to their specialisation in the food and beverages subsector. The Member States least specialised in this sector were Poland, Slovakia, Lithuania, Hungary, the Czech Republic, Romania and Latvia, where the accommodation and food services sector contributed less than 2% of non-financial business economy value added.

In absolute terms, Germany recorded the highest level of value added within the accommodation and food services sector in 2009 (EUR 31400 million). Germany also had the largest share of EU-27 value added for

accommodation services (18.1%), while for food and beverage services the highest contribution to EU-27 value added came from France (18.5%) – see Table 3.

An analysis of the wage-adjusted labour productivity shows that Romania had by far the highest wage-adjusted labour productivity ratio among the Member States in the accommodation and food sector, with a ratio of 169.1%, followed at some distance by the United Kingdom, Cyprus, Germany and the Netherlands (all 137%).

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

Tourism plays an important role in Europe and makes a considerable contribution to employment and regional development, as well as a range of other EU objectives, such as sustainable development or the enhancement of natural and cultural heritage,

One of the main characteristics of tourism-related activities is their high income elasticity of demand, which increases or reduces more easily than for many other products or services. As such, spending on tourism generally decreases proportionally faster than consumers' income during times of economic slowdown. Moreover, political or economic uncertainties (for example, when exchange rates change rapidly) tend to lead to a diversion of tourism demand, resulting in shifts between outbound tourism and domestic tourism. Furthermore, a downturn in economic fortunes is also likely to result in reduced business activity; this in turn may be reflected in fewer business trips and nights spent in hotels, as well as less corporate entertainment.

In June 2010, the European Commission adopted a Communication titled [Europe, the world's No 1 tourist destination – a new political framework for tourism in Europe](#). This Communication addresses issues such as: the impact of the changing global economy on tourism, as well as various challenges to be faced by the providers of tourism services, such as seasonality of demand or an ageing population. The Communication outlines policies to stimulate competitiveness: to support diversification of tourism supply, develop innovation, improve professional skills, encourage an extension of the tourism season, and consolidate the socio-economic knowledge base for tourism. Further policies concern the promotion of the development of sustainable, responsible and high-quality tourism, the consolidation of the image and profile of Europe as a collection of sustainable and high-quality tourist destinations, and the maximisation of the potential of EU financial policies and instruments for developing tourism.

As a follow-up to the communication, the European Commission launched a '50000 tourists' pilot initiative in 2011 in an attempt to combat seasonality, stimulate the creation of employment, strengthen the image of Europe, and to cooperate with non-member countries. The first pilot intends to encourage 25000 South Americans to travel to Europe during the off-season between October 2012 and March 2013, and for 25000 Europeans to travel to South America between May and October 2013.

EDEN is an acronym for [European Destinations of Excellence](#), a project run by the European Commission to promote sustainable tourism development models. The project is based on national competitions that take place every year which result in the selection of tourist destinations of excellence in each participating country. The European Commission has been running EDEN since 2006.

Table 4b: Key indicators, accommodation (NACE Division 55), 2009 - Source: Eurostat (sbs_na_1a_se_r2)

Main statistical findings

Structural profile

There were 264 thousand enterprises operating in the EU-27 in 2009 with accommodation services (Division 55) as their main activity. Together they employed 2.3 million persons, which was equivalent to 1.7% of the non-financial business economy (Sections B to J and L to N and Division 95) workforce or almost one quarter (23.2%) of the persons working in accommodation and food services (Section I). Accommodation services generated EUR61805 million of value added which was 1.1% of the non-financial business economy total or one third (33.1%) of the accommodation and food services added value, suggesting that the apparent labour productivity of the accommodation services sector was somewhat higher than that recorded for food and beverage services.

Apparent labour productivity of the EU-27's accommodation services sector in 2009 was EUR27 thousand per person employed, which was considerably below the non-financial business economy average of EUR41.6 thousand per person employed. This relatively low level of apparent labour productivity was, at least in part, linked to a high propensity for part-time work. The accommodation services sector had the tenth lowest level of apparent labour productivity among the NACE divisions that make-up the non-financial business economy.

Alongside relatively low apparent labour productivity, average personnel costs for the EU-27's accommodation services sector were also well below the non-financial business economy average: EUR19.7 thousand per employee for accommodation services compared with an average of EUR30.0 thousand per employee. As such, the EU-27's accommodation services sector had the seventh lowest level of average personnel costs per employee across all of the NACE divisions in the non-financial business economy. Again this ratio is influenced to some extent by the high incidence of part-time employment in this sector.

The wage-adjusted labour productivity ratio combines the two previous indicators and shows the extent to which value added per person employed covers average personnel costs per employee. As the divergence between apparent labour productivity and average personnel costs of the accommodation services sector and the non-financial business economy was of almost the same magnitude, the wage-adjusted labour productivity ratio for the EU-27's accommodation services sector in 2009 was, at 135.5%, almost identical to the non-financial business economy average (138.8%).

The gross operating rate (which measures the relation between the gross operating surplus and turnover) is one measure of operating profitability; it stood at 16.1% for the EU-27's accommodation services sector in 2009, around 1.7 times as high as the non-financial business economy average of 9.7%.

Sectoral analysis

The accommodation services sector in the EU-27 is dominated by the hotels and similar accommodation subsector (Group55.1), which accounted for 84.3% of sectoral value added in 2009 and for 84.1% of the sectoral workforce. There were just over 150 thousand enterprises in the EU-27 that reported hotels and similar establishments as their principal activity in 2009. Together they employed almost two million persons and generated around EUR52100 million of added value.

The next largest subsector, in terms of value added and employment, was that of holiday and other short-stay accommodation (Group55.2), which accounted for 10.4% of the accommodation services workforce and for 8.7% of sectoral value added. Camping grounds, recreational vehicle parks and trailer parks (Group55.3) employed 85900 persons across the EU-27 (some 3.7% of the accommodation services total), while generating 5.4% of sectoral value added. The smallest activity (on the basis of a comparison of persons employed or value added) was the miscellaneous category of other accommodation (Group55.4) which accounted for less than 2% of the accommodation services workforce and value added.

The relatively low level of EU-27 apparent labour productivity for the whole of the accommodation services sector (EUR27 thousand per person employed in 2009) was repeated for three of the four subsectors. The camping grounds, recreational vehicle parks and trailer parks subsector was the exception to this rule, as apparent labour productivity reached EUR39 thousand per person employed, close to the non-financial business economy average (EUR41.6 thousand per person employed).

Each of the four subsectors within the accommodation services sector recorded relatively low levels of average personnel costs in 2009, ranging from a high of EUR21.7 thousand per employee for the EU-27's camping grounds, recreational vehicle parks and trailer parks subsector to EUR18.0 thousand per employee for holiday and other short-stay accommodation. As such, all four subsectors recorded average personnel costs that were well below the non-financial business economy average of EUR30 thousand per employee.

With relatively low apparent labour productivity and average personnel costs cancelling each other out, EU-27 wage-adjusted labour productivity ratios for three of the four accommodation services subsectors were not particularly far from the non-financial business economy average of 138.8% in 2009, ranging from a high of 135.1% for both the hotels and similar accommodation subsector and the other accommodation subsector, to a low of 123.4% for the holiday and other short-stay accommodation subsector. In contrast, the wage-adjusted labour productivity ratio for camping grounds, recreational vehicle parks and trailer parks was considerably higher (178.9%) than the non-financial business economy average, influenced by a somewhat higher level of apparent labour productivity.

In contrast to the productivity measures, the four subsectors within the EU-27's accommodation services sector consistently recorded higher than average gross operating rates in 2009. This measure of operating profitability peaked at 24.7% for camping grounds, recreational vehicle parks and trailer parks, while the lowest gross operating rate was registered for hotels and similar accommodation (15.3%). Nevertheless, even this rate was more than 50% above the non-financial business economy average of 9.7%.

Country analysis

The largest contribution to EU-27 value added within the accommodation services sector in 2009 was made by Germany (18.1% of the total). The next highest share of value added was registered by the United Kingdom (16.0%), while France (13.4%), Spain (13.3%) and Italy (12.9%) had very similar levels of added value; after these Member States there was no other country with a double-digit share of EU-27 value added for accommodation services, the next highest share being 5.8% for Austria. Nevertheless, the 0.7% share of EU-27 value added recorded for Cyprus within the accommodation services sector was the highest Cypriot share for any of the non-financial business economy NACE divisions (with data available) in 2009.

In employment terms, the relative importance of Germany was higher, accounting for 22.1% of the EU-27's workforce within the accommodation services sector in 2009, considerably above the second ranked Member State, the United Kingdom (15.7%).

At a more disaggregated level, Germany also had the highest share (18.8%) of EU-27 value added for hotels and similar accommodation, whereas Italy had the highest share (19.9%) of EU-27 added value for the

holiday and other short-stay accommodation subsector, and the United Kingdom (32.7%) for camping grounds, recreational vehicle parks and trailer parks.

Cyprus was by far the most specialised Member State within the accommodation services sector in 2009, as 5.1% of Cypriot non-financial business economy value added was generated in this sector. The relative specialisation of Cyprus in accommodation services was 4.6 times as high as the EU-27 average, while Austria was the only other Member State to report that the contribution of the accommodation services sector to non-financial business economy value added was at least twice as high as the EU-27 average; no recent data are available for Greece or Malta, although both of these Member States are known to be specialised in the accommodation services sector. Furthermore, although its relative importance was not so high in value added terms, Ireland reported a relatively high degree of specialisation for the accommodation services sector in terms of employment, as this sector occupied some 4.2% of the non-financial business economy workforce (the second highest share behind Cyprus, 6.6%).

Looking in more detail, Cyprus also recorded the highest specialisation ratios for the hotels and similar accommodation subsector and for the holiday and other short-stay accommodation subsector, while the United Kingdom was the most specialised Member State for camping grounds, recreational vehicle parks and trailer parks.

There were quite small differences in the respective wage-adjusted labour productivity ratios of the Member States for the accommodation services sector in 2009. This ratio ranged from highs of 196.8% in Romania and 182.3% in Bulgaria to lows of 102.0% in Ireland and 101.3% in Estonia; the United Kingdom and Cyprus also recorded relatively high ratios (178.6% and 153.4%).

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

This article presents an overview of statistics for the accommodation services sector in the EU, as covered by NACE Rev.2 Division 55. The provision of hotels and similar accommodation, holiday and other collective accommodation and recreational vehicle parks, trailer parks and camping grounds includes accommodation typically provided for short stays by visitors.

Hotels and similar accommodation are provided as furnished accommodation in guest rooms and suites, sometimes with kitchenettes; cleaning and bed-making services are generally offered as well as additional services, for example food and beverage services, spa or sports facilities, parking and laundry services. This type of accommodation is provided by: hotels, resort hotels, suite/apartment hotels and motels.

Holiday and other collective accommodation is made-up of self-contained space consisting of complete furnished rooms or areas for living/dining and sleeping, with cooking facilities or fully-equipped kitchens. This type of accommodation is provided through: apartments or flats in small free-standing multi-storied buildings or clusters of buildings, or single storied bungalows, chalets, cottages and cabins. Generally this type of accommodation service provides minimal, if any, complementary services.

The other accommodation subsector includes the provision of temporary or longer-term accommodation in single or shared rooms or dormitories for students, migrant (seasonal) workers and other individuals. This type of accommodation is provided through: student residences, school dormitories, hostels, rooming and boarding houses, or railway sleeping cars.

This NACE division is composed of four separate groups:

- hotels and similar accommodation (Group55.1);
- holiday and other collective accommodation (Group55.2);
- recreational vehicle parks, trailer parks and camping grounds (Group55.3);
- other accommodation (Group55.9).

The information presented in this article excludes activities related to the provision of long-term primary residences in facilities such as apartments (typically leased on a monthly or annual basis); these are classified as part of [real estate activities](#) (Division68).

- Source: Eurostat (sbs_na_1a_se_r2)

Main statistical findings

Structural profile

There were 609 thousand enterprises operating with management services (Division 70) as their main activity in the EU-27 in 2009. Together they employed 2.0 million persons, equivalent to approximately 1.5% of the total number of persons employed in the non-financial business economy (Sections B to J and L to N and Division 95) and 18.2% of the professional, scientific and technical activities (Section M) workforce. They generated EUR 115 420 million of value added which was 2.1% of the non-financial business economy total and 22.2% of the professional, scientific and technical activities total.

The apparent labour productivity of the EU-27's management services sector in 2009 was EUR 58 thousand per person employed, around 40% higher than the non-financial business economy average of EUR 41.6 thousand per person employed and also clearly above the professional, scientific and technical activities average of EUR 47 thousand per person employed: in fact, this sector had the highest apparent labour productivity among the seven NACE divisions within professional, scientific and technical activities.

Accompanying this high apparent labour productivity was very high average personnel costs, EUR 54.5 thousand per employee for the EU-27's management services sector in 2009, around 80% higher than the average for the non-financial business economy (EUR 30.0 thousand per employee) and again well above the average for all professional, scientific and technical activities (EUR 40.5 thousand per employee). The management services sector had the fifth highest average personnel costs among the non-financial business economy NACE divisions in 2009 and the highest ratio among the divisions within professional, scientific and technical activities.

The wage-adjusted labour productivity ratio combines the two previous indicators and shows the extent to which value added per person employed covers average personnel costs per employee. Due to particularly high average personnel costs the EU-27's management services sector in 2009 had a low wage-adjusted labour productivity ratio, just 106.0%; this was the sixth lowest wage-adjusted labour productivity ratio among all non-financial business economy NACE divisions in 2009 and was also below the professional, scientific and technical activities average (117.0%).

The gross operating rate (the relation between the gross operating surplus and turnover) is a measure of operating profitability. In 2009, the gross operating rate for the EU-27's management services sector was 10.0%, broadly in line with the non-financial business economy average (9.7%), but lower than the professional, scientific and technical activities average (17.8%).

Sectoral analysis

The sector is composed of two groups, namely activities of head offices (Group70.1) and management consultancy activities (Group70.2). In the EU-27, the management consultancy activities subsector was by far the largest of these two subsectors and in 2009 contributed just over two thirds (68.5%) of sectoral value added and three quarters (75.0%) of sectoral employment – see Figure 1.

The high apparent labour productivity figure for the whole of the EU-27's management services sector in 2009 was the result of similarly high productivity in both subsectors: EUR60 thousand per person employed for head office activities and EUR57 thousand per person employed for management consultancy activities.

In many other respects the subsectors were quite different. The high average personnel costs recorded for the management services sector was mainly due to very high average personnel costs (EUR71.0 thousand per employee) for the head office activities subsector, although average personnel costs were still high (EUR45.5 thousand per employee) for management consultancy activities. This large range in average personnel costs translated into very different wage-adjusted labour productivity ratios for the two subsectors. For the EU-27's management consultancy activities the wage-adjusted labour productivity ratio was 125.3% in 2009, above the professional, scientific and technical activities average (117.0%) but below the non-financial business economy average (138.8%). In contrast, the wage-adjusted labour productivity ratio for the head office activities subsector was just 85.8%; as this ratio was below 100% this indicates that average personnel costs per employee were below apparent labour productivity per person employed. The wage-adjusted labour productivity ratio for the EU-27's head office activities subsector was the third lowest among all non-financial business economy NACE groups in 2009, higher only than retail sale via stalls and markets (Group47.8) and building completion and finishing (Group43.3).

For the gross operating rate a wide range of values for the two subsectors could be observed. A particularly low rate was observed for the EU-27's head office activities subsector, the negative rate (-2.5%) indicating that the gross operating surplus was negative resulting from personnel costs exceeding value added. This was the lowest of only two negative gross operating rates recorded for the EU-27 among all of the non-financial business economy NACE groups in 2009, the other being a rate of -1.0% for passenger air transport (Group51.1). For the management consultancy activities subsector the EU-27 gross operating rate was 20.0%, more than double the non-financial business economy average (9.7%) and also above the professional, scientific and technical activities average (17.8%).

Country analysis

As for most of the professional, scientific and technical activities, the United Kingdom had the largest management services sector among the EU Member States in value added terms in 2009. The United Kingdom's share of EU-27 value added was 23.1%, followed by Germany (20.4%) and France (20.0%). The next highest share was 8.8% in the Netherlands which reflected the fact that the Netherlands was the most specialised Member State in this sector, where 3.4% of Dutch non-financial business economy value added was generated. Other Member States that were relatively specialised in professional, scientific and technical activities included the United Kingdom (where this sector accounted for 3.1% of non-financial business economy value added), Belgium (3.0%) and France (2.8%); Switzerland (3.9%) was even more specialised than the Netherlands. In Poland, Lithuania, Spain and Cyprus the professional, scientific and technical activities sector contributed between 0.7% and 0.9% of non-financial business economy value added in 2009; in Norway the share was even lower, at 0.6%.

At a more detailed level, France was the most specialised Member State in the head office activities subsector, followed by Belgium and Austria and it was in this subsector that Switzerland was also particularly specialised. For management consultancy activities the United Kingdom and the Netherlands were by far the most specialised (in value added terms).

Several Member States reported wage-adjusted labour productivity ratios below 100% for the management services sector in 2009, indicating that average personnel costs per employee were higher than apparent labour productivity. The lowest rates were recorded for Italy (82.1%) and Hungary (90.8%). In 2009, very few Member States recorded wage-adjusted labour productivity ratios in the professional, scientific and technical activities sector that were above their average rates for the non-financial business economy, the main exceptions being

Romania, Latvia, Cyprus and Estonia where management services' wage-adjusted labour productivity ratios were at least 10 percentage points above the non-financial business economy average.

In contrast, the gross operating rate for management services was higher than the rate for the non-financial business economy in most Member States in 2009, although lower rates were recorded for seven countries, most notably Lithuania, France and Ireland. Relative to their non-financial business economy average, particularly high gross operating rates were recorded for management services by Estonia, Latvia, Spain, Cyprus and Romania, as well as Switzerland and Croatia.

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

This article presents an overview of statistics for the management services sector in the EU, as covered by NACE Rev.2 Division70. This division includes the overseeing and managing of other units of the same enterprise (or group), in other words, the activities of head offices. This may involve undertaking the strategic or organisational planning and decision-making role, exercising operational control, and managing the day-to-day operations of related units. This activity includes activities of head offices such as centralised administrative offices, corporate offices, district and regional offices.

Management consultancy activities include the provision of advice and assistance to businesses and other organisations on public relations and communication (including lobbying), as well as issues such as strategic and organisational planning, financial planning and budgeting, marketing objectives and policies, human resource policies, practices and planning, production scheduling and control planning.

This NACE division is composed of two groups:

- activities of head offices (Group70.1);
- management consultancy activities (Group70.2).

The information presented in this article does not cover the activities of holding companies, not engaged in managing (considered part of financial service activities, Division64). Also excluded are legal advice and representation, accounting, bookkeeping and auditing activities, tax consulting (which are classified as part of [legal and accounting activities](#) , Division69), advertising agencies and media representation services and market research and public opinion polling (which form part of the [advertising and market research](#) sector, Division73).

Administrative and support service statistics - NACE Rev. 2

Data from April 2012, most recent data: Further Eurostat information, Main tables and Database

This article presents an overview of statistics for the [European Union's \(EU's\)](#) administrative and support services, as covered by [NACE Rev. 2](#) Section N. Administrative and support services comprise a variety of activities that support business operations; they can be distinguished from [professional, scientific and technical services](#) (Section M) in that their primary purpose is not the transfer of specialised knowledge. Administrative and support services include the following six Nace divisions:

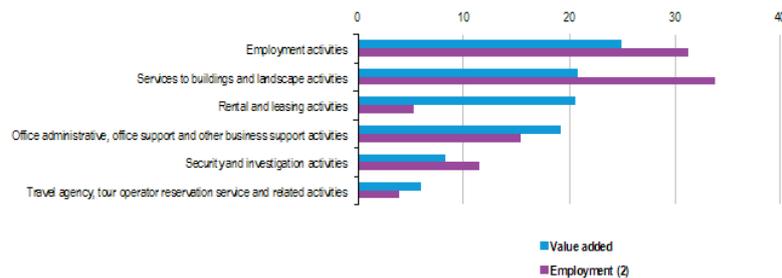

- rental and leasing of motor vehicles, personal and household goods, machinery and equipment, and intellectual property (Division 77);
- employment activities including recruitment and personnel selection services, as well as job placement services (Division 78);
- travel agency, tour operator, reservation services and related activities (Division 79);
- security and investigation activities, including the transportation of valuables (Division 80);
- services to buildings and landscape activities including combined facilities support and cleaning services (Division 81);
- office administrative, office support and other business support activities, including call centres and the organisation of trade shows (Division 82).

The administrative and support services sector does not include financial leasing which is considered as a financial service. Renting of real estate is excluded as is the renting of equipment with operator which is included as appropriate in the [construction sector](#) (Section F) or the [transportation and storage sector](#) (Section H). Employment activities do not include agents of individual artists which are considered to be part of a professional activity (Section M) as is the provision of security consultancy and landscape design (rather than landscaping itself). Security services do not include public order and safety activities (for example, by the police). Cleaning services do not include car washing which is part of [motor trades](#) within the distributive trades sector (Section G).

	Value

Main statistical findings

Structural profile

In 2009 there were around 1.1 million **enterprises** active within the administrative and support services sector (Section N) in the EU-27; this was equivalent to 5.1% of the **non-financial business economy** (Sections B to J and L to N and Division 95) enterprise population. Many administrative and support services are labour-intensive activities and often personnel work part-time, for example, in cleaning activities (part of services to buildings and landscape activities), security and investigation activities, or employment activities. Total employment for the administrative and support services sector reached 12.0 million in 2009, a 9.0% share of the non-financial business economy workforce; in **value added** terms the administrative and support services sector contributed EUR 350000 million, some 6.3% of the non-financial business economy total.

Average personnel costs for the EU-27's administrative and support services sector in 2009 were equal to EUR 20.9 thousand per employee, which was a third below the non-financial business economy average (EUR 30.0 thousand per employee). This was the second lowest level of average personnel costs among the non-financial business economy NACE sections, higher only than for the accommodation and food sector (Section I). As with that sector, the administrative and support services sector traditionally employs many part-time employees, which has a downward influence on average personnel costs (which are measured in terms of a head count). The **wage-adjusted labour productivity ratio** is based on the relation between value added and personnel costs and is expressed as a percentage and not a per head value, and so is not directly influenced by the incidence of part-time employment. For the administrative and support services sector this ratio was 139.1% in the EU-27 in 2009, which was almost the same as the non-financial business economy average (138.8%). The **gross operating rate** (the relation between the **gross operating surplus** and **turnover**) stood at 15.2% for the EU-27's administrative and support services sector in 2009, well above the non-financial business economy average (9.7%).

Sectoral analysis

Figure 1 shows the varied contributions of the subsectors to the administrative and support services sectoral total, depending upon whether value added or employment is chosen. Services to buildings and landscape activities (Division 81) and employment services (Division 78) accounted for the highest shares of sectoral employment and value added, although their contribution to value added was considerably lower. In contrast, the capital-intensive rental and leasing activities (Division 77) subsector had a much higher value added share (20.6%) than its employment share (5.3%), indicating a very high apparent labour productivity ratio. The travel agency, tour operator reservation service and related activities subsector (Division 79) was the smallest subsector (at the NACE division level) in terms of both value added and employment.

Both apparent labour productivity and average personnel costs in 2009 were particularly low in the EU-27's services to buildings and landscape activities subsector, security and investigation activities subsector (Division 80) and employment activities subsector in 2009. Apparent labour productivity and average personnel costs were close to the non-financial business economy averages for travel agency, tour operator reservation service and related activities and for office administrative, office support and other business support activities (Division 82).

The main exception was the rental and leasing subsector where the average value added generated per person employed in the EU-27 reached EUR 112 thousand in 2009 which was 2.7 times the non-financial business economy average, while average personnel costs were EUR 31.6 thousand per employee, only slightly above the non-financial business economy average (EUR 30.0 thousand per employee). This high level of apparent labour productivity for rental and leasing reflects the nature of the activity which often involves purchasing capital assets and generating operating income from these assets. This activity typically has very low operating expenditure while the levels of depreciation, financial charges or extraordinary expenditure may be high – none of these charges are taken into account in the calculation of value added. The elevated apparent labour productivity and relatively subdued average personnel costs translated into a very high wage-adjusted labour productivity ratio for the rental and leasing subsector, namely 355.6%. At the NACE division level this was the second highest wage-adjusted labour productivity ratio across the whole of the non-financial business economy, lower only than the extraction of crude petroleum and natural gas (Division 06). Among the five remaining administrative and support services subsectors the only other activity to record a wage-adjusted labour productivity ratio in the EU-27 that was above the non-financial business economy average (138.8%) in 2009 was that of travel agency, tour operator reservation service and related activities (148.0%). The four subsectors with lower than average ratios ranged from 126.1% for office administrative, office support and other business support activities down to 109.0% for employment activities.

As well as its high productivity, the EU-27's rental and leasing subsector also had a very high gross operating rate; indeed, rental and leasing activities recorded the third highest rate (37.6% in 2009) among all of the NACE divisions within the non-financial business economy and a rate that was almost four times as high as the average for the whole of the non-financial business economy (9.7%). Gross operating rates in the other subsectors (at the NACE division level) were much lower than that in rental and leasing activities: the services to buildings and landscape activities subsector and the office administrative, office support and other business support activities subsector reported gross operating rates that were 2-3 percentage points higher than the non-financial business economy average; the remaining three subsectors each recorded rates that were below the average, falling to a low of 6.1% for the travel agency, tour operator reservation service and related activities subsector.

Country analysis

As was the situation for professional, scientific and technical activities (Section M), the Netherlands and the United Kingdom were both relatively specialised in the administrative and support service activities sector, as were Belgium and France. In the Netherlands the contribution of this sector to the non-financial business economy workforce reached 16.3%, which was 1.8 times the EU-27 average. In value added terms, the United Kingdom was the most specialised Member State, as 8.5% of non-financial business economy value added was generated in this sector.

Within the administrative and support service activities sector value added and employment were relatively concentrated in geographical terms: the five largest Member States generated 75.4% of EU-27 added value (compared with a non-financial business economy average of 71.5%), while the share of the five largest Member States in the administrative and support services' workforce was 69.2% (compared with a non-financial business economy average of 60.3%).

As a result of its high specialisation in value added terms the United Kingdom had the largest administrative and support services sector among the Member States, accounting for 21.1% of the EU-27 total. Germany had the largest workforce in this sector, 2.4 million persons, equivalent to one fifth (20.2%) of the EU-27 total.

Denmark (data are for 2008) was the only Member State to report a wage-adjusted labour productivity ratio for administrative and support services that was below 100%, indicating that average personnel costs were higher than apparent labour productivity; Sweden (101.2%) and Slovenia (104.5%) also recorded low wage-adjusted labour productivity ratios that were only just above parity. In the majority of the Member States for which data are available, the wage-adjusted labour productivity ratio for administrative and support services was below the national average for the whole of the non-financial business economy; this was not the case for Slovakia (179.9%), Austria (161.8%), Germany (160.7%) and Italy (114.4%).

Among the six subsectors at the NACE division level which make-up the administrative and support services sector, the United Kingdom generated the highest level of value added in four of them, while Germany generated the highest level of added value for rental and leasing activities and for services to buildings and landscape activities. The United Kingdom's highest specialisation ratios (in value added terms) were for travel agency, tour operator reservation service and related activities and for employment activities. However, the only activity where the United Kingdom recorded the highest specialisation among the Member States was the office administrative, office support and other business support activities subsector.

Several Member States were particularly strongly specialised in just one or two of the subsectors, the most notable examples being: Luxembourg for rental and leasing activities; Cyprus for travel agency, tour operator reservation service and related activities; Estonia and Bulgaria for security and investigation activities; and Belgium for the employment activities subsector.

Looking at specialisation in terms of the contribution of each of the six subsectors to the non-financial business economy workforce, the Netherlands stood out for employment activities, as 10.5% of its entire non-financial business economy workforce was employed within this activity (some 3.7 times the EU-27 average); it should be noted that the Netherlands has a higher proportion of part-time workers in its labour force than any other Member State.

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

The freedom to provide services and the freedom of establishment are central principles to the [internal market](#) for services. They guarantee EU enterprises the freedom to establish themselves in other Member States, and the freedom to provide services on the territory of another EU Member State. The [Directive on services in the internal market](#) (COM(2006) 123) aims to achieve a genuine internal market in services, removing legal and administrative barriers to the development of services activities between Member States. As well as covering most administrative and support service activities (with the notable exception of services of temporary work agencies), the Directive applies to a wide variety of services including many industrial and construction activities, as well as distributive trades, accommodation and food services, real estate, and professional, scientific and technical services.

Rental and leasing services are provided to households and to business clients. The use of renting or operating leasing can increase financial flexibility, reducing the need to commit own capital, whether for machinery, equipment or appliances. Personnel services may be supplied to persons looking for work or to an enterprise trying to hire. Security and investigation activities as well as services to buildings and landscape activities are mainly business services, although there is also a market for these services among households.

Travel agencies are enterprises that are engaged in arranging transport, accommodation and catering on behalf of travellers. Travel agents act as retailers selling travel services or packaged trips to the customer. Traditionally, tour operators acted as wholesalers to travel agents but have moved towards selling directly to customers. Tourist guides and tourist information services play a supporting role, offering information and services usually at the tourism destination. According to Eurostat's information society statistics, more than one fifth (22%) of all individuals (aged 16 to 74) booked travel and/or accommodation over the Internet in 2011; this may be directly with travel and accommodation providers, or with intermediaries.

Table 4b: Key indicators, advertising and market research (NACE Division73), 2009 - Source: Eurostat (sbs_na_1a_se_r2)

Main statistical findings

Structural profile

Around one quarter of a million enterprises operated within the EU-27's advertising and market research (Division73) sector in 2009. These enterprises employed 1.1 million persons, approximately 0.8% of the total number of persons employed in the non-financial business economy (Sections B to J and L to N and Division95) and 10.0% of the total workforce for professional, scientific and technical activities (Section M).

In 2008, the value added for the EU-27's advertising and market research sector reached EUR53367 million, equivalent to 9.3% of the professional, scientific and technical activities total. Based on data for 24 Member States (EU-27 excluding Greece, Malta and Finland), value added for this sector in 2009 was 8.6% of the professional, scientific and technical activities total and 0.8% of the non-financial business economy total.

The apparent labour productivity of the EU-27's advertising and market research sector in 2009 was EUR39 thousand per person employed, below the professional, scientific and technical activities average of EUR47 thousand per person employed and the non-financial business economy average of EUR41.6 thousand per person employed. Average personnel costs within the EU-27's advertising and market research sector were EUR32.0 thousand per employee, which was much lower than the EUR40.5 thousand per employee average for professional, scientific and technical activities, but somewhat higher than the EUR30.0 thousand per employee average for the whole of the non-financial business economy. As a result of this mixed situation concerning labour productivity and personnel costs, the wage-adjusted labour productivity ratio for the EU-27's advertising and market research sector in 2008 stood at 125.8%, just above the professional, scientific and technical activities average for 2008 of 124.5%.

The gross operating rate, which shows the relation between the gross operating surplus and turnover, is a measure of operating profitability. For the EU-27's advertising and market research sector this rate was 10.0% in 2009, in line with the non-financial business economy average (9.7%) and therefore substantially lower than the professional, scientific and technical activities average (17.8%). This was the same level of profitability (using this measure) as recorded for management services (Division70) and the second lowest gross operating rate among the seven NACE divisions within professional, scientific and technical activities, higher only than the gross operating rate that was recorded for scientific research and development (Division72).

Sectoral analysis

The EU-27's advertising subsector (Group73.1) dominated the advertising and market research sector and was more than 4.5 times as large as the market research and public opinion polling subsector (Group73.2) in value added (2008 data) and employment (2009 data) terms – see Figure 1. The advertising subsector recorded slightly lower apparent labour productivity than for market research and public opinion polling in 2009, but higher average personnel costs. This combination resulted in a wage-adjusted labour productivity ratio of 119.6% for the EU-27's advertising subsector in 2009, below the non-financial business economy average of 138.8% but roughly in line with the 2009 average of 117.0% for professional, scientific and technical activities. The wage-adjusted labour productivity ratio of the EU-27's market research and public opinion polling subsector in 2008 was 125.7%, also roughly in line with the professional, scientific and technical activities average for that year (124.5%).

The gross operating rate for the EU-27's advertising subsector was 9.3% in 2009, just below the non-financial business economy average (9.7%) and approximately half the professional, scientific and technical activities average (17.8%). In contrast, the gross operating rate for the EU-27's market research and public opinion polling subsector reached 15.0% in 2009.

Country analysis

The United Kingdom recorded EUR8993 million of value added in the advertising and market research sector in 2009, which was the highest level among the Member States, and about one tenth more than in Germany (EUR8139 million) and France (EUR8104 million), and double the level in Spain. The United Kingdom was also the largest Member State, in value added terms, in the market research and public opinion polling subsector where its share of the EU-27 total was 29.1%, whereas Germany had the largest advertising subsector (19.9% of the EU-27 total).

In relative terms, Latvia was the most specialised Member State in this sector, as 1.3% of the value added created in the Latvian non-financial business economy was generated by the advertising and market research sector in 2009. Other Member States that were relatively specialised in advertising and market research activities included the Netherlands (1.1% of non-financial business economy value added), the United Kingdom, France and Sweden (all 1.0%). The least specialised Member States were Ireland and Italy where less than 0.5% of non-financial business economy value added came from the advertising and market research sector in 2009, a situation that was also observed in Norway.

Among the Member States, the wage-adjusted labour productivity ratio of the advertising and market research sector was lowest in Slovenia and Italy where it failed to pass 100%; relatively low values were observed for nearly all of the Member States. Germany and Latvia were the only Member States with a wage-adjusted labour productivity ratio in 2009 that was above their national averages for the whole of non-financial business economy.

Most Member States reported a low gross operating rate for advertising and market research in 2009. The two largest Member States, Germany and the United Kingdom, recorded the highest rates and were among five Member States (with Poland, the Netherlands and France) that recorded a higher gross operating rate for the advertising and market research sector than they did for the non-financial business economy as a whole.

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

This article presents an overview of statistics for the advertising and market research sector in the EU, as covered by NACE Rev.2 Division73.

Advertising agencies include the provision of a full range of advertising services including advice, creative services, production of advertising material and placement; some of these services may be subcontracted. Placement may be in newspapers, periodicals, radio, television, the internet and other media, as well as outdoor advertising, showroom design and aerial advertising. Services may also include the distribution or delivery of advertising material or samples, the creation of stands and other display structures, conducting marketing campaigns, and other advertising services aimed at attracting and retaining customers, for example, point-of-sale marketing and direct mail advertising.

Media representation services concern the sale or re-sale of time and space for various media soliciting advertising.

Market research includes investigation into market potential, awareness, acceptance and familiarity of goods and services and buying habits of consumers for the purpose of sales promotion and the development of new goods and services, including statistical analyses of the results. Public opinion polling is the investigation into collective opinions of the public about political, economic and social issues and statistical analysis thereof.

This NACE division is composed of two groups:

- advertising (Group73.1);
- market research and public opinion polling (Group73.2).

The information that is presented in this article does not cover the publishing of advertising material (included as part of [publishing](#) , Division58), nor the production of commercial messages for radio, television and film (included within [motion picture, video and television programme production, sound recording and music publishing activities](#) , Division59), nor advertising photography (included as part of [other professional, scientific and technical activities](#) , Division74), nor convention and trade show organisers and mailing activities (which is classified as part of [office administrative, office support and other business support activities](#) , Division82).

Advertising services statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database .

This article presents the [European Union \(EU\) structural business statistics](#) for advertising services, corresponding to [NACE](#) Group 74.4, which includes:

- the creation and placing of outdoor advertising;
- the sale of advertisement time and space;
- the distribution or delivery of advertising material;
- direct marketing, sponsorship and sales promotion services.

Note that advertising enterprises buying and reselling sales time or space tend to have a relatively high level of [turnover](#) (and therefore a relatively low [gross operating rate](#)), because purchases of goods and services tend to be high relative to [personnel costs](#) , reflecting the [distributive nature](#) of this part of their activity.

Table 1: Advertising (NACE Group 74.4), 2006

Main statistical findings

Advertising and direct marketing are among the activities for which expenditures tend to rapidly decrease when the economic climate is not favourable. However, when an upturn is foreseen, expenditure on these services generally increase faster than the economy in general. This sector was affected by the slowdown observed in the EU's economy in 2001 and 2002, and again by the recession that started in the second half of 2008.

Advertising and direct marketing enterprises engage in services aimed at promoting goods, services and information, be it to the general public, specific target groups, or other enterprises. Advertising maintains or raises awareness about an issue, event, person, product or brand, and so can support choice and competition.

Structural profile

The 210.100 enterprises that were classified to advertising activities (NACE Group 74.4) in the EU in 2006 employed an estimated 882.000 persons and generated 38.6 billion euro of [value added](#) . By all of these measures the contribution of advertising to the [business services](#) (NACE Divisions 72 and 74) total was between 4.0% and 4.8%. In turnover terms, however, advertising made a greater contribution to business services: its EUR 144.4 billion of turnover in 2006 was equivalent to 8.2% of the business services total. This high turnover reflected the fact that some parts of advertising involve buying and reselling advertising space, effectively a distributive trade activity, which therefore involves high turnover with relatively low margins.

The United Kingdom and Germany were the two largest contributors to the EU's value added in advertising activities in 2006, both contributing just under one fifth of the total. The contribution of France (18.2%) was only slightly lower, but was itself nearly twice as high as the next highest share, from Spain. Nevertheless, in [employment](#) terms, Germany, France and Spain all had larger workforces in the advertising sector than were recorded in the United Kingdom. Few Member States were strongly specialized in this sector, with Sweden,

France and Latvia recording the highest shares (0.9%) of advertising activities in [non-financial business economy](#) value added. Using this measure, the least specialized Member State was Luxembourg, with advertising generating 0.3% of non-financial business economy value added.

Expenditure and productivity

A large share of operating expenditure within EU advertising activities was accounted for by purchases of goods and services, as the share of personnel costs was just 17.1%, the lowest of all of the business services sectors. Nevertheless the share of personnel costs was slightly higher than the average for the non-financial business economy (16.1%). Tangible investment by the advertising sector was low, EUR 2.6 billion in 2006, resulting in an investment rate of 6.8%.

Average personnel costs for the advertising sector were EUR 30.9 thousand per employee, almost exactly the same as the business services average, while the apparent [labour productivity](#) was EUR 43.7 thousand per person employed, some EUR 3.6 thousand per person above the business services average. As a result the advertising sector had the highest wage adjusted labour productivity ratio of all business services sectors, at 141.5%, although this was still 9.6 percentage points below the non-financial business economy average.

Data sources and availability

The main part of the analysis in this article is derived from structural business statistics (SBS), including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other possible data sources include [short-term statistics \(STS\)](#) and the [Labour force survey \(LFS\)](#) . In addition, use has also been made of specialist sources for particular areas, notably transport, energy, [research and development](#) , environment, tourism and information society statistics.

Context

The freedom to provide services and the freedom of establishment are central principles to the [internal market](#) for services and are set out in the [EC Treaty](#) . They guarantee EU enterprises the freedom to establish themselves in other Member States, and the freedom to provide services on the territory of another EU Member State. The Directive on services in the internal market ([COM\(2006\)123](#)) aims to achieve a genuine internal market in services, removing legal and administrative barriers to the development of services activities between Member States. The Directive was to be implemented by Member States by the end of 2009 at the latest. As well as covering most business services (with the notable exception of services of temporary work agencies), the Directive applies to a wide variety of services including industrial and construction activities, as well as [distributive trades](#) , [hotels](#) and restaurants, travel agents, real estate and renting services.

Aerospace equipment production statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), the present article covers the production of aerospace equipment, corresponding to NACE Group 35.3, which is part of the [transport equipment](#) sector. The activities covered in this article are the manufacture of:

- military aircraft;
- aircraft used for the transport of passengers or freight;
- other means of air transport, such as gliders, balloons and spacecraft;
- parts and accessories which are used in the construction of aerospace equipment.

(1) Including McDonnell Douglas for all years.

Source: Eurostat (SBS)

Table 2: Manufacture of aircraft and spacecraft (NACE Group 35.3). Structural profile: ranking of top five Member States in terms of value added and persons employed, 2006

The EU-27's aerospace equipment manufacturing (NACE Group 35.3) sector in 2006 consisted of 2.3 thousand enterprises which created EUR 30.0 billion of value added and employed 384.0 thousand persons. This was equivalent to 15.4% of transport equipment manufacturing (NACE Subsection DM) value added, and 12.2% of its workforce, making this the second largest transport equipment manufacturing subsector.

The United Kingdom reported a 33.0% share of EU-27 value added in this sector, the highest share among the Member States, followed by France and Germany. These three large Member States dominated this sector to such an extent that none of the other Member States were relatively specialised in this activity, in the sense that the contribution of this sector to national non-financial business economy value added was below the EU-27 average in all other Member States⁶.

The evolution of the index of production for EU-27 aerospace equipment manufacturing followed a rather

⁶Cyprus, Poland, Portugal and Slovakia, 2005; Bulgaria, Estonia, Latvia, Luxembourg, Malta, the Netherlands and Romania, not available.

similar pattern to that for transport equipment manufacturing as a whole, although with slower growth after 2001. The effects of the general economic slowdown, coupled with a downturn in air transport after the terrorist attacks in the United States in September 2001, resulted in a relatively large contraction in output in 2002, and there was a smaller contraction in 2006.

Expenditure and productivity

The EU-27's aerospace equipment manufacturing sector recorded EUR 3.7 billion of [tangible investment](#) in 2006, equivalent to 12.5% of value added, below the average [investment rate](#) for transport equipment manufacturing (16.2%). [Personnel costs](#) accounted for a notably higher share of [operating expenditure](#) in the EU-27's aerospace equipment manufacturing sector, a little more than one quarter (26.3%) of the total, which was around 10 percentage points above the transport equipment manufacturing and non-financial business economy averages.

Average personnel costs were EUR 59.4 thousand per employee in the EU-27's aerospace equipment manufacturing sector in 2006, the third highest level among non-financial business economy NACE groups in 2005 or 2006, while apparent [labour productivity](#) was EUR 78.0 thousand per person employed. For both of these indicators these were the highest levels recorded among the transport equipment manufacturing subsectors. Combining the ratios of apparent labour productivity and average personnel costs, the EU-27's [wage-adjusted labour productivity ratio](#) for aerospace equipment manufacturing was 131.4% in 2006, slightly below the transport equipment manufacturing average (133.3%). In most Member States⁷ value added per person employed exceeded average personnel costs per employee, the exceptions being the Czech Republic, Ireland and Bulgaria where the wage-adjusted labour productivity ratio was below 100%.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#), including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [Airbus](#) and [Boeing](#).

Context

The transport equipment manufacturing sector is central to economic development, as it provides the means for transporting both individuals and goods. Demand for transport equipment has risen as the volume of goods transported and the distance travelled by passengers have expanded greatly – see the article on [Transport and storage statistics] for information on transport flows.

The issue of sustainable development is likely to play an important role in future product developments, as transport equipment manufacturers try to meet demands for more environmentally friendly transport solutions, for example, engines with lower fuel consumption or emissions.

Most transport equipment manufacturing activities are structured on the basis of complex pyramidal relationships between major manufacturers and several tiers of component suppliers, ranging from systems suppliers down to very small, specialised manufacturers that may provide a single component for a vehicle. It is common to find clusters of enterprises concentrated in regions around the leading producers.

The aerospace equipment manufacturing sector is highly concentrated within the EU and the United States, and within a few large manufacturers with a pyramidal supply chain: manufacturers of aircraft, missiles, space equipment and engines at the top of the pyramid, followed by a second-tier of suppliers making systems, [medium-sized enterprises](#) producing structural elements and components, and a final tier of [SMEs](#) producing materials, software and services (note that these may be excluded from data on this sector, as their principal activity may not be the manufacture of aerospace equipment). There are two main market segments for the aerospace sector, military and civilian, with the former dependent on government defence spending plans and the latter being a

⁷The Netherlands, Poland, Portugal and Slovakia, 2005; Estonia, Cyprus, Latvia, Luxembourg and Malta, not available.

cyclical market.

Globally the main producers of civil aircraft are Boeing and Airbus; their delivery figures since 1989 clearly indicate the cyclical nature of this part of the sector.

Aerospace equipment manufacturing is one of the most important manufacturing sectors in terms of [research and development \(R & D\)](#) . The level of intra-mural R & D expenditure by this sector in ten of the Member States (that collectively accounted for more than four fifths of EU-27 value added in this sector) reached EUR 6.8 billion. This sector's contribution to manufacturing (NACE Section D) R & D was particularly significant in the United Kingdom and France, the two EU-27 Member States most specialised in this sector.

Agricultural and forestry machinery production statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev. 1.1](#)), the present article covers the production of agricultural and forestry machinery, corresponding to NACE Group 29.3, which is part of the [machinery and equipment](#) sector. The activities covered in this article include the manufacture of agricultural tractors and other agricultural and forestry machinery, but not agricultural hand tools.

	Highest value added (1)		Largest number of persons employed (1)		Most specialised: share in non-financial business economy (%) (2)			
	Country	(EUR million)	(% of EU-27)	Country	(thou-sand)	(% of EU-27)	Country	Value added
1	Germany	2 390	26.8	Germany	38.3	18.1	Finland	0.4

Source: Eurostat (SBS)

Table 1: Manufacture of agricultural and forestry machinery (NACE Group 29.3). Structural profile: ranking of top five Member States in terms of value added and persons employed, 2006

Main statistical findings

The number of [agricultural holdings](#) in the EU has been declining rapidly for many years. A lengthy time-series is only available for the [EU-15](#), and this shows that the number of holdings fell from 7.4 million in 1995 to 5.7 million by 2007 (an overall decline of 23.2%). Within the [EU-27](#), the number of holdings fell by 8.8% overall between 2005 and 2007 to 13.7 million. This reduction in holdings may reflect a change in land use, or the consolidation of small-sized holdings into larger farms, both of which are likely to result in a reduction in domestic demand for machinery.

Structural profile

	Prodcom code	Production value (EUR million)	Volume of sold production (thousand)	Unit of volume	Rounding base (thousand)
New agricultural and forestry tractors, wheeled, of an engine power > 90 kW (excluding pedestrian-controlled tractors)	29.31.23.70	4 559	60	units	3
New agricultural and forestry tractors, wheeled, of an engine power > 59 kW but ≤ 75 kW (excluding pedestrian-controlled tractors)	29.31.23.30	1 742	63	units	-
Combine harvester-threshers	29.32.34.10	1 418	16	units	-
New agricultural and forestry tractors, wheeled, of an engine power > 75 kW but ≤ 90 kW (excluding pedestrian-controlled tractors)	29.31.23.50	1 031	19	units	-

(1) Excluding products of a generic nature (other), sales of services such as repairs, maintenance and installation; estimates; threshold of production value set at EUR 1 billion; the rounding base indicates the magnitude of the rounding employed to protect confidential cells (in the case of PRODCOM code 29.31.23.50, the volume of production lies within the range +/- 3 000 units of the reported value).

Table 3: Manufacture of agricultural and forestry machinery (NACE Group 29.3). Expenditure, productivity and profitability, EU-27, 2006

The agricultural and forestry machinery manufacturing sector (NACE Group 29.3) was one of the smaller activities within the EU-27's machinery and equipment (NACE Subsection DK) manufacturing sector. There were 22.2 thousand enterprises for whom this was their principal activity, together employing an estimated 212.0 thousand persons in 2006. The EU-27's agricultural and forestry machinery manufacturing sector generated EUR 8.9 billion of value added in 2006 from a turnover of approximately EUR 40 billion. This equated to 4.6% of the total value added for the whole of the machinery and equipment sector, while sectoral shares were somewhat higher in terms of employment (5.8%) and turnover (6.4%), and much higher in terms of numbers of enterprises – where the agricultural and forestry machinery manufacturing sector made its greatest contribution to the machinery and equipment sector (12.8%).

Within the EU-27's agricultural and forestry machinery sector, the vast majority of activity could be attributed to the other agricultural and forestry machinery (NACE Class 29.32) manufacturing subsector, which accounted for the bulk of sectoral value added (80.4%), the remainder being generated by the manufacture of agricultural tractors (NACE Class 29.31).

More than one quarter (26.8%) of the EU-27's value added in 2006 within the agricultural and forestry machinery manufacturing sector was generated in Germany, the next largest contributions coming from Italy (17.7%) and France (13.7%) – the only other Member States to provide double-digit shares. In terms of this sector's contribution to non-financial business economy (NACE Sections C to I and K) value added, Finland and Austria were relatively the most specialised countries for the manufacture of agricultural and forestry machinery⁸, as this sector provided 0.4% of non-financial business economy value added in Finland and 0.3% in Austria, compared with an EU-27 average of 0.2%.

EU-27 agricultural and forestry machinery manufacturing output grew by 2.5% per year, on average, during the period between 1997 and 2007. The development of the index of production followed an uneven pattern, with rapid growth to 1998, followed by a period of almost no change in output through to 2001, a temporary expansion in 2002 and then more renewed growth from 2004 onwards. A particularly rapid increase in production was recorded in 2007 when output rose by 9.5%.

Expenditure and productivity

The apparent labour productivity of those working in the EU-27's manufacture of agricultural and forestry machinery sector was EUR 42.1 thousand per person employed in 2006, well below the machinery and equipment average (EUR 52.8 thousand) and also low for the machinery and equipment production sector. Average personnel costs within the agricultural and forestry machinery sector were also relatively low, at EUR 31.4 thousand per employee in the EU-27 in 2006, again low for the machinery and equipment production sector. The resulting wage-adjusted labour productivity ratio for the agricultural and forestry machinery sector (134.0%) was slightly below the machinery and equipment average (135.8%) and well below the average for the whole of the non-financial business economy (151.1%).

Data sources and availability

The main part of the analysis in this article is derived from structural business statistics (SBS), including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

⁸Bulgaria, Cyprus, Poland and Romania, 2005; Malta and the Netherlands, not available.

Other data sources include the [PRODCOM](#) statistics on the production of manufactured goods.

Context

Technological advancements in the machinery and equipment that is used in other sectors of the economy (particularly in mining, manufacturing, energy provision and construction) can have a considerable impact upon the speed, quality and quantity of what is produced, thereby impacting on downstream productivity and profitability. The machinery and equipment sector is sensitive, therefore, to overall economic conditions and investment patterns both within the European Union and across the world (the two arguably being more intertwined than ever).

Domestic demand for agricultural machinery is closely linked to structural developments and profitability within farming, which in turn are, at least in part, linked to the Common Agricultural Policy and to the opening-up of world agricultural markets.

Agricultural wholesale trade statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev. 1.1](#)), the present article covers agricultural [wholesale trade](#), corresponding to NACE Group 51.2, which is part of the [wholesale trade](#) sector. This article covers the wholesaling of:

- raw materials for agricultural activities (such as seeds and animal feed);
- live animals.

It does not cover the wholesaling of outputs from farming other than hides, skins and leather, and unmanufactured tobacco.

	Enterprises (thousand)	Turnover (EUR million)	Value added (EUR million)	Persons employed (thousand)	Share in total (%)	
					Value added	Persons employed

Table 2: Agricultural wholesaling (NACE Group 51.2). Structural profile: ranking of top five Member States in terms of value added and persons employed, 2006

Agricultural wholesaling (NACE Group 51.2) was the smallest of the NACE groups within the wholesale trade sector (NACE Division 51), whether measured in terms of the number of [enterprises](#), [turnover](#), [value added](#) or [employment](#). Indeed, the 64.5 thousand agricultural wholesaling enterprises generated EUR 188.9 billion of turnover and EUR 14.1 billion of value added in the EU-27 in 2006, which represented 4.1% of wholesale trade turnover and 2.7% of wholesale trade value added. Agricultural wholesaling employed some 344.5 thousand persons in the EU-27 in 2006, 3.5% of the total wholesale trade workforce.

Among the NACE classes that make up this sector, the wholesale of grain, seeds and animal feeds was dominant, both in terms of value added and employment, accounting for more than half of the sectoral total for both of these measures. The wholesale of flowers and plants contributed approximately one fifth of the sector's employment and value added, while the wholesale of live animals recorded shares around 15%.

France, Germany and the Netherlands recorded the highest levels of value added and employment in the agricultural wholesale sector. Based on data from 2005 and 2006 the most specialised Member State in the agricultural wholesale sector was Hungary where these activities contributed 0.6% of non-financial business economy (NACE Sections C to I and K) value added; older data indicate that the Netherlands was more specialised in 2004, when this sector contributed 0.8% of non-financial business economy value added.

Expenditure and productivity

Although the investment rate in agricultural wholesaling was below the average for the [non-financial business economy](#) , at 17.6% it was the highest among the wholesaling NACE groups. Accompanying this relatively high level of investment, agricultural wholesaling reported a low proportion of [personnel costs](#) within operating expenditure, just 4.4%, the fourth lowest share among all of the NACE groups in the non-financial business economy for which 2005 or 2006 data are available.

EU-27 apparent [labour productivity](#) of the agricultural wholesaling sector was EUR 40.8 thousand per person employed in 2006 and average personnel costs were EUR 28.0 thousand per employee, both below the wholesale trade average. The resulting [wage-adjusted labour productivity ratio](#) was 145.6%, some 14.2 percentage points below the wholesale trade average, and the second lowest within wholesale trades, higher only than that recorded for wholesale on a fee or contract basis.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Context

The activities in NACE Division 51 cover all wholesale trade except that [concerning motor vehicles and motorcycles](#) : the wholesaling of automotive fuel is considered as a wholesale trade rather than a motor trade. This article covers resale (sale without transformation) of new and used products, as well as wholesale activities carried out on a fee or contract basis.

The wholesaling activity consists of selling to retailers or to industrial, commercial, institutional and professional users. Wholesalers can act on a [fee or contract basis as agents](#) or for their own account, buying and selling goods. The own-account wholesale sub-sectors distinguish the types of product in which the wholesaler is specialised (agricultural products (this article), [consumer goods](#) , [intermediate goods](#) , [machinery and equipment](#)), while specialised wholesalers of other products are included in [non-specialised wholesalers](#) .

In the supply chain, wholesalers are located between producers and users, providing know-how and knowledge in markets for which they have expertise. Competition within the wholesale trade activity is often centred on providing more efficient services or more sophisticated value added services. Wholesalers can provide a range of services from basic storage and break of bulk, sorting, grading and logistics to pre- and post-production operations (for instance, labelling, packaging, bottling and installation).

Table 4: Air transport (NACE Division 62). Main indicators, 2006 (1)

Main statistical findings

Structural profile

In 2005, there were 3.5 thousand enterprises in the air transport sector (NACE Division 62) in the EU-27. In 2006, the estimated 400.0 thousand persons employed in this sector generated EUR 30 billion of value added, and as such the air transport sector's contribution to the transport services (NACE Divisions 60 to 63) total was 4.5% for employment and 7.5% for value added. Paid employees accounted for 99.0% of all persons employed in the EU-27's air transport sector in 2005, the highest share among the transport services activities presented in the transport and storage sub-sectors, and one of the highest rates among all non-financial business economy NACE divisions in 2005 or 2006.

Three tenths of the EU-27's value added in air transport was generated in the United Kingdom alone, while France's contribution was one fifth. For the third consecutive year Germany recorded a negative value added for air transport in 2006, and this Member State's relative size can be better expressed by its 13.9% share of the EU-27 workforce.

Luxembourg was by far the most specialised Member State⁹ in this sector as air transport represented 3.3% of non-financial business economy value added, while this share only exceeded 1.0% in two other Member States, namely Cyprus (2005) and Portugal. Although recent shares of the air transport sector in non-financial business economy value added can not be calculated for Malta and the Netherlands it is likely that these Member States were also relatively specialised in air transport, particularly Malta.

The EU-27's air transport sector recorded low average **turnover** growth between 2000 and 2004, however in the most recent years for which data are available (2005 to 2007) it has recorded double-digit annual growth each year. Concerning the **employment index**, air transport in the EU-27 recorded an annual average growth rate of 0.5% between 1998 and 2007, but this was composed of strong growth in 1999 and 2000, followed by a more gentle decline most years since then, with a 1.0% increase in 2006 the only significant recent employment gain in this sector.

Transport of goods and passengers

Turning to traffic figures, the United Kingdom accounted for close to one quarter (24.2%) of all passengers on flights originating or ending outside of the EU-27 in 2007, and Germany just under one fifth (19.9%). For **intra-EU** air travel, the United Kingdom again topped the ranking (19.4% of passengers carried between EU-27 Member States) followed by Spain (15.6%); Spain had by far the largest market for domestic flights. The volume of passenger traffic (based on passenger kilometres rather than passenger numbers) for a selection of airlines shows that the three largest airlines from France, the United Kingdom and Germany dominated. An analysis of the rates of change between 2005 and 2006 shows an increase for all of the selected airlines except SAS Scandinavian Airlines, with the fastest rates of growth recorded by Ryanair, THY Turkish Airlines and Air Berlin.

Expenditure and productivity

Gross **tangible investment** by the EU-27's air transport sector in 2005 was valued at EUR 6.7 billion, equivalent to 24.8% of value added. This **investment rate** was below the transport services average in the same year (31.2%) but above the non-financial business economy average (18.0%). France alone accounted for 26.9% of the EU-27's investment in this sector in 2005.

The share of **personnel costs** (21.1%) in operating expenditure recorded by the EU-27's air transport sector in 2005 was slightly lower than the average recorded for all transport services in the same year (23.4%). In contrast, average personnel costs were higher, reaching EUR 58.0 thousand per employee in air transport compared with a transport services average of EUR 30.7 thousand. This high figure for average personnel costs was only partly compensated for by higher apparent **labour productivity**, which reached EUR 75.0 thousand per person employed in 2006. This was reflected in a **wage-adjusted labour productivity ratio** that was 120.0% for the EU-27's air transport sector in 2005, below the transport services average of 141.9% in the same year. Due to their negative value added in this sector Germany and Slovakia both recorded negative wage-adjusted labour productivity ratios for air transport in 2006. These two exceptional cases aside, Hungary recorded the lowest wage-adjusted labour productivity ratio, just 45.2%, while Estonia, Greece, Lithuania and Austria also registered ratios below parity (100%), indicating that average personnel costs were greater than apparent labour productivity.

Data sources and availability

The main part of the analysis in this article is derived from **structural business statistics (SBS)**, including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include **short-term statistics (STS)**, Eurostat air transport statistics and Association of

⁹Bulgaria, Denmark, Cyprus and Poland, 2005; the Czech Republic, Ireland, Malta, the Netherlands and Romania, not available.

European Airlines, International Air Transport Association, air companies, in EU energy and transport in figures statistical pocketbook 2007/2008, European Commission, Directorate-General for Energy and Transport.

Context

The transport and storage sector focuses on transport services provided to clients for hire and reward. When analysing transport traffic volumes (for example, tonnes of freight) as presented in this article, it is important to bear in mind that these include own account transport as well as transport services for hire and reward. This is particularly important in road transport where, for example, a manufacturer might collect materials or deliver own output, rather than contracting a transport service enterprise to do this. Equally, the use of own vehicles (typically passenger cars) accounts for a very large part of passenger transport. Such own account transport does not contribute towards the statistics on the transport services sector.

EU transport policy is based upon the 2001 White paper ' [European transport policy for 2010: time to decide](#) ' and the 2006 mid-term review in the European Commission's communication ([COM\(2006\) 314](#)) 'Keep Europe moving – sustainable mobility for our continent'. In 2007 the European Commission adopted a communication ([COM\(2007\) 606](#)) on 'Keeping freight moving', to make rail freight more competitive, facilitate modernisation of ports, and review progress in the development of sea shipping.

Environmental issues remain of great importance to this sector, as transport is a major source of emissions and noise. In 2008 the European Commission put forward a package of measures related to road and rail transport referred to as 'Greening Transport'. This included a communication ([COM\(2008\) 433](#)) summarising the packages and initiatives planned for 2009, a strategy to internalise the cost of transport externalities, a proposal for a Directive on road tolls for lorries, and a communication on rail noise. The overall thrust of the package is to try to move towards more sustainable transport.

The expansion of air traffic has faced criticism, notably because of the growing levels of air emissions and noise from this means of transport, although emissions have grown more slowly than air traffic volumes due to technological improvements. In November 2008 a Directive was adopted ([2008/101](#)) to include aviation in the existing emissions trading scheme for carbon dioxide, starting from 2012.

Growth in EU air traffic has occurred during a period of market liberalisation and structural change, with an increased number of operators, particularly low-cost carriers. The development of low-cost carriers has expanded the market for air travel, by offering the possibility of relatively cheap flights for the leisure market. The three largest low-cost carriers in Europe in 2006 in terms of revenue passenger-kilometres were Ryanair, easyJet and Air Berlin. Increased competition, allied with greater costs (notably for fuel), and the rapidly worsening economic climate, have led to a number of airlines struggling to continue operations, with Alitalia, for example, entering administration in 2008 before emerging in a restructured form in 2009.

In September 2008, a Regulation ([1008/2008](#)) for air services was adopted, updating legislation from 1992. With the aims of ensuring more competition, and improving quality, it covers a wide range of issues, such as price transparency, oversight of operating licences, market access, aircraft registration, and public service obligations.

Table 4b: Key indicators, air transport (NACE Division 51), 2009 - Source: Eurostat (sbs_na_1a_se_r2)

Main statistical findings

Structural profile

There were approximately four thousand enterprises operating within the air transport services sector (Division 51) in the EU-27 in 2009. Together they employed almost 380 thousand persons, equivalent to 0.3% of the non-financial business economy (Sections B to J and L to N and Division 95) workforce or 3.6% of the total number of persons employed in transportation and storage services (Section H). EU-27 air transport services generated EUR 23 000 million of value added in 2009, which was 0.4% of the non-financial business economy total and 5.3% of the transportation and storage total.

The apparent labour productivity of the EU-27's air transport services sector in 2009 was EUR 61 thousand per person employed, which was considerably higher than either the non-financial business economy average of EUR 41.6 thousand per person employed or the transportation and storage average of EUR 41 thousand per person employed. Although apparent labour productivity was relatively high, the EU-27's air transport services sector had even higher average personnel costs, which rose to EUR 64.1 thousand per employee in 2009. These high average personnel costs were more than twice the non-financial business economy average (EUR 30.0 thousand per employee) and ranked third highest across the NACE divisions that make-up the non-financial business economy. The high level of average personnel costs impacted upon the wage-adjusted labour productivity ratio which combines the two previous indicators and shows the extent to which value added per person employed covers average personnel costs per employee. This ratio was below parity and stood at 94.5% for the EU-27's air transport services sector in 2009; this was the lowest wage-adjusted labour productivity ratio for any of the NACE divisions within the non-financial business economy and considerably lower than the non-financial business economy average of 138.8%.

The gross operating rate measures the relation between the gross operating surplus and turnover and is one measure of operating profitability; it stood at -0.9% for the EU-27's air transport services sector in 2009. This was also the lowest value recorded for this rate among any of the NACE divisions within the non-financial business economy, as the air transport services sector was the only NACE division to record a negative rate. The negative gross operating rate resulted from total personnel costs being higher than the value added generated by the air transport services sector in 2009.

Sectoral analysis

The air transport services sector is divided within NACE into passenger air transport (Group 51.1) on the one hand, and freight air transport and space transport (Group 51.2) on the other. By far the largest of these two subsectors – no matter which measure of size is used – was the passenger air transport subsector. It accounted for 94.1% of the added value of the EU-27's air transport services sector in 2009 and 94.8% of its workforce. There were more than five times as many passenger air transport enterprises as there were freight and space transport enterprises, a ratio that rose to 16:1 when based on value added and more than 18:1 in relation to the air transport services workforce.

Although the size of the two subsectors was quite different, their performance in relation to a range of different structural business indicators was comparable. For example, the apparent labour productivity of the EU-27's passenger air transport subsector was EUR60 thousand per person employed in 2009, while that for freight air transport and space transport was EUR69 thousand per person employed. Average personnel costs were at a similar level between the two subsectors, with the freight air transport and space transport subsector again reporting a somewhat higher level (EUR69.2 thousand per employee) compared with EUR63.8 thousand per employee for passenger air transport. The resulting wage-adjusted labour productivity ratios (which combine the results of the first two indicators) were below parity for both subsectors, standing at 99.6% for the freight air transport and space transport subsector and 94.2% for the passenger air transport subsector. As such, the two air transport services subsectors were among the nine NACE groups within the non-financial business economy to report a wage-adjusted labour productivity ratio below 100%, indicating that the apparent labour productivity of each person employed was not covered by average personnel costs per employee.

Both of the air transport services subsectors recorded gross operating rates that were very low when compared with the non-financial business economy average (9.7%) in 2009. The gross operating rate for the EU-27's passenger air transport subsector was -1.0%, which was the second lowest value across all of the NACE groups within the non-financial business economy. The gross operating rate for the freight air transport and space transport subsector was only slightly higher, at 0.2%.

Country analysis

Compared with many activities, the air transport services sector remains relatively concentrated within a few Member States, reflecting the distribution and economic performance of Europe's main airlines and those airports that serve as hubs between inter-continental and European services. Nevertheless, in the last couple of decades there has been a significant change in the make-up of the air transport services sector away from a model that was dominated by large, national carriers that often had a monopoly. With deregulation, market entry (principally from low-cost carriers), increased choice concerning the routes available to consumers and downward price pressure, the air transport services sector in the EU-27 witnessed an expansion in passenger numbers.

The United Kingdom had the highest share (24.9%) of EU-27 value added for the passenger air transport subsector in 2009, while France also accounted for a relatively high share (21.8%); none of the remaining Member States for which data are available recorded a share that was into double-digits. For the freight air transport and space transport subsector, Germany recorded the highest share (27.9%) of EU-27 value added in 2009, while the United Kingdom (17.1%) and France (11.5%) were the only other Member States to account for double-digit shares.

While the air transport services sector was dominated by the larger Member States, there were relatively high degrees of specialisation in a limited number of other countries. For example, Ireland and Portugal reported that the contribution of their respective passenger air transport subsectors to national non-financial business economy added value in 2009 was around three times as high as the EU-27 average (specialisation ratios of 318.4% and 297.9%). Within the freight air transport and space transport subsector Lithuania was the most specialised country, as this activity contributed approximately four times as much added value to the national non-financial business economy total as the average across the whole of the EU-27; Bulgaria was also relatively specialised (288.4%).

As noted, the economic performance (as measured by the wage-adjusted labour productivity ratio and the gross operating rate) of the EU-27's air transport services sector was relatively weak. Just nine of the 20 Member States for which data are available reported wage-adjusted labour productivity ratios above 100% in 2009 (latest data is for 2008 for some Member States). Germany, Spain and Italy were among those Member States

where average personnel costs were not covered by apparent labour productivity, while in Slovakia (2008) the air transport services sector recorded negative value added. The highest gross operating rate for air transport services was registered in Poland, at 17.6% in 2009, while Belgium (14.3% in 2008) was the only other Member State to record a double-digit rate. Indeed, there were only seven other Member States that reported positive gross operating rates in 2009, while 12 Member States had negative values for this measure of operating profitability, with the lowest being recorded for Germany (-10.9%), Italy (-13.1%) and Slovakia (-19.5%, 2008).

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

This article presents an overview of statistics for the air transport services sector in the EU, as covered by NACE Rev.2 Division51. This division includes transport services by air or via space; it excludes own account transport. For air transport a distinction is made between the transport of passengers and freight transport. Included are scheduled and non-scheduled (charter) flights, as well as scenic and sightseeing flights. Also included are general aviation activities such as transport of passengers by aero clubs for instruction or pleasure. Space transport includes the launching of satellites and space vehicles and space transport of freight and passengers.

This NACE division is composed of two groups:

- passenger air transport (Group51.1);
- freight air transport and space transport (Group51.2).

The following activities are excluded from the statistics presented in this article: crop spraying (which is part of Division01, crop and animal production, hunting and related service activities – which does not form part of the non-financial business economy), the operation of airports (part of Division52, [warehousing and support activities for transportation](#)) and the renting of air transport equipment without an operator (part of Division77, the [renting and leasing of goods](#)).

Architectural, engineering and technical services statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database .

This article presents the [European Union structural business statistics](#) for

- architectural and engineering activities, corresponding to [NACE](#) Group 74.2, which include:
 - architectural consulting activities (such as building design and drafting, supervision of construction, town and city planning, and landscape architecture);
 - various engineering and technical activities related to construction;
 - geological and prospecting activities;
 - weather forecasting activities;
 - geodetic surveying;
- technical testing and analysis activities, corresponding to NACE Group 74.3, which include:
 - environmental measuring;
 - testing of food hygiene, buildings and equipment;
 - periodic testing of vehicles for roadworthiness.

In this article, these activities are collectively referred to as 'technical [business services](#)'.

		Number of employees (units)	Turnover (EUR million)

Table 2: Architectural and engineering activities and related technical consultancy; technical testing and analysis (NACE Groups 74.2 and 74.3), 2006

The ten largest architectural enterprises (groups) in the EU are presented, based on information compiled by the Swedish Federation of Consulting Engineers and Architects (STD). As can be seen, the United Kingdom dominated this activity in 2007, as the six largest groups were British. However, even the largest groups were relatively small, with only the two largest having 1000 or more employees.

Structural profile

Some EUR 129.6 billion of **value added** was generated in 2006 by the EU's technical business services sector (NACE Groups 74.2 and 74.3), from a **turnover** of EUR 269.6 billion. This corresponded to 15.3% of the total turnover for business services (NACE Divisions 72 and 74) and 14.5% of the value added. There were 2.7 million persons employed across the 926.3 thousand enterprises that were active in this sector, equivalent to 12.4% of the EU's business services' workforce and more than one fifth (21.2%) of the business services' enterprise population. Among the persons employed in this sector, 71.8% were paid employees, the lowest level of this share among the business services sectors, indicating a high incidence of working proprietors and unpaid family workers.

The United Kingdom contributed the greatest share (23.4%) of value added in the EU's technical business services sector, the second largest contribution being recorded by Germany (17.4%). However, Germany had a larger workforce in this sector than the United Kingdom. In value added terms, the United Kingdom, Sweden and France were the most specialised Member States in these activities in 2006, as this sector contributed between 2.7% and 2.8% to national **non-financial business economy** (NACE Sections C to I and K) value added. Bulgaria (2005) was the least specialised in this activity, generating just 1.0% of its non-financial business economy value added in technical business services, with Poland, Cyprus (both 2005), Slovakia, Portugal and Latvia also recording shares below 1.5%.

Expenditure and productivity

The share of **personnel costs** in operating expenditure was 35.0% for the EU's technical services sector in 2006, 4.5 percentage points below the business services average, but nevertheless far above the non-financial business economy average (16.1%). Average personnel costs were relatively high, EUR 40.0 thousand per employee, while apparent **labour productivity** was EUR 47.2 thousand of value added per person employed, also above the business services average. The resulting **wage-adjusted labour productivity ratio** was low, 118.2%, reflecting the high average personnel costs. This was the second lowest ratio among the business services activities. Italy and Belgium both recorded ratios below parity (100%) indicating that average personnel costs were higher than apparent labour productivity. Only in Greece was the wage-adjusted labour productivity ratio for the technical business services sector above the national average for the non-financial business economy.

Data sources and availability

The main part of the analysis in this article is derived from structural business statistics (SBS), including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other possible data sources include **short-term statistics** and the **Labour force survey**. In addition, use has also been made of specialist sources for particular areas, notably transport, energy, **research and development**, environment, tourism and information society statistics.

Context

The freedom to provide services and the freedom of establishment are central principles to the **internal market** for services and are set out in the **EC Treaty**. They guarantee EU enterprises the freedom to establish themselves in other Member States, and the freedom to provide services on the territory of another EU Member State. The Directive on services in the internal market (**COM (2006)123**) aims to achieve a genuine internal

market in services, removing legal and administrative barriers to the development of services activities between Member States. The Directive was to be implemented by Member States by the end of 2009 at the latest. As well as covering most business services (with the notable exception of services of temporary work agencies), the Directive applies to a wide variety of services including industrial and construction activities, as well as distributive trades, hotels and restaurants, travel agents, real estate and renting services.

Main statistical findings

Structural profile

The EU-27's architectural and technical services (Division71) sector comprised 940 thousand enterprises in 2009, employed 2.9 million persons and recorded value added of EUR142084 million. Within the **non-financial business economy** (SectionsB to J and L to N and Division95) this sector represented 2.2% of the total number of persons employed and 2.5% of value added. Based on value added and employment measures, the architectural and technical services sector was the second largest among the seven NACE divisions within **professional, scientific and technical activities** (SectionM), smaller only than **legal and accounting services** (Division69). Architectural and technical services employed 26.5% of the professional, scientific and technical activities workforce and accounted for 27.3% of its value added.

Apparent labour productivity within the EU-27's architectural and technical services sector in 2009 was EUR49 thousand per person employed, above the non-financial business economy average of EUR41.6 thousand per person employed and slightly above the professional, scientific and technical activities average of EUR47 thousand per person employed. Equally, at EUR41.3 thousand per employee, **average personnel costs** within the EU-27's architectural and technical services sector were much higher than the non-financial business economy average (EUR30.0 thousand per employee) and just above the professional, scientific and technical activities average (EUR40.5 thousand per employee).

The **wage-adjusted labour productivity ratio** combines the two previous indicators and shows the extent to which value added per person employed covers average personnel costs per employee. As the architectural and technical services sector's apparent labour productivity and average personnel costs were broadly similar to those for all professional, scientific and technical activities in 2009 it is unsurprising that the wage-adjusted labour productivity ratios were also similar: 118.5% for the EU-27's architectural and technical services sector compared with 117.0% for all professional, scientific and technical activities, well below the wage-adjusted labour productivity ratio for the whole of the non-financial business economy (138.8%).

The **gross operating surplus** for the EU-27's architectural and technical services sector was equivalent to 18.7% of **turnover**, which was a slightly higher **gross operating rate** than the professional, scientific and technical activities average (17.8%) and close to double the non-financial business economy average (9.7%).

Sectoral analysis

The EU-27's architectural and engineering activities (Group71.1) subsector dominated the architectural and technical services sector and was approximately 6.5 times as large as the technical testing and analysis (Group71.2) subsector in 2009 in value added and employment terms – see Figure 1.

In terms of productivity and labour cost the two subsectors were very similar. The EU-27's architectural and engineering activities subsector recorded apparent labour productivity of EUR49 thousand per person employed in 2009 which was EUR1 thousand per person more than for the smaller technical testing and analysis subsector. In terms of average personnel costs, the EUR41.4 thousand per employee for architectural and engineering activities was just EUR700 per employee more than the average recorded for technical testing and analysis. This closeness resulted in nearly identical wage-adjusted labour productivity ratios: 118.4% for architectural and engineering activities and 118.6% for technical testing and analysis.

One indicator where the two subsectors did show a notable difference was the gross operating rate. The EU-27's architectural and engineering activities subsector produced more than 90% of the sector's gross operating surplus and this high share translated into a higher gross operating rate (19.2%) than for technical testing and analysis (14.3%). For technical testing and analysis, the gross operating rate was below the professional, scientific and technical activities average (17.8%) but above the non-financial business economy average (9.7%).

Country analysis

The United Kingdom contributed just over one fifth (20.9%) of EU-27 value added in the architectural and technical services sector in 2009. Indeed, the architectural and technical services sector accounted for a higher share (3.4%) of non-financial business economy value added in the United Kingdom than in any other Member State. The United Kingdom's leading position for this sector was also reflected at a more detailed level for the architectural and engineering activities subsector, whereas Germany had the highest level of value added for technical testing and analysis, while Latvia was the most specialised. As well as the United Kingdom, Slovenia, Sweden and Luxembourg were all relatively highly specialised, as the architectural and technical services sector's contribution to non-financial business economy value added was 3.2% in all four of these Member States in 2009; Croatia (3.3%), Switzerland (3.3%) and Norway (3.1%) were also relatively specialised in architectural and technical services.

Four Member States recorded wage-adjusted labour productivity ratios below 100% in the architectural and technical services sector in 2009, namely Belgium, Hungary, Ireland and Italy, indicating that average personnel costs were higher than apparent labour productivity. In contrast, the wage-adjusted labour productivity ratio in Bulgaria was, at 200.3%, the highest among the Member States. Bulgaria and Estonia (161.3%) were the only Member States that recorded higher wage-adjusted labour productivity ratios for architectural and technical services than for their non-financial business economies as a whole in 2009; a similar situation was apparent in Croatia.

The relatively high gross operating rate observed for the EU-27's architectural and technical services sector in 2009 was mainly due to high rates for several large Member States, notably Italy, the United Kingdom and Germany, while Bulgaria, Cyprus, Poland and Estonia also recorded relatively high rates – see Table 4b. Gross operating rates for architectural and technical services were higher than averages for the whole of the non-financial business economy in nearly all Member States, the rare exceptions being Ireland and Denmark; Norway also recorded a gross operating rate for the architectural and technical services sector that was below average its non-financial business economy average.

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

This article presents an overview of statistics for the architectural and technical services sector in the EU, as covered by NACE Rev.2 Division71. This division includes the provision of architectural services such as consulting, design and drafting services, town planning and engineering services such as engineering design and implementation, geophysical, geological and seismic surveying, and mapping services. The architectural and technical services sector also includes the performance of physical, chemical, and other analytical testing services of materials and products, including, for example, testing activities in the field of food hygiene, reliability testing, testing and measuring of environmental indicators, the operation of police laboratories, and the certification of products such as transport equipment.

This NACE division is composed of two groups:

- architectural and engineering activities (Group71.1);
- technical testing and analysis (Group71.2).

The information that is presented in this article does not cover test drilling in connection with mining operations (classified as part of [mining support service activities](#) , Division09), research and development activities related to engineering (included as part of [scientific research and development](#) , Division72), or industrial design, aerial photography and interior decorating (which form part of [other professional, scientific and technical activities](#) , Division74).

Arms and ammunition production statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), the present article covers the production of arms and ammunition, corresponding to NACE Group 29.6, which is part of the [machinery and equipment](#) sector. The activities covered in this article are the production of:

- tanks and other fighting vehicles;
- artillery material and ballistic missiles;
- military small arms and ammunition;
- hunting, sporting or protective firearms and ammunition;
- explosive devices such as bombs, mines and torpedoes.

This article does not cover military aircraft and warships, which are classified instead as transport equipment – see [Transport equipment production statistics - NACE Rev. 1.1](#).

Table 1: Manufacture of weapons and ammunition (NACE Group 29.6). Structural profile: ranking of top five Member States in terms of value added and persons employed, 2006

In the [EU-27](#), the arms and ammunition (NACE Group 29.6) manufacturing sector was the smallest of the NACE groups that make up machinery and equipment (NACE Subsection DK) manufacturing. In 2006, it generated EUR 4.7 billion of [value added](#) and employed 97.3 thousand persons, and thereby accounted for only 2.4% of the total value added generated across machinery and equipment manufacturing as a whole and 2.7% of its workforce. There were 1.3 thousand [enterprises](#) registered in the EU-27's arms and ammunition manufacturing sector in 2006, less than 1% of all the machinery and equipment manufacturing enterprises in the EU-27.

The arms and ammunition manufacturing sector generated more value added in the United Kingdom than in any other Member State, accounting for well over one third (37.3%) of EU-27 value added in 2006. The next largest contribution in this sector was made by Germany, with a 22.4% share, and no other Member State recorded a double-digit share of the EU-27 total. The contribution made by the manufacture of arms and ammunition to the value added of the non-financial business economy (NACE Sections C to I and K) reached 0.6% in Bulgaria, more than three times its share in the next most specialised Member State¹⁰, namely Sweden. In [employment](#) terms, this sector was less concentrated: although the United Kingdom was again the largest

¹⁰Bulgaria, Cyprus, Poland, Portugal and Romania, 2005; Denmark, Estonia, Latvia, Luxembourg, Malta and the Netherlands, not available.

by this measure (16.6 thousand persons employed), its share of the EU-27 total was just 17.0%, less than half its share in value added terms. Bulgaria had the second largest workforce, 14.1 thousand persons employed, slightly more than in Germany.

Over the period between 1997 and 2007, the production index for arms and ammunition manufacturing grew by an average 1.3% per year in the EU-27, the second slowest rate of growth among the NACE groups that comprise machinery and equipment manufacturing, faster only than for the manufacture of domestic appliances (NACE Group 29.7). However, there were three distinct periods of output development: the first was characterised by falling output after 1997 through until 2000; the second was the subsequent, sustained strong growth through until 2006, at an average rate of 5.3% per year; the third and most recent was a return to negative rates of change in 2007 when output contracted by 4.9%.

Expenditure and productivity

Gross [tangible investment](#) by the EU-27's arms and ammunition manufacturing sector was valued at EUR 326 million in 2006, 1.9% of the machinery and equipment manufacturing total. This level of investment was equivalent to just 6.9% of the sector's value added, which was the lowest [investment rate](#) among all of the EU-27's machinery and equipment manufacturing NACE groups in 2006. In Slovenia and Cyprus, the investment rate in this sector was much higher than the average for machinery and equipment manufacturing, more than three times as high in Slovenia, and more than twice as high in Cyprus.

An analysis of expenditure shows that personnel costs accounted for 28.1% of [operating expenditure](#) in the EU-27's arms and ammunition manufacturing sector in 2006, higher than the average 23.6% share for machinery and equipment manufacturing. Average [personnel costs](#) were EUR 37.8 thousand per employee in the EU-27's arms and ammunition manufacturing sector in 2006, while apparent [labour productivity](#) was EUR 48.2 thousand per person employed: both of these were below the averages for machinery and equipment manufacturing as a whole, particularly the apparent labour productivity. The [wage-adjusted labour productivity ratio](#) of the EU-27's arms and ammunition manufacturing sector was 127.3% in 2006, the lowest of any of the NACE groups that make up machinery and equipment manufacturing. The United Kingdom, Slovenia, the Czech Republic and Spain were the only Member States¹¹ to record higher wage-adjusted labour productivity ratios for arms and ammunition manufacturing than for machinery and equipment manufacturing as a whole in 2006. Several Member States, namely Romania, France, Greece and Lithuania, reported wage-adjusted labour productivity ratios below 100% in this sector, indicating that average personnel costs exceeded apparent labour productivity.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#), including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Context

Technological advancements in the machinery and equipment that is used in other sectors of the economy (particularly in mining, manufacturing, energy provision and construction) can have a considerable impact upon the speed, quality and quantity of what is produced, thereby impacting on downstream productivity and profitability. The machinery and equipment sector is sensitive, therefore, to overall economic conditions and investment patterns both within the European Union and across the world (the two arguably being more intertwined than ever).

In comparison to many other sectors of the economy, the availability of data on the arms and ammunition sector is often restricted by issues of confidentiality. Therefore, the likelihood of an under-reporting of arms production and sales must be borne in mind by readers.

¹¹Poland and Portugal, 2005; Denmark, Estonia, Ireland, Latvia, Luxembourg, Malta and the Netherlands, not available.

Notes

Beverages production statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). The present article covers alcoholic and non-alcoholic beverages, corresponding to [NACE Rev 1.1 Group 15.9](#), which is part of the [food, beverages and tobacco](#) sector. The beverages covered in this article are:

- mineral waters;
- soft drinks;
- beer;
- wine;
- spirits.

Note that this article does not include fruit and vegetable juices (NACE Class 15.32) or the processing of tea and coffee (NACE Class 15.86).

It should be noted that this article excludes the agricultural activities of growing, farming, rearing and hunting and also fishing (NACE Divisions 01 and 05). A number of products, such as wine, are also sold directly by agricultural holdings. As such, their weight is likely to be under-reported in this article, as part of their production is recorded as an agricultural activity.

Main statistical findings

Structural profile

 Source: Eurostat (SBS)

Table 3: Manufacture of beverages (NACE Group 15.9). Expenditure and productivity, EU-27, 2006

There were an estimated 22.0 thousand enterprises across the EU-27

that manufactured beverages as their main activity in 2006. These enterprises employed a little less than half a million persons (the equivalent of about one in every ten persons working in the food, beverages and tobacco manufacturing workforce). The beverages manufacturing sector of the EU-27

generated an estimated EUR 34.0 billion of value added in 2006. After the manufacture of bread, fresh pastry goods and cakes (NACE Group 15.8), this represented the second largest contribution (17.3%) at the NACE group level to the total value added of the food, beverages and tobacco manufacturing sector in 2006.

The manufacture of beer (NACE Class 15.96) generated EUR 12.5 billion of value added in 2006, a little over one third (36.8%) of the EU-27

total for these activities. The manufacture of mineral water and soft drinks (NACE Class 15.98) generated the next highest amount of value added (EUR 9.3 billion), the equivalent of just over a quarter (27.3%) of the beverages total. The other main activities within the sector included the manufacture of distilled potable alcoholic beverages (NACE Class 15.91) and wines (NACE Class 15.93), which generated EUR 5.8 billion and EUR 5.1 billion of value added respectively in 2006.

Beverages manufacturing in the United Kingdom generated EUR 6.4 billion of value added in 2006, a little less than one fifth (18.9%) of the EU-27

total. Germany, France and Spain were the other main beverages manufacturing Member States, each of a broadly similar size in terms of their respective contributions to EU-27

value added in 2006. Poland was the most specialised Member State for the manufacture of beverages, as these activities contributed about four times the EU average to value added within the whole of the non-financial business economy in 2005. Romania, Bulgaria and Lithuania were also relatively specialised in beverages man-

ufacturing, with specialisation ratios around 200%.

There was an upward trend in the [production index](#) of beverages in the EU-27

in the ten years through to 2007 (with an average increase of 1.5% per year). This long-term evolution was similar to that observed for the food, beverages and tobacco manufacturing sector, albeit somewhat more volatile in nature. The overall growth in the EU-27

index of production for beverages was driven mainly by higher growth for mineral waters and soft drinks (average annual growth of 2.5%, despite a small decline in 2007) and wine (average growth of 1.4% per year being underpinned by the increases in 2006 and 2007). In contrast, the production index for beer in 2007 was 6.1% less than in 2000.

Expenditure and productivity

The beverages sector recorded the highest average [personnel costs](#) (EUR 36.4 thousand per employee) within the EU-27

in 2006 among the NACE groups that make-up the food, beverages and tobacco manufacturing sector. Nevertheless, total personnel costs for beverages manufacturing in the EU-27

represented only a slightly higher proportion of total [operating expenditure](#) (15.1%) than was the case across food, beverages and tobacco manufacturing as a whole (13.8%), suggesting that this activity had a relatively small but well-remunerated workforce.

The [wage adjusted labour productivity ratio](#) (203.3% in 2006) of the beverages manufacturing sector was the second highest (behind tobacco manufacturing) among the ten NACE groups that comprise food, beverages and tobacco manufacturing. This relatively high ratio was based on apparent [labour productivity](#) of EUR 73.9 thousand across the EU-27

's beverages sector in 2006, which was about 75% higher than the food, beverages and tobacco manufacturing average. Within the beverages sector, the apparent labour productivity of those producing beer (EUR 93.5 thousand per person employed) and distilled potable alcoholic beverages (EUR 97.2 thousand per person employed) was particularly high in 2006.

Relatively high wage adjusted labour productivity ratios were a common feature across almost all of the Member States within the beverages manufacturing sector. In the case of Poland, the ratio was particularly notable (865.2% in 2005) – which was more than double the national average for the whole of food, beverages and tobacco manufacturing (361.7%), which was in itself also by far the highest ratio among the Member States.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics \(STS\)](#) .

Context

The food, beverages and tobacco manufacturing sector in the EU is comprised of a relatively small number of enterprises that have a considerable global market presence, which operate alongside a high number of relatively small enterprises that serve more local, regional and national markets.

As these enterprises not only produce goods for final consumption but also intermediate products for other

manufacturing activities, they are affected by a broad scope of legislation. The main legislative areas affecting the EU's food, beverages and tobacco manufacturing sector, however, tend to involve international trade agreements, or food and feed legislation. As a majority of the EU's agricultural production is processed by the [food, beverages and tobacco manufacturing sector](#), developments in [Common agricultural policy](#) and associated Common Market Organisations can have important implications for costs and processes in the food chain. Regarding food legislation, the [European Parliament](#) and the [Council](#) proposed an update of the laws regarding the provision of information to consumers ([COM\(2008\) 40 final](#)) in 2008, in order to clarify and consolidate existing regulations. In part, this proposal was built on a 2007 White Paper covering a Strategy for Europe on Nutrition, Overweight and Obesity ([COM\(2007\) 279 final](#)), which stressed the need for consumers to have access to clear, consistent and evidence-based nutritional information.

A new Council Directive ([Council Directive 2008/118/EC](#)) clarifying the general arrangements for products subject to excise duty (alcoholic beverages, tobacco products and energy products) entered into force on the 15 January 2009 and will apply across the EU from 1 April 2010. Rules on the labelling of some alcoholic drinks was also updated; the definition, description, presentation, labelling and protection of geographical indications of [spirit drinks](#) was updated by the European Parliament and Council in January 2008, and that of certain [wine products](#) in April 2007.

Boilers, metal containers and steam generators production statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). The present article covers the production of boilers, metal containers and steam generators, which is part of the [metals and metal products](#) sector. The activities covered in this article correspond to two different [NACE Rev. 1.1](#) groups, which are the manufacture of:

- metal tanks, reservoirs and containers, as well as central heating radiators and boilers (corresponding to NACE Group 28.2);
- steam generators, for example, vapour generators, condensers and nuclear reactors (NACE Group 28.3).

The manufacture of boilers, containers and steam generators supplies various downstream sectors, most notably those of construction (see [Construction statistics - NACE Rev. 1.1](#)), fuel processing and chemicals (see [Fuel processing and chemicals production statistics - NACE Rev. 1.1](#)), and network supply of electricity, gas and steam (see [Electricity, gas and steam production and distribution statistics - NACE Rev. 1.1](#)).

Table 3: Manufacture of tanks, reservoirs and containers of metal; manufacture of central heating radiators and boilers; manufacture of steam generators, except central heating hot water boilers (NACE Groups 28.2 and 28.3). Expenditure, productivity and profitability, EU-27, 2006

There were 14.8 thousand enterprises throughout the EU-27 for whom the manufacture of boilers, metal containers and steam generators (NACE Groups 28.2 and 28.3) was their principal activity and they provided employment for 316.3 thousand persons in the Member States in 2006 (the equivalent of 6.2% of the workforce in metals and metal products manufacturing). The boilers, metal containers and steam generators manufacturing sector created EUR 14.2 billion of value added in 2006, corresponding to one third of its turnover, and this came in similar measure from its two subsectors.

France contributed the largest share (28.4%) of EU-27 value added within the boilers, metal containers and steam generators manufacturing sector in 2006. Germany contributed the second highest amount (20.4%), the only one of the subsectors of metals and metal products in which Germany did not make the largest contribution to EU-27 output. The boilers, metal containers and steam generators manufacturing sectors in Finland and France both contributed 0.5% of the value added generated within their respective non-financial business economies, more than any of the other Member States and about twice the EU-27 average.

The development of the production indices for the activities within the manufacture of boilers, metal containers and steam generators were rather different to that for metals and metal products as a whole in the period between 1997 and 2003, after which they were broadly similar. EU-27 output of boilers, reservoirs, containers and central heating radiators and boilers (NACE Group 28.2) fell relatively sharply from 1997, and despite an upsurge in 1999, to a relative low in 2001, after which there was a relatively steady and continuous rise in output through until 2007. Over the ten year period as a whole, the EU-27's production index for this activity rose by an average 0.7% per year. In contrast, the production index for the manufacture of steam generators (NACE Group 28.3) rose much more strongly (an average rate of 3.6% per year), with short-lived cutbacks only being recorded in 1999 and, more particularly, 2003.

Expenditure and productivity

Tangible investment in the EU-27's boilers, metal containers and steam generators manufacturing sector was EUR 1.2 billion in 2006, which represented a much smaller share (3.7%) of the tangible investment across metal and metal products activities than the contribution of this sector to value added (5.8%). The corresponding investment rate (relating tangible investment to value added) of the boilers, metal containers and steam gener-

ators manufacturing sector was just 8.7%, considerably less than the average for all metals and metal products manufacturing. The investment rate in the EU-27's manufacture of steam generators subsector was only 5.5% in 2006, by far the lowest rate among the dozen NACE groups covered within the metals and metal products manufacturing sector and the second lowest rate among all industrial NACE groups in 2006, only a little higher than for the manufacture of industrial process control equipment (NACE Group 33.3).

Average [personnel costs](#) of EUR 34.5 thousand per employee in the EU-27's boilers, metal containers and steam generators manufacturing sector were a little higher than the average for all metals and metal products manufacturing in 2006. However, the proportion of [operating expenditure](#) accounted for by personnel costs in this sector was substantially higher (26.1% compared with 19.2%). Indeed, in the manufacture of steam generators subsector, personnel costs accounted for closer to one third (31.6%) of all operating expenditure.

The average value added generated by each person employed in the EU-27's boilers, metal containers and steam generators manufacturing sector was EUR 44.9 thousand in 2006, which was 6.6% less than the average for all metals and metal products manufacturing. The [wage-adjusted labour productivity ratio](#) of the EU-27's boilers, metal containers and steam generators manufacturing sector was 130.1% in 2006, the lowest rate among the seven subsectors of the metals and metal products sector. The wage-adjusted labour productivity ratio of the boilers, metal containers and steam generators manufacturing sector was lower than the ratio for metals and metal products manufacturing as a whole in all Member States for which data is available¹², with the exception of Italy and the United Kingdom where it was very slightly higher.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics \(STS\)](#) .

Context

The metals and metal products manufacturing sector is part of a diverse and interwoven economic network that incorporates upstream sectors and large downstream segments of manufacturing such as the transport equipment manufacturing and construction sectors. The challenges faced by the EU's metals and metal products manufacturing sector therefore have direct and indirect consequences on many other parts of the economy. Looking ahead, a Communication ([COM\(2008\) 108](#)) from the [European Commission](#) to the [Council](#) and the [European Parliament](#) on the competitiveness of the metals industries was adopted in February 2008, and highlighted the challenges to be faced.

The EU-27 is largely dependent on imports of ore and concentrates for steel, ferro-alloys and non-ferrous metals production; it produces only 1.7% of the world's nickel, 2% of its iron ore and 5% of its copper ([SEC\(2007\) 771](#)). Access to minerals and secondary raw materials at competitive prices is important, especially given the exhaustion of certain deposits in the EU-27 over time or their absence, and supply constraints that have been exacerbated by the strong growth in international demand from emerging economies such as China and India. This concern was part of a raw materials initiative of the European Commission ([COM\(2008\) 699](#)).

Parts of the metals and metal products manufacturing sector are highly [energy-intensive](#) . Energy costs for the EU-27's metals and metal products manufacturing sector accounted for 4.4% of purchases of goods and services in 2006, which was the third joint highest proportion among the industrial structural business statistics sectors, albeit well behind non-energy mining and quarrying (10.1%) and other nonmetallic mineral products (9.5%). Within this sector, however, energy costs in the casting of metals subsector accounted for 7.2% of purchases of goods and services in 2006 and in the first processing of ferrous metals as much as 7.9%. This level of energy consumption has important implications for energy and environmental (particularly climate change) policy.

The metals and metal products manufacturing sector is covered by a Directive on [integrated pollution prevention and control \(IPPC\)](#) and [REACH](#) . A proposal from the European Commission on the review of EU

¹²The Netherlands and Poland, 2005; Denmark, Cyprus, Latvia, Lithuania, Luxembourg and Malta, not available.

[Emissions trading system \(ETS\)](#) adopted in January 2008 ([COM\(2008\) 30](#)) foresees the inclusion of non-ferrous metals from 2013 onwards, along with some transitional measures to avoid 'carbon leakage'.

Table 4: Manufacture of bread, sugar and other food products (NACE Group 15.8). Expenditure and productivity, EU-27, 2006

- bread;
- sugar;
- confectionery;
- other food products (including pasta, tea and coffee, homogenised and dietetic foods).

It should be noted that this article excludes the agricultural activities of growing, farming, rearing and hunting and also fishing (NACE Divisions 1 and 5).

Main statistical findings

Structural profile

By far the largest of the NACE groups within food, beverages and tobacco manufacturing (NACE Subsection DA) was the bread, sugar, confectionery and other food products manufacturing (NACE Group 15.8) subsector; it consisted of 192.4 thousand [enterprises](#) across the [EU-27](#)

in 2006, which generated EUR 72.0 billion of [value added](#) (36.6% of the sectoral total) and employed 2.1 million people (43.8% of the food, beverages and tobacco manufacturing workforce).

Within the bread, sugar, confectionery and other food products sector, the largest activity was the manufacture of bread, fresh pastry goods and cakes (NACE Class 15.81); it generated two fifths (39.8% or EUR 28.6 billion) of sectoral value added in theEU-27

in 2006 and accounted for two thirds (65.2% or 1.3 million persons) of the workforce in this sector. The second and third largest activities, namely the manufacture of cocoa, chocolate and sugar confectionery (NACE Class 15.84) and the manufacture of rusks and biscuits, preserved pastry goods and cakes (NACE Class 15.82), together accounted for around a quarter (24.3%) of value added and 16.9% of sectoral [employment](#) .

Almost two thirds (63.0%) of the value added generated within theEU-27

's bread, sugar, confectionery and other foods products manufacturing sector in 2006 came from Germany (EUR 13.9 billion), the United Kingdom (EUR 12.5 billion), France (11.0 billion) and Italy (EUR 7.9 billion). In terms of the relative importance of these activities, as measured by their contribution to the value added of the whole of the [non-financial business economy](#) , Ireland was by far the most specialised Member State; the bread, sugar, confectionery and other foods products manufacturing sector contributed 4.1% of Irish value added in 2006, well above the average share (1.3%) recorded across all of the Member States.

The [output](#) of theEU-27

's bread, sugar, confectionery and other foods products manufacturing sector grew, on average, by 1.6% per year

during the ten-year period through to 2007. This was marginally higher than the overall rate for food, beverages and tobacco manufacturing. In the shortened period between 2000 and 2007, the output of homogenised food preparations and dietetic food (NACE Class 15.88) grew across the EU-27

by an average of 5.1% per year. Otherwise, there was also a high average growth rate for other miscellaneous food products n.e.c. (NACE Class 15.89) – although care should be taken when interpreting this residual category, as it is likely that any new products that could not be attributed within the NACE would be placed here. There were considerable fluctuations in the level of sugar manufacturing output (NACE Class 15.83) within the EU-27

, which masked to some degree an overall downward trend in the level of activity. The decline in output accelerated in 2006, such that production fell by 12.7% compared with the year before; this could, at least in part, be linked to the lowering of sugar quotas within the EU's agricultural sector.

Expenditure and productivity

Personnel costs within the EU-27

's bread, sugar, confectionery and other food products manufacturing sector represented a much higher proportion of total **operating expenditure** than was the case across the food, beverages and tobacco manufacturing sector in 2006 (20.7% compared with 13.8%). Average personnel costs (EUR 22.5 thousand per employee) were among the lowest in the food, beverages and tobacco manufacturing sector, pointing to a relatively large, but low-paid workforce.

The apparent **labour productivity** of those working in EU-27

's bread, sugar, confectionery and other food products manufacturing sector was EUR 34.9 thousand per person employed in 2006, almost 20% lower than the average across the food, beverages and tobacco manufacturing sector. The relatively low average personnel costs in the EU-27

's bread, sugar, confectionery and other food products manufacturing sector, however, resulted in a wage-adjusted labour productivity ratio (155.6%) that was close to the food, beverages and tobacco manufacturing average (163.0%) in 2006. Among the Member States, some of the highest wage adjusted labour productivity ratios were recorded for Ireland (627.6%) and the United Kingdom (221.9%).

Data sources and availability

The main part of the analysis in this article is derived from **structural business statistics (SBS)**, including core business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include **short-term statistics (STS)** and the **PRODCOM** statistics on the production of manufactured goods.

Context

The food, beverages and tobacco manufacturing sector in the EU is comprised of a relatively small number of enterprises that have a considerable global market presence, which operate alongside a high number of relatively small enterprises that serve more local, regional and national markets.

As these enterprises not only produce goods for final consumption but also intermediate products for other manufacturing activities, they are affected by a broad scope of legislation. The main legislative areas affecting the EU's food, beverages and tobacco manufacturing sector, however, tend to involve international trade agreements, or food and feed legislation. As a majority of the EU's agricultural production is processed by the

food, beverages and tobacco manufacturing sector , developments in [Common Agricultural Policy](#) and associated Common Market Organisations can have important implications for costs and processes in the food chain. Regarding food legislation, the [European Parliament](#) and the [Council](#) proposed an update of the laws regarding the provision of information to consumers ([COM\(2008\) 40 final](#)) in 2008, in order to clarify and consolidate existing regulations. In part, this proposal was built on a 2007 White Paper covering a Strategy for Europe on Nutrition, Overweight and Obesity ([COM\(2007\) 279 final](#)), which stressed the need for consumers to have access to clear, consistent and evidence-based nutritional information.

Sugar is found in many natural foods, but is generally only extracted commercially from sugar beet and sugar cane. Sugar beet production in the EU has been protected for many years by the imposition of tariffs on cane sugar. However, a 2006 reform cut the guaranteed minimum price for EU beet sugar by 36%, opening-up the EU market to more cane-based sugar from developing countries and, in the process, turning the EU from a sugar exporting region to a sugar importing region. These changes have had an important impact on EU sugar processors, as well as manufacturers of chocolates, biscuits and confectionery, all of which source sugar as an ingredient for use as a sweetener, preservative, flavour enhancer, or bulking agent.

Ensuring that wholesome food is freely available and contributes significantly to the health and well-being of EU citizens, the European Parliament and the Council adopted a [common authorisation procedure](#) for food additives, food enzymes and food flavourings in December 2008. The legislation underlines that sweeteners, colourings, preservatives, antioxidants, emulsifiers, gelling agents and packaging gases can only be authorised if they are safe for consumers and if there is a technological need for their use.

Building completion statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), the present article covers building completion work, corresponding to NACE Group 45.4, which is part of the [construction](#) sector. The activities covered in this article are:

- plastering (NACE Class 45.41);
- joinery installation (NACE Class 45.42);
- floor and wall covering (NACE Class 45.43);
- painting and glazing (NACE Class 45.44);
- other building completion (NACE Class 45.45).

As well as work on new structures, the renovation, repair and maintenance markets are also important for building completion enterprises.

	Enterprises (thousand)	Turnover (EUR million)	Value added (EUR million)	Persons employed (thousand)	Share in total (%)

Source: Eurostat (585)

Table 3: Building completion (NACE Group 45.4). Expenditure and productivity, EU-27, 2006

Building completion (NACE Group 45.4) was the main activity for around 873.1 thousand enterprises in the EU-27 in 2006. Together, these enterprises employed 2.5 million persons, equivalent to 17.7% of the construction (NACE Section F) total. The share of paid employees in the workforce was just 68.0% for the EU-27, well below the construction sector average of 82.2%, indicating a particularly high proportion of self-employed workers.

From a turnover of EUR 180.1 billion, the building completion sector generated EUR 75.8 billion of value added in the EU-27, some 14.9% of the construction sector total. Joinery installation (NACE Class 45.42) was the largest building completion subsector, contributing 29.8% of the sector's value added, followed by painting and glazing (NACE Class 45.44) with 28.0%. These two subsectors also had the largest share of the building completion workforce. Floor and wall covering work (NACE Class 45.43) was the third largest subsector with 18.1% of value added and one fifth (20.0%) of employment. Other building completion work (NACE Class 45.45) and plastering (NACE Class 45.41) each contributed between 10% and 15% of the sector's employment and value added.

France had the largest building completion sector in value added terms, contributing over 22.0% of the EU-27 total in 2006. The United Kingdom had the second largest contribution (19.4%). In terms of employment, Spain and France had the largest building completion workforces, both with well over 400 thousand workers each. The relative importance of the building completion sector was particularly high in Spain, Denmark and France, with this sector contributing more than 2.0% of non-financial business economy value added in all three of these Member States. In terms of this sector's importance within the construction sector, this was most pronounced in Denmark and France where it contributed 26.0% and 24.0% respectively to value added within construction. In contrast, building completion contributed less than 5% of total construction value added in Slovakia, Romania, Ireland, Estonia and Bulgaria¹³.

A number of specialisations among the building completion subsectors can be noted in particular Member States notably: joinery installation contributed 63.9% of building completion value added in Denmark; painting and glazing contributed more than 50% of value added in Cyprus, Finland and Sweden; floor and wall covering work contributed 89.8% of value added in Lithuania; and other building work contributed more than 40% of value added in Italy and Slovenia.

Expenditure and productivity

The EU-27's building completion sector made EUR 5.0 billion worth of tangible investment in 2006, 10.5% of the construction total, lower than this sector's share of value added and employment. The investment rate

¹³Poland, 2005; Malta, not available.

was 6.6%, which was the second lowest among the construction NACE groups, just above that for building installation. Only in Slovakia and Latvia was the investment rate in this sector higher than the average for construction as a whole¹⁴.

For building completion, the share of [personnel costs](#) in total operating expenditure was 30.6%, the second highest share among construction NACE groups behind the renting of construction or demolition equipment (NACE Group 45.5).

Building completion in the EU-27 recorded apparent [labour productivity](#) of EUR 30.4 thousand per person employed in 2006, the lowest of the construction NACE groups and EUR 5.7 thousand lower than the construction average. Average personnel costs in these activities were EUR 27.2 thousand per employee, again the lowest among the construction NACE groups, but just EUR 0.7 thousand per employee lower than the construction average. The low average personnel costs were not enough to compensate for low apparent labour productivity, and as such the [wage-adjusted labour productivity ratio](#) was just 112.1%, clearly the lowest of the five construction NACE groups. Indeed, this was the third lowest wage-adjusted labour productivity ratio among all of the non-financial business economy NACE groups (with 2005 or 2006 data available), higher only than for two retail trade and repair groups.

This particularly low ratio for the EU-27 reflected the fact that six Member States¹⁵ recorded wage adjusted labour productivity ratios that were below 100% in 2006, indicating that average personnel costs were higher than apparent labour productivity. This was most notably the case in the Netherlands and Greece where ratios below 90% were recorded. In contrast, in the United Kingdom and Latvia the wage adjusted labour productivity ratio for building completion exceeded the national average for the whole of the non-financial business economy.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#), including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Context

Building and civil engineering projects typically take much longer from conception to completion than in many other sectors, and often involve a large number of sub-contracting enterprises with various specialisations. Construction projects are often a key factor in urban regeneration, and also in maintaining or developing transport and communication infrastructure. Nevertheless, construction projects impact upon the environment in a number of ways, notably the change in land use, the consumption of materials and fuel, the production of waste, as well as noise and air emissions.

Another characteristic of construction activity is that it is particularly cyclical, influenced by business and consumer confidence, interest rates and government programmes. The level of confidence among construction enterprises, according to the [European Commission's Directorate-General for Economic and Financial Affairs](#) is presented in terms of a balance of positive compared with negative responses. This measure turned positive in July 2006 for the first time since June 1990, peaked in September 2006 and then became negative again in November 2007. During 2008, the fall in construction confidence accelerated and fell particularly strongly in the final quarter of 2008, such that by December 2008 the balance was down to -32.3%. At the time of writing, with overall economic activity declining in many Member States, major public sector funding for infrastructure projects has been proposed by a number of governments as one means of stimulating activity and creating jobs.

Notes

Building installation statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), the present article covers installation work, corresponding to NACE Group 45.3, which is part of the [construction](#) sector. Installation work is divided into four NACE classes:

- installation of electrical wiring and fittings (NACE Class 45.31), including heating and air-conditioning systems, aerials, alarm systems and other electrical work, sprinkler systems, elevators and escalators, and illumination and signalling systems for roads, railways, airports, harbours, etc.;
- insulation for water, heat and sound (NACE Class 45.32);
- plumbing (NACE Class 45.33), including all water and gas supply, drainage, heating and ventilation work;
- other building installation (NACE Class 45.34).

Note that the installation of industrial equipment (for example, the installation of industrial furnaces and turbines) is excluded.

	Enterprises (thousand)	Turnover (EUR million)	Value added (EUR million)	Persons employed (thousand)	Share in total (%)	
					Value added	Persons employed
Building installation	720.0	292 000	112 000	3 330.0	100.0	100.0
Installation of electrical wiring & fittings	312.3	139 943	55 704	1 592.4	49.7	47.8
Insulation work activities	28.9	14 339	5 586	170.8	5.0	5.1
Plumbing	332.7	120 522	44 265	1 374.1	39.5	41.3
Other building installation	46.5	17 700	6 470	193	5.8	5.8

Table 3: Building installation (NACE Group 45.3). Expenditure and productivity, EU-27, 2006

Building installation (NACE Group 45.3) consisted of 720.0 thousand enterprises, which employed 3.3 million persons and generated EUR 112 billion of value added in the EU-27 in 2006. As such, building installation made up more than one fifth of the construction sector (NACE Section F), contributing 23.6% of the workforce and 22.0% of the value added. At the NACE class level, the largest activities (in value added terms) were the installation of electrical wiring and fittings (NACE Class 45.31), which alone generated almost half of the sectoral total, and plumbing (NACE Class 45.33) that contributed just under two fifths of the total.

The United Kingdom had the largest building installation sector in the EU-27 in value added terms, contributing 19.1% of EU-27 total. In employment terms, Spain had the largest workforce (16.2% of the [[Glossary:Enterprise] total) with over half a million workers. Furthermore, the workforce in the United Kingdom only accounted for 11.5% of the [[Glossary:Enterprise] total (7.6 percentage points less than its value added share). Spain and Luxembourg were the Member States most specialised in terms of the contribution made by building installation to the value added of the non-financial business economy.

Within the construction sector, the building installation sector¹⁶ was most important (in value added terms) in Sweden where it contributed 29.6% of construction value added, while in Germany, Denmark, Luxembourg and Austria it also contributed more than one quarter of construction value added.

In all of the Member States, the two main subsectors (namely the installation of electrical wiring and fittings, and plumbing) together accounted for at least three quarters of sectoral value added. The contribution of the other building installation subsector was greatest in Portugal where it accounted for 17.1% of building installation value added, and its share was also over 15% in Hungary and Bulgaria. The specialist insulation subsector only exceeded 8% of building installation value added in the Czech Republic and Slovakia.

Expenditure and productivity

In the [[Glossary:Enterprise]'s building installation sector, tangible investment was EUR 5.6 billion in 2006, which equated to 11.7% of the construction total, around half this sector's share of value added and employment. The investment rate, in other words the relation between investment and value added, was just 5.0%, the lowest among the construction NACE groups, and only slightly more than half the average recorded for construction as a whole. This was the fourth lowest investment rate of any NACE group (with 2005 or 2006 data available) within the non-financial business economy, higher only than three of the groups from within business services.

The share of personnel costs in total operating expenditure was 30.0%, above the average for construction,

¹⁶Cyprus and Poland, 2005; Malta, not available.

but lower than for building completion or the renting of construction or demolition equipment (NACE Groups 45.4 and 45.5). The building installation sector recorded apparent [labour productivity](#) of EUR 33.6 thousand per person employed in the [\[\[Glossary:Enterprise|](#) in 2006. This was higher than for building completion, but otherwise was the lowest among the construction NACE groups. Average personnel costs were EUR 28.5 thousand per employee, which stood above the construction average. This combination of relatively low apparent labour productivity and slightly above average personnel costs resulted in a [wage-adjusted labour productivity ratio](#) for building installation of just 117.9%, well below the construction average of 129.7%, and again higher only than the ratio for the building completion sector (among construction NACE groups). The wage-adjusted labour productivity ratio for building installation was, across the Member States, generally below the average ratio for the construction sector, other than in Slovakia, the Netherlands, Poland, Lithuania and Austria¹⁷.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Notes

Business services statistics - NACE Rev. 1.1

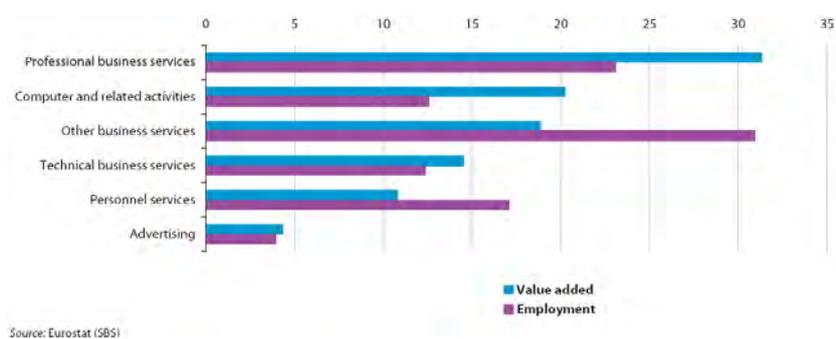

Data from January 2009. Most recent data: Further Eurostat information, Main tables and Database .

This article presents an overview of [European Union structural business statistics](#) for [business services](#) . Business services consist of many different activities, treated more in depth in specific articles:

- [Advertising services](#)
- [Architectural, engineering and technical services](#)
- [Computer and information services](#)
- [Legal, accounting, market research and consultancy services](#)
- [Recruitment and personnel selection services](#)
- [Security, cleaning, translation services](#)

Business services are the aggregate of [NACE](#) Divisions 72, 'Computer and related activities', and 74, 'Other business activities'.

Main statistical findings

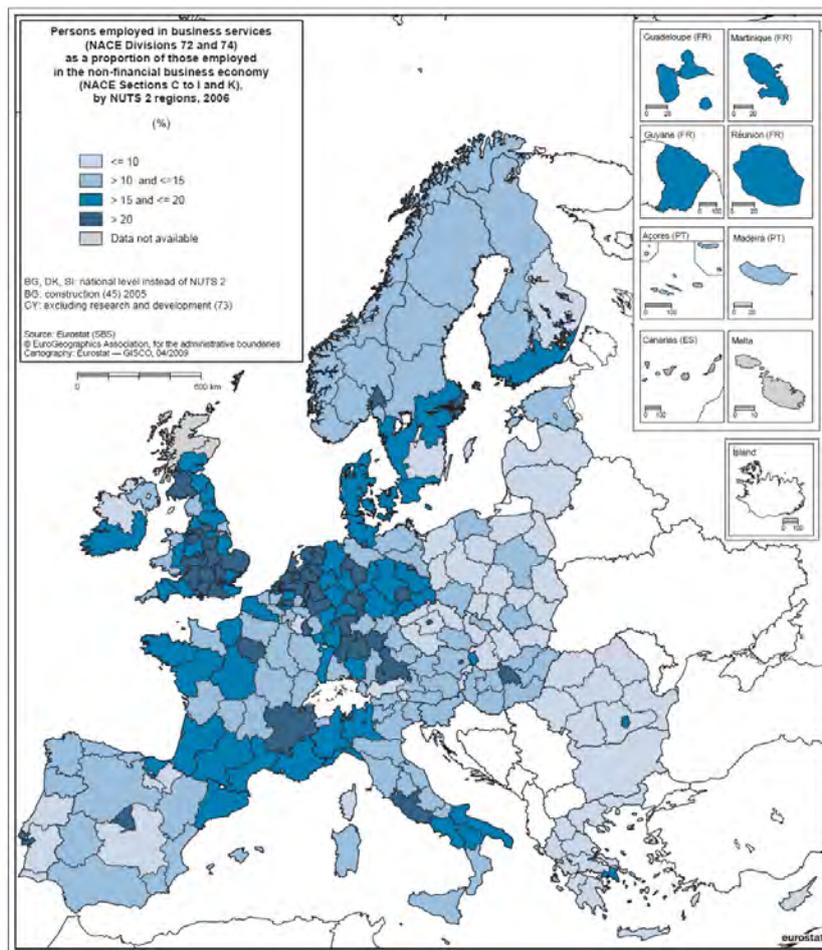

Graph 1: Business services (NACE Divisions 72 and 74) - Share of non-financial business economy, EU-27, 2006 (%)

Source: Eurostat (SBS)

Table 3: Business Business services (NACE Divisions 72 and 74) - Share of value added and persons employed by enterprise size class, EU-27, 2006 (%)

Structural profile

In 2006, the EU's business services (NACE Divisions 72 and 74) sector comprised 4.4 million enterprises, more than one in every five enterprises in the whole of the [non-financial business economy](#) (NACE Sections C to I and K). The sector's workforce included 22.2 million persons, making it the largest workforce in the non-financial business economy, with a 17.1% share of the non-financial business economy workforce. This workforce generated EUR 1763.3 billion of [turnover](#) in 2006 leading to EUR 892.1 billion of [value added](#). As such, the business services sector accounted for 7.9% of the turnover in the non-financial business economy, while accounting for twice as much of value added, a 15.8% share. In turnover terms business services was the third biggest sector within the EU's non-financial business economy, smaller only than [wholesale trade](#) and [retail trade](#) and repair, whereas in value added terms it was the largest sector. In 15 of the 26 Member States with recent value added data available (no Malta) business services was the largest sector, while it was second largest in three more: seven of the eight Member States where business services was not one of the two largest sectors were [Member States that joined the EU in 2004 or 2007](#), the one exception being Greece.

Among the two NACE divisions that make up the business services sector, computer and related activities (NACE Division 72) accounted for about one fifth of sectoral value added in 2006. Other business activities (NACE Division 74) accounted for the remainder of the output. Of these activities, the largest was professional business services (NACE Group 74.1) which alone provided 31.3% of all business services value added but just 23.1% of the workforce. The other business services (NACE Groups 74.6 to 74.8), together contributed 18.8% of business services value added. However, in [employment](#) terms, this subsector was the largest, providing employment for 31.0% of the business services workforce. Looking at the employment and value added contributions of each subsector, by both of these measures advertising (NACE Group 74.4) was the smallest subsector. Personnel services (NACE Group 74.5) made a considerably greater contribution in employment rather than in value added terms, unsurprising given that one part of this activity involves providing workers through employment agencies.

In value added terms, the United Kingdom was by far the largest contributor to the EU's business services sector in 2006, and in fact was the largest contributor to each and every one of the subsectors. With EUR 203.5 billion of value added in the business services sector in 2006 the United Kingdom generated 27.0% of the EU's business services value added, and also 22.5% of all value added in the non-financial business economy in the United Kingdom, making it also the most specialised Member State in business services. Germany contributed 17.4% of the EU's value added and employment in business services, making it the second largest Member State according to both of these measures. France, Italy and Spain were the only other Member States that recorded more than EUR 50 billion of value added in 2006 in this sector as well as workforces in excess of 2 million persons.

The regional specialization in business services is shown in the map which is based on the non-financial business economy employment share of this sector. The region with the highest specialization in business services in 2006 was Inner London where more than two fifths (43.2%) of non-financial business economy employment was within this sector. As well as parts of the United Kingdom, several other countries had many regions specialised in these services, notably in the Netherlands and Germany. In a number of countries one region was particularly specialized in these services, typically around the capital city. The regions least specialized in business services (in employment terms) were mainly in Slovakia, Romania and Greece, along with Åland (Finland) and Ciudad Autónoma de Ceuta (Spain).

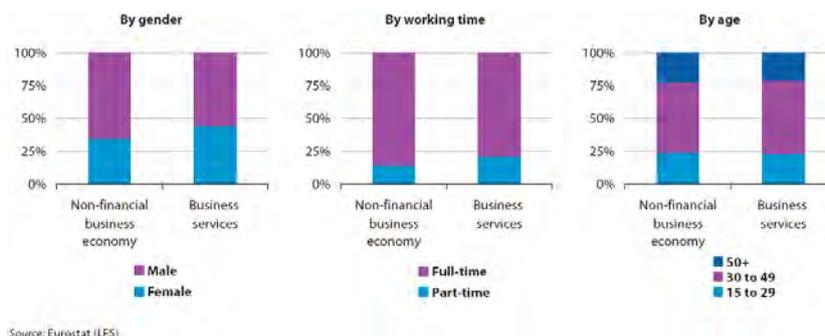

Data availability for the development of business services based on annual short-term statistics starts in 1998 for computer and related activities and 2000 for other business activities, with the turnover index recording uninterrupted year on year growth (in current prices) for both of these activities. Combined, their growth rate exceeded the average for non-financial services (NACE Sections G to I and Divisions 72 and 74) every year except for 2004. Both of these activities recorded double digit annual growth in 2001, and also in the latest

year available, 2007. Between 2000 and 2007, other business activities averaged growth of 6.9% per annum, and computer and related activities averaged 6.5% per annum: for comparison the non-financial services average was 5.3%. The employment index also followed an upward development. Business services as a whole averaged growth of 4.6% per annum between 1998 and 2007, double the non-financial services average. Employment growth for computer and related activities averaged 5.5% per annum, despite a fall of 0.8% in 2003. This one negative rate of change and the relatively low growth of 1.1% in 2004 were the only years where the rate of change in the employment index for computer and related activities was below the average rate for non-financial services. In contrast, the growth in the employment index for other business activities outstripped the non-financial services average each and every year from 1999 to 2007.

In 2006, a size class breakdown of the EU's business services value added showed that **large enterprises** (with more than 250 persons employed) generated about one third (33.4%) of the total, a somewhat lower share than the non-financial business economy average (42.1%). However, **micro enterprises** (with less than 10 persons employed) brought some 29.1% of value added to the sector in 2006, around 8 percentage points above the non-financial business economy average in 2005. A more detailed analysis, comparing computer and related activities with other business activities, shows that these activities had quite different size structures. Large enterprises played a greater role in computer and related activities, providing 44.6% of value added in 2006, slightly above the non-financial business economy average.

In contrast, in other business activities, large enterprises generated just three tenths (30.5%) of value added, while micro enterprises dominated in this activity with a 32.1% share of value added in 2006, far higher than the equivalent 21.0% (in 2005) for the non-financial business economy. However, an analysis based on employment gives a different picture. Large enterprises classified to the business services sector employed over one third of the sector's workforce, slightly above the non-financial business economy average. In total 7.9 million persons worked for large enterprises in the EU's business services sector in 2006, nearly one in five (18.6%) of all persons working for large enterprises in the non-financial business economy. This high incidence of employment in large enterprises was due in large part to the importance of labour-intensive activities among several of the other business activities, for example industrial cleaning and personnel services.

Employment characteristics

Graph 3: Business services (NACE Divisions 72 and 74) - Employment characteristics, 2007

According to **Labour force survey** data, male employment represented 55.3% of the total number of persons employed in the EU's business services sector in 2007; a share that was 9.6 percentage points lower than that for the non-financial business economy as a whole, but in line with the non-financial services (NACE Sections C to I and K) average. However, among the two NACE divisions that compose the business services sector, male employment was considerably higher (77.3%) for computer and related activities, but much lower (51.0%) for other business activities. The share of the workforce that was male was as low as 39.8% for other business activities in Cyprus, and was below 50% in around half of the Member States. In contrast, in computer and related activities, the lowest share of male employment was 67.8% in Luxembourg, and this share reached as high as 84.8% in the Netherlands. Close to four fifths (78.8%) of those employed in the EU's business services sector worked on a full-time basis, again very similar to the non-financial services average. Once more this average disguised very different characteristics between the two NACE divisions that compose the sector: nine tenths (90.5%) of the computer and related activities' workforce worked full-time, compared with three quarters (76.4%) for other business activities.

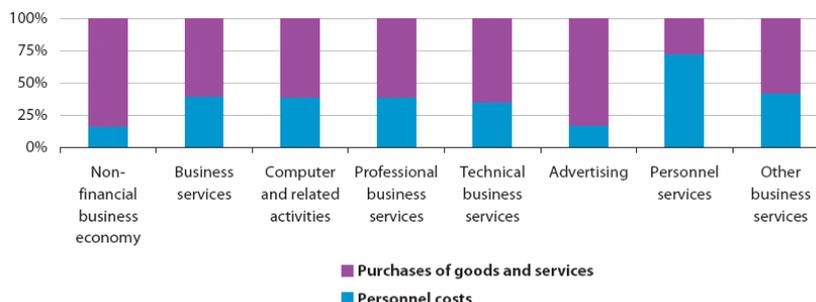

The age structure of the EU's business services workforce was quite similar to that of the non-financial business economy as a whole in 2007, although the proportions of young persons (aged less than 30) and older persons (aged 50 or more) were both somewhat lower in business services, balanced by a slightly higher proportion of those aged between 30 and 49. In the computer and related activities' workforce this age class was significantly more represented, 61.4% compared with 53.7% on average in the non-financial business economy, while the proportion of older persons (12.8%) was considerably below the nonfinancial business economy (21.9%) average.

Expenditure, productivity and profitability

	(EUR million)			(EUR thousand per person)		(%)	
	Personnel costs	Purchases of goods & services	Investment in tangible goods	Apparent labour productivity	Average personnel costs	Wage adjusted labour productivity	Gross operating rate

Source: Eurostat (SBS)

Graph 5: Business services (NACE Divisions 72 and 74) - Labour output and costs, EU-27, 2006 (EUR thousand per capita)

Graph 6: Business services (NACE Divisions 72 and 74) - Gross operating rate, EU-27, 2006 (%)

Gross tangible investment by the EU's business services sector was valued at EUR 66.6 billion in 2006, around 6.4% of all investment in the nonfinancial business economy. Professional business services accounted for two fifths (40.9%) of this total, and computer and related activities a further one fifth (20.1%). Overall the business services sector recorded an investment rate (investment as a percentage of value added) of 7.5% in the EU, less than half the non-financial business economy average. The EU recorded investment rates for most of the subsectors within a narrow range, from 6.8% for advertising to 9.7% for professional business services: the one exception was personnel services that had a very low investment rate, just 1.2%, that was in fact the lowest investment rate of all NACE groups within the EU's non-financial business economy in 2005 or 2006. A very low investment rate was recorded for business services in Luxembourg (1.5%), while none of the Member States recorded an investment rate higher in business services than in the non-financial business economy as a whole. An analysis of operating expenditure for the EU's business services sector shows that close to two fifths (39.5%) was dedicated to personnel costs in 2006, around two and a half times the average share within the non-financial business economy. This share was particularly high for the personnel services subsector, where the share reached 72.6%, while the lowest share was 17.1% for advertising. Average [personnel costs](#) were EUR 31.1 thousand per [employee](#) for business services in the EU in 2006, but this average varied greatly between the subsectors. The lowest average was EUR 19.3 thousand per employee for other business services, while for personnel services the average was only slightly higher, EUR 21.6 thousand per employee. All other subsectors recorded average personnel costs above the non-financial business economy average, reaching their highest level at EUR 51.1 thousand per employee for computer and related activities. A similar pattern could be seen for apparent [labour productivity](#) with the same two subsectors recording the lowest averages and all other subsectors above the non-financial business economy average with computer and related activities at the top of the ranking. However, the overall average for the business services sector was EUR 40.2 thousand of value added per person employed, below the non-financial business economy average of EUR 43.5 thousand per person employed.

The combination of below average apparent labour productivity and above average personnel costs per employee led to a wage adjusted labour productivity ratio of 129.4% for the EU's business services sector in 2006, some 21.8 percentage points below the non-financial business economy average. In fact none of the subsectors recorded a wage adjusted labour productivity ratio above the non-financial business economy in 2006, the highest being 141.5% for advertising, and the lowest being 117.5% for personnel services and 118.2% for technical services. Despite these low ratios, the business services sector recorded a relatively high gross operating rate (ratio of gross operating surplus to turnover) of 17.6% in 2006, significantly higher than the non-financial business economy average of 10.8%. Furthermore, all of the subsectors recorded a rate above the non-financial business economy average, ranging from 11.5% for advertising and 12.2% for personnel services, up to 22.5% for professional business services.

Data sources and availability

The main part of the analysis in this article is derived from structural business statistics (SBS), including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other possible data sources include [short-term statistics](#) and the [Labour force survey](#). In addition, use has also been made of specialist sources for particular areas, notably transport, energy, [research and development](#), environment, tourism and information society statistics.

Context

The freedom to provide services and the freedom of establishment are central principles to the [internal market](#) for services and are set out in the [EC Treaty](#) . They guarantee EU enterprises the freedom to establish themselves in other Member States, and the freedom to provide services on the territory of another EU Member State. The Directive on services in the internal market ([COM \(2006\) 123](#)) aims to achieve a genuine internal market in services, removing legal and administrative barriers to the development of services activities between Member States. The Directive was to be implemented by Member States by the end of 2009 at the latest. As well as covering most [business services](#) (with the notable exception of services of temporary work agencies), the Directive applies to a wide variety of services including industrial and construction activities, as well as distributive trades, hotels and restaurants, travel agents, real estate and renting services.

Many of these services could be performed in-house by enterprises themselves, but purchasing (outsourcing) them from service providers enables them to focus on their core activities, taking advantage of the specialization offered by service providers. As such, an efficient and successful business services sector can contribute to the overall competitiveness of the economy.

Table 4: Motor vehicles and motorcycles distribution (NACE Groups 50.1, 50.2, 50.3 and 50.4). Expenditure and productivity, EU-27, 2006

- The [wholesale](#) , retail and commission sale of:
 - new and used motor vehicles (NACE Group 50.1), including not just passenger cars, but also other passenger vehicles, lorries, trailers and caravans;
 - parts and accessories (NACE Group 50.3);
 - motorcycles (part of NACE Group 50.4).
- The maintenance and repair of motor vehicles (NACE Group 50.2) and motorcycles (the remainder of NACE Group 50.4). This includes all types of repairs (mechanical, bodywork and electrical), spraying and painting, regular servicing, as well as the installation of replacement parts and accessories. Equally, the data presented cover tyre repair and fitting, towing, roadside assistance and car cleaning services.

The renting of motor vehicles is not covered (see [Renting and operational leasing statistics - NACE Rev. 1.1](#)).

Main statistical findings

According to the [European Commission's latest report on car prices](#) , based on figures from the beginning of 2008, pre-tax prices in the [EU-27](#) were lowest in Denmark on average, followed by Estonia. According to the same source, between January 2007 and January 2008, car prices (reflecting actual prices paid by consumers, including VAT and registration taxes) increased by just 0.2% in the EU-27, well below the overall average for consumer prices. Among the large markets (in terms of volume), car prices increased by 2.5% in France (in part due to tax changes), 1.1% in Germany and 0.9% in Italy. Spain (-0.8%) and the United Kingdom (-1.1%) recorded a fall in average car prices.

Structural profile

The EU-27's motor vehicles and motorcycles distribution sector (NACE Groups 50.1 to 50.4) generated EUR 147.8 billion of value added in 2006 from [turnover](#) of over EUR 1.1 trillion. Some 3.7 million persons were employed by the 734.4 thousand enterprises in the motor vehicles and motorcycles distribution sector. In [value added](#) terms, this sector accounted for 91.4% of the value added in motor trades (NACE Division 50), and 88.2% of the persons employed.

Alone, the sale of motor vehicles (NACE Group 50.1) generated just under three fifths (58.8%) of the motor vehicles and motorcycles distribution value added, while the maintenance and repair of motor vehicles (NACE Group 50.2) contributed close to one quarter of the total (24.4%). The same two subsectors were the main contributors to the sector's [employment](#), although the share recorded by the sale of motor vehicles (43.9%) was considerably less than its value added share, while that contributed by the maintenance and repair of motor vehicles (36.7%) was consequently higher. A comparison of these shares indicates the different characteristics of the activities, particularly between the sale of motor vehicles which concerns the sale of expensive capital goods and the maintenance and repair of motor vehicles which provides labour-intensive services.

Germany and the United Kingdom were the two largest Member States in the motor vehicles and motorcycles distribution sector in terms of value added and employment in 2006. While together they accounted for less than one third of the EU-27's employment (32.7%), their combined value added share was close to half (46.5%) the EU-27 total. In particular, Germany had a very high level of value added in this sector, resulting in it being the second most specialised Member State¹⁸ in terms of this sector's contribution to non-financial business economy value added, exceeded only by Latvia.

The [turnover index](#) (in current prices) is presented for the maintenance and repair of motor vehicles and for other activities. These two subsectors followed a similar development between 2001 and 2007, recording uninterrupted year on year growth within the EU-27. Over this six year period, they both averaged growth of about 5% per year.

Expenditure and productivity

Just over two thirds of the EUR 20.7 billion worth of investment made within the EU-27's motor vehicles and motorcycles distribution sector in 2006 was in the sale of motor vehicles subsector, a higher share than this subsector's contribution to value added. The [investment rate](#) for motor vehicles and motorcycles distribution as a whole was 14.0% in 2006, the same rate as for motor trades as a whole. The sale of motor vehicles unsurprisingly had the highest investment rate among the four subsectors, reaching 16.1%, still below the non-financial business economy average of 18.4%. The lowest investment rates were recorded for the subsectors of maintenance and repair of motor vehicles and the sale of motor vehicle parts and accessories, both 10.9%.

Apparent [labour productivity](#) per person employed in the EU-27's motor vehicles and motorcycles distribution sector was EUR 39.5 thousand in 2006 and average [personnel costs](#) were EUR 26.9 thousand, both slightly above the motor trades average. Apparent labour productivity was particularly high for the sale of motor vehicles subsector, at EUR 52.9 thousand per person employed, which was just over double the level recorded in the maintenance and repair of motor vehicles subsector. Average personnel costs were also higher in the EU-27's sale of motor vehicles subsector, but less so than for the apparent labour productivity, resulting in a [wage-adjusted labour productivity ratio](#) (171.2%) that was higher than that of any of the other subsectors of the motor trade sector.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#), including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics \(STS\)](#) and [ACEA](#).

¹⁸Bulgaria, Cyprus, Poland and Romania, 2005; Malta and the Netherlands, not available.

Context

The activities within this sector are very different in terms of the frequency of purchase of the goods and services offered. In contrast to the retail of automotive fuel, the purchase of motor vehicles is usually the result of a long-term process, the collection of information and comparison between different vehicles and different suppliers. However, retailing and repair of motor vehicles are to some extent substitutes, in that the purchase of a replacement vehicle may often be postponed, particularly in times of economic hardship.

The market for vehicles and motorcycles distribution is divided into different segments: passenger cars, motorcycles and caravans are often purchased by households, while large-scale business customers sometimes buy cars directly from manufacturers. However, business customers dominate the market for commercial vehicles and lorries.

[Taxes](#) can influence demand for motor vehicles and motorcycles, including taxes for the registration of a vehicle, as well as annual circulation taxes. The demand for new passenger cars is also closely linked to the general health of the economy, and the sharp decline in overall economic activity witnessed at the time of writing has been reflected in considerable falls in sales of new cars – as shown by the development over time of the number of new car registrations, which indicates a strong downward movement since the end of the third quarter of 2007.

In terms of the environment, the EU strategy for reducing emissions from cars has been based on voluntary commitments by car manufacturers, legislative controls, consumer information (car labelling) and fiscal measures to encourage purchases of more fuel-efficient cars.

Table 3: Manufacture of motor vehicles, trailers and semi-trailers (NACE Division 34). Main indicators, 2006 (1)

*motor vehicles (corresponding to NACE Group 34.1);

- bodies for motor vehicles, trailers and semi-trailers (NACE Group 34.2);
- parts and accessories for motor vehicles and their engines (NACE Group 34.3).

The article does not cover the manufacture of tyres (see [Rubber and plastics production statistics - NACE Rev. 1.1](#)), nor that of batteries or other electrical equipment used in motor vehicles (see [Electrical machinery and](#)

Main statistical findings

According to [VDA](#) , the [EU-25](#) produced 28.5% of the world's passenger cars in 2007 a slightly larger share than the three [NAFTA](#) countries (24.9%), but less than the Asian total of 36.4%. For information on the retail sale (rather than production) of motor vehicles please refer to the article on [\[Motor and fuel retail trade statistics\]](#).

Structural profile

The [EU-27](#) 's motor vehicles, trailers and semi-trailers (NACE Division 34) sector consisted of 18.4 thousand [enterprises](#) which generated EUR 144.0 billion of value added in 2006, which equated to 73.9% of the transport equipment manufacturing (NACE Subsection DM) total. Its share of the transport equipment manufacturing workforce was less, at 70.9%, implying a higher than average apparent [labour productivity](#) . Within this sector, the motor vehicles manufacturing subsector (NACE Group 34.1) generated 61.0% of EU-27 sectoral [value added](#) , motor vehicle parts and accessories manufacturing (NACE Group 34.3) a further 33.3%, and the manufacture of bodies, trailers and semi-trailers (NACE Group 34.2) the remaining 5.7%; in [employment](#) terms the share of motor vehicles manufacturing was considerably lower and that of the other two subsectors higher.

As already noted, Germany dominated transport equipment manufacturing in general, and this was particularly true for the manufacture of motor vehicles, trailers and semi-trailers where it generated close to half (47.4%) of the EU-27's value added in 2006. Within the subsector of the manufacture of motor vehicles (NACE Group 34.1), Germany's share rose to 50.9% of EU-27 value added, while for the motor vehicle parts and accessories manufacturing subsector Germany's share was 44.6%; among the [non-financial business economy](#) NACE groups for which data are available these were respectively the third and fifth highest shares Germany recorded in the EU-27 total. Unsurprisingly, Germany was the most specialised Member State regarding the manufacture of motor vehicles, trailers and semi-trailers, as this sector contributed 5.9% of German non-financial business economy (NACE Sections C to I and K) value added. Looking in more detail, Slovenia and Sweden recorded a particularly high specialisation in the manufacture of bodies, trailers and semi-trailers, and the Czech Republic and Hungary in the manufacture of motor vehicle parts and accessories.

[Output](#) from the manufacture of motor vehicles, trailers and semi-trailers in the EU-27 increased each and every year between 1997 and 2007, with 5.8% growth in the latest year available (2007), which was above the latest ten-year average of 4.4% per year.

Expenditure and productivity

Gross [tangible investment](#) in the motor vehicles, trailers and semi-trailers manufacturing sector was EUR 25.7 billion in 2006, 81.4% of all investment in transport equipment manufacturing. The [investment rate](#) of 17.9% was above the industrial average, and the highest among the transport equipment manufacturing activities. Within this sector investment rates varied greatly from just 9.1% for the manufacture of bodies, trailers and semi-trailers subsector to 20.4% for the motor vehicles manufacturing subsector. Slovakia recorded an investment rate of 97.4% in this sector, closely followed by Slovenia with a rate of 82.4%.

[Personnel costs](#) accounted for 14.2% of [operating expenditure](#) in the EU-27's motor vehicles, trailers and semi-trailers manufacturing sector in 2006, which was the lowest share within transport equipment manufacturing. For the motor vehicles manufacturing subsector the share was particularly low, at 12.1%. Average personnel costs in the motor vehicles, trailers and semi-trailers manufacturing sector were EUR 47.6 thousand per employee, but this average disguised great differences between the subsectors. Average personnel costs for the motor vehicles manufacturing subsector were EUR 59.0 thousand per employee, the fourth highest average personnel costs in 2005 or 2006 among all of the NACE groups within the non-financial business economy; average personnel costs were at least EUR 22.0 thousand per employee lower in the other two subsectors. This disparity was reflected in the apparent labour productivity recorded for each subsector, which was EUR 79.7 thousand per person employed for the motor vehicles manufacturing subsector and was at least EUR 29.0 thousand per person employed lower in the other two subsectors. Despite these big differences, all three subsectors recorded

relatively similar [wage-adjusted labour productivity ratios](#) , with the motor vehicles, trailers and semi-trailers manufacturing sector as a whole recording a ratio of 135.3%. Several of the [Member States that joined the EU in 2004](#) recorded particularly high wage-adjusted labour productivity ratios in this sector, notably Hungary and Poland (2005) where the latest figures available rose to over 300%.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics \(STS\)](#) , the [PRODCOM](#) statistics on the production of manufactured goods and [VDA \(Verband der Automobilindustrie\)](#) .

Context

The transport equipment manufacturing sector is central to economic development, as it provides the means for transporting both individuals and goods. Demand for transport equipment has risen as the volume of goods transported and the distance travelled by passengers have expanded greatly – see the article on [transport and storage statistics](#) for information on transport flows.

The issue of sustainable development is likely to play an important role in future product developments, as transport equipment manufacturers try to meet demands for more environmentally friendly transport solutions, for example, engines with lower fuel consumption or emissions.

Most transport equipment manufacturing activities are structured on the basis of complex pyramidal relationships between major manufacturers and several tiers of component suppliers, ranging from systems suppliers down to very small, specialised manufacturers that may provide a single component for a vehicle. It is common to find clusters of enterprises concentrated in regions around the leading producers.

In December 2005 the [European Commission](#) published a ten year strategy for the EU's car sector put forward by the ' [CARS 21 High Level Group](#) '. In October 2008 a conference based on a mid-term review of the strategy was held to focus on actions to foster a competitive European car industry. This recommended: a supportive regulatory framework and better regulation; basing future policy to reduce carbon dioxide emissions from road transport on an integrated approach involving motor vehicles, fuels, consumers/drivers and infrastructure; increased trade liberalisation, provided this is achieved on the basis of mutual benefit.

Reducing emissions remain a major issue for all types of vehicle manufacturing. In December 2007 the European Commission adopted a proposal ([COM\(2007\) 856](#)) for setting emission performance standards for new passenger cars. The aim is to introduce binding requirements on car manufacturers to reduce carbon dioxide emissions, while at the same time trying to reduce emissions in other ways, for example, through changes in fuels, tyres and other components impacting fuel consumption. After the adoption of new standards (referred to as Euro 5 and 6) to reduce the emissions of new passenger cars and light commercial vehicles in 2007, the European Commission adopted in December 2007 a proposal ([COM\(2007\) 851](#)) for standards (referred to as Euro VI) for heavy duty vehicles. Compared to the Euro V standards, emissions of nitrogen oxides from lorries and buses should be reduced by 80% and particulate matter by 66%. In January 2009 a [Regulation](#) of the [European Parliament](#) and of the [Council](#) was adopted on the type-approval of hydrogen-powered motor vehicles, aiming to simplify the marketing of clean and safe hydrogen vehicles.

The motor vehicles, trailers and semi-trailers manufacturing sector is characterised by a structure that is dominated by enterprises belonging to a few very large enterprise groups. These are supported by partners and contractors who deliver systems, parts and accessories. Demand for vehicle parts and accessories is divided between that for original equipment (OE) which is supplied directly to motor vehicle manufacturers, and that for the after-market (AM) as used for the upkeep, repair and modification of vehicles. Larger vehicle parts suppliers tend to cluster around their major customers.

Cement and concrete production statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). The present article covers cement and concrete production, which is part of the [other non-metallic minerals](#) sector. The activities covered in this article correspond to two different [NACE Rev 1.1](#) groups, which are:

- the manufacture of cement, lime and plaster (NACE Group 26.5);
- the manufacture of articles made from concrete, plaster and cement (NACE Group 26.6).

	Enterprises (thousand)	Turnover (EUR million)	Value added (EUR million)	Persons employed (thousand)	Share in total (%)

Table 3: Manufacture of cement, lime and plaster; manufacture of articles of concrete, plaster, cement (NACE Groups 26.5 and 26.6). Expenditure, productivity and profitability, EU-27, 2006

The EU-27's cement and concrete manufacturing sector (NACE Groups 26.5 and 26.6) comprised 27.3 thousand enterprises in the Member States in 2006, which employed 545.2 thousand persons or the equivalent of about one person in every three (34.4%) of those working in the activities of other non-metallic mineral products manufacturing (NACE Division 26). From a turnover of EUR 113.2 billion in 2006, the cement and concrete manufacturing sectors of the Member States together generated a total added value of EUR 35.4 billion, which represented 44.3% of the value added created by all the activities of other non-metallic mineral products manufacturing in the EU-27. The cement, lime and plaster subsector was the smallest of the two subsectors in cement and concrete manufacturing, as it generated 29.9% of sectoral value added and employed 15.0% of the workforce.

Among the Member States for which data are available¹⁹, the cement and concrete manufacturing sector in Spain was the largest, contributing 15.7% of EU-27 value added in 2006. It was marginally bigger than in Germany (14.9% of EU-27 value added) and Italy (14.0%), with France (12.3%) and the United Kingdom (10.6%) a little smaller still. Cyprus, Bulgaria, Romania (all 2005) and Greece were relatively specialised²⁰ in the manufacture of cement and concrete, the contribution of this sector to the value added generated across their respective non-financial business economies being between two and three times the EU-27 average.

Between 1997 and 2007, the EU-27's production index for cement, lime and plaster closely followed the development for industry (NACE Sections C to E) as a whole, including a temporary levelling off in output in 2001 and 2002. This short period of stability in the production index for cement, lime and plaster contrasted with cutbacks in the output of articles of concrete, plaster and cement in the same two years and explains much of the difference in the rate of growth in the two indices over the ten years through to 2007 (an average 2.2% per year compared with 1.7% per year).

Expenditure and productivity

A little over two fifths (42.8%) of the tangible investment made within other non-metallic mineral products manufacturing activities of the EU-27 in 2005 was invested within the cement and concrete sector. Tangible investment in the sector of EUR 5.6 billion in 2005 was the equivalent of 17.8% of the added value generated in this sector, an almost identical investment rate to that for other non-metallic mineral products manufacturing as a whole in 2005.

Although average personnel costs of EUR 33.9 thousand per employee within the EU-27's cement and concrete manufacturing sector were just over one tenth higher than the average for other non-metallic mineral products manufacturing in 2006, they accounted for a lower share of operating expenditure (18.3% compared with 21.6%).

On average, each person employed within the EU-27's cement and concrete manufacturing sector generated EUR 64.9 thousand of added value in 2006, almost 30% more than the average for the manufacture of other non-metallic mineral products. Even when adjusting productivity for personnel costs, the resulting wage-adjusted labour productivity ratio (191.4%) of the EU-27's cement and concrete manufacturing sector remained much higher than the corresponding ratio (164.5%) for the manufacture of other non-metallic mineral products in 2006. The wage-adjusted labour productivity ratio (290.9%) of the EU-27's cement, lime and plaster manufacturing subsector was significantly higher than that for the manufacture of articles of concrete, plaster and cement subsector (167.5%), and was the third highest ratio among all of the manufacturing NACE groups in 2006, lower only than the reproduction of recorded media (NACE Group 22.3) and the manufacture of refined petroleum products (NACE Group 23.2).

¹⁹Belgium and Poland, 2005; Denmark, Estonia, Latvia, Luxembourg, Malta, the Netherlands and Austria, not available.

²⁰Belgium, Bulgaria, Cyprus, Poland and Romania, 2005; Denmark, Estonia, Latvia, Luxembourg, Malta, the Netherlands and Austria, not available.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics \(STS\)](#) and the [PRODCOM](#) statistics on the production of manufactured goods.

Context

The processes of transforming mineral raw materials such as clay, lime, sand or stone into other non-metallic mineral products (for use, among others, by construction, food and beverages manufacturing, or households in the form of consumer durables) tend to be energy-intensive. Indeed, energy costs accounted for 9.5% of the purchases of goods and services in the EU's other non-metallic mineral products manufacturing sector in 2006, the second highest ratio after non-energy mining and quarrying (NACE Subsection CB) among the industrial structural business statistics sectors. Within this sector, the share of energy costs in purchases of goods and services reached 14.9% for the EU-27

's ceramic goods and clay products manufacturing subsector.

Current policy initiatives are focused on environmental impacts, energy strategies, and health and safety. Under the Competitiveness and Innovation Programme (CIP), independent consultants delivered studies to the [European Commission's Directorate-General for Enterprise and Industry](#) on the competitiveness of the ceramics and glass sectors in October 2008.

Challenges were identified, including ensuring the availability of energy and raw materials at affordable prices, the need to minimise energy waste, reduce energy use, as well as maintaining emissions within targets and removing tariff and non-tariff international barriers to trade. Suggested areas of development were a focus on the high quality and high value products end of the market, investment in cleaner technologies and environmental management systems, investment in more efficient and flexible automation technologies, improved and more targeted skills training programmes and efforts at a policy level to establish EU environmental regulations on a global platform.

The production of cement is a two-step process that involves producing a clinker from raw materials (mainly limestone and clay) that is heated within a kiln at an intense heat, before being cooled at 100oC – 200oC. In a second step, gypsum and sometimes additions like coal fly ash are added to the clinker and ground to a fine cement powder. Concrete is a solid material that is made of cement, mixed with water, aggregates, sand and usually some admixtures.

Notes

Ceramic and clay production statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). The present article covers ceramic and clay production, which is part of the [other non-metallic minerals](#) sector. The activities covered in this article correspond to three different [NACE Rev 1.1](#) groups, which are the manufacture of:

- ceramic goods other than for construction (NACE Group 26.2), which comprises refractory ceramic products and non-refractory ceramic goods for purposes other than construction;
- ceramic tiles and flags (NACE Group 26.3);
- clay construction products (NACE Group 26.4), which includes bricks, tiles and other construction products made of clay.

	Enterprises (thousand)	Turnover (EUR million)	Value added (EUR million)	Persons employed (thousand)	Share in total (%)	
					Value added	Persons employed
Ceramic and clay products (2)	21.0	39 074	15 572	368.4	100.0	100.0
Ceramic goods other than for construction purposes	16.2	17 273	6 600	191.9	42.4	52.1
Ceramic tiles and flags (2)	1.8	13 076	4 602	93.5	29.5	25.4
Clay bricks, tiles and construction products	3.0	10 657	4 371	83.0	28.1	22.5

Source: Eurostat (PRODCOM)

Table 2: Ceramic and clay products (CPA Groups 26.2 to 26.4). Production of selected products, EU-27, 2007 (1)

The market for ceramic and clay products is principally driven by the construction sector, for which bricks and tiles are used during the general construction phase and as wall and floor coverings, as well as sanitary ware in completion and installation stages.

Structural profile

The manufacture of ceramic and clay products (NACE Groups 26.2 to 26.4) was the main activity of about 21.0 thousand enterprises within the EU-27 in 2006. These enterprises employed 368.4 thousand people in the Member States, a little less than one in every four (23.2%) of the other non-metallic mineral products manufacturing (NACE Division 26) workforce. The EU-27's ceramic and clay products manufacturing sector generated EUR 15.6 billion of value added in 2006 (one fifth of the value added across the activities of other non-metallic mineral products manufacturing), the largest contribution (42.4%) of which came from the ceramic goods other than for construction (NACE Group 26.2) manufacturing subsector, the remainder coming relatively evenly from the manufacture of ceramic tiles and flags (NACE Group 26.3) and the manufacturing of clay construction products (NACE Group 26.4) subsectors.

The value added generated by the ceramic and clay products manufacturing sector in Italy was EUR 3.7 billion in 2006, a little less than one quarter (23.9%) of the value added generated by the ceramic and clay products manufacturing sectors in the EU-27. The next largest contributions of value added came from Spain (18.6%) and Germany (16.1%). Among those Member States with available data²¹, Italy, Hungary and Spain were the countries that were most specialised in ceramic and clay products manufacturing in value added terms.

There were contrasting developments in the production indices of the three NACE groups that comprise ceramic and clay products manufacturing. After rises in 1997 and 1998, there was then a relatively steady downward trend in the EU-27's output of ceramic tiles and flags through until 2007, the average rate of decline over the ten years being -1.0% per year. There was also a clear downward trend in the EU-27's output of ceramic goods other than for construction purposes during the same period, despite upturns in 2000, 2004 and 2007, the average rate of decline being -1.5% per year. The development of the production index for clay construction products, however, was similar to the development for other non-metallic mineral products as a whole, albeit with more exaggerated rises from 1998 through to 2000 and again after 2002, and steeper falls in 2001 and 2002.

²¹ Belgium, Bulgaria, Cyprus and Poland, 2005; the Czech Republic, Denmark, Estonia, Latvia, Luxembourg, Malta, the Netherlands, Austria, Portugal, Romania, Slovenia and Sweden, not available.

Expenditure and productivity

Tangible investment in the EU-27's ceramic goods and clay products sector was valued at EUR 2.7 billion in 2006, corresponding to 17.7% of tangible investment across all the activities of other non-metallic mineral products manufacturing. In comparison to the value added generated by the ceramic goods and clay products sector in 2006, this level of tangible investment corresponded to an **investment rate** of 17.3%, somewhat lower than the average rate (19.1%) for other non-metallic mineral products manufacturing.

Average **personnel costs** across the EU-27's ceramic goods and clay products sector were EUR 27.3 thousand per employee in 2006, about 10% less than the average for other non-metallic mineral products manufacturing activities. However, personnel costs accounted for a relatively high proportion (28.7% in 2005) of operating expenditure. Personnel costs accounted for a slightly higher share (29.3%) of operating expenditure in the ceramic goods other than for construction subsector, despite lower average personnel costs (EUR 25.2 thousand per employee), suggesting that this subsector was relatively labour-intensive.

The average added value generated by each person employed within the EU-27's ceramic goods and clay products sector was EUR 42.3 thousand in 2006, which was the equivalent of EUR 8.0 thousand less per person than the average for all workers within other non-metallic mineral products manufacturing. Although average personnel costs were also lower, the **wage-adjusted labour productivity ratio** of 154.7% for the EU-27's ceramic goods and clay products sector remained below the average ratio (164.5%) for all other non-metallic mineral products manufacturing in 2006. Within the ceramic goods and clay products sector, there was a wide spread in wage-adjusted labour productivity ratios, ranging from 136.6% for the ceramic goods other than for construction manufacturing subsector to 196.3% for the manufacturing of clay construction products subsector.

Data sources and availability

The main part of the analysis in this article is derived from **structural business statistics (SBS)**, including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include **short-term statistics (STS)** and the **PRODCOM** statistics on the production of manufactured goods.

Context

The processes of transforming mineral raw materials such as clay, lime, sand or stone into other non-metallic mineral products (for use, among others, by construction, food and beverages manufacturing, or households in the form of consumer durables) tend to be energy-intensive. Indeed, energy costs accounted for 9.5% of the purchases of goods and services in the EU's other non-metallic mineral products manufacturing sector in 2006, the second highest ratio after non-energy mining and quarrying (NACE Subsection CB) among the industrial structural business statistics sectors. Within this sector, the share of energy costs in purchases of goods and services reached 14.9% for the EU-27's ceramic goods and clay products manufacturing subsector.

Current policy initiatives are focused on environmental impacts, energy strategies, and health and safety. Under the Competitiveness and Innovation Programme (CIP), independent consultants delivered studies to the **European Commission's Directorate-General for Enterprise and Industry** on the competitiveness of the ceramics and glass sectors in October 2008.

Challenges were identified, including ensuring the availability of energy and raw materials at affordable prices, the need to minimise energy waste, reduce energy use, as well as maintaining emissions within targets and removing tariff and non-tariff international barriers to trade. Suggested areas of development were a focus on the high quality and high value products end of the market, investment in cleaner technologies and environmental management systems, investment in more efficient and flexible automation technologies, improved and more targeted skills training programmes and efforts at a policy level to establish EU environmental regulations on a global platform.

Notes

Chemicals manufacturing at regional level

Data from March 2008, most recent data: Further Eurostat information, Main tables and Database .

What effects do the economic and regional policies of the [European Union \(EU\)](#) have on the business structure of the regions? Which sectors are growing, which sectors are contracting and which regions are likely to be most affected by policy decisions? What are the differences in investment levels and wages and what effects will this have on growth and the future location of business?

A detailed analysis of the structure of the European economy can only be made at regional level. Regional [structural business statistics](#) provide data with a detailed activity breakdown which can be used for this kind of analysis. This article analyses the activity in the chemicals manufacturing sector in Europe in detail.

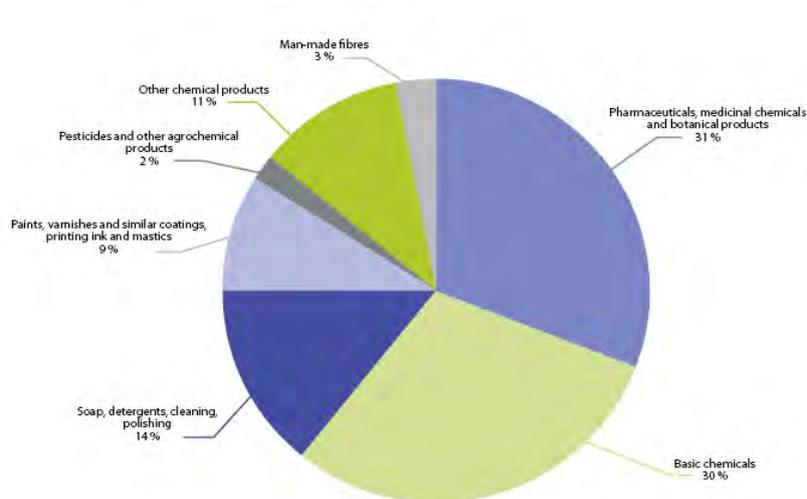

Figure 1: Employment in manufacture of chemicals and chemical products (NACE division 24) by subsector, EU, 2005 - Percentage of sectoral total

Main statistical findings

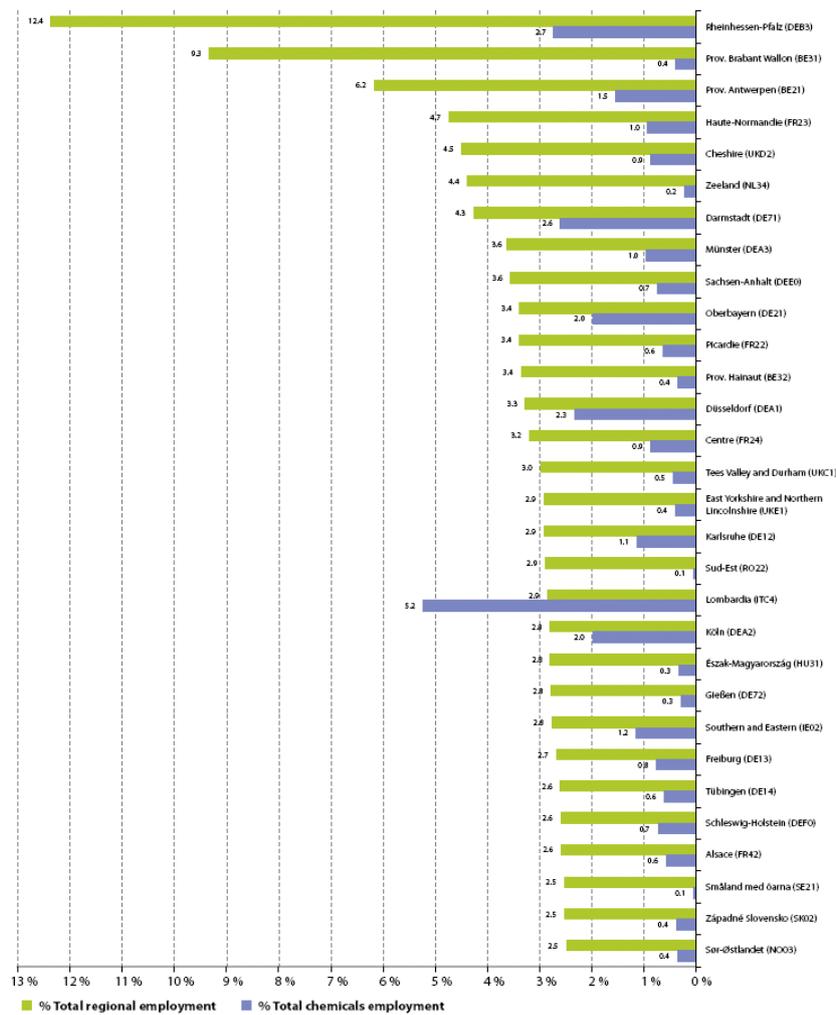

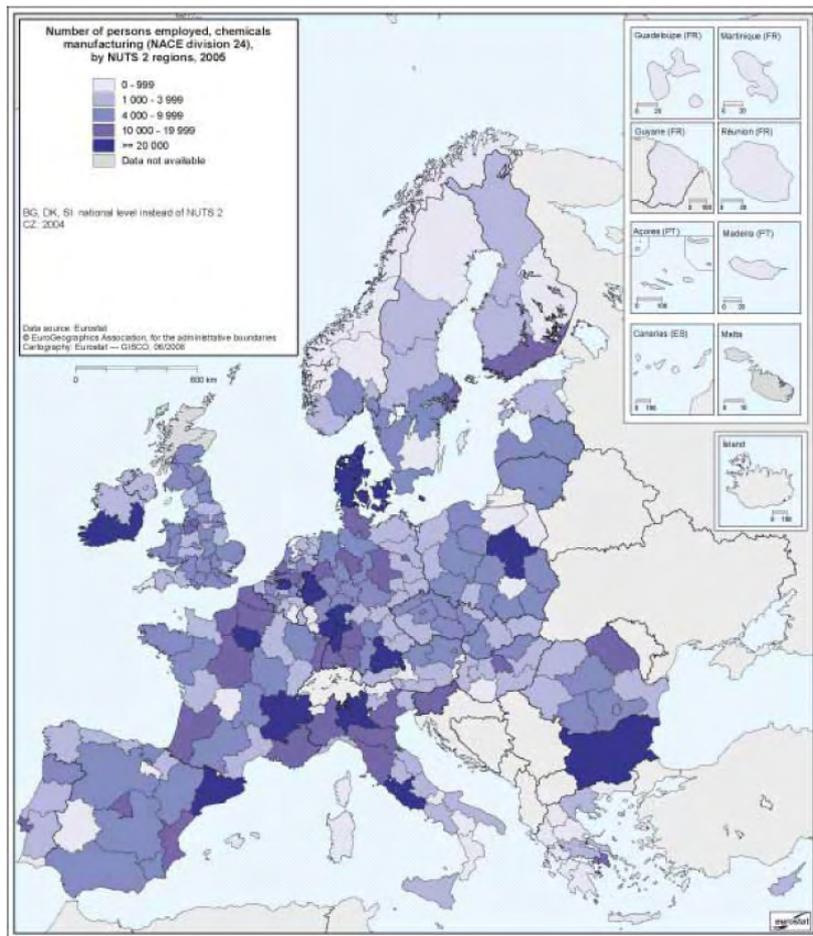

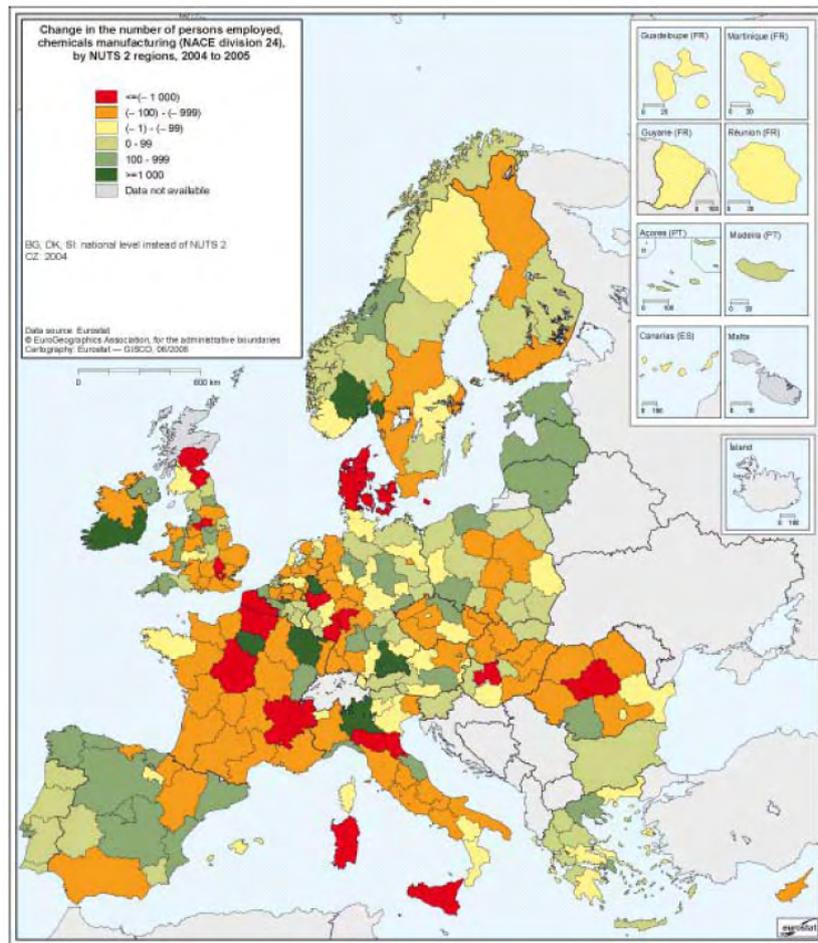

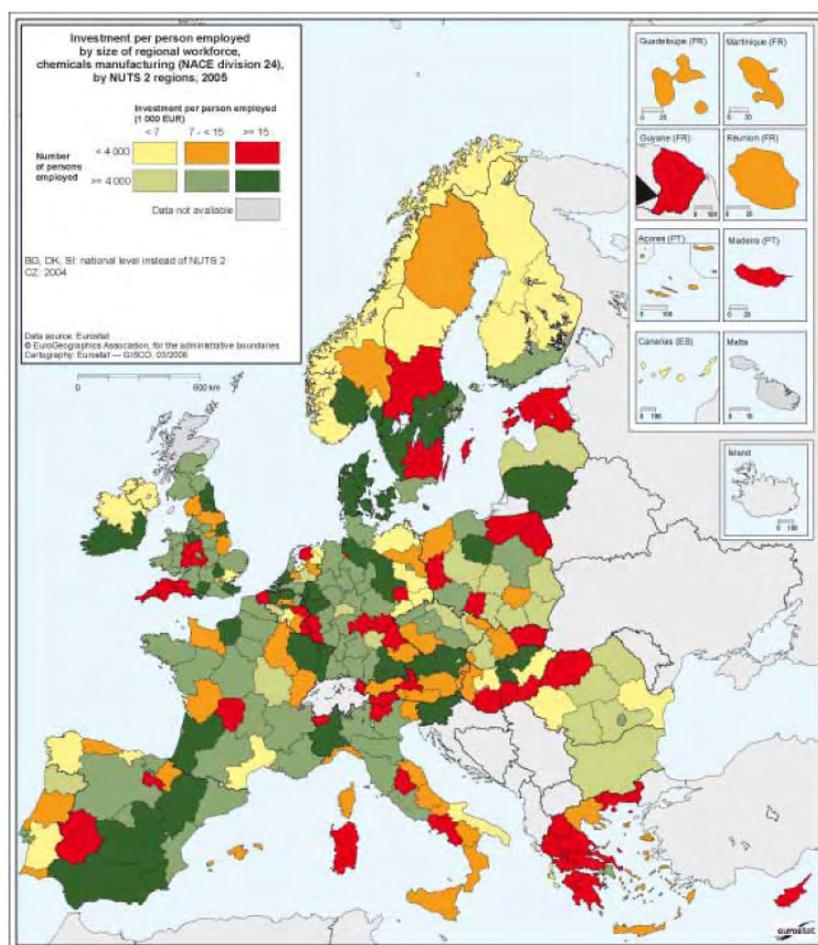

Figure 2: 30 most specialised regions in chemicals manufacturing, EU and Norway, 2005 - Share of non-financial business economy employment of the region and the region's share of total chemicals manufacturing employment, in percentage

Map 1: Number of people employed, chemicals manufacturing (NACE division 24), by NUTS 2 regions, 2005

Map 2: Change in the number of people employed, chemicals manufacturing (NACE division 24), by NUTS 2 regions, 2004 to 2005

Map 3: Investment per person employed by size of regional workforce, chemicals manufacturing (NACE division 24), by NUTS 2 regions, 2005

This article focuses on chemicals manufacturing (NACE division 24), where raw materials, particularly oils and minerals, are transformed into a wide variety of substances which are used as inputs by many downstream economic sectors and in a wide variety of consumer products. Chemicals manufacturing, dominated by the manufacturing of pharmaceuticals and basic chemicals (see Figure 1), was the fifth largest manufacturing activity (NACE division) in terms of employment in the EU in 2005. It also had the second highest labour productivity in terms of value added per person employed .

While employment in chemicals manufacturing has decreased steadily in the EU over the last decade, production has increased steadily; the figures being -8% and +22% respectively in total between 2000 and 2007, according to short-term statistics. This indicates a considerable increase in productivity in the period. Chemicals manufacturing is a sector dominated by large enterprises. Small and medium-sized enterprises (SMEs) , with fewer than 250 employees, accounted for only one-third of the workforce in the EU in 2005, compared with close to 60% in manufacturing as a whole and around two-thirds in the total non-financial business economy . The European enterprises within this sector account for about 30% of global chemicals sales and include many of the world's largest enterprises (groups)²².

Regions specialised in chemicals manufacturing

Figure 2 shows the 30 regions that are most specialised in chemicals manufacturing in 2005 in terms of this activity's share of total non-financial business economy employment. The most specialised region was Rhineland-Pfalz (Germany), where 12.4% of all people employed in the region worked in chemicals manufacturing. Five of the 10 most specialised regions in chemicals manufacturing were in Germany, two of the top four were in Belgium, and there were also several highly-specialised regions in France and the United Kingdom. Only three

²²Source: CEFIC and Chemical and Engineering News in European business: Facts and Figures, 2007 edition, Eurostat (2008).

of the 30 most specialised regions were in [Member States that joined the EU in 2004 or 2007](#) , namely Sud-Est in Romania, Észak-Magyarország in Hungary and Západoň Slovensko in Slovakia. Figure 2 also shows the share accounted for by these regions in total chemicals employment in the EU and Norway.

Many of the regions shown were also among those with the largest workforces, including 15 of the 30 largest regions in terms of employment in 2005, which encompassed nine of the 14 regions with a workforce over 20000 people. This includes Lombardia in Italy, the region with the largest workforce of all, alone accounting for 5.2% of total chemicals employment in the EU and Norway in 2005. However, the figure also includes several smaller-sized regions where chemicals manufacturing accounted for a large proportion of regional employment, but where the region's actual share of total chemicals employment was rather small.

By far the largest difference in relative terms concerned the second and sixth most specialised regions: Brabant Wallon in Belgium and Zeeland in the Netherlands, where chemicals manufacturing accounted for 9.3% and 4.4% respectively of regional employment in 2005. This was, respectively, 23 and 18 times their contribution to total chemicals employment in the EU and Norway (0.4% and 0.2%).

Map 1 shows the relative size of the chemicals manufacturing workforce in the regions of the EU and Norway in 2005. As can be seen, this activity was relatively well dispersed throughout the EU, but with a sizeable part located in central Europe: particularly in western Germany, northern Italy, France, Belgium and the Netherlands. The regions with the largest chemicals manufacturing workforces in 2005 were Lombardia in northern Italy (with 96000 people employed), Île-de-France (81000) in France and Cataluña in Spain (62000), followed by five regions in southern and western Germany: Rheinhessen-Pfalz (50000), Darmstadt (48000), Düsseldorf (43000), Köln (37000) and Oberbayern (36000).

Trends in employment

Between 2004 and 2005, employment in chemicals manufacturing increased in 105 regions, decreased in 156 regions and was unchanged in four regions (see Map 2). In total, employment among the regions shown decreased by 20600 people employed, or 1.1%. There is some evidence of an increase in the regional concentration of employment in chemicals manufacturing. In France and Italy, employment has risen substantially in the regions with the largest workforce while, at the same time, it has fallen in almost every other region. As a consequence, the leading regions have significantly increased their share of total national employment in the sector: from 23.5% in 2004 to 30.9% in 2005 in the capital region of France, and from 45.7% to 48.8% in Lombardia in Italy. In addition, an analysis of the employment trend based on the employment size-classes used in Map 1 shows that employment decreased in all classes, except the class containing the regions with the largest workforces. The 16 regions with a chemicals workforce of over 20000 people employed in 2005 recorded a total net increase of 19300 persons employed (+ 3.0%) between 2004 and 2005.

Employment in regions with a workforce of between 10000 and 19999 decreased by 3.2%, with a decrease of 2.4% in regions with a workforce of between 4000 and 9999. The largest relative decline in chemicals employment occurred in regions with the smallest workforces: 1000 to 3999 persons employed (-5.7%) and below 1000 persons employed (-5.0%). Five of the eight regions with an increase in employment of more than 1000 people were among the regions with the largest workforces in 2005:

- Île-de-France, the area around Paris in France, with an increase of 21000 persons employed,
- Lombardia in Italy (+ 5300);
- Düsseldorf in Germany (+ 2100);
- Oberbayern. also Germany (+ 1300);
- Southern and Eastern in Ireland (+ 1200).

The other three regions had a relatively small chemicals workforce in 2005, despite growth of between 15% and 25%:

- Prov. Brabant Wallon in Belgium (+ 1900);

- Lorraine in north-eastern France (+ 1300);
- Sør-Østlandet in southern Norway (+ 1100).

Chemicals employment decreased by over 1000 people in 19 regions: five of these were in the United Kingdom, four in France, three each in Germany and Italy, one each in Belgium, Hungary and Romania, and also Denmark (considered here as one region). The largest decrease was recorded in Picardie in north-western France (-3400 people), followed by Köln in Germany (-3000) and Brussels Hoofdstedelijk Gewest/Région de Bruxelles-Capitale in Belgium (-2600).

Investment trends

Investment and growth are correlated at the macro level, but not necessarily in terms of employment creation, as investments in new machinery and equipment could reduce the need for labour input. Map 3 shows how much was invested, on average, per person employed in chemicals manufacturing in 2005 in each region, with regions classified in one of two categories according to the size of the chemicals workforce: below 4000 people employed, or 4000 and above. It should be noted that data have not been adjusted to take into account differences in purchasing power between regions, which generally are significantly lower in the [Member States that joined the EU in 2004 and 2007](#).

The highest investments relative to the size of the workforce in chemicals manufacturing were recorded in Åland (Finland) and in Ionia Nisia (Greece), but these were among the regions with the smallest workforces, which means that, in euro terms, investments were actually among the smallest of all the regions. Among the regions with over 4000 people working in chemicals manufacturing, the highest investment rate was recorded in Sør-Østlandet in Norway with EUR 42100 per person employed, followed by Észak-Magyarország in Hungary with EUR 38400, and Cheshire in the United Kingdom with EUR 36800. Five of the 16 regions with over 20000 persons employed in chemicals manufacturing had an investment rate of over EUR 15000 per person employed. These were:

- Southern and Eastern in Ireland (EUR 33800);
- Oberbayern in Germany (EUR 20800);
- Denmark, considered as one region (EUR 19700);
- Köln in Germany (EUR 16300);
- Prov. Antwerpen in Belgium (EUR 15300).

The investment rate tended to be higher on average in regions which experienced an increase in employment. Regions where employment decreased in 2005 recorded an investment rate of EUR 12900 per person employed on average. This is somewhat lower than the investment rate in regions where employment increased (EUR 13300). The difference is greater between the 20 regions with the largest increase and decrease in employment: being EUR 14700 and EUR 12500 respectively.

Furthermore, the averages for both sets of regions with an increase in employment are strongly affected by the relatively moderate investments per person employed in the two regions with the largest workforces: Lombardia in Italy (EUR 11900) and the French capital region (EUR 10200). If these two regions are excluded, the average investments per person employed for regions with an increase in employment would be EUR 14000, while the average for the top 20 regions would be as high as EUR 17500.

Data sources and availability

Regional structural business statistics (SBS) are collected within the framework of a Council and Parliament regulation, according to the definitions and breakdowns specified in the Commission regulations implementing it. The data cover all the EU Member States and Norway. Data for Bulgaria are only presented at the national level as, at the time of writing, data are only available according to pre-accession regional breakdowns. Most data series are continuously updated and revised where necessary. This article reflects the data situation in

March 2007.

Structural business statistics are presented by sectors of activity, according to the NACE Rev. 1.1 classification, with a breakdown to the two-digit level (NACE divisions). The data presented here are restricted to the [non-financial business economy](#). The non-financial business economy includes sections C (mining and quarrying), D (manufacturing), E (electricity, gas and water supply), F (construction), G (wholesale and retail trade), H (hotels and restaurants), I (transport, storage and communication) and K (real estate, renting and business activities). It excludes agricultural, forestry and fishing activities and public administration and other non-market services (such as education and health, which are currently not covered by the SBS), as well as financial services (NACE section J), which for the time being are collected on a voluntary basis only. These activities together accounted for around 30% of the total EU value added and 38% of employment in 2005, according to national accounts. They could, however, represent a substantially larger share in certain regions.

The [observation unit](#) for the regional SBS data is the [local unit](#), which is an enterprise or part of an enterprise situated in one geographically identified place. Local units are classified into sectors (by NACE) according to their main activity. At national level, the statistical unit is the enterprise. An enterprise can consist of several local units. It is possible for the principal activity of a local unit to differ from that of the enterprise to which it belongs. Hence, national and regional structural business statistics are not entirely comparable. It should be noted that, in some countries, the activity code assigned is based on the principal activity of the enterprise in question.

Regional data are available at the NUTS 2 level for a limited set of variables: the number of local units, wages and salaries, the number of people employed and investments in tangible goods. The latter variable is collected on an optional basis, except for Industry (NACE sections C to E), which results in a more limited availability of data than for the other variables. Below is a summary of the definitions of the variables presented in this publication:

Number of persons employed : The total number of people who work (paid or unpaid) in the observation unit, as well as people who work outside the unit who belong to it and are paid by it. It includes working proprietors, unpaid family workers, part-time workers, seasonal workers, etc.

Gross investment in tangible goods : All new and existing tangible capital goods, whether bought from third parties or produced for own use, having a useful life of more than one year, including non-produced tangible goods, such as land. Also included are all additions, alterations, improvements and renovations which prolong the service life or increase the productive capacity of capital goods.

Wages and salaries : The total remuneration, in cash or in kind, payable to all people on the payroll (including home workers) in return for work done during the accounting year. Wages and salaries include the value of any social contributions, income taxes, etc., payable by the employee, even if they are paid directly by the employer. Wages and salaries do not include social contributions payable by the employer.

Context

Regional structural business statistics offer a detailed, harmonised data source for users who want to know more about the structure and development of the regional business economy. This article has shown how some of these data can be used to analyze different regional business characteristics. These are many more examples. As more time series become available, it will be possible, for example, to study changes in specialisation or concentration patterns across regions. Further horizontal studies can also be carried out where regional structural business statistics are used in combination with other sources to increase the understanding of the factors affecting the regional business economy and the driving forces behind structural changes.

Notes

Civil engineering statistics - NACE Rev. 2

Data from April 2012. Most recent data: Further Eurostat information, Main tables and Database .

This article presents an overview of statistics for the civil engineering sector in the [European Union \(EU\)](#) , as covered by [NACE Rev. 2](#) Division 42. Like buildings, civil engineering projects typically take much longer from conception to completion than most other products in different sectors. Civil engineering projects are often a key factor in urban regeneration, and also in maintaining or developing transport and communication infrastructure. However, the civil engineering sector is particularly cyclical as it is strongly influenced by government programmes, which in turn fluctuate as a function of government policies.

	Value
Main indicators	
Number of enterprises (1 000)	100
Number of persons employed (1 000)	1 701
Turnover (EUR million)	260 023
Purchases of goods and services (EUR million)	190 682

Table 4b: Key indicators, civil engineering (NACEDivision42), 2009 - Source: Eurostat (sbs_na_con_r2)

Main statistical findings

Structural profile

There were 100.3 thousand enterprises in the EU-27's civil engineering sector (Division42) in 2009. Civil engineering enterprises employed 1.7 million persons, equivalent to 1.3% of the total number of persons employed in the non-financial business economy (Sections B to J and L to N and Division95) and 11.6% of the construction (Section F) workforce. These enterprises generated EUR72470 million of value added which was also 1.3% of the non-financial business economy total, but reached 14.2% of the construction total. For comparison, the number of civil engineering enterprises was a little more than one tenth of the number of enterprises within the population for the construction of buildings sector (Division41), whereas employment and value added shares were nearer to two fifths, indicating that the average size of civil engineering enterprises was much greater than that of enterprises classified to the construction of buildings.

Average value added per person employed ([apparent labour productivity](#)) in the EU-27's civil engineering sector in 2009 was EUR43 thousand, which was above not only the construction average of EUR35 thousand but also the non-financial business economy average of EUR41.6 thousand. Accompanying this moderately high apparent labour productivity was an elevated level of [average personnel costs](#) : these averaged EUR32.8 thousand per employee within the EU-27's civil engineering sector compared with EUR30.0 thousand per employee for the non-financial business economy and EUR30.6 thousand per employee for construction. The [wage-adjusted labour productivity ratio](#) shows the extent to which value added per person employed covers average personnel costs per employee, and this ratio was 129.8% for civil engineering in 2009, below the non-financial business economy average (138.8%), but substantially above the construction average (113.9%).

In contrast to the productivity indicators that were above the construction average, the [gross operating rate](#) , which is a measure of operating profitability, was relatively low, 7.7% for the EU-27's civil engineering sector in 2009 compared with a non-financial business economy average of 9.7% and a construction average of 10.6%. This was the lowest gross operating rate observed among the three construction NACE divisions in the EU-27 in 2009.

Sectoral analysis

The construction of roads and railways (Group42.1) is the largest civil engineering subsector in the EU-27, accounting for approximately half of sectoral employment and value added; the other two subsectors, the construction of other civil engineering projects (Group42.9) and the construction of utility projects (Group42.2), were roughly similar in size to each other according to the main indicators shown in Figure 1.

The EU-27's construction of utility projects subsector recorded lower apparent labour productivity, average personnel costs, and wage-adjusted labour productivity than the other two subsectors; the 2008 wage-adjusted labour productivity ratio of 122.8% for this subsector was also below the 127.8% average recorded for the whole of construction in 2008. For the largest subsector, the construction of roads and railways, these three indicators were relatively high, not just above the average values for construction in 2009 but also above for the average values for the whole of the non-financial business economy. The construction of other civil engineering projects subsector also recorded apparent labour productivity and average personnel costs above the non-financial business economy average, but the particularly high average personnel costs pushed the wage-adjusted labour productivity ratio for this sector down below the non-financial business economy average, although it remained well above the construction average. All three subsectors recorded relatively low gross operating rates, ranging from 7.0% for the construction of utility projects to 8.0% for the construction of other civil engineering projects.

Country analysis

The largest civil engineering sector within the EU-27 in 2009 was in the United Kingdom, both in terms of employment and value added, with a 13.0% share of EU-27 employment and an 18.4% share of EU-27 value added. The next largest Member States, in value added terms, were France, Spain and Germany, all with more than 10% of EU-27 value added. The leading position of the United Kingdom in the civil engineering sector was, in large part, due to its dominance of the construction of other civil engineering projects subsector where it contributed half (50.9%) of the EU-27's value added; France had the highest share of value added for the construction of utility projects (20.7% of the EU-27 total) and Spain the highest share (14.7%) for the construction of roads and railways.

In value added terms, the most specialised Member State in the civil engineering sector in 2009 was Romania where 3.4% of non-financial business economy value added was generated; among the non-member countries shown in Tables 4a and 4b Croatia was even more specialised (4.8%). Portugal, Latvia, Bulgaria and Cyprus were also relatively highly specialised in the civil engineering sector as more than 3.0% of their non-financial business economy value added was generated in this sector; the relative importance of the civil engineering sector was much lower in some countries, as its share of non-financial business economy value added fell below 1.0% in Italy, Denmark, Germany and Sweden, as well as Switzerland and Norway.

Around half of the Member States recorded a wage-adjusted labour productivity ratio for their civil engineering sector that was below the average for their non-financial business economy in 2009, but each of these ratios remained above 100%, with Sweden (103.4%) recording the lowest. The highest wage-adjusted labour productivity ratio, by far, was recorded by Ireland (267.6%), where the wage-adjusted labour productivity of the civil engineering sector was about one third higher than the average for the Irish non-financial business economy (180.8%). For the gross operating rate the situation was similar, with a small majority of Member States reporting rates that were lower for civil engineering than for the whole of their non-financial business economy, while Ireland again recorded, by far, the highest rate (26.4%).

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

This article presents an overview of statistics for the civil engineering sector in the EU, as covered by NACE Rev.2 Division42. This division includes general construction for civil engineering objects. It includes new work, repair, additions and alterations, the erection of pre-fabricated structures on the site and also construction of a temporary nature. This work can be carried out on own account or on a fee or contract basis. Portions of the work and sometimes even the whole practical work can be subcontracted out.

The construction of roads and railways includes the construction (and surface work) of motorways, streets, roads, other vehicular and pedestrian ways, bridges or tunnels, railways and subways. It also includes road painting and other marking, the installation of crash barriers, traffic signs and the like and the construction of airfield runways.

The construction of utility projects includes projects for electricity and telecommunications as well as fluids such as long-distance and urban pipelines, irrigation systems, canals, reservoirs, sewer systems, sewage disposal plants and pumping stations. The construction of distribution lines and related buildings and structures that are integral part of these systems is included.

The construction of other civil engineering projects includes: water projects such as the construction of harbour and river works, marinas, locks, dams and dykes and the construction or dredging of waterways; the construction of industrial facilities (except buildings) such as refineries and chemical plants; outdoor sports facilities; land subdivision with land improvement (for example, adding roads, utility infrastructure and so on).

This NACE division is composed of three groups:

- the construction of roads and railways (Group42.1);
- the construction of utility projects (Group42.2);
- the construction of other civil engineering projects (Group42.9).

The information within this article covers neither the installation of street lighting and electrical signals (which are included in NACE as [specialised construction activities](#) , Division43), nor land subdivision without land improvement (included within [real estate activities](#) , Division68).

Clothing production statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). The present article covers clothing manufacturing, corresponding to [NACE Rev 1.1 Division 18](#), which is part of the [textiles, clothing, leather and shoe production](#) sector. Clothing manufacturing comprises the production of:

- leather clothes;
- workwear;
- outerwear;
- underwear;
- articles of fur.

Table 5: Manufacture of wearing apparel; dressing and dyeing of fur (NACE Division 18). Main indicators, 2006 (1)

There were about 1.4 million people employed across the EU-27 by the 143.9 thousand enterprises that had clothing manufacturing (NACE Division 18) as their main activity in 2006. These enterprises generated EUR 22.5 billion of value added in 2006, accounting for about one third (34.7%) of the value added generated by textiles, clothing and leather manufacturing (NACE Subsections DB and DC).

The principal clothing activity in the EU-27 is the manufacture of other wearing apparel and accessories (NACE Group 18.2) such as other outerwear and underwear, which generated the overwhelming majority (96.8%) of clothing value added in 2006 and employed most of its workers. In more detail, the manufacture of other outerwear (NACE Class 18.22), such as coats, jackets and trousers, accounted for a clear majority (61.1%) of clothing value added in 2006, with most of the rest (17.5%) coming from the manufacture of other wearing apparel and accessories not elsewhere classified (NACE Class 18.24), such as babies garments, hats and headgear and also (13.1%) the manufacture of underwear (NACE Class 18.23).

Among the Member States, Romania and Italy had by far the largest clothing manufacturing workforces, each employing about a quarter of a million workers (the equivalent of a combined 35.6% of the EU-27 total), followed by Bulgaria with a 10.1% share. In terms of the value added generated by the clothing sector, however, Italy was by far the largest Member State, the EUR 7.2 billion of value added in 2006 accounting for almost one third (32.0%) of the total across the EU-27. By comparison, the value added generated in Romania accounted for only 4.0% of the total. These differences in large part reflect the opposing ends of the clothing manufacturing spectrum; clothes manufacturing in Italy is more focused on higher value products (including many designer and luxury brands), whereas in Romania production is concentrated more on the labour-intensive stages of clothing production and mass-market products. Nevertheless, the value added generated by the clothing manufacturing sector in Romania contributed 3.1% of its non-financial business economy total in 2005, more than in any other Member State and about seven and a half times the EU-27 average. In these relative terms, only Bulgaria (2.9%, 2005) was almost as specialised as Romania in the manufacture of clothing, with Lithuania (1.6%) and Portugal (1.5%) some way behind.

There was a strong downward trend in the production index of clothing manufacturing across the EU-27 during the period between 1997 and 2007, despite an abrupt levelling-off in 2006 and 2007. In the ten years through to 2007, the average rate of decline in clothing output across the EU-27 was 5.3% per year. However, this overall picture disguises contrasting developments in some of the Member States. There were particularly rapid and sustained declines in clothing manufacturing output in Belgium (an average 14.0% per year), France (16.1% per year) and Ireland (17.4% per year) between 1997 and 2007. For a time, production appeared to shift from west to east with strong growth in the Baltic Member States through to 2001 and in Romania through to about 2002 to 2003. However, after this time there were also steep declines in eastern European countries. Bulgaria stood

alone among the Member States as having sustained and sometimes rapid growth in clothing manufacturing output; in the period between 2000 and 2007, the Bulgarian production index for clothing manufacturing more than doubled.

Among the NACE classes within other wearing apparel and accessories manufacturing activities (NACE Group 18.2), the fastest rate of decline in output across the EU-27 during the ten years through until 2007 was for underwear (8.6% per year). However, the decline in the output of the relatively small activity of the dressing and dyeing of fur and the manufacture of articles of fur (NACE Group 18.3) was even stronger (an average rate of 12.5% per year).

Expenditure and productivity

Tangible investment across the clothing manufacturing sector amounted to EUR 1.8 billion in 2006, the equivalent of about a quarter (24.2%) of the tangible investment in textiles, clothing and leather manufacturing as a whole. In comparison to the value added generated by the clothing sector, therefore, tangible investment was relatively low. The resulting **investment rate** of 7.9% (less than one half of that across the non-financial business economy) may, at least in part, reflect the continued, further shift in production to non-member countries.

An analysis of the clothing manufacturing sector's **operating expenditure** shows that it was very similar to that of textiles, clothing and leather manufacturing as a whole, with about a fifth (19.9%) of expenditure going on personnel costs. This was despite very low average **personnel costs** of EUR 12.0 thousand per employee – this average being lower than for any other NACE division within the non-financial business economy. The apparent **labour productivity** of those working in clothing manufacturing across the EU-27 was also less than any other NACE division in the non-financial business economy; average value added generated per person employed in clothing manufacturing was EUR 16.2 thousand in 2006, almost exactly one quarter less than the figure for textiles, clothing and leather manufacturing as a whole and approaching two thirds (62.8%) less than the average across the EU-27's non-financial business economy.

Nevertheless, the value added generated in the clothing sector more than covered personnel costs in 2006, the resulting **wage-adjusted labour productivity ratio** of 135.1% in the EU-27 being very similar to the ratio for textiles, clothing and leather manufacturing as a whole. In Ireland, Greece, the Netherlands (2005), and Slovenia, however, value added per person employed did not cover average personnel costs. In contrast, the wage-adjusted labour productivity ratios of the clothing manufacturing sectors in Italy, Sweden and the United Kingdom were not only higher than the average for textiles, clothing and leather manufacturing as a whole, but were similar to or a little higher than average ratios for the non-financial business economy.

Data sources and availability

The main part of the analysis in this article is derived from **structural business statistics (SBS)**, including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include the **PRODCOM** statistics on the production of manufactured goods.

Context

Since the closure of the World Trade Organisation's (**WTO**) ten-year, transitional Agreement on Textiles and Clothing (ATC) at the end of 2004, the European Union market for textiles, clothing, leather and footwear has been open to far more global competition, particularly from China and other Far Eastern countries. The **European Commission** published a study on the competitiveness, economic situation and location of production in the **textiles and clothing, footwear, leather (and furniture) industries** in 2007, which put forward some ideas for consideration: to upgrade knowledge and skills within the sector; to enhance the value added of EU manufactured products, perhaps through emphasising social ethics, environmental and health considerations and ethical sourcing; to enhance the protection of intellectual property; to foster trade and eliminate trade barriers; to improve the integration of fashion and design in the sector and better support young designers.

The manufacture of clothing involves design (styling, prototyping and choice of collections), development (patterns, sourcing fabric) and production (cutting, sewing, pressing and finishing) processes. Innovation is seen as an important requirement if clothing manufacturing in the EU is going to be more competitive in ever more global markets. The European Commission has already identified technical textiles for intelligent personal protective clothing and equipment (PPE) as a key area of high potential growth under its Lead Market Initiative ([COM\(2007\)860 final](#)). Protective textiles comprise clothing and other textile-based systems whose main function is to protect users from hazards and dangers in the conditions in which they operate, such as civil and military emergency interventions or in hospitals and manufacturing environments that require insulation from bacterial and viral contamination. Various forms of support have been proposed to stimulate research and development in this area, as well as accelerating standardisation, raising the know-how of public purchasers and enhancing the coherence of safety user requirements. A further challenge faced by small producers who want to develop new products and applications is the ease and ability to secure additional capital, whether from public or private bodies.

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database .

This article presents the [European Union \(EU\) structural business statistics](#) for NACE Division 72, 'Computer and related activities', which consists of:

- consultancy activities for hardware or software;
- data processing activities;
- database activities;
- the maintenance and repair of office and information technology machinery.

Although the repair of computers is included in this list, neither their actual manufacture (NACE Class 30.02) nor their wholesaling, retailing, or renting (NACE Classes 51.84, 52.48 and 71.33) are covered here.

Table 1: Structural profile - ranking of top five Member States in terms of value added and persons employed, 2006

Computer and related activities are at the forefront of the information society along with telecommunications. Computer and related activities have one of the highest levels of expenditure on [research and development](#) among services. An average from the 22 Member States for which data are available shows a 5.5% share for computer and related activities, a substantial share bearing in mind that manufacturing activities account for 78.5% of the total.

It is quite common for [enterprises](#) to outsource their requirements for hardware, software and data processing services to specialist providers. The ability of such services to be traded across borders has been assisted by improved telecommunications.

Structural profile

The EU's computer and related activities (NACE Division 72) sector generated EUR 180.4 billion of [value added](#) from EUR 369.8 billion of [turnover](#) in 2006, therefore contributing around one fifth of [business services](#) (NACE Divisions 72 and 74) output. The computer and related activities workforce comprised 2.8 million persons, one eighth (12.6%) of the business services total, working in just over half a million enterprises.

An analysis of the breakdown of turnover in computer and related activities is available for a subset of Member States, based on the data from a development project compiled on a voluntary basis. The results show that software consultancy and supply (NACE Group 72.2) generated the largest share (68%) of the sector's turnover, followed by data processing services (NACE Group 72.3, 13%).

The United Kingdom had by far the largest computer and related activities sector within the EU in 2006, providing about three tenths of the EU's value added and one fifth of the [employment](#) total. By the same two measures Germany had the next largest computer and related activities workforce, significantly smaller than in the United Kingdom. Given its extremely high share of EU value added in 2006, the United Kingdom was the most specialised Member State within computer and related activities, as this sector contributed 4.9% of [non-financial business economy](#) (NACE Sections C to I and K) value added in the United Kingdom. The next most specialised Member States included Ireland and the three [Nordic Member States](#) , which all generated at least 3.5% of their non-financial business economy value added in this sector. By the same measure the least specialised Member States in computer and related activities were Cyprus and Bulgaria (both 2005), Greece and the [Baltic Member States](#) that all generated 1.5% or less of their non-financial business economy value added in this sector.

Expenditure and productivity

Apparent [labour productivity](#) in the EU's computer and related activities sector was EUR 64.7 thousand per person employed in 2006 and average [personnel costs](#) were EUR 51.1 thousand per [employee](#) . In several other respects the EU's computer and related activities sector was typical of business services, with a wage-adjusted labour productivity ratio (126.5%) and share of personnel costs in operating expenditure (39.0%) both just below the business services averages.

Computer and related activities accounted for one fifth of gross tangible investment in EU business services in 2006, valued at EUR 13.4 billion. The resulting investment rate was 7.4%, typical for a business services activity, and as such around two fifths of the non-financial business economy average.

Data sources and availability

The main part of the analysis in this article is derived from structural business statistics (SBS), including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other possible data sources include [short-term statistics](#) and the [Labour force survey](#) . In addition, use has also been made of specialist sources for particular areas, notably transport, energy, research and development, environment, tourism and information society statistics.

Context

The freedom to provide services and the freedom of establishment are central principles to the [internal market](#) for services and are set out in the [EC Treaty](#) . They guarantee EU enterprises the freedom to establish themselves in other Member States, and the freedom to provide services on the territory of another EU Member State. The Directive on services in the internal market ([COM\(2006\) 123](#)) aims to achieve a genuine internal market in services, removing legal and administrative barriers to the development of services activities between Member States. The Directive was to be implemented by Member States by the end of 2009 at the latest. As well as covering most [business services](#) (with the notable exception of services of temporary work agencies), the Directive applies to a wide variety of services including industrial and construction activities, as well as

distributive trades, hotels and restaurants, travel agents, real estate and renting services.

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), the present article covers for the manufacture of computers and office equipment, corresponding to NACE Division 30, which is part of the [electrical machinery and optical equipment](#) sector. The activities covered in this article are the manufacture of:

- office machinery;
- computers;
- peripherals, such as printers and terminals.

Note that the manufacture of electronic games is classified under toys and is covered within the article on [jewelry, musical instruments, sports goods and toy production](#).

	Enterprises (thousand)	Turnover (EUR million)	Value added (EUR million)	Persons employed (thousand)	Share in total (%)	
					Value added	Persons employed

Source: Eurostat (SBS)

Table 4: Manufacture of office machinery and computers (NACE Division 30). Main indicators, 2006 (1)

There were 10.7 thousand enterprises within the EU-27's computer and office equipment (NACE Division 30) manufacturing sector in 2005, employing 154.6 thousand persons in 2006, while value added reached EUR 9.6 billion from a turnover of EUR 59.6 billion in the same year. The computer and office equipment manufacturing sector was by a considerable margin the smallest activity among the four NACE divisions that comprise the electrical machinery and optical equipment (NACE Subsection DL) manufacturing sector; this was the case for each of the main indicators used to measure the size of an activity. In relative terms, the computer and office equipment sector generally accounted for around 5% of the electrical machinery and optical equipment manufacturing sector; this share rising as high as 8.4% for turnover and falling as low as 4.2% for the number of persons employed.

Within the activity of computer and office equipment manufacturing, the biggest subsector was clearly the manufacture of computers and other information processing equipment (NACE Class 30.02), which accounted for more than three quarters of both the EU-27's value added (77.3%) and number of persons employed (77.5%), the remainder being accounted for by the manufacture of office machinery (NACE Class 30.01).

The production of computers and office equipment was highly concentrated in three of the Member States, which together accounted for just over 75% of the EU-27's value added in 2006. Germany was the leading producer, with a 38.3% share of EU-27 value added (considerably higher than its corresponding share of the workforce, which stood at 25.4%). The second highest level of output was recorded in Ireland (20.9% of EU-27 value added), while one sixth (16.7%) of the total was generated in the United Kingdom. To give some idea of the extent to which these three countries dominated EU-27 production, the fourth highest share in EU-27 value

added was recorded in Italy at just 4.5%. The contribution of the computer and office equipment sector to **non-financial business economy** value added was highest in Ireland (2.2%), which may be attributed to Ireland often being used as a hub by large international manufacturers before distributing their computers across Europe. The next most specialised country was Hungary (where the manufacture of computers and office equipment accounted for 0.6% of non-financial business economy value added), while Germany (0.3%) was the third most specialised Member State.

As with many technology-related activities, EU-27 output from computer and office equipment manufacturing followed an erratic development, rising at a rapid pace through to the peak of the dot.com boom in 2000, before falling in the period from 2001 to 2003. Annual short-term statistics show that the **index of production** for the computer and office equipment manufacturing thereafter rose at a particularly fast pace (on average by 9.2% per year) between 2003 and 2007. Having also peaked in 2000 the EU-27 index of employment for computer and office equipment manufacturing started to follow a downward path and fell in successive years through to 2007, losing an average of 4.5% of the workforce each year; this trend was likely to be endemic of a gradual shift in assembly operations to lower labour cost regions.

Price comparisons over time are particularly difficult because computer specifications are constantly increasing, while the price of computers tends to fall. Indeed, in contrast to the majority of industrial NACE divisions, the domestic **output price index** for the manufacture of computers and office equipment in the EU-27 fell between 1997 and 2007 at an average rate of 8.1% per year.

Expenditure and productivity

Gross investment in tangible goods of the EU-27's computer and office equipment manufacturing sector in 2006 was particularly low at EUR 710 million. Computer and office equipment manufacturing accounted for 3.5% of the total investment made in the electrical machinery and optical equipment sector in 2006. The **investment rate** (defined here as the ratio of investment to value added) of the computer and office equipment manufacturing sector in the EU-27 was 7.4% in 2006, which was the second lowest ratio among all of the NACE divisions within the non-financial business economy for which data are available in 2005 or 2006 (higher only than for instrument engineering – see **Instrument engineering statistics - NACE Rev. 1.1**). The Czech Republic and Greece (2005) were the only Member States among those for which data are available²³ to report an investment rate for computer and office equipment manufacturing that was above their non-financial business economy average.

The relative importance of **personnel costs** in relation to **operating expenditure** was 10.9% in the EU-27's computer and office equipment manufacturing sector in 2006. This was almost half the average share recorded within the electrical machinery and optical equipment sector (20.6%) and was the lowest share among the four NACE divisions that comprise the electrical machinery and optical equipment sector.

In **productivity** terms, each person employed in the EU-27's computer and office equipment manufacturing sector generated an average of EUR 62.3 thousand of value added in 2006, which was well above the EUR 55.3 thousand average for electrical machinery and optical equipment. Average personnel costs were also somewhat higher, at EUR 42.6 thousand per employee in 2005 for computer and office equipment manufacturing, when compared with the average for electrical machinery and optical equipment (EUR 39.6 thousand per employee in the same year). Apparent **labour productivity** more than covered average personnel costs, as the **wage-adjusted labour productivity ratio** for computer and office equipment manufacturing stood at 153.0% in 2005, which was above the average for the whole of electrical machinery and optical equipment sector (130.9% in the same year), as well as being the highest wage-adjusted labour productivity ratio among the four NACE divisions covered within the electrical machinery and optical equipment sector.

In the majority of the Member States²⁴, average personnel costs were considerably higher within the computer and office equipment manufacturing sector than across the whole of the non-financial business economy. This was particularly true in Germany, where they were 83.4% above the average in 2006. These relatively high personnel costs per employee were to some extent reflection of a high level of apparent labour productivity, as each person employed in the German computer and office equipment manufacturing sector generated 75.7% more added value than the national average within the non-financial business economy. This relative performance was only bettered in Latvia (where apparent labour productivity among the computer and office

²³Greece, Poland and Portugal, 2005; Ireland, Cyprus, Luxembourg, Malta and the Netherlands, not available.

²⁴Bulgaria, Greece, Poland, Portugal and Romania, 2005; Cyprus, Luxembourg, Malta and the Netherlands, not available.

equipment workforce was 212.1% higher than the average), Ireland (87.1%) and in Hungary (82.9% higher).

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include the [PRODCOM](#) statistics on the production of manufactured goods.

Context

The electrical machinery and optical equipment sector is an important and strategic part of Europe's manufacturing sector, producing a wide range of mostly high-technology products (for example, computers, switchgears or semi-conductors). This sector has been cited as being at the centre of industrial development, as almost every other sector depends, at least to some degree, on the capital equipment, technology, end-products, research and innovations that are provided by the electrical machinery and optical equipment sector. It is therefore often referred to as one of the main drivers of [productivity](#) gains and central to the EU's objective of creating more and better jobs.

The goods and services made within the electrical machinery and optical equipment sector range from capital goods used in energy and primary transformation activities, transport manufacturing (motor vehicles, aeronautics and rail equipment producers) or process manufacturing sectors (agro-industries, chemicals, plastics or wood), through intermediate goods (such as electronic components or wiring) that are often used by other manufacturers, to consumer goods (such as consumer electronics, mobile phones and household appliances).

This sector operates within a long-established legislative framework that covers issues such as product safety, energy labelling, minimum efficiency requirements, eco-design and waste. Two Directives ([2008/34](#) and [2008/35](#)) on waste electrical and electronic equipment (WEEE) and the restriction of the use of certain [hazardous substances](#) in electrical and electronic equipment were introduced in 2008. The EU aims to take measures to prevent the generation of electrical and electronic waste and to promote reuse, [recycling](#) and other forms of recovery in order to reduce the quantity of such waste by encouraging manufacturers to design products with the environmental impacts in mind throughout their entire life cycle.

The potential role that may be played by the electrical machinery and optical equipment sector with respect to energy efficiency has also been highlighted in recent years. Indeed, considerable effort has gone into reducing the energy consumption of appliances, although changes in lifestyle and working practices have sometimes offset these, for example, while changes to the manufacture of domestic and office appliances has made these more energy efficient, rising equipment rates and the introduction of new technologies may result in higher overall energy consumption. Several directives cover this area of energy saving, in particular a Directive on eco-design requirements for energy-using products, a Directive on the energy labelling of domestic appliances and a Regulation on the energy efficiency labelling programme for office equipment.

The [i2010 strategy](#) is the EU's policy framework for the information society and media. It promotes the positive contribution that [information and communication technologies \(ICT\)](#) can make to the economy, society and personal quality of life. Fundamental to these objectives is the use of personal computers in the workplace, at home, or in the form of mobile devices (laptops and netbooks). From a manufacturing perspective, one of the most important priorities of i2010 is a focus on the EU's [research and development](#) instruments to promote innovation and technological leadership. Actions implemented under this priority aim to strengthen European innovation and research in ICT through initiatives such as the [seventh research framework programme \(FP7\)](#) , [European technology platforms](#) , or [joint technology initiatives \(JTIs\)](#) .

As noted in the overview article [Electrical machinery and optical equipment production statistics - NACE Rev. 1.1](#) , there have in recent years been increasing calls to use the potential of ICTs to improve energy efficiency as part of an effort to combat climate change and drive economic recovery. ICTs can be used to improve monitoring and management of energy use in factories, offices and public spaces, as well as helping to make people more aware of how they use energy at home (through metering systems that identify where energy is

being used). The energy efficiency of information technology (IT) products – computers and peripherals – is covered by the EU's energy star label which is a voluntary standard that differentiates between efficient and less efficient [IT products](#) .

Notes

Computer and personal and household good repair statistics - NACE Rev. 2

Data from April 2012, most recent data: Further Eurostat information, Main tables and Database

This article presents an overview of statistics for the repair of computers and personal and household goods in the [European Union \(EU\)](#), as covered by [NACE Rev. 2](#) Division 95. This is the only division within Section S (other service activities) for which [structural business statistics \(SBS\)](#) are compiled and this division completes the SBS coverage of the non-financial business economy which is defined as Sections B to J, L to N and Division 95.

The activities covered by Division 95 which forms the basis of this article are the repair and/or maintenance of:

- [computers](#) and computer peripherals such as printers as well as communications equipment like fax machines and mobile phones;
- home electronic goods (consumer electronics); garden equipment; clothing and footwear; furniture and furnishings; personal items such as watches and jewellery; most other consumer goods such as bicycles, toys, sports equipment and musical instruments.

This article does not cover the repair of industrial machinery and equipment, central heating and air conditioning equipment, nor hand-held power tools and it also excludes enterprises that carry out repair as a secondary activity in combination with other activities; as such, it focuses exclusively on specialist repairers.

Table 4b: Key indicators, repair of computers and personal and household goods (NACE Section S95), 2009 - Source: Eurostat (sbs_na_1a_se_r2)

Main statistical findings

Structural profile

There were 173 thousand [enterprises](#) operating with the repair of computers and personal and household goods (Division 95) as their main activity in the EU-27 in 2009. Together they employed 383 thousand persons, equivalent to 0.3% of the [non-financial business economy](#) (Sections B to J and L to N and Division 95) workforce, while they generated EUR 9500 million of [value added](#) which was 0.2% of the non-financial business economy total.

Apparent labour productivity of the EU-27's repair of computers and personal and household goods sector in 2009 was EUR 25 thousand per person employed, about three fifths of the non-financial business economy average of EUR 41.6 thousand per person employed and lower than the level in all except one of the NACE

sections that make-up the non-financial business economy.

The repair of computers and personal and household goods sector is characterised as a labour-intensive activity. Despite very low [apparent labour productivity](#), the EU-27's [average personnel costs](#) for the repair of computers and personal and household goods sector were not much below average: EUR 26.2 thousand per employee in the repair of computers and personal and household goods compared with EUR 30.0 thousand per employee for the non-financial business economy.

The [wage-adjusted labour productivity ratio](#) combines the two previous indicators and shows the extent to which value added per person employed covers average personnel costs per employee. The particularly low apparent labour productivity for the repair of computers and personal and household goods sector was below the corresponding level for average personnel costs in 2009, resulting in a wage-adjusted labour productivity ratio below parity (94.8%). As such, the repair of computers and personal and household goods sector had lower wage-adjusted labour productivity than any of the NACE sections within the non-financial business economy, all of which recorded ratios in excess of 100%.

The [gross operating rate](#) (the relation between the [gross operating surplus](#) and [turnover](#)) is a measure of profitability. The gross operating rate for the EU-27's repair of computers and personal and household goods sector in 2009 stood at 12.9%, above the non-financial business economy average (9.7%). This relatively high gross operating rate is achieved because of the low levels of turnover relative to value added – typical of many labour-intensive service activities (other than distributive trades).

Sectoral analysis

Three quarters (76.8%) of the enterprises within the EU-27's repair of computers and personal and household goods sector were classified to the repair of personal and household goods (Group 95.2) in 2009, with the remainder repairing computers and communication equipment (Group 95.1). The repair of personal and household goods subsector was also largest in terms of employment, accounting for 59.7% of the sectoral workforce, but it generated less value added than the repair of computers and communication equipment, as the latter contributed 54.7% of sectoral added value. These large variations in the contribution of the two subsectors depending on the indicator used for analysis are reflected in some of the derived indicators concerning personnel costs, productivity and profitability.

The low apparent labour productivity figure for the whole of the EU-27's repair of computers and personal and household goods sector (EUR 25 thousand per person employed in 2009) was pulled downwards by the subsector for the repair of personal and household goods which recorded EUR 19 thousand of value added per person employed in contrast to EUR 34 thousand per person employed recorded for the repair of computers and communication equipment: the former was less than half the non-financial business economy average (EUR 41.6 thousand), whereas the latter was about 18% below the average. Average personnel costs per employee ranged from EUR 32.3 thousand per employee for the repair of computers and communication equipment – somewhat higher than the average of EUR 30.0 thousand for the whole of the non-financial business economy – to EUR 19.9 thousand per employee for the repair of personal and household goods.

The gross operating rate for the EU-27's repair of personal and household goods subsector was 18.9% in 2009, which was almost twice as high as the average for the whole of the non-financial business economy (9.7%). In contrast, the gross operating rate for the repair of computers and communication equipment (8.6%) was slightly below average.

Country analysis

France accounted for just over one quarter (26.5%) of the EU-27's value added within the repair of computers and personal and household goods sector in 2009, a considerably greater share than recorded by any of the other Member States – see Figure 3. It should be noted that even in those countries with the largest repair of computers and personal and household goods sectors, the contribution of this activity to the non-financial business economy remained low: for example, in the Czech Republic, France and Poland it accounted for just 0.3% of non-financial business economy value added. In employment terms, the share of the repair of computers and personal and household goods sector in the non-financial business economy workforce was 0.5% in Hungary

and 0.4% in the Czech Republic, Spain and Poland.

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

Enterprises providing services for the repair of computers and communications equipment as their principal activity may provide services directly to end clients such as households and business clients, or they may provide specialised services to intermediaries such as manufacturers or distributors. Enterprises providing repair and maintenance services for personal and household goods are generally focused on household clients.

Business clients with more complex requirements for information technology (IT) services may well receive repair and maintenance services for computers and communications equipment bundled into broader IT services (see the article on [information and communication services](#)) provided by information technology services providers (Division 62). Equally, repair and maintenance services may be provided as a secondary activity by enterprises that are principally manufacturers or distributors of computers and communications equipment.

Many repair activities, including those presented in this article – or others, such as those related to motor vehicles – often face increased demand during downturns in the overall economic cycle as households and businesses postpone purchases of new capital goods or consumer durables and semi-durables and repair existing items instead; equally demand for repair services may decrease during an upturn in the cycle.

Main statistical findings

Structural profile

There were 453 thousand enterprises operating in the computer programming and consultancy (Division 62) sector in the EU-27 in 2008. Fresher data are available for the remaining indicators in Table 1. In 2009 the EU-27 computer programming and consultancy sector employed 2.46 million persons, equivalent to 1.8% of the non-financial business economy (Sections B to J and L to N and Division 95) workforce or 43.0% of those employed in information and communication services (Section J). They generated EUR 164 490 million of value added which was 2.9% of the non-financial business economy total or 34.5% of the information and communication services total.

The apparent labour productivity of the EU-27's computer programming and consultancy sector in 2009 was EUR 67.0 thousand per person employed, which was higher than the non-financial business economy average of EUR 41.6 thousand per person employed, but below the information and communication services average of EUR 83.0 thousand per person employed. In contrast, average personnel costs within the EU-27's computer programming and consultancy sector were particularly high: at EUR 53.4 thousand per employee they exceeded the level recorded for the non-financial business economy (EUR 30.0 thousand per employee) as well as for information and communication services (EUR 48.6 thousand per employee). As a result of these relatively high average personnel costs – the sixth highest among any of the NACE divisions that make-up the non-financial business economy – the EU-27's wage-adjusted labour productivity ratio which combines the two previous indicators stood at 125.1% for the computer programming and consultancy sector in 2009. This was well below the non-financial business economy average of 138.8% and even further removed from the information and communication services average of 171.2%.

The gross operating rate (the relation between the gross operating surplus and turnover) – which is a measure of operating profitability – stood at 14.6% for the EU-27's computer programming and consultancy sector in 2009. This was around 1.5 times as high as the non-financial business economy average (9.7%), but below the information and communication services average (20.9%).

Sectoral analysis

There are four subsectors that constitute the computer programming and consultancy sector (when broken down at the NACE class level of detail). Among these, computer consultancy (Class 62.02) and computer program-

ming (Class62.01) were by far the largest in the EU-27 in 2009: together these two subsectors accounted for 78.3% of sectoral value added and 78.9% of the sectoral workforce. Other information technology and computer service activities (Class62.09) accounted for a 14.3% share of value added and a 14.7% share of the sectoral workforce, leaving computer facilities management (Class62.03) to account for the remainder.

Enterprises within other information technology and computer service activities, computer consultancy and computer programming activities tended to be smaller (in terms of average numbers of persons employed per enterprise) than enterprises that were active within computer facilities management; there may be some constraints which require a minimum efficient scale of operation for the latter, which averaged 11.5 persons per enterprise across the EU-27 in 2009, compared with between 4.7 and 5.8 persons per enterprise for the other three subsectors.

EU-27 apparent labour productivity among the four subsectors that constitute the computer programming and consultancy sector was generally quite high and also quite uniform in 2009, ranging from a low of EUR65 thousand per person employed for both computer programming activities and other information technology and for computer service activities, through EUR67 thousand per person employed for computer consultancy activities, to reach a high of EUR78 thousand per person employed for computer facilities management.

The distribution of average personnel costs followed a similar pattern, as the magnitude of the differences between the four subsectors was also relatively modest. EU-27 average personnel costs in 2009 ranged from EUR49.2 thousand per employee for other information technology and computer service activities up to a high of EUR61.0 thousand per employee for computer facilities management activities.

This relatively uniform pattern between subsectors was repeated for the wage-adjusted labour productivity ratio, as this indicator ranged from 122.8% for EU-27 computer programming activities up to a high of 131.5% for other information technology and computer service activities in 2009. As such, all four subsectors recorded wage-adjusted labour productivity ratios that were below the average recorded for the non-financial business economy (138.8%).

Each of the four subsectors within the computer programming and consultancy sector recorded a gross operating rate for the EU-27 in 2009 that was above the non-financial business economy average (9.7%). These rates ranged from a high of 17.3% for other information technology and computer service activities down to 11.5% for computer facilities management activities.

Country analysis

The United Kingdom recorded the highest share (23.4%) of EU-27 value added within the computer programming and consultancy sector in 2009; this pattern was often seen for information and communication services and was repeated in four of the six NACE divisions that make-up the whole of Section J. At a more detailed level within the specific activity of computer programming and consultancy, the United Kingdom had the largest share of EU-27 value added for computer consultancy activities (31.3% of the EU-27 total) and for other information technology and computer service activities (41.4%). Germany recorded the highest share of EU-27 value added for the remaining two subsectors, with a 27.4% share of computer programming activities and a 36.5% share for computer facilities management activities.

The dominance of the United Kingdom was reinforced when analysing the relative specialisation of Member States through the value added contribution of an activity to the non-financial business economy. The United Kingdom was the most specialised Member State for computer programming and consultancy, as this sector contributed 4.5% of non-financial business economy value added in 2009. Other Member States that were relatively specialised in this sector included Sweden, Finland and the Netherlands – as computer programming and consultancy activities provided at least 3.7% of non-financial business economy value added in 2009. There were four Member States where the relative weight of computer programming and consultancy activities was less than 1.5% of national non-financial business economy value added; these were Romania, Lithuania, Poland and Cyprus (where the lowest share was recorded, 1.0%).

Apparent labour productivity for computer programming and consultancy activities was consistently higher than national non-financial business economy averages across each of the Member States for which data are available for 2009. This was most noticeable in Slovakia, where apparent labour productivity reached EUR47.0 per person employed for this sector, which was 2.2 times as high as the non-financial business economy average.

However, average personnel costs within the computer programming and consultancy activities sector were also consistently higher than the non-financial business economy average for all Member States. Furthermore, they were, with the exception of Cyprus, proportionally higher than for apparent labour productivity. As a result, the wage-adjusted labour productivity ratios for the computer programming and consultancy activities sector were generally low and Cyprus was the only Member State where the wage-adjusted labour productivity ratio for the computer programming and consultancy activities sector was higher than the average for the whole of the non-financial business economy. Wage-adjusted labour productivity ratios ranged from a high of 159.3% in Cyprus down to a low of 104.5% in Sweden.

There was a greater diversity in the spread of gross operating rates for the computer programming and consultancy sector across the Member States in 2009. This measure of operating profitability ranged from a high of 22.4% in the United Kingdom and upwards of 20% in Poland and Cyprus, to less than 9.7% (the average value for the EU-27's non-financial business economy) in Slovenia, Sweden and France.

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

This article presents an overview of statistics for the computer programming and consultancy sector in the EU, as covered by NACE Rev.2 Division62. This division includes the provision of expertise in the field of information technologies.

Computer programming activities include writing, modifying, testing, documenting and supporting software development. Information technology consultancy activities include the analysis of users needs and problems, as well as the planning and designing of computer systems. The units classified in this activity may provide the hardware and software components of the system as part of their integrated services or these components may be provided by third parties or vendors. The units classified to this activity often install the system and train and support the users of the system. Computer facilities management activities include the provision of on-site management and operation of clients' computer systems and/or data processing facilities, as well as related support services. Other information technology service activities include computer disaster recovery services and software installation services.

This NACE division is composed of four classes organised into one group:

- computer programming activities (Class62.01);
- computer consultancy activities (Class62.02);
- computer facilities management activities (Class62.03);
- other information technology and computer service activities (Class62.09).

Data processing and hosting is excluded (Division63, part of [information service activities](#)).

Construction of buildings statistics - NACE Rev. 2

Data from April 2012. Most recent data: Further Eurostat information, Main tables and Database .

This article presents an overview of statistics for the construction of buildings in the [European Union \(EU\)](#) , as covered by [NACE Rev.2 Division41](#).

Building projects typically take much longer from conception to completion than the creation of products in many other sectors, and often involve a large number of sub-contracting enterprises with various specialisations. Another characteristic of the construction of buildings sector is that this activity is particularly cyclical, influenced by business and consumer confidence, interest rates and government programmes; this should be borne in mind when interpreting data that concern recent years which have been affected by the financial and economic crisis.

	Value
Main indicators	
Number of enterprises (1 000)	873
Number of persons employed (1 000)	4 292
Turnover (EUR million)	658 079

Table 4b: Key indicators, construction of buildings (NACE Division 41), 2009 - Source: Eurostat (sbs_na_con_r2)

Main statistical findings

Structural profile

The construction of buildings sector is one of the largest (at the NACE division level) within the EU-27's non-financial business economy (Sections B to J and L to N and Division 95). Around 873 thousand enterprises operated in the EU-27's construction of buildings sector (Division 41) in 2009, accounting for some 4.2% of all enterprises in the non-financial business economy. Together these enterprises employed 4.3 million persons, 3.2% of the non-financial business economy workforce and 29.2% of the total number of persons employed in construction (Section F). They generated EUR171150 million of value added which was 3.1% of the non-financial business economy total and 33.4% of the construction total.

The apparent labour productivity of the EU-27's construction of buildings sector in 2009 was EUR40 thousand per person employed, broadly in line with the non-financial business economy average of EUR41.6 thousand per person employed, but clearly above the construction average of EUR35 thousand per person employed. Average personnel costs within the EU-27's construction of buildings sector were EUR28.3 thousand per employee, slightly lower than the non-financial business economy average (EUR30.0 thousand per employee) and the construction average (EUR30.6 thousand per employee). Due mainly to its relatively low average personnel costs the EU-27's construction of buildings sector recorded a wage-adjusted labour productivity ratio of 140.8%, just above the non-financial business economy average (138.8%) and well above the construction average (113.9%); indeed, this was the highest wage-adjusted labour productivity ratio among the three construction NACE divisions. Equally this sector's gross operating rate (the relation between the gross operating surplus and turnover) of 11.0% was above the averages registered for the whole of the non-financial business economy (9.7%) and the whole of construction (10.6%).

Sectoral analysis

The construction of buildings sector is composed of two subsectors: the development of building projects (Group 41.1) and the construction of residential and non-residential buildings (Group 41.2). The development of building projects was the smaller of the two subsectors within the EU-27 according to most measures, with 8.4% of the sector's employment and 22.0% of sectoral value added in 2009 – see Figure 1.

Due to its larger value added share the EU-27's development of building projects subsector had a much higher apparent labour productivity (EUR105 thousand per person employed) than that for the construction of residential

and non-residential buildings subsector (EUR34 thousand per person employed). In fact, the apparent labour productivity of the development of building projects subsector was by far the highest among all of the NACE groups within the construction sector. A similar situation could be seen for the other indicators shown in Table 2b. In 2009, average personnel costs, wage-adjusted labour productivity and gross operating rates were higher for the EU-27's development of building projects subsector than for any other NACE group within construction.

In contrast, the construction of residential and non-residential buildings recorded an apparent labour productivity of EUR34 thousand per person employed, just below the construction average of EUR35 thousand per person employed and average personnel costs of EUR27.5 thousand per employee that were further (proportionally and in absolute terms) below the construction average of EUR30.6 thousand per employee. As a consequence of these inferior average personnel costs, the wage-adjusted labour productivity ratio for the EU-27's construction of residential and non-residential buildings subsector was above the construction average of 113.9%, reaching 123.6%, although this remained below the non-financial business economy average of 138.8%. The gross operating rate of the construction of residential and non-residential buildings subsector was 8.9%, below both the non-financial business economy average (9.7%) and the construction average (10.6%).

Country analysis

As noted above, the construction of buildings sector traditionally displays a strongly cyclical development. Furthermore, activity contracted sharply during the financial and economic crisis, and the effects of this are still being felt in many of the Member States at the time of writing.

In 2009, Spain was the largest Member State in the construction of buildings sector in employment and value added terms, with a 25.3% share of EU-27 value added and a 20.2% share of the EU-27's workforce; Spain was also the largest Member State for both subsectors – see Table 3. In value added terms, Cyprus was most specialised Member State for the construction of buildings sector in 2009, where 12.0% of its non-financial business economy value added was generated. Unsurprisingly, given its large share of EU-27 value added, Spain was also relatively highly specialised in this sector, as the construction of buildings accounted for 8.9% of Spanish non-financial business economy value added in 2009. The least specialised Member States, in value added terms, were Denmark (2008 data), Slovakia, Hungary, France and Germany, where the construction of buildings sector contributed less than 2.0% of non-financial business economy value added.

A wage-adjusted labour productivity ratio below 100% was observed in three Member States for the construction of buildings sector in 2009, namely Italy (96.4%), Lithuania (92.3%) and Greece (53.0%), indicating that the average value added generated per person employed was less than average personnel costs. At the other end of the ranking, the highest wage-adjusted labour productivity ratio observed for any Member State in this sector in 2009 was 304.0% in Cyprus, which was nearly double the average for the Cypriot non-financial business economy (158.1%). Other Member States that recorded wage-adjusted labour productivity ratios that were far above their non-financial business economy averages included Bulgaria, Ireland, Romania and the United Kingdom, and these same Member States also recorded relatively high gross operating rates. A small majority of Member States recorded lower gross operating rates for the construction of buildings sector in 2009 than across their non-financial business economies as a whole, including Greece and Lithuania that recorded negative gross operating rates resulting from personnel costs exceeding value added.

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

This article presents an overview of statistics for the construction of buildings sector in the EU, as covered by NACE Rev.2 Division41. This division includes general construction of buildings of all kinds. It includes new

work, repair, additions and alterations, the erection of pre-fabricated buildings or structures on the site and also constructions of a temporary nature. Also included are the construction of entire dwellings, office buildings, stores and other public and utility buildings, farm buildings, and so on.

The development of building projects (residential and non-residential) involves bringing together financial, technical and physical means to achieve the building projects for later sale.

The construction of buildings (residential and non-residential) includes the construction of complete buildings on own account for sale or on a fee or contract basis. Outsourcing parts or even the whole construction process is possible. All types of residential buildings and non-residential buildings are included, such as factories, workshops, assembly plants, warehouses, stores, shopping malls, hotels, restaurants, airport buildings, office buildings, hospitals, schools, religious buildings, indoor sports facilities and parking garages (including underground). Remodelling or renovating existing structures is also included.

This NACE division is composed of two groups:

- the development of building projects (Group41.1);
- the construction of residential and non-residential buildings (Group41.2).

The information that is presented in this article excludes the erection of complete prefabricated constructions from self-manufactured parts not of concrete (these activities form part of the [wood](#) and [metal](#) manufacturing sectors (Divisions16 and 25 respectively)), the construction of industrial facilities except buildings (which are included within [civil engineering](#) , Division42). Also excluded are [architectural and engineering activities](#) and project management services related to building projects (Division71).

Construction site preparation statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), the present article covers construction site preparation, corresponding to NACE Group 45.1, which is part of the [construction](#) sector. The activities covered in this article are relatively diverse and include:

- test drilling and boring to determine ground conditions;
- demolition of existing buildings and structures;
- site clearance;
- ground stabilisation;
- excavation;
- earth moving and trench digging.

	Enterprises (thousand)	Turnover (EUR million)	Value added (EUR million)	Persons employed (thousand)	Share in total (%)	
					Value added	Persons employed
Site preparation	107.8	50 000	15 793	420.0	100.0	100.0
Demolition and wrecking of buildings; earth moving	104.0	47 779	16 932	416.7	93.6	94.5
Test drilling and boring	3.9	3 394	1 011	23.2	6.4	5.5

Source: Eurostat (SBS)

Table 2: Site preparation (NACE Group 45.1). Structural profile: ranking of top five Member States in terms of value added and persons employed, 2006

By many measures, the site preparation sector (NACE Group 45.1) was the second smallest NACE group within the construction sector, larger only than the renting of construction or demolition equipment with an operator (NACE Group 45.5). In the [EU-27](#), there were 107.8 thousand [enterprises](#) classified to the activity of site preparation in 2006. Together, these enterprises generated an estimated EUR 50.0 billion of [turnover](#) resulting in EUR 15.8 billion of [value added](#) (equivalent to 3.4% of the construction total).

The demolition and wrecking of buildings and earth moving subsector (NACE Class 45.11) dominated the sector, accounting for 93.6% of value added, the remainder being accounted for by the test drilling and boring subsector (NACE Class 45.12). The site preparation sector employed 420.0 thousand persons in the EU-27 in

2006, equivalent to 3.1% of the construction sector's workforce.

France had the largest site preparation sector in the EU-27 with EUR 4.2 billion of value added generated in 2006 and a workforce of 87.7 thousand persons. In the majority of the Member States²⁵, site preparation accounted for a small proportion of the value added generated in the non-financial business economy, with Sweden, Spain and France showing the highest shares. In Spain, this largely reflected the high importance of all construction activities in the economy, while for Sweden and France it resulted from a specialisation in site preparation – as site preparation accounted for just over 10% of the value added of the construction sector in Sweden and 6% in France.

Expenditure and productivity

Tangible investment made by the EU-27's site preparation sector was EUR 3.5 billion in 2006, equivalent to 7.4% of the tangible investment made in construction as a whole, a higher share than the sector contributed in terms of value added or employment. The **investment rate** in 2005 was 22.2%, more than double the rate for construction as a whole, and also above the **non-financial business economy** average.

In 2005, the EU-27's site preparation sector reported higher apparent **labour productivity**, average **personnel costs**, and wage adjusted labour productivity than the construction average. Apparent labour productivity was EUR 37.6 thousand per person employed and average personnel costs EUR 29.1 thousand per employee, resulting in a **wage-adjusted labour productivity ratio** of 129.2% (just above the construction average of 127.9%).

Data sources and availability

The main part of the analysis in this article is derived from **structural business statistics (SBS)**, including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Context

Building and civil engineering projects typically take much longer from conception to completion than in many other sectors, and often involve a large number of sub-contracting enterprises with various specialisations. Construction projects are often a key factor in urban regeneration, and also in maintaining or developing transport and communication infrastructure. Nevertheless, construction projects impact upon the environment in a number of ways, notably the change in land use, the consumption of materials and fuel, the production of waste, as well as noise and air emissions.

Another characteristic of construction activity is that it is particularly cyclical, influenced by business and consumer confidence, interest rates and government programmes. The level of confidence among construction enterprises, according to the **European Commission's Directorate-General for Economic and Financial Affairs** is presented in terms of a balance of positive compared with negative responses. This measure turned positive in July 2006 for the first time since June 1990, peaked in September 2006 and then became negative again in November 2007. During 2008, the fall in construction confidence accelerated and fell particularly strongly in the final quarter of 2008, such that by December 2008 the balance was down to -32.3%. At the time of writing, with overall economic activity declining in many Member States, major public sector funding for infrastructure projects has been proposed by a number of governments as one means of stimulating activity and creating jobs.

Notes

Construction statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article introduces a [set of statistical articles](#) which analyse the structure, development and characteristics of the economic activities in the construction sector in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), this sector covers NACE Section F (which is the same as NACE Division 45). Its activities are treated in more depth in five further articles, each corresponding to a different NACE group and covering a different chronological stage of the construction process:

- [demolition and site preparation](#) (NACE Group 45.1);
- [general construction activities](#) (NACE Group 45.2);
- [installation work](#) (NACE Group 45.3);
- [completion work](#) (NACE Group 45.4);
- [renting of construction equipment](#) (NACE Group 45.5).

Table 4: Construction (NACE Section F). Main indicators, 2006 (1)

Some technical activities related to the construction sector, although not formally part of it, such as architectural services or landscaping, are classified in the business services sector (see [Business services statistics - NACE Rev. 1.1](#)). Some providers of real estate services, such as property developers, are closely related to construction and these are covered in the article on [Real estate statistics - NACE Rev. 1.1](#).

Main statistical findings

Structural profile

The construction sector (NACE Section F) had around 2.9 million enterprises that together generated a combined value added of EUR 510.0 billion in the EU-27 in 2006 and employed 14.1 million persons, equivalent to 9.0% of the non-financial business economy's (NACE Sections C to I and K) value added and 10.9% of its employment. Among this workforce the proportion of paid employees was 82.2% in the EU-27 in 2006, below the non-financial business economy average of 86.5%, which reflected the relatively high levels of self-employment in certain areas within this sector.

The largest of the five subsectors (NACE groups) in the EU-27, both in employment and value added terms, was the building of complete constructions or parts thereof and civil engineering (NACE Group 45.2, hereafter referred to as general construction). This subsector alone accounted for more than half of the value added (58.8%) and employment (55.0%) in the EU-27's construction sector in 2006. Building installation (NACE Group 45.3) and building completion (NACE Group 45.4) were the next largest subsectors, with 22.0% and 14.9% respectively of the EU-27's value added in construction, and slightly larger shares of employment. The two smallest subsectors were site preparation (NACE Group 45.1) and the renting of construction or demolition equipment with an operator (NACE Group 45.5) which contributed 3.4% and 0.8% of the construction sector's value added in the EU-27 in 2006.

In value added terms, the United Kingdom had the largest construction sector in the EU-27 with a 19.1% share of the EU-27 total in 2006. The Spanish construction sector was also significant, with the second highest contribution to value added (18.5% of the EU-27 total) and the largest workforce, some 2.8 million persons employed (19.9% of the EU-27 total). The construction sector contributed 17.6% to Spanish value added in the non-financial business economy and 20.1% of its employment, making Spain the most specialised Member State. In value added terms, the next most specialised²⁶ countries were Cyprus, Lithuania and Portugal, while the least specialised included Germany, Slovakia, Hungary and Poland (2005) – which all reported that the

²⁶Bulgaria, Cyprus, Poland and Romania, 2005; Malta and the Netherlands, not available.

construction sector accounted for less than 6.0% of the value added generated in their respective non-financial business economies.

The contribution of the construction sector to regional employment within the non-financial business economy is shown in the map. The importance of construction in several southern and south-western Member States is clear. Spanish regions occupied 14 of the top 15 places in a ranking of the most specialised regions, and many regions in southern France, Italy and Portugal, as well as the island of Cyprus registered 15.0% or more of their non-financial business economy employment within the construction sector. The only regions outside of southern Europe to record such a high degree of specialisation were Luxembourg, and the neighbouring Belgian province of Luxembourg. In contrast 36 of the 40 regions where less than 6.0% of non-financial business economy employment was in construction were German. Most construction enterprises serve a local market and, consequently, the construction sector is characterised by a large number of **small enterprises**, and relatively few large ones. **Micro** and small enterprises (with less than 50 persons employed) together employed 72.1% of the EU-27's workforce in the construction sector in 2006, a higher share than in the activities covered by any of the other structural business statistics sectors: the average for the non-financial business economy was just 50.4%. **Large enterprises** (with more than 250 persons employed) employed just over one tenth of the EU-27's workforce (12.0%) in construction, compared with a non-financial business economy average of one third (32.6%). Most Member States²⁷ displayed a similar pattern, as in 2006 the combination of micro and small enterprises employed at least two fifths of the construction sector's workforce in all Member States, and more than half of the workforce in the majority of them. The largest contribution by large enterprises was 25.4% of the workforce in Romania.

Developments in output, costs and prices

The development of construction output in the EU-27 and some of the larger Member States – based on the 'classification of constructions' (rather than NACE) shows that building work followed an upward trend for several years through to the first quarter of 2008. The most recent data (at the time of writing) shows a sharp fall in **output**, with building production down 1.4% in the second quarter and by a further 0.7% in the third quarter of 2008. The fall in the second quarter of 2008 was the biggest quarter on quarter reduction in EU-27 output in more than a decade.

The long-term development for civil engineering in the EU-27 was somewhat different, with short cyclical movements since the mid-1990s. However, between the first quarters of 2006 and 2008 there was a period of sustained growth, with output increasing overall by 9.8%. After the first quarter of 2008 the situation reversed and negative rates of change were recorded for civil engineering, -1.5% in the second quarter of 2008 and -0.1% in the third quarter.

There were contrasting developments in construction output in the five largest Member States. Spain recorded almost uninterrupted quarter on quarter growth in construction output until the second quarter of 2007, since when output contracted by 16.1% overall in the ensuing five quarters. Between 2000 and 2007, Italy recorded a relatively similar level of overall growth as Spain, with short periods of strong growth followed by periods of more gentle contraction. Although Italian construction output also recorded a fall in the second and third quarters of 2008 this was considerably less than that seen in Spain. The United Kingdom also showed a clear upward trend in construction output from the turn of the century, less pronounced than in Spain or Italy, but more regular. In contrast to the other large economies, construction output in the United Kingdom was stable in the middle half of 2008 rather than contracting. After several years of gently falling output, French construction activity grew steadily from the end of 2004 to the beginning of 2008. In the second and third quarters of 2008 French construction output fell, although less sharply than in Italy or Spain. Over much of the previous decade, German construction activity also recorded sustained periods of falling output, often more severe than in France. Nevertheless, between the second quarter of 2006 and the first quarter of 2008 German construction output increased every quarter except one, before it too recorded a contraction in the second and third quarters of 2008.

Construction cost indices for residential buildings for the same Member States show that growth was lowest in Germany and highest in the United Kingdom between 2000 and the middle of 2008, with the other three economies recording cost increases that were slightly below the EU-27 average.

²⁷Poland, 2005; Ireland and Malta, incomplete or not available.

Employment characteristics

An analysis of the EU-27's construction workforce, based on [Labour Force Survey](#) data, shows that the male proportion of the construction sector's workforce was relatively high, at 92.1% in the EU-27 in 2007. This share was 27.2 percentage points higher than the non-financial business economy average, and the highest of all of the non-financial business economy NACE divisions for which data are available. In all Member States, the proportion of men in the construction labour force was at least 22 percentage points higher than the national non-financial business economy average.

In the construction sector, 94.3% of persons were employed on a full-time basis in the EU-27 in 2007 compared with 85.7% in the non-financial business economy as a whole. Only in Romania was the part-time employment rate for construction lower than the national non-financial business economy average.

Expenditure, productivity and profitability

The level of [tangible investment](#) made by the construction sector in 2006 reached EUR 47.8 billion in the EU-27, equivalent to 4.6% of all tangible investment made in the non-financial business economy. The [investment rate](#) shows the ratio between investment and value added: in 2006 this was 9.4% for the EU-27's construction sector, approximately half the average for the non-financial business economy (18.4%). Building installation and completion recorded the lowest investment rate among the construction subsectors. The capital-intensive subsector of renting of construction or demolition equipment had, unsurprisingly, the highest investment rate, reaching 32.8%.

Turning from capital to [operating expenditure](#), the share of [personnel costs](#) was relatively high in the construction sector, 22.8% in the EU-27 in 2006. This high share reflected the labour-intensive nature of these activities, and was around 40% above the non-financial business economy average of 16.1%. Furthermore, each of the five construction subsectors recorded a share above the non-financial business economy average, with general construction (19.5%) appearing as the least labour-intensive.

Apparent [labour productivity](#) in the EU-27's construction sector in 2006 was EUR 36.2 thousand per person employed and average personnel costs were EUR 27.9 thousand per employee. Both of these were below the equivalent averages for the non-financial business economy, particularly the apparent labour productivity. The relatively low levels of these two ratios in the construction sector are all the more notable given the small proportion of part-time employment within this sector (part-time employment has the effect of making these ratios lower). Indeed, most of the other activities that recorded particularly low values for these two indicators, for example, retail trade or accommodation and food services, were characterised by considerably higher levels of part-time employment. The [wage-adjusted labour productivity ratio](#) combines the two previous ratios, and shows the extent to which value added per person employed covers average personnel costs per employee. This composite indicator is less affected by issues of part-time employment and so facilitates analysis between activities. In the EU-27's construction sector in 2006, this ratio was 129.7%, indicating that value added per person employed was 29.7% higher than average personnel costs per employee. This was conspicuously lower than the average for the non-financial business economy which was 151.1%. Four of the five NACE groups that make up the construction sector recorded a wage-adjusted labour productivity ratio in the EU-27 below the average for the non-financial business economy. The exception was the renting of construction or demolition equipment, which recorded a ratio of 175.0%.

Unlike the [productivity](#) indicators, the [gross operating rate](#) (the relation between the [gross operating surplus](#) and [turnover](#)) in the construction sector in the EU-27 in 2006 was above the average for the non-financial business economy. This is partly an effect of the relatively high share of self-employment in construction, as working owners and other unpaid persons employed contribute to the value added but are recompensed through a share of profits but not in the form of personnel costs, so boosting the gross operating surplus. The gross operating rate in the EU-27's construction sector was 12.0% in 2006, ranging from 11.0% for general construction activities to 16.6% for building completion, with the renting of construction or demolition equipment with an operator posting a gross operating rate well above this range, at 23.2% (in 2005).

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics \(STS\)](#) , the [Labour force survey \(LFS\)](#) and the Directorate-General for Economic and Financial Affairs.

Context

Building and civil engineering projects typically take much longer from conception to completion than in many other sectors, and often involve a large number of sub-contracting enterprises with various specialisations. Construction projects are often a key factor in urban regeneration, and also in maintaining or developing transport and communication infrastructure. Nevertheless, construction projects impact upon the environment in a number of ways, notably the change in land use, the consumption of materials and fuel, the production of waste, as well as noise and air emissions.

Another characteristic of construction activity is that it is particularly cyclical, influenced by business and consumer confidence, interest rates and government programmes. The level of confidence among construction enterprises, according to the [European Commission](#) 's [Directorate-General for Economic and Financial Affairs](#) is presented in terms of a balance of positive compared with negative responses. This measure turned positive in July 2006 for the first time since June 1990, peaked in September 2006 and then became negative again in November 2007. During 2008, the fall in construction confidence accelerated and fell particularly strongly in the final quarter of 2008, such that by December 2008 the balance was down to -32.3%. At the time of writing, with overall economic activity declining in many Member States, major public sector funding for infrastructure projects has been proposed by a number of governments as one means of stimulating activity and creating jobs.

Notes

Construction statistics - NACE Rev. 2

Data from April 2012, most recent data: Further Eurostat information, Main tables and Database

This article presents information relating to the construction sector in the [European Union \(EU\)](#), as covered by [NACE Rev. 2 Section F](#). The NACE classification distinguishes between, on the one hand, two general types of construction activity, construction of buildings (Division 41) and civil engineering (Division 42), and a collection of specialised activities (Division 43) such as site preparation, installation activities, and completion and finishing activities. Not included, however, are some related technical activities such as architectural services (see the article on [real estate services](#) for more details).

The financial and economic crisis had a major impact on the construction sector in nearly all EU Member States. Output and employment fell sharply in many of the Member States, particularly in Spain and the [Baltic Member States](#). Between February 2008 and December 2010 the [EU-27](#)'s seasonally adjusted production index for construction fell by more than one fifth (-21.4%) underlining both the length and severity of the downturn in this activity. During the first half of 2011 there were modest signs of a recovery although this pattern was reversed in the second half of the year, such that by the start of 2012, the level of output for construction had almost returned to its lowest level during the financial and economic crisis (at the end of 2010). The considerable changes in market conditions for the construction sector since 2008 should be borne in mind when considering the data presented in this article which relates to the situation in 2009.

	Value
Main indicators

Table 4b: Key indicators, construction (NACE Section F), 2009 - Source: Eurostat (sbs_na_con_r2)

Main statistical findings

Structural profile

The EU-27's construction sector (Section F) was made up of 3.2 million enterprises in 2009, employing 14.7 million persons and generating EUR 512000 million of value added. As such, the construction sector accounted for 15.3% of all enterprises in the non-financial business economy (Sections B to J and L to N and Division 95), employed 11.0% of its workforce, and generated 9.2% of value added. The construction sector can be characterised as having enterprises that are, on average, smaller than the non-financial business economy average both in terms of their employment levels or their added value.

The share of personnel costs in operating expenditure (personnel costs plus purchases of goods and services) was 24.0% in the EU-27's construction sector in 2009, above the non-financial business economy average of 17.3%, underlining the importance of labour input in the construction activity as a whole. A number of construction

activities (at a more detailed level) are also relatively capital-intensive, for example, the construction of roads and railways (Group 42.1) or the development of building projects (Group 41.1).

Apparent labour productivity in the EU-27's construction sector in 2009 was EUR 35 thousand per person employed and average personnel costs were EUR 30.6 thousand per employee. While [apparent labour productivity](#) was below the average for the non-financial business economy, average personnel costs per employee were higher. The relatively low level of the apparent labour productivity is all the more notable given the small proportion of part-time employment within the construction sector: part-time employment has the effect of making this ratio lower as this productivity measure is calculated on a per head basis. The [wage-adjusted labour productivity ratio](#) combines the ratios for apparent labour productivity and average personnel costs and is less affected by issues of part-time employment and so facilitates analysis between activities. This ratio is also adjusted for the relative importance of unpaid working proprietors and family workers – which is higher in the construction sector (24.1%) than in the non-financial business economy as a whole (14.5%). The wage-adjusted labour productivity ratio shows that value added per person employed in the EU-27's construction sector in 2009 was equivalent to 113.9% of the average personnel costs per employee, well below the average for the non-financial business economy which was 138.8%; indeed, this was the lowest value for this indicator across any of the NACE sections that make-up the non-financial business economy.

Unlike the productivity indicators, the [gross operating rate](#) (the relation between the [gross operating surplus](#) and [turnover](#)) for the construction sector in the EU-27 in 2009 was above the average for the non-financial business economy, reaching 10.6% for construction compared with 9.7% for the non-financial business economy. This is partly an effect of the relatively high share of self-employment in construction, as working owners and other unpaid persons employed contribute to the value added but are recompensed through a share of profits (not in the form of personnel costs), so boosting the gross operating surplus.

Sectoral analysis

There were 2.2 million enterprises in the EU-27's specialised construction activities subsector (Division 43) in 2009, almost seven tenths (69.3%) of all construction enterprises. Most of the remainder, around 870 thousand enterprises or 27.5% of the construction total, were classified to the construction of buildings subsector (Division 41) and the rest (100 thousand or 3.2%) were in the civil engineering subsector (Division 42).

On average, civil engineering enterprises in the EU-27 in 2009 were considerably larger than other construction enterprises, probably due to the large-scale investment that is often required in plant and machinery for this subsector. The civil engineering share of construction employment was 11.6% and its value added share reached 14.2% (compared with a 3.2% share in the number of construction enterprises). The construction of buildings subsector also accounted for a larger proportion of construction employment (29.2%) and value added (33.4%) than its share of the total number of construction enterprises. Although the specialised construction activities subsector accounted for a smaller share of employment (59.2%) and value added (52.4%) than its comparative share based simply on the number of enterprises, it was nevertheless the largest subsector according to both of these measures and contributed more than half of the construction total for both variables.

EU-27 apparent labour productivity in 2009 ranged from EUR 31 thousand per person employed in the specialised construction activities subsector to EUR 43 thousand per person employed for civil engineering, the latter being just above the non-financial business economy average (EUR 41.6 thousand per person employed). Average personnel costs ranged from EUR 28.3 thousand per employee for the construction of buildings which was below the non-financial business economy average (EUR 30.0 thousand per employee), to EUR 32.8 thousand per employee for civil engineering. As already noted, the wage-adjusted labour productivity ratio for the construction sector was the lowest among any of the NACE sections that compose the non-financial business economy, and this was, in large part, due to the particularly low ratio (98.5%) for the specialised construction activities subsector. As such, this subsector posted the fourth lowest wage-adjusted labour productivity ratio in 2009 for the EU-27 across all of the NACE divisions covered by the non-financial business economy. The wage-adjusted labour productivity ratio for civil engineering (129.8%) was also below the non-financial business economy average (138.8%), leaving the construction of buildings to record the highest ratio (140.8%) and therefore was the only subsector to register a ratio above the non-financial business economy average.

Country analysis

In value added terms, France, Spain and the United Kingdom had the largest construction sectors in the EU-27, the former accounting for a 16.2% share of the EU-27 total in 2009, while Spain and the United Kingdom both had 15.3% shares. As such, the relative contribution of the French construction sector to EU-27 value added was somewhat higher than the average French contribution to non-financial business economy value added (14.6%). The relative importance of the construction sector was considerably higher in Spain (despite the onset of the financial and economic crisis), as the value added from the Spanish construction sector was 1.8 times as high as the average Spanish contribution to the EU-27's non-financial business economy as a whole. In contrast, Germany (12.0% of the EU-27's value added in the construction sector) reported a much lower share than its average (22.1%) for the whole of the non-financial business economy. In value added terms, Spain had the largest subsector for the construction of buildings (25.3% of the EU-27 total in 2009); the United Kingdom had the largest civil engineering subsector (18.4%); and France the largest subsector for specialised construction activities (23.5%).

The construction sector contributed 19.8% of total added value in the Cypriot non-financial business economy in 2009 and 16.2% of the total in Spain, making these the most specialised Member States in value added terms; the next highest share was 13.4% in Bulgaria. The least specialised country, in value added terms, was Germany as the construction sector contributed just 5.0% of non-financial business economy value added, which was slightly more than half the EU-27 average (9.2%); Hungary and Slovakia were the next least specialised Member States in the construction sector. In employment terms a slightly different situation can be observed. Cyprus and Spain remained near the top of the ranking, as construction provided 15.3% and 14.9% of the non-financial business economy workforce; however, Luxembourg reported a higher share (17.7%) and the share in Portugal was identical to that recorded for Spain.

Productivity in the Member States can be compared using the wage-adjusted labour productivity ratio which shows the relative level of value added per person employed compared with average personnel costs per employee, in other words the average value of output compared with the average cost of personnel input. Bulgaria and Romania had by far the lowest average personnel costs in the construction sector and this was reflected in their relatively high wage-adjusted labour productivity ratios (228.4% and 225.7% respectively). Cyprus recorded relatively high apparent labour productivity combined with average personnel costs per employee below the EU-27 average resulting in the third highest wage-adjusted labour productivity ratio (192.1%), ahead of Poland, Ireland and the United Kingdom (the latter two Member States recorded the highest levels of apparent labour productivity within the construction sector). The lowest wage-adjusted labour productivity ratios were recorded in Italy and Greece (94.0% and 75.1%). As such, average personnel costs per employee were not covered by the added value generated by each person employed in either of these two Member States' construction sectors in 2009.

Data sources and availability

Coverage

This article presents an overview of statistics for the construction sector in the EU, as covered by NACE Rev. 2 Section F. Within the construction sector there is a further distinction made between two general types of construction activity on the one hand (Divisions 41 and 42), and a collection of specialised activities on the other (Division 43). These three NACE divisions are described in more detail below:

- construction of buildings (Division 41);
- civil engineering (Division 42);
- specialist activities (Division 43), such as:
 - site preparation (including demolition and earth moving),
 - installation activities (such as, installation of electrical wiring and fittings, heating systems, plumbing, elevators and insulation),
 - completion and finishing activities (such as, plastering, joinery, flooring, glazing or painting),
 - other specialist activities, such as, roofing, pile driving, scaffolding.

Some technical activities related to the construction sector, although not formally part of it, such as architectural services, are classified as business services (see article on [professional, scientific and technical activity statistics](#)). Some providers of real estate services are closely related to construction and these services are covered in the article on [real estate activity statistics](#) .

Data sources

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

Construction activity and construction products (structures) have a number of specific characteristics that differentiate them from many areas of the economy. Among the most important of these are that the final product is one of the few non-transportable goods, as well as being one of the most durable of human artefacts, forming the physical infrastructure where people live and work. Many construction projects are one-off designs and furthermore the time scale for many projects from conception to completion is typically longer than in many other sectors, and may run to several years.

Public procurement is especially important for construction as the public sector is a major purchaser of buildings and particularly civil engineering works. Construction is one of the most geographically dispersed activities with marked regional differences, and plays a very important economic role in some regions, particularly those associated with tourism, those that are transport and communication hubs, or cultural and sporting centres. Construction is also a highly heterogeneous activity depending on a large number of different specialists. The structure of the construction sector can be viewed as a pyramid, with project coordinating enterprises at the top, subcontracting out work to smaller, specialised enterprises in lower tiers.

In many Member States construction activity is seasonal as it is often conducted in the open air or in unfinished structures without heating or air conditioning. Over a longer time period construction is often sensitive to the overall economic cycle. As a provider of tangible assets it typically leads overall economic movements, although this has not been the case following the recent financial and economic crisis where the downturn in construction activity has continued for much longer than in a range of other activities.

One issue that has gained greater visibility in recent years has been the energy efficiency of structures and the sustainability of construction methods. In 2010 the [recast energy performance of buildings Directive](#) was adopted (replacing a 2002 directive on the same subject) in order to strengthen the energy performance requirements of the original directive and to clarify and streamline some of its provisions. Under the new directive, the Member States must apply minimum requirements as regards the energy performance of new and existing buildings, ensure the certification of their energy performance, and require the regular inspection of boilers and air conditioning systems in buildings.

In 2011 the [construction products Regulation](#) replaced the construction products Directive that was passed in 1989. This regulation lays down harmonised conditions for the marketing of construction products and forms the central part of the EU's legislation for a single market in the construction sector. In a similar vein, a Commission Recommendation on Eurocodes was adopted In December 2003 to promote the use of harmonised methods for calculating the strength of structural construction products. The full set of [Eurocodes](#) were published in 2006 and cover ten design areas: the basis of structural design, actions on structures, steel, concrete, composite steel and concrete, timber, masonry and aluminium structures, as well as geotechnical design and seismic design.

Consumer goods wholesale trade statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), the present article covers consumer goods [wholesale trade](#), corresponding to NACE Groups 51.3 and 51.4, which are part of the [wholesale trade](#) sector. The activities covered in this article are the wholesaling of:

- food, beverages and tobacco, corresponding to NACE Group 51.3;
- household products such as textiles, clothing, electrical appliances, games, toys, tableware, furniture and furnishings, as well as cleaning products and personal products, corresponding to NACE Group 51.4.

It should be noted that although these two categories are grouped together here as consumer goods, these activities also include the wholesaling of food and beverage products as inputs for further processing.

	Enterprises (thousand)	Turnover (EUR million)	Value added (EUR million)	Persons employed (thousand)	Share in total (%)	
					Value added	Persons employed
Wholesaling of consumer goods	5499	1 741 395	205 935	4 174.0	100.0	100.0

Table 2: Wholesaling of consumer goods (NACE Groups 51.3 and 51.4). Structural profile: ranking of top five Member States in terms of value added and persons employed, 2006

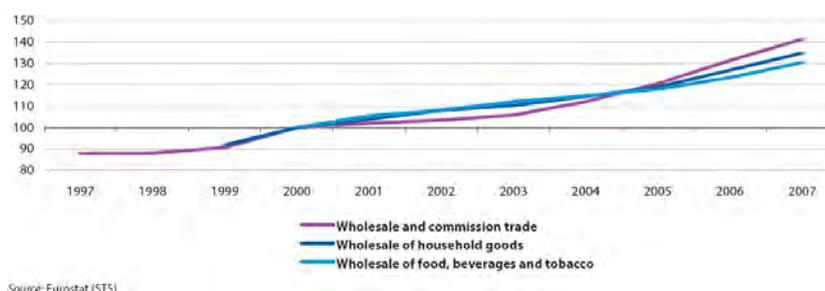

Figure 1: Wholesaling of consumer goods (NACE Groups 51.3 and 51.4). Index of turnover, EU-27 (2000=100)

The 549.9 thousand enterprises with wholesaling of consumer goods (NACE Groups 51.3 and 51.4) as their main activity generated EUR 1741 billion of turnover in the EU-27 in 2006, representing 37.8% of the wholesale trade (NACE Division 51) total. With EUR 205.9 billion of value added this was the largest of the wholesale trade sub-sectors, with a 39.7% share of wholesale value added. However, its contribution to wholesale trade employment was even higher (41.9%) as there were 4.2 million persons employed in the EU-27's consumer goods wholesaling sector.

The wholesale of household goods (NACE Group 51.4) was the larger of the two NACE groups in this sector, with more than half of the sector's employment and turnover and just over three fifths of its value added; the wholesale of food, beverages and tobacco (NACE Group 51.3) recorded the smaller share for all three indicators.

None of the larger Member States particularly dominated this sector within the EU-27, Germany registering the largest shares of turnover (17.8%) and value added (17.7%), and Spain the biggest share of the workforce (14.6%). Greece was the most specialised Member State²⁸ in this sector, as the wholesaling of consumer goods contributed 7.7% of value added generated within the Greek non-financial business economy (NACE Sections C to I and K).

Annualised short-term statistics are available for an analysis of the evolution of turnover indices for consumer goods wholesaling, for each of the two NACE groups that compose this sector. The EU-27 turnover index registered gains for both of these activities in every year for which data is available, with fairly stable growth recorded for both activities, ranging between 2.2% and 8.8%. However in the last few years (2004 to 2007) these two activities both recorded growth below the average for wholesale trade, with food, beverages and tobacco wholesaling recording the slowest growth each year.

Expenditure and productivity

The expenditure structure of the EU-27's wholesaling of consumer goods sector was typical for a wholesale trade activity, but there were some notable differences between the two main parts of the consumer goods wholesaling sector. The level of investment in the sector reached EUR 20.1 billion in 2006, equivalent to 9.8% of value added, and just below the wholesale trade average of 10.2%. The investment rate was lower for the wholesaling of household goods (8.3%), while the corresponding rate for the wholesaling of food, beverages and tobacco was 12.3% (above the wholesale trade average). At a further level of detail, the highest investment rate was recorded for the wholesaling of fruit and vegetables (NACE Class 51.31), at 14.5%, while the lowest was for tobacco products wholesaling (NACE Class 51.35, 7.0%).

Apparent labour productivity for consumer goods wholesaling was EUR 49.3 thousand per person employed in the EU-27 in 2006 and average personnel costs were EUR 30.6 thousand per employee, both figures standing below the wholesale trade average. There were significant differences between the two subsectors, as the values recorded for the wholesaling of household goods were more than one third higher (for both indicators) than those recorded for the wholesale of food, beverages and tobacco. The wholesale of pharmaceutical goods (NACE Class 51.46) recorded the highest apparent labour productivity figure (EUR 83.8 thousand per person employed) and average personnel costs (EUR 47.8 thousand per employee), while the wholesale of fruit and vegetables recorded the lowest levels, EUR 32.9 thousand per person employed and EUR 22.9 thousand per employee respectively.

The wage-adjusted labour productivity rate for the EU-27 was slightly higher in the wholesaling of consumer

²⁸Bulgaria, Cyprus, Poland and Romania, 2005; Malta and the Netherlands, not available.

goods (161.1%) than for the wholesale trade sector (159.8%). At a detailed level of activity quite a range of productivity levels were recorded within this sector. The highest rate, 220.8%, was recorded for the wholesaling of coffee, tea, cocoa and spices (NACE Class 51.37), some way ahead of the 181.2% for the wholesaling of beverages (NACE Class 51.34). None of the activities recorded particularly low ratios, the lowest being 143.6% for the wholesale of fruit and vegetables.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics \(STS\)](#) .

Context

The activities in NACE Division 51 cover all wholesale trade except that concerning motor vehicles and motorcycles (see [Fuel retail and service station statistics](#)): the wholesaling of automotive fuel is considered as a wholesale trade rather than a motor trade. This article covers resale (sale without transformation) of new and used products, as well as wholesale activities carried out on a fee or contract basis.

The wholesaling activity consists of selling to retailers or to industrial, commercial, institutional and professional users. Wholesalers can act on a [fee or contract basis as agents](#) or for their own account, buying and selling goods. The own-account wholesale sub-sectors distinguish the types of product in which the wholesaler is specialised ([agricultural products](#) , consumer goods (this article), [intermediate goods](#) , [machinery and equipment](#)), while specialised wholesalers of other products are included in [non-specialised wholesalers](#) .

In the supply chain, wholesalers are located between producers and users, providing know-how and knowledge in markets for which they have expertise. Competition within the wholesale trade activity is often centred on providing more efficient services or more sophisticated value added services. Wholesalers can provide a range of services from basic storage and break of bulk, sorting, grading and logistics to pre- and post-production operations (for instance, labelling, packaging, bottling and installation).

Notes

Dairy statistics - NACE Rev. 1.1

Data from January 2009. Most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). The present article covers [dairy products](#), corresponding to [NACE Rev 1.1 Group 15.5](#), which is part of the [food, beverages and tobacco \(NACE Rev. 1.1\)](#) sector. Dairy products consist of:

- fresh milk;
- cream;
- butter;
- yoghurt;
- cheese;
- whey;
- ice creams;
- sorbets.

It should be noted that this article excludes the agricultural activities of growing, farming, rearing and hunting and also fishing (NACE Divisions 01 and 05). A number of products, such as eggs or cheese are also sold directly by agricultural holdings. As such, their weight is likely to be under-reported in this article, as part of their production is recorded as an agricultural activity.

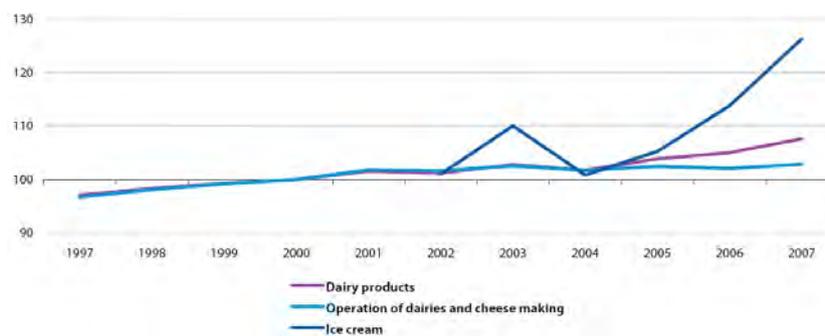

Figure 1: Manufacture of dairy products (NACE Group 15.5). Index of production, EU-27 (2000=100)

Table 1: Manufacture of dairy products (NACE Group 15.5). Structural profile: ranking of top five Member States in terms of value added and persons employed, 2006

There were about 13.0 thousand [enterprises](#) across the [EU-27](#) whose main activity was the manufacture of dairy products (NACE Group 15.5) in 2006. These enterprises employed an estimated 400.0 thousand persons, representing 8.5% of the food, beverages and tobacco manufacturing sector's workforce (NACE Subsection DA). The overwhelming majority of these workers (83.9%) were engaged in the operation of dairies and cheese making (NACE Class 15.51). The dairy products manufacturing sector generated EUR 17.7 billion of [value added](#) in 2005, equivalent to 8.9% of the value added generated by food, beverages and tobacco manufacturing activities in 2005.

The largest dairy products manufacturing sectors in terms of value added generated in 2006 were found in France (EUR 3.2 billion), Germany (EUR 2.6 billion) and Italy (EUR 2.5 billion); together these three Member States contributed just under half (48.1%) of the EU-27's value added. The dairy products manufacturing sectors of the United Kingdom and Spain were also relatively large; they accounted for a combined 18.4% of EU-27 output in 2005.

On average, the dairy products manufacturing sector contributed 0.3% to total value added within the EU-27's [non-financial business economy](#) in 2005. In these relative terms, Germany and the United Kingdom were among the least specialised Member States. In contrast, Lithuania was by far the most specialised country, as the manufacture of dairy products provided 1.4% of the added value that was generated within the non-financial business economy in 2006.

In the ten years through until 2007, there was an upward trend in the [output](#) of dairy products manufacturing across the EU-27, albeit with a couple of relatively small downturns in 2002 and 2004. Overall, the average rate of increase for production over the period considered was 1.0% per year. The EU-27 [index of production](#) for dairy products rose by 2.5% in 2007, hence, well above the trend observed during the previous decade. Output grew at a somewhat faster rate than the EU-27 average in the three largest dairy producing countries (France, Germany and Italy) during the ten-year period through to 2007. The strongest rates of growth, however, were recorded for Poland (on average rising by 4.5% per year) and Latvia (3.0% per year).

Costs, productivity and profitability

[Personnel costs](#) in the EU-27's dairy products manufacturing sector accounted for a lower proportion of operating expenditure (9.9% in 2005) than across the food, beverages and tobacco manufacturing sector (13.8%). Nevertheless, average personnel costs stood at EUR 30.0 thousand per [employee](#), which was about 15% higher than the food, beverages and tobacco manufacturing average in 2005.

Each person employed within the EU-27's dairy products manufacturing sector generated an average of EUR 44.3 thousand of value added in 2005 – above the average for food, beverages and tobacco manufacturing. However, with average personnel costs also being higher, the resulting wage adjusted labour productivity ratio was, at 150.0% in 2005, lower than the average for the whole of the food, beverages and tobacco manufacturing sector 163.0%.

In most of the Member States, the wage adjusted labour productivity ratio for the dairy products manufacturing sector was relatively low. Indeed, in Poland and Slovenia it stood at about half the average recorded for food, beverages and tobacco manufacturing, while in Ireland it was about a third lower, and in the Netherlands and Slovakia about a quarter less. There were a few Member States, however, where the wage adjusted labour productivity ratio of the dairy products manufacturing sector was higher; principally, in Portugal (about 25% above the food, beverages and tobacco manufacturing average), Spain, Germany, Greece and Bulgaria (all 10-15% higher).

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#), including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics \(STS\)](#), the [Labour force survey \(LFS\)](#), the [COMEXT](#) database for external trade and the [Confederation of Food and Drink Industries \(CIAA\)](#).

Context

The food, beverages and tobacco manufacturing sector in the EU is comprised of a relatively small number of enterprises that have a considerable global market presence, which operate alongside a high number of relatively small enterprises that serve more local, regional and national markets.

As these enterprises not only produce goods for final consumption but also intermediate products for other manufacturing activities, they are affected by a broad scope of legislation. The main legislative areas affecting the EU's food, beverages and tobacco manufacturing sector, however, tend to involve international trade agreements, or food and feed legislation. As a majority of the EU's agricultural production is processed by the [food, beverages and tobacco manufacturing sector](#), developments in [Common Agricultural Policy](#) and associated Common Market Organisations can have important implications for costs and processes in the food chain. Regarding food legislation, the [European Parliament](#) and the [Council](#) proposed an update of the laws regarding the provision of information to consumers ([COM\(2008\) 40 final](#)) in 2008, in order to clarify and consolidate existing regulations. In part, this proposal was built on a 2007 White Paper covering a Strategy for Europe on Nutrition, Overweight and Obesity ([COM\(2007\) 279 final](#)), which stressed the need for consumers to have access to clear, consistent and evidence-based nutritional information.

To meet growing demand for milk and milk products within the EU and across global markets, the [European Commission](#)'s proposal ([COM\(2007\) 802 final](#)) for a 2% increase in milk quotas (a total of 2.84 million tonnes) beginning on 1 April 2008 was approved by agricultural ministers. The wider Health Check of the [Common Agricultural Policy](#) that was adopted in January 2009 formally schedules an end to milk quotas in the EU by 2015; it was proposed that a 'soft landing' be ensured by increasing quotas by 1% every year between 2009/10 and 2013/14. In a further underpinning of demand, a new version of the [European School Milk scheme](#) was adopted in July 2008, laying down detailed rules regarding Community aid for supplying milk and certain milk products to pupils in educational establishments.

Distributive trade statistics - NACE Rev. 2

Data from April 2012, most recent data: Further Eurostat information, Main tables and Database

This article presents an overview of statistics for the [European Union's \(EU's\)](#) wholesale and retail trade and repair of motor vehicles and motorcycles sector (hereafter referred to as distributive trades), as covered by [NACE Rev. 2 Section G](#). Distributive trades includes wholesale and retail sale (sale without transformation) of any type of goods; wholesaling and retailing are the final steps in the distribution of merchandise. Sale without transformation is considered to include the usual operations (or manipulations) associated with trade, for example, sorting, grading and assembling of goods, mixing or blending of goods, bottling, packing, breaking bulk and repacking for distribution in smaller lots, storage, cleaning and drying of agricultural products, cutting out of wood fibreboards or metal sheets as secondary activities. Also included in distributive trades are the repair of motor vehicles and motorcycles but not the repair of any other goods. The distributive trades sector does not include any renting activities, for example, the renting of motor vehicles, industrial equipment or household goods. Distributive trades are organised into three NACE divisions:

- Division 45 covers wholesaling and retailing of motor vehicles and motorcycles, as well as their repair, hereafter referred to as motor trades;
- Division 46 covers all wholesale trade other than wholesaling of motor vehicles and motorcycles;
- Division 47 covers all retail trade other than retailing of motor vehicles and motorcycles.

Since the development of the Internet, there has generally been a gradual increase in the use of e-commerce. According to Eurostat's information society statistics, some 13% of the turnover of distributive trades enterprises with ten or more persons employed was derived from [e-commerce](#) in 2011 (this was two percentage points lower than in 2010).

	Value
Main indicators	
Number of enterprises (1 000)	6 045
Number of persons employed (1 000)	33 349

Main statistical findings

Structural profile

Most distributive trades (Section G) **enterprises** serve a local market and consequently this sector is characterised by a large number of enterprises: in total 6.0 million enterprises were classified to this sector in the EU-27 in 2009, making it the largest enterprise population among any of the NACE sections within the **non-financial business economy** (Sections B to J and L to N and Division 95) and amounting to 29.1% of all non-financial business economy enterprises. Together these enterprises generated **turnover** (sales) of EUR 8224 billion across the whole of the EU-27 in 2009, again the largest value among any of the NACE sections within the non-financial business economy and equivalent to 37.3% of the total. A similar pattern was observed for employment, as the 33.3 million persons employed within the EU-27's distributive trades sector accounted for an estimated

24.9% of the non-financial business economy workforce. In **value added** terms, the distributive trades sector was the second largest in the non-financial business economy, smaller only than manufacturing (Section C) generating EUR 1110 billion of value added in the EU-27 in 2011 (or 19.9% of the non-financial business economy total).

The **apparent labour productivity** of the EU-27's distributive trades sector in 2009 was EUR 33 thousand per person employed, some EUR 8.6 thousand less per person employed than the non-financial business economy average. Average personnel costs were EUR 25.0 thousand per employee in the EU-27's distributive trades sector, also below the average of EUR 30.0 thousand for the non-financial business economy. Apparent labour productivity and average personnel costs for the distributive trades sector were both among the lowest levels recorded among all of the NACE sections within the non-financial business economy in 2009. However, it should be noted that both of these indicators are pulled downwards by the traditionally high incidence of part-time employment in the distributive trades sector. The **wage-adjusted labour productivity ratio** is not directly affected by the incidence of part-time employment as it shows the ratio between value added and the total personnel costs without relating this to the number of persons producing the output or receiving wages and salaries. This ratio is adjusted for the relative importance of unpaid working proprietors and family workers which is high in some parts of distributive trades, in particular in retail trade. The wage-adjusted labour productivity ratio for the EU-27's distributive trades sector was 133.2% in 2009 – relatively close to the 138.8% average for the non-financial business economy.

The **gross operating rate** shows the relation between the **gross operating surplus** and turnover and is one measure of profitability. The EU-27's distributive trades sector recorded the lowest gross operating rate (5.1%) among the NACE sections within the non-financial business economy in 2009, as the level of this ratio was pulled down by the exceptionally high turnover that is an intrinsic characteristic of wholesale and retail trade activities.

Sectoral analysis

Around three out of every five (58.8%) enterprises within the EU-27's distributive trades sector were in the retail trade subsector; most of the remainder were in the wholesale trade subsector (28.5%), while the motor trades subsector had the smallest share (12.7%) of the distributive trades' enterprise population. In terms of turnover, the relative size of the retail and wholesale trade subsectors was reversed, as retail trade generated 29.9% of distributive trades turnover, wholesale trade accounted for a 58.1% share, while motor trades contributed the remaining 11.9%.

Figure 1 shows a similar analysis of the distributive trades' sectoral structure based on employment and value added. As can be seen, the relative importance of the motor trades subsector remained (as for the number of enterprises and turnover) within the range of 11.9 to 12.7% of the distributive trades' total. In contrast, retail trade had by far the largest share of the sectoral workforce (55.6%), while wholesale trade accounted for the highest share of sectoral value added (46.2%).

These large differences in the relative size of wholesale and retail trade activities when measured in value added and employment terms underline the significant differences in apparent labour productivity between these two activities – see Table 2b. Apparent labour productivity stood at EUR 23 thousand per person employed for the EU-27's retail trade sector in 2009. This was less than half the productivity level recorded for wholesale trade (EUR 51 thousand per person employed) and resulted in retail trade recording the seventh lowest level of apparent labour productivity among the NACE divisions that make-up the non-financial business economy. Average personnel costs for the retail trade sector were EUR 18.6 thousand per employee in 2009, which was slightly less than half the level recorded for wholesale trade (EUR 34.7 thousand per employee). These relatively low levels of apparent labour productivity and average personnel costs recorded for retail trade can to some extent be explained by a high incidence of part-time employment: the use of the wage-adjusted labour productivity ratio takes account of this to a large extent. Despite this, the wage-adjusted labour productivity ratio for the retail trade sector (125.0%) remained well below the corresponding figure for wholesale trade (146.5%).

Within the EU-27's motor trades sector, apparent labour productivity stood at EUR 32 thousand per person employed in 2009, which was EUR 1 thousand per person employed less than the distributive trades average and almost EUR 10 thousand per person employed less than the non-financial business economy average. Average personnel costs for the motor trades sector, at EUR 27.3 thousand per employee) were situated between the distributive trades' average of EUR 25.0 thousand per employee and the non-financial business economy average of EUR 30.0 thousand per employee. As a result, the wage-adjusted labour productivity ratio for the motor

trades sector was relatively low, at 117.4% (the lowest value among the three distributive trades' subsectors).

Country analysis

The share of distributive trades within the non-financial business economy's value added ranged from 14.5% in the Czech Republic to 24.5% in Belgium, while the employment share ranged from 19.1% in Luxembourg to 30.0% in Lithuania. Despite this apparently wide range in the relative weight of the distributive trades sector in the Member States, when taking into consideration that the distributive trades sector is large in absolute terms, the sector as a whole is not one which displays any high degree of specialisation; the buying and reselling of goods is a commonplace activity that occurs on a daily basis in almost every village, town or city. Figure 3 shows that value added and employment within the distributive trades sector was somewhat less concentrated in the five largest Member States than on average across the whole of the non-financial business economy: France, the United Kingdom and Italy all accounted for a smaller share of EU-27 value added in distributive trades than in the non-financial business economy as a whole, while Germany had a slightly larger share in distributive trades. The relatively low level of specialisation in distributive trades is underlined by the information presented in Table 3, which shows Germany recording the highest share of EU-27 value added for each of the three subsectors that compose distributive trades, ranging from a 21.7% share for retail trade to a 29.2% share for motor trades. Nevertheless, for motor trades, Germany also reported the highest degree of specialisation (in terms of value added), such that the motor trades sector accounted for 3.0% of value added within the German non-financial business economy in 2009. Belgium was the most specialised Member State in relation to wholesale trade, which may in part be linked to its geographical location, in particular its proximity to several of the largest maritime ports; wholesale trade accounted for 13.9% of Belgian value added within the non-financial business economy in 2009. The highest degree of specialisation for retail trade was recorded in Cyprus, where retail trade represented 10.5% of Cypriot non-financial business economy value added.

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

The purchase of motor vehicles is usually the result of a long-term process, the collection of information and comparison between different vehicles and different suppliers. Retailing and repair of motor vehicles are to some extent substitutes, in that the purchase of a replacement vehicle may often be postponed, particularly in times of economic hardship, in favour of repairing an existing vehicle.

Wholesale trade is the resale of new and used goods to retailers, to industrial, commercial, institutional or professional users, or to other wholesalers. Equally, it includes acting as an agent or broker in buying merchandise for, or selling merchandise to, such persons or enterprises. Merchant (or own account) wholesalers take title to the goods while brokers and agents trade on a commission or fee basis. In the supply chain, wholesalers are located between producers and users, providing know-how and knowledge in markets for which they have expertise. Competition within the wholesale trade activity is often centred on providing more efficient services or more sophisticated value added services. Wholesalers can provide a range of services from basic storage and break of bulk, sorting, grading and logistics to pre- and post-production operations (for instance, labelling, packaging, bottling and installation).

Retailing is the resale of new and used goods mainly to the general public for personal or household consumption or use. Sales may be made in stores (mainly shops), at stalls or markets, or through other forms such as remote selling (mail-order or Internet), vending machines or door-to-door salespersons. Most retailers take title to the goods they sell, but some act as agents for a principal and sell either on consignment or on a commission basis. Retailing is typically the final stage of distribution between producers and consumers and many of the EU policies affecting this activity concern consumer protection. In October 2011, a [Directive on](#)

[consumer rights](#) was formally adopted, giving the governments of the Member States two years to implement national rules. The Directive aims to make purchases easier and safer, whether in-store or not, and covers a wide range of issues linked to the provision of price information, protection against late delivery and non delivery, as well as setting out rights on issues such as cooling-off periods, returns, refunds, repairs and guarantees and unfair contract terms. The main benefits for consumers are expected to be:

- the elimination of hidden charges and costs on the internet;
- the banning of pre-ticked boxes on websites;
- increased price transparency;
- a 14-day period for customers to change their mind relating to purchases;
- better refund rights;
- the introduction of an EU-wide model withdrawal form;
- the elimination of surcharges for the use of credit cards and hotlines;
- clearer information on who pays for returning goods;
- better consumer protection in relation to digital products;
- common rules for businesses to make it easier for them to trade all over Europe.

Domestic appliances production statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev. 1.1](#)), the present article covers the production of domestic appliances, corresponding to NACE Group 29.7, which is part of the [machinery and equipment](#) sector. The activities covered in this article include the production of:

- electrical appliances (such as refrigerators, freezers and dish washing machines);
- heating appliances;
- non-electric domestic cooking equipment.

	Highest value added (1)		Largest number of persons employed (2)		Most specialised: share in non-financial business economy (%) (3)			
	Country	(EUR million)	(% of EU-27)	Country	(thousand)	(% of EU-27)	Value added

Source: Eurostat (SBS)

Table 3: Manufacture of domestic appliances n.e.c. (NACE Group 29.7). Expenditure, productivity and profitability, EU-27, 2006

The domestic appliances manufacturing sector (NACE Group 29.7) of the EU-27 consisted of 5.2 thousand enterprises, which employed 287.6 thousand persons, accounting for 7.9% of the workforce within machinery and equipment manufacturing (NACE Subsection DK). These enterprises recorded EUR 52.7 billion of turnover in 2006, from which EUR 12.7 billion of value added was generated, the latter accounting for 6.6% of the machinery and equipment manufacturing total. Within this sector the manufacture of electric domestic appliances (NACE Class 29.71) contributed just over 84% of sectoral value added and employment, the remainder coming from the manufacture of non-electric domestic appliances (NACE Class 29.72).

The value added generated by the domestic appliances manufacturing sector in Germany was much larger than that in any other Member State, accounting for 28.4% of the EU-27 total in 2006: Italy (20.6% of the EU-27 total) and the United Kingdom (10.4%) were the only other Member States with a double-digit share. Italy and Germany had the largest workforces in this sector, both over 55000 persons employed. In relative terms, Slovenia was by far the most specialised Member State²⁹ in the manufacture of domestic appliances, as this sector contributed 2.0% to Slovenian non-financial business economy (NACE Sections C to I and K) value added in 2006, approaching nine times the average contribution (0.2%) across the EU-27: this high degree of specialisation in Slovenia was due essentially to the electric domestic appliances manufacturing subsector.

The production index for domestic appliances manufacturing in the EU-27 developed in an almost identical manner to the index for machinery and equipment manufacturing as a whole in the period between 1997 and 2002. Thereafter, the output of domestic appliances manufacturing either contracted or grew weakly in every year with the exception of 2006 when growth of 4.4% was recorded. Between 2003 and 2007 output from domestic appliances manufacturing grew on average by 0.8% per year, whereas overall output from machinery and equipment manufacturing averaged growth of 5.3% per year during the same period.

Expenditure and productivity

The EU-27's domestic appliances manufacturing sector recorded EUR 1.9 billion of gross tangible investment in 2006, 10.6% of the machinery and equipment manufacturing total. This was equivalent to 14.6% of the domestic appliances manufacturing sector's value added, giving this sector the highest investment rate among any of the machinery and equipment manufacturing NACE groups in 2006, although it was still some way below the non-financial business economy average of 18.4%.

The proportion of operating expenditure accounted for by personnel costs in the EU-27's domestic appliances manufacturing sector was 18.4% in 2006, much lower than the average proportion within machinery and equipment manufacturing as a whole (23.6%) and much closer to the proportion across the non-financial business economy (16.1%). This low proportion may be explained, in part, by average personnel costs in the sector that were EUR 6.0 thousand per employee lower than the machinery and equipment manufacturing average, at EUR 32.8 thousand per employee. The apparent labour productivity of the domestic appliances manufacturing sector was EUR 44.2 thousand per person employed in 2006, resulting in a wage-adjusted labour productivity ratio of 134.6%, fractionally below the ratio (135.8%) for machinery and equipment manufacturing as a whole. The non-electric domestic appliances manufacturing subsector recorded a higher wage adjusted labour productivity ratio (150.4%) that was only just below the non-financial business economy average (151.1%). Slovakia recorded a negative wage-adjusted labour productivity ratio in its domestic appliances manufacturing sector in 2006, due to negative value added, while Sweden recorded a ratio of 92.1% indicating that average personnel costs exceeded apparent labour productivity in its domestic appliances manufacturing sector.

²⁹Bulgaria, Cyprus, Poland, Portugal and Romania, 2005; Denmark, Estonia, Latvia, Luxembourg, Malta and the Netherlands, not available.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include the [PRODCOM](#) statistics on the production of manufactured goods.

Context

Technological advancements in the machinery and equipment that is used in other sectors of the economy (particularly in mining, manufacturing, energy provision and construction) can have a considerable impact upon the speed, quality and quantity of what is produced, thereby impacting on downstream productivity and profitability. The machinery and equipment sector is sensitive, therefore, to overall economic conditions and investment patterns both within the European Union and across the world (the two arguably being more intertwined than ever).

Among the activities covered by the machinery and equipment manufacturing sector, the domestic appliances manufacturing sector (NACE Group 29.7) is the only one for which [households](#) are the main customers. Product innovations have tended to concentrate on efficiency and environmental considerations such as energy and water consumption, lifestyle changes, the incorporation of new materials, design and ergonomics.

Table 5: Manufacture of electrical machinery and apparatus n.e.c. (NACE Division 31). Main indicators, 2006 (1)

The 70.7 thousand enterprises that were operating within the EU-27's electrical machinery and equipment manufacturing sector (NACE Division 31) in 2006 made the largest contribution of the four NACE divisions within the electrical machinery and optical equipment sector to the value added of the electrical machinery and optical equipment (NACE Subsection DL) manufacturing sector, accounting for two fifths of the total (40.9%), and just under half (46.6%) of all those employed. The electrical machinery and equipment manufacturing sector in the EU-27 generated EUR 82.9 billion of value added in 2006 from sales of EUR 282.0 billion.

Looking in more detail, the largest activity in the EU-27 in terms of the NACE groups which compose the electrical machinery and equipment sector was the manufacture of electricity distribution and control apparatus (NACE Group 31.2) which contributed EUR 33.1 billion of value added (39.9% of the electrical machinery and equipment manufacturing total), followed by the manufacture of electrical equipment not elsewhere classified (NACE Group 31.6) which contributed EUR 19.7 billion (23.8%) and the manufacture of electric motors, generators and transformers (NACE Group 31.1) which provided EUR 15.0 billion (18.1%). In employment terms, these three subsectors together accounted for more than four fifths (80.9%) of the 1.7 million persons employed in the EU-27's electrical machinery and equipment manufacturing sector.

As with most of the activities covered within electrical machinery and optical equipment sector, the electrical machinery and equipment sector was dominated by Germany, which contributed a little over two fifths (40.8%) of the EU-27's value added in 2006 – more than three times as high as the next biggest shares recorded by Italy and France (11.5% and 10.8% respectively). In relation to the non-financial business economy value added of each Member State, the electrical machinery and equipment manufacturing sector in Hungary contributed the highest share (4.1%) in 2006, while the Czech Republic (3.0%) and Germany (2.9%) were the next

most specialised Member States, with ratios that were about double the EU-27 average (1.5%).

The development of the index of production for the manufacture of electrical machinery and equipment in the EU-27 during the ten years between 1997 and 2007 was similar to that observed for the whole of electrical machinery and optical equipment manufacturing (NACE Subsection DL), albeit with less pronounced fluctuations both when expanding and contracting. Furthermore, the downturn in electrical machinery and equipment manufacturing [output](#) in 2002 and the subsequent upturn in 2004 lagged, by one year, a similar development for electrical machinery and optical equipment manufacturing as a whole. Over the ten years through to 2007, the [index of production](#) for the manufacture of electrical machinery and equipment grew at an average rate of 2.7% per year, a lower figure than that recorded for the whole of electrical machinery and optical equipment manufacturing (4.5% per year).

Expenditure and productivity

The EU-27's electrical machinery and equipment manufacturing sector recorded an [investment rate](#) (the ratio of investment to value added) of 9.1% in 2006, about half the average for the whole of the non-financial business economy (18.4%). The relatively low level of capital intensity of this activity is evident when looking at its share of total investment within the EU-27's non-financial business economy (0.7%), which was less than half its corresponding share of non-financial business economy value added (1.5%).

In contrast, the relative importance of [personnel costs](#) in the electrical machinery and equipment sector's [operating expenditure](#) was relatively high, at 22.3% for the EU-27 in 2006, compared with an average of 16.1% for the whole of the non-financial business economy. This share was based on average personnel costs in the EU-27 of EUR 36.1 thousand per employee, which was well above the non-financial business economy average of EUR 28.8 thousand, while being the lowest level among the four NACE divisions within the electrical machinery and optical equipment sector.

The EU-27's electrical machinery and equipment manufacturing sector recorded an apparent [labour productivity](#) of EUR 48.5 thousand per person employed in 2006, which was also the lowest level among the four NACE divisions within the electrical machinery and optical equipment sector, but was again higher than the non-financial business economy average (EUR 43.5 thousand per person employed). Combining these two ratios into the [wage-adjusted labour productivity ratio](#) shows the relationship between value added and personnel costs per head, and indicates that value added per person employed in the EU-27's electrical machinery and equipment manufacturing sector was equivalent to 134.4% of the average personnel costs in 2006, the lowest ratio for this indicator among the four NACE divisions that are treated in the electrical machinery and optical equipment sector, and also below the non-financial business economy average (151.1%).

Among the NACE groups that make up the electrical machinery and equipment manufacturing sector, none were particularly capital-intensive, with the highest for the EU-27 being recorded for two relatively small subsectors that concern the manufacture of insulated wires and cables (11.7%) and the manufacture of accumulators, primary cells and batteries (11.8%). The least capital-intensive subsector – using this measure of the investment rate – was the manufacture of electricity distribution and control apparatus (7.4%), which also recorded the highest share of personnel costs in operating expenditure (26.8%) among the six NACE groups covered by this article, as well as the highest level of apparent labour productivity (EUR 57.0 thousand per person employed) and the highest level of average personnel costs per employee (EUR 47.1 thousand).

However, when adjusting labour productivity to take account of personnel costs, the highest wage-adjusted labour productivity ratios within the EU-27's electrical machinery and equipment manufacturing sector were recorded for the manufacture of insulated wire and cable (154.2%) and the manufacture of lighting equipment and electric lamps (158.2%); both of which were characterised by relatively low average personnel costs per employee that were close to the non-financial business economy average.

Among the Member States³⁰, high average personnel costs were recorded in Germany, at EUR 54.7 thousand per employee in 2006, the highest level among the Member States. Average personnel costs in the German electrical machinery and equipment manufacturing sector were 53.4% higher than the national average for the non-financial business economy, once again the highest value. Using a similar measure, the relative apparent labour productivity of the electrical machinery and equipment manufacturing sector (in relation to the non-financial business economy average) was at around 50% above average in Spain, Greece and Hungary.

³⁰Bulgaria, Greece, Poland and Romania, 2005; Ireland, Cyprus, Luxembourg, Malta and the Netherlands, not available.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics \(STS\)](#) and the [PRODCOM](#) statistics on the production of manufactured goods.

Context

The electrical machinery and optical equipment sector is an important and strategic part of Europe's manufacturing sector, producing a wide range of mostly high-technology products (for example, computers, switchgears or semi-conductors). This sector has been cited as being at the centre of industrial development, as almost every other sector depends, at least to some degree, on the capital equipment, technology, end-products, research and innovations that are provided by the electrical machinery and optical equipment sector. It is therefore often referred to as one of the main drivers of [productivity](#) gains and central to the EU's objective of creating more and better jobs.

The goods and services made within the electrical machinery and optical equipment sector range from capital goods used in energy and primary transformation activities, transport manufacturing (motor vehicles, aeronautics and rail equipment producers) or process manufacturing sectors (agro-industries, chemicals, plastics or wood), through intermediate goods (such as electronic components or wiring) that are often used by other manufacturers, to consumer goods (such as consumer electronics, mobile phones and household appliances).

This sector operates within a long-established legislative framework that covers issues such as product safety, energy labelling, minimum efficiency requirements, eco-design and waste. Two Directives ([2008/34](#) and [2008/35](#)) on waste electrical and electronic equipment (WEEE) and the restriction of the use of certain hazardous substances in electrical and electronic equipment were introduced in 2008. The EU aims to take measures to prevent the generation of electrical and electronic waste and to promote reuse, recycling and other forms of recovery in order to reduce the quantity of such waste by encouraging manufacturers to design products with the environmental impacts in mind throughout their entire life cycle.

The potential role that may be played by the electrical machinery and optical equipment sector with respect to energy efficiency has also been highlighted in recent years. Indeed, considerable effort has gone into reducing the energy consumption of appliances, although changes in lifestyle and working practices have sometimes offset these, for example, while changes to the manufacture of domestic and office appliances has made these more energy efficient, rising equipment rates and the introduction of new technologies may result in higher overall energy consumption. Several directives cover this area of energy saving, in particular a Directive on eco-design requirements for energy-using products, a Directive on the energy labelling of domestic appliances and a Regulation on the energy efficiency labelling programme for office equipment.

The electrical machinery and equipment sector is composed of a diverse range of activities that are mainly supplied to professional downstream users in the form of electro-technical equipment and less frequently to consumer markets. Many of the activities within the electrical machinery and equipment subsector, in contrast to the others in the electrical machinery and optical equipment sector, may be considered to be quite mature. This may explain why there are relatively low [research and development](#) budgets in some of these activities, while many producers focus on their key products and make increasing recourse to [outsourcing](#) .

Notes

Electrical machinery and optical equipment production statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article introduces a [set of statistical articles](#) which analyse the structure, development and characteristics of the economic activities in the electrical machinery and optical equipment sector in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), this sector covers NACE Subsection DL, which is divided into four NACE divisions, each of which is treated in more depth in a further article:

- [the manufacture of computers and office machinery](#), corresponding to NACE Division 30;
- [the manufacture of electrical machinery and equipment](#), corresponding to NACE Division 31;
- [the manufacture of radio, television and communication equipment](#), corresponding to NACE Division 32;
- [instrument engineering](#), corresponding to NACE Division 33, which includes the manufacture of medical, precision and optical equipment.

Table 9: Manufacture of medical, precision and optical instruments, watches and clocks (NACE Division 33). Main indicators, 2006 (1)

Among the structural business statistics sectors, electrical machinery and optical equipment manufacturing (NACE Subsection DL) was the third largest industrial activity in the EU-27 in 2006 in terms of its value added generated, only behind the manufacture of basic metals and fabricated metal products (see [Metals and metal products statistics - NACE Rev. 1.1](#)) and fuel processing and the manufacture of chemicals (see [Rubber and plastics production statistics - NACE Rev. 1.1](#)).

The 202.6 thousand enterprises active in the electrical machinery and optical equipment manufacturing sector in 2006 together employed 3.7 million persons across the EU-27; of these, the vast majority (95.0%) were paid employees. The EU-27's electrical machinery and optical equipment manufacturing sector generated EUR 202.9 billion of value added in 2006, contributing 3.6% of the total value added that was generated within the non-financial business economy (NACE Sections C to I and K). This was considerably higher than the corresponding shares of this sector in the number of enterprises (1.1%) or persons employed (2.8%), suggesting that the electrical machinery and optical equipment manufacturing sector was characterised by relatively large enterprises that were more productive than the average.

Among the four NACE divisions that comprise the electrical machinery and optical equipment manufacturing sector, the largest in the EU-27 was the electrical machinery manufacturing (NACE Division 31) subsector, which accounted for two fifths (40.9%) of sectoral value added in 2006; this subsector also had the highest share of turnover (39.7%) and persons employed (46.6%). Instrument engineering (NACE Division 33) was the next largest subsector (in value added terms), accounting for 29.6% of the electrical machinery and optical equipment total, closely followed by radio, television and telecommunication equipment manufacturing (NACE Division 32), with a share that was a little over one quarter (25.6%). A relatively high proportion of enterprises reported their principal activity concentrated within the instrument engineering subsector, as these accounted for 45.4% of all enterprises within the EU-27's electrical machinery and optical equipment manufacturing sector. In contrast, the radio, television and telecommunication equipment manufacturing subsector accounted for just 14.5% of enterprises, suggesting that this activity was populated by considerably fewer, large enterprises. By far the smallest subsector, by any of these measures of size, was the manufacture of office machinery and computers (NACE Division 30), which contributed just 4.7% of sectoral value added in 2006.

The electrical and optical equipment manufacturing sector was dominated by output from Germany, which provided one third (33.7%) of the EU-27's value added in 2006, some 2.8 times as high as the next largest contribution which was made by France (12.2%). The United Kingdom and Italy were the only other countries to report double-digit shares (10.9% and 10.2% respectively) of EU-27 value added, with a considerable gap thereafter, as Ireland made the next largest contribution (4.1%).

In relative terms, Finland, Hungary and Ireland were the most specialised Member States in this sector, as electrical machinery and optical equipment manufacturing provided between 9% and 10% of their non-financial business economy value added in 2006. Germany and Slovakia (both 5.9% of non-financial business economy value added) were the next most specialised countries. At the other end of the range, Greece and Cyprus (2005) reported that electrical machinery and optical equipment manufacturing accounted for less than 1% of their non-financial business economy value added or employment³¹.

The map shows the regional specialisation of the electrical machinery and optical equipment manufacturing sector, which is largely concentrated within central and eastern Europe. The most specialised regions (at the level of detail shown in the map) were Zapadne Slovensko (Slovakia), Oberpfalz (Germany) and Közép-Dunántúl (Hungary), where at least one in every ten persons employed within the non-financial business economy worked in electrical machinery and optical equipment manufacturing. There were several regions in Germany that were relatively specialised in this activity, which was also the case in the Czech Republic, Hungary, Finland and Slovakia as well as Slovenia (which is considered as one region at the level of detail shown in the map).

Business investment decisions and consumer demand for electronic goods are highly influenced by broader developments in the business cycle, and production patterns for electronic machinery and optical equipment goods may therefore be expected to adapt to these changes more strongly and perhaps more quickly than is the case for many other manufactured goods. The development of the production index for EU-27 electrical machinery and optical equipment manufacturing followed, but magnified, the economic cycle for industrial (NACE Sections C to E) output between 1997 and 2007, with more rapid growth during the years to 2000, a bigger contraction through to 2003, and then a faster expansion in each subsequent year through to 2007. The average rate of growth for the EU-27 [production index](#) for electrical machinery and optical equipment manufacturing in the ten years to 2007 was, at 4.5% per year, more than double the average for total industry (2.1% per year). The growth in EU-27 output of electrical machinery and optical equipment was driven by radio, television and communication equipment manufacturing (up on average by 5.4% per year between 1997 and 2007), while the relatively small activity of office machinery and computer manufacturing also recorded a relatively high growth rate (averaging 5.2% per year). While these two activities recorded the highest rates of growth, they also displayed the greatest fluctuations in output over time – both in a positive and negative sense – suggesting that consumer expenditure on electronic items was more sensitive to the economic cycle than the investment behaviour of enterprises (as witnessed through the comparatively stable evolution of the index of production for electrical machinery and apparatus).

[Domestic output prices](#) for electrical machinery and optical equipment in the EU-27 followed a steady downward trend over the period from 1997 to 2005. Indeed, this was the only industrial activity (at the level of NACE subsections) where prices fell, on average, during the most recent decade for which information is available. However, in 2006 the output price of electrical machinery and optical equipment rose by 1.0%, which was consolidated in 2007 by a further increase of 0.2%.

There were three distinct developments in the employment index for electrical machinery and optical equipment manufacturing in the EU-27, largely reflecting the overall [economic cycle](#). Between 1997 and 2001 there was some growth in employment levels, which contrasted with a broad decline in the wider industrial workforce. This was followed by a relatively steep decline in the number of persons employed in electrical machinery and optical equipment manufacturing during the period from 2001 to 2003, at a pace that outstripped the industrial average. From 2004 until 2007 the employment index for electrical machinery and optical equipment manufacturing outperformed that for total industry, with the number of persons employed rising by 0.4% in 2006 and by a further 1.2% in 2007.

[Large enterprises](#) (employing 250 or more persons) generated 61.9% of the value added within the EU-27's electrical machinery and optical equipment manufacturing sector in 2006, considerably more than their average contribution (42.1%) across the whole of the non-financial business economy. The relative importance of [medium-sized enterprises](#) (employing between 50 and 249 persons), 19.9% of sectoral value added, was also above the non-financial business economy average (17.8% in 2005). The relative importance of [micro enterprises](#) (with fewer than ten persons employed) was particularly low within the electrical machinery and optical equipment sector, as these accounted for just 5.9% of value added, compared with a non-financial business economy average of 21.0% (2005).

This relatively important presence of large enterprises was apparent for three of the four NACE divisions that make up the electrical machinery and optical equipment sector, with large enterprises accounting for more

³¹Malta, not available.

three fifths of the EU-27's value added in 2006. The only exception was instrument engineering, where large enterprises contributed 46.0% of the total value added, which was still considerably more than the 24.0% share of medium-sized enterprises, which were also relatively important within this subsector.

Employment characteristics

The gender profile of the EU-27's electrical machinery and optical equipment workforce in 2007 was very similar to that for the whole of the non-financial business economy, with 65.0% of workers in this sector male compared with an average of 64.9%. Among the Member States, however, there were considerable differences, as less than half the electrical machinery and optical equipment workforce were male in Slovakia and the three Baltic Member States³², while men accounted for upwards of 70% of those employed in Cyprus (2006), Greece, the Netherlands, the United Kingdom and Austria.

The age profile of the electrical machinery and optical equipment workforce in 2007 also resembled closely that of the non-financial business economy as a whole, with persons aged less than 30 accounting for 23.1% of those employed in the EU-27 (compared with a non-financial business economy average of 24.3%). The proportion of those aged 50 or more (20.2%) was also slightly lower in the electrical machinery and optical equipment sector than across the non-financial business economy (21.9%). As a result, some 56.3% of those employed in this sector were aged 30 to 49 (2.6 percentage points higher than the non-financial business economy average). Among the Member States, a majority (54.9%) of those employed in the Maltese electrical machinery and optical equipment sector in 2007 were aged less than 30, while this age group also accounted for a relatively high proportion of the workforce in a number of central and eastern European Member States, principally Slovakia (37.7%), Poland (34.3%) and Hungary (31.7%). In each of these countries the proportion of persons aged less than 30 working in the electrical machinery and optical equipment sector was at least 6 percentage points higher than the corresponding share of this age group within the whole of the non-financial business economy, a pattern that was also repeated in the Czech Republic, Estonia and Romania.

While the gender and age breakdowns of the EU-27's electrical machinery and optical equipment workforce were generally in line with those of the non-financial business economy, the prevalence of part-time employment in the electrical machinery and optical equipment sector (6.7% of those employed in 2007) was much lower than the corresponding average for the non-financial business economy (14.3%), and was also somewhat lower than the industrial average (7.3%). The high prevalence of full-time employment was particularly evident in the central and eastern Europe and despite part-time work being generally less common in many of these countries (in terms of its importance within the whole of the non-financial business economy), the proportion of persons working part-time in the electrical machinery and optical equipment sector was even less common, and the incidence of full-time employment reached or exceeded 97.5% in 11 of the 27 Member States.

Expenditure, productivity and profitability

The level of **gross investment in tangible goods** within the EU-27's electrical machinery and optical equipment sector was EUR 20.5 billion in 2006. This was equivalent to 2.0% of non-financial business economy total, and resulted in an **investment rate** (gross tangible investment as a percentage of value added) of 10.1%, which was considerably lower than the non-financial business economy average (18.4%).

Across the four NACE divisions that make up the EU-27's electrical machinery and optical equipment sector only the manufacture of radio, television and communication equipment recorded an investment rate (15.1%) above the sectoral average in 2006, with rates falling below 8% for both the manufacture of office machinery and computers and instrument engineering.

The electrical machinery and optical equipment sector reported a slightly higher than average share of **personnel costs** in total operating expenditure: some 20.6% for the EU-27 in 2006, higher than the 16.1% share of personnel costs in operating expenditure within the whole of the EU-27's non-financial business economy. Within the manufacture of instrument engineering, the relative importance of labour as an input in the manufacturing process rose considerably, such that personnel costs accounted for 30.8% of **operating expenditure**.

Average personnel costs for the EU-27's electrical machinery and optical equipment sector were EUR 38.7

³²Cyprus, 2006; Luxembourg, not available.

thousand per employee in 2006 and apparent **labour productivity** was EUR 55.3 thousand per person employed. Average personnel costs were 34.4% higher than the non-financial business economy average, while the corresponding ratio for apparent labour productivity showed a difference of 27.1% in favour of the electrical machinery and optical equipment sector.

These differences feed through into the **wage-adjusted labour productivity ratio**, which stood at 142.8% for the EU-27's electrical machinery and optical equipment sector in 2006, compared with a non-financial business economy average of 151.1%. The only one of the four NACE divisions included within the electrical machinery and optical equipment sector to report a wage-adjusted labour productivity ratio above the non-financial business economy average was the manufacture of office machinery and computers (153.0% in 2005 compared with a non-financial business economy average of 146.5% for the same year).

Among the Member States³³, the apparent labour productivity of those employed within the electrical machinery and optical equipment sector rose well above the national non-financial business economy average in Finland and Ireland (by 88.4% and 79.7% respectively), while average personnel costs were relatively high in Portugal (59.7% more than the non-financial business economy average) and Germany (45.3% higher). A similar analysis shows that Finland (38.6%), Hungary (37.6%), Greece (24.3%) and Sweden (21.5%) were the only Member States (no information for Ireland) where the wage-adjusted labour productivity ratio for electrical machinery and optical equipment was significantly higher than the non-financial business economy average. In most of the Member States the opposite was true, with Germany, Luxembourg and the Baltic Member States reporting wage-adjusted labour productivity ratios that were around 14-20% lower than their national non-financial business economy averages.

Profitability for the EU-27's electrical machinery and optical equipment sector, as measured by the ratio of the **gross operating surplus** to **turnover**, was 9.6% in 2006, slightly below the non-financial business economy average of 10.8%. Among the four NACE divisions covered within the electrical machinery and optical equipment sector, the lowest gross operating rate was recorded for the manufacture of office machinery and computers (5.9%), with only instrument engineering reporting a rate above the sectoral average (12.8% in 2005).

External trade

Among the Member States, Germany recorded the largest **trade surplus** (EUR 20.0 billion) in electrical and optical equipment in 2007, followed by Ireland (EUR 8.9 billion); only eight of the Member States exported more electrical and optical goods than they imported in 2007. The largest **deficits** were recorded by the United Kingdom (EUR 28.2 billion), Spain (EUR 22.3 billion) and France (EUR 12.3 billion). In relative terms, electrical and optical equipment exports and imports often accounted for a considerable share of total industrial **exports** and **imports**. In 2007, these goods accounted for more than half (57.9%) of all Maltese industrial exports, for more than a third of industrial exports from Luxembourg and Hungary, and for around a quarter of the total from the Czech Republic, Ireland, the Netherlands and Finland.

The EU-27 imported electrical and optical equipment (CPA Subsection DL) to the value of EUR 267.8 billion in 2007, which represented 20.1% of all industrial (CPA Sections C to E) imports. These imports of electrical and optical equipment from non-member countries accounted for 42.5% of the total (**intra-** and **extra-EU**) trade of these products by EU-27 Member States in 2007, some 6.9 percentage points higher than the industrial average (35.7%). Exports of electrical and optical equipment to non-member countries were valued at EUR 200.0 billion in 2007 (17.2% of all industrial exports), resulting in a trade deficit of EUR 67.8 billion. The overall EU-27 trade deficit could be attributed to considerable imports of office machinery and computers (CPA Division 30) and radio, television and communication equipment (CPA Division 32), which led to deficits of EUR 45.1 billion and EUR 44.3 billion respectively for these products in 2007. In contrast, the EU-27 ran a trade surplus for electrical machinery and apparatus (EUR 14.3 billion, CPA Division 31) and for instrument engineering (EUR 7.3 billion, CPA Division 33).

By far the largest share of EU-27 imports of electrical and optical equipment from non-member countries originated from China (34.2% in 2007). This share was more than double that of the second most important trade partner, the United States (16.1%), while south-east Asian economies accounted for the vast majority of the remaining imports. The importance of Chinese imports was particularly concentrated with respect to office machinery and computers, where China accounted for almost half (48.0%) of the imports from non-member

³³Bulgaria, Cyprus, Poland and Romania, 2005; Malta and the Netherlands, not available.

countries. Instrument engineering was the only one of the four CPA divisions covered within the electrical machinery and optical equipment sector where China (12.6%) did not account for the largest proportion of EU-27 imports, as both the United States (36.7%) and Switzerland (17.3%) recorded higher shares. The largest single export market for EU-27 electrical and optical equipment in 2007 was the United States (18.9%); the Russian Federation, China and Switzerland each accounted for between 7.5% and 6.0% of the EU-27's exports.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics \(STS\)](#) and the [COMEXT](#) database for external trade.

Context

The electrical machinery and optical equipment sector is an important and strategic part of Europe's manufacturing sector, producing a wide range of mostly high-technology products (for example, computers, switchgears or semi-conductors). This sector has been cited as being at the centre of industrial development, as almost every other sector depends, at least to some degree, on the capital equipment, technology, end-products, research and innovations that are provided by the electrical machinery and optical equipment sector. It is therefore often referred to as one of the main drivers of [productivity](#) gains and central to the EU's objective of creating more and better jobs.

The goods and services made within the electrical machinery and optical equipment sector range from capital goods used in energy and primary transformation activities, transport manufacturing (motor vehicles, aeronautics and rail equipment producers) or process manufacturing sectors (agro-industries, chemicals, plastics or wood), through intermediate goods (such as electronic components or wiring) that are often used by other manufacturers, to consumer goods (such as consumer electronics, mobile phones and household appliances).

This sector operates within a long-established legislative framework that covers issues such as product safety, energy labelling, minimum efficiency requirements, eco-design and waste.

Two Directives ([2002/96/EC](#) and [2002/95/EC](#)) on waste electrical and electronic equipment (WEEE) and the restriction of the use of certain hazardous substances in electrical and electronic equipment were introduced in 2002. The EU aims to take measures to prevent the generation of electrical and electronic waste and to promote reuse, recycling and other forms of recovery in order to reduce the quantity of such waste by encouraging manufacturers to design products with the environmental impacts in mind throughout their entire life cycle.

The potential role that may be played by the electrical machinery and optical equipment sector with respect to energy efficiency has also been highlighted in recent years. Indeed, considerable effort has gone into reducing the energy consumption of appliances, although changes in lifestyle and working practices have sometimes offset these, for example, while changes to the manufacture of domestic and office appliances has made these more energy efficient, rising equipment rates and the introduction of new technologies may result in higher overall energy consumption. Several directives cover this area of energy saving, in particular a Directive on eco-design requirements for energy-using products, a Directive on the energy labelling of domestic appliances and a Regulation on the energy efficiency labelling programme for office equipment.

Notes

Electricity, gas and steam production and distribution statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article introduces a [set of statistical articles](#) which analyse the structure, development and characteristics of the economic activities in the production and distribution of electricity, gas and steam in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), this sector covers NACE Division 40, and its activities are subdivided into three groups:

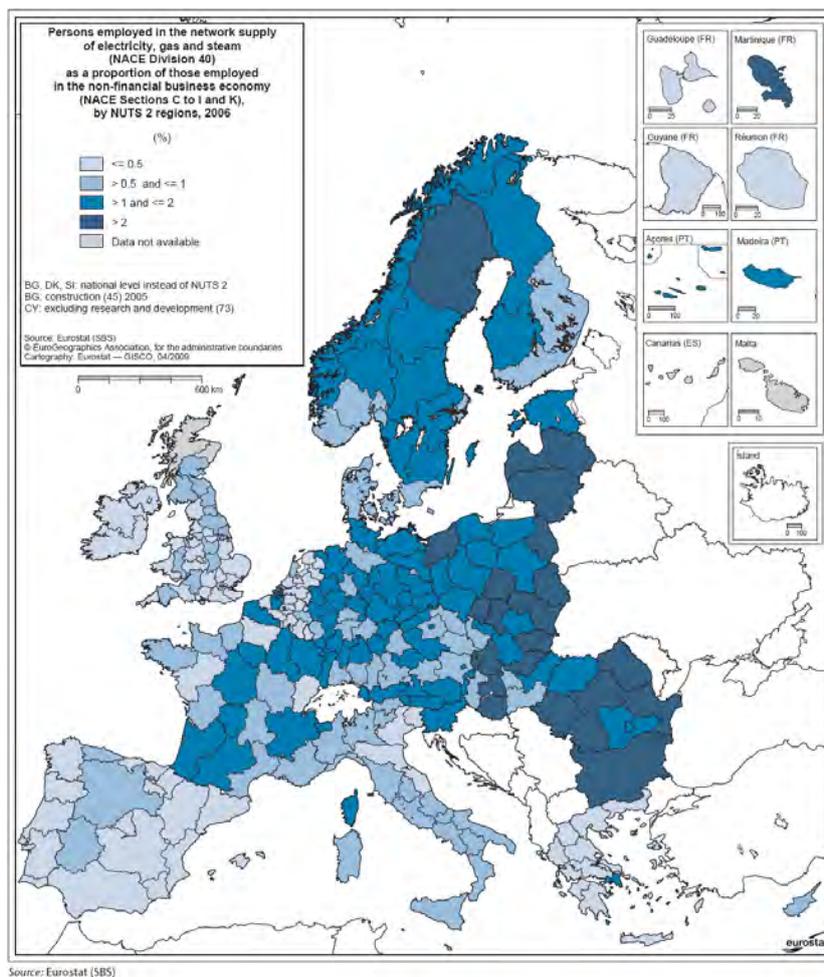

Source: Eurostat (Energy statistics (ES) - quantities)

Figure 1: Electricity, gas, steam and hot water supply (NACE Division 40). Final energy consumption: share of selected network fuels, EU-27 (%)

	Highest value added (1)		Largest number of persons employed (2)		Most specialised: share in the non-financial business economy (%) (3)

Table 3: Electricity, gas, steam and hot water supply (NACE Division 40). Main indicators, 2006 (1)

- The production and distribution of electricity (corresponding to NACE Group 40.1). This can be generated from [fossil](#) , nuclear or [renewable](#) fuels.
- The production and distribution of gas via mains (NACE Group 40.2). The manufacture of gas includes the manufacture of gas from the carbonisation of coal, from by-products of agriculture or from waste, but does not include the manufacture of refined petroleum products, or of industrial gases. The distribution of gas concerns only distribution through a mains network, and does not include the bulk sale and transport of gaseous fuels, or its distribution in canisters.
- The production and distribution of steam and hot water supply (NACE Group 40.3). This is normally for district heating, also known as city heating. District heating is the distribution of heat through a network to one or several buildings using hot water or steam produced centrally, often from [co-generation](#) plants, from waste heat from industry, or from dedicated heating systems. Large-scale district heating in Europe is commonly found in central and eastern Europe and in the Nordic countries.

Main statistical findings

[Final energy consumption](#) in the EU-27 was 1176 million [tonnes of oil equivalent](#) in 2006, an overall increase of 5.5% compared with the level in 1996. When comparing the situation in 2006 with ten years earlier, the two main network fuels, natural gas and electricity, both witnessed an increase in their share of final energy consumption, particularly electricity.

Structural profile

There were 22.2 thousand [enterprises](#) in the electricity, gas, steam and hot water supply sector (NACE Division 40) across the EU-27 in 2006 which employed 1.2 million persons. Together these enterprises generated EUR 180.4 billion of [value added](#) . This sector clearly benefitted from a very high level of [labour productivity](#) , as it contributed far more to the [non-financial business economy](#) (NACE Sections C to I and K) in terms of value added (3.2%) than in terms of [employment](#) (0.9%).

An analysis of the subsectors is difficult due to generally weak data availability. Nevertheless, the production and distribution of electricity (NACE Group 40.1) was clearly the largest in value added terms, as it contributed approximately four fifths of the sector's value added. The manufacture of gas and distribution of gaseous fuels through mains (NACE Group 40.2) subsector was the next largest, certainly with more than one tenth of the sectoral value added, while the steam and hot water supply subsector (NACE Group 40.3) was the smallest subsector.

In a number of Member States this sector was particularly important in terms of its contribution to value added within the non-financial business economy. In Slovakia the electricity, gas, steam and hot water supply sector contributed 13.7% of non-financial business economy value added in 2006, making this the largest of all the structural business statistics sectors presented in that country. Furthermore, this was the sector where both the Czech Republic and Slovakia recorded their highest levels of specialisation in value added terms. Several of the Member States that were particularly specialised in the electricity, gas, steam and hot water supply sector were net exporters of electricity – while the least specialised Member State³⁴, Luxembourg, was also the biggest net importer (in relative terms).

For reasons of statistical confidentiality the exact regional specialisation data for this sector is rather limited. Nevertheless, the map shows several Hungarian, Polish, Slovak and Romanian regions, one Swedish region as well as Lithuania, Latvia and Bulgaria (which are each considered as a single region at the level of detail in the map) that are specialised in the supply of electricity, gas, steam and hot water in employment terms.

Over the ten years between 1997 and 2007, electricity, gas, steam and hot water supply output in the EU-27 increased more or less in line with that for total industry, but employment fell faster and output prices grew much faster. Over the same period, output from the production and distribution of electricity grew by 1.5% per year on average, while for the manufacture of gas and its distribution through mains growth averaged 2.9% per year: the latter was well above the industrial average of 2.1% per year.

The decrease in employment averaged 3.0% per year in the ten years to 2007 for electricity, gas, steam and hot

³⁴Bulgaria, Poland and Romania, 2005; Ireland, Greece, Cyprus, Malta and the Netherlands, not available.

water supply, a rate of decline that was approximately two and a half times as fast as the industrial average.

The most remarkable characteristic of the developments over time for these activities was however the change in prices. Between 2003 and 2006 electricity, gas, steam and hot water supply output prices rose every year, particularly in 2005 and 2006 when double-digit growth was recorded. In 2007 output prices for these activities fell very slightly (-0.4%) while industrial prices as a whole continued to increase (2.8%). Note that output prices are valued at basic prices, therefore excluding taxes on products.

The enterprise size class structure of the electricity, gas, steam and hot water supply sector was very different from that of the non-financial business economy as a whole. The sector was dominated by **large enterprises** (with 250 or more persons employed) that employed more than four fifths of the sector's workforce in the EU-27, some 2.5 times as much as the non-financial business economy average: this was the highest employment share contributed by large enterprises among the structural business statistics sectors. The contribution of the other size classes, in particular **micro** and **small enterprises** with less than 50 persons employed, was extremely low.

Employment characteristics

The EU-27's workforce in the electricity, gas, steam and hot water supply sector contained a particularly high proportion of men, 76.8% in 2007, 6.8 percentage points above the industrial (NACE Sections C to E) average and 11.9 percentage points above the non-financial business economy average. The incidence of full-time employment was also above the industrial and non-financial business economy averages, at 94.5%.

The age profile of the EU-27's electricity, gas, steam and hot water supply sector was also very different from that for the non-financial business economy. The proportion of the workforce aged less than 30 was particularly low, just 15.6%, the fourth lowest among the industrial NACE divisions. Consequently the proportions of the workforce in the other two age classes were high: the 29.0% of the workforce aged 50 or over was the third highest among all non-financial business economy NACE divisions in 2007.

Expenditure, productivity and profitability

An analysis of investment and **operating expenditure** indicates the capital-intensive nature of the electricity, gas, steam and hot water supply sector. Gross **tangible investment** in the EU-27 was valued at EUR 62.1 billion in 2006, 6.0% of the non-financial business economy total. This high level of investment was equivalent to 34.4% of value added in this sector, the second highest **investment rate** among the industrial (NACE Sections C to E) NACE divisions. The relatively low labour input in this sector is underlined by the very low share of **personnel costs** in operating expenditure, just 7.4% in the EU-27, less than half the non-financial business economy average and the third lowest among the EU-27's industrial NACE divisions.

Average personnel costs in the EU-27's electricity, gas, steam and hot water supply sector were EUR 46.7 thousand per employee in 2006, and the apparent **labour productivity** was EUR 147.0 thousand per person employed. Both of these were high in comparison with non-financial business economy averages, particularly the apparent labour productivity which was the fourth highest of all non-financial business economy NACE divisions in 2005 or 2006. The resulting **wage-adjusted labour productivity ratio** was 314.4% indicating that value added per person employed was over three times as high as average personnel costs. In every Member State³⁵ the wage-adjusted labour productivity ratio in this sector was higher than the non-financial business economy average.

The EU-27 gross operating rate for the electricity, gas, steam and hot water supply sector, calculated as the ratio of the gross operating surplus to turnover, was 14.0% in 2006, also above the non-financial business economy (10.8%) average.

³⁵Bulgaria, Poland and Romania, 2005; Ireland, Greece, Cyprus, Malta and the Netherlands, not available.

Focus on electricity

Gross electricity generation in the EU-27 in 2006 was 3358 TWh. More than half (53.6%) of this was generated in coal, natural gas, lignite, oil or derived gas-fired thermal power stations and just under three tenths (29.5%) in nuclear power stations. The largest part of the remaining generation was in hydroelectric power plants (10.3%), **biomass**-fired power stations (2.7%) and wind turbines (2.4%).

Within Europe there are some movements of electricity across borders and in fact some smaller Member States and **candidate countries** are particularly dependent on external sources for their electricity supply. For example, in Luxembourg and Latvia, as well as in Croatia, the level of net imports is very high relative to gross electricity generation. Among the Member States, the largest net exporters of electricity in 2006 (in relative terms) were Bulgaria, Denmark, the Czech Republic and France.

In 2001, a target of 21% was set for the share of renewable energy sources (wind, solar, geothermal, wave, tidal, hydropower, biomass, landfill gas, sewage treatment plant gas and biogases) in electricity consumption by 2010. The contribution to electricity generation from renewables in 2006 in terms of gross national electricity consumption (gross national electricity generation from all fuels plus net electricity imports) for the EU-27 as a whole stood at 14.6%. Several of the Member States recorded a large increase in the contribution of renewables in recent years: notably Denmark and Germany.

Concerns about safety and waste have been issues for nuclear energy for a long time, but the benefits of nuclear fuel have been boosted due to rising concerns about the security of other energy supplies, while at the same time the Member States have committed themselves to reduce emissions. According to the **World Nuclear Association**, as of February 2009, Bulgaria, France, Romania, Slovakia, Finland and Turkey had started construction or planned new nuclear reactors, as had Russia, Belarus and the Ukraine: outside of Europe most of the countries constructing or planning new nuclear reactors were in Asia or North America.

Prices

The price of two types of energy provided to consumers is shown, in this case to industrial consumers, in terms of the price per unit (GJ for gas or kWh for electricity) at the beginning of 2007 across the Member States. Bulgaria, Estonia and Latvia recorded the lowest prices for both products. Ireland, Cyprus and Italy had the most expensive electricity prices, and Germany, Sweden and the United Kingdom the highest gas prices.

Data sources and availability

The main part of the analysis in this article is derived from **structural business statistics (SBS)**, including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include **short-term statistics (STS)**, the **Labour force survey (LFS)**, energy statistics (ES) and structural indicators.

Context

The gas and electricity markets in the EU have been changing through the requirements of the second electricity and gas directives adopted in 2003. In September 2007 the European Commission adopted proposals for a third package of legislation (**COM(2007) 530**). This proposed the effective separation of production and transmission/distribution, harmonisation of the powers of national regulators, measures to facilitate and promote cross-border collaboration and trade, as well as investment.

Notes

Electricity, gas, steam and air conditioning supply statistics - NACE Rev. 2

Data from April 2012, most recent data: Further Eurostat information, Main tables and Database

This article presents an overview of statistics for the European Union's (EU's) electricity, gas, steam and air conditioning supply sector, as covered by NACE Rev. 2 Section D, hereafter referred to as the network energy supply sector. Network energy concerns providing electric power, natural gas, steam, hot water and the like through a network (permanent infrastructure) of lines, mains and pipes, but also the generation of electric power and the production of steam, hot or chilled water and cooled air.

The network energy supply sector can be further subdivided into the production, transmission, distribution and trade of electricity (Group 35.1), the manufacture, distribution and trade of gas via mains (Group 35.2) and the supply of steam and air conditioning (Group 35.3).

	Value
Main indicators	
Number of enterprises (1 000)	39

Main statistical findings

Structural profile and sectoral analysis

The network energy supply sector (Section D) in the EU-27 employed 1.2 million persons in 2009 and generated EUR 212150 million of value added . The production, transmission, distribution and trade of electricity subsector (Group 35.1, hereafter referred to as the electricity supply subsector) was by far the largest part of the network energy sector, contributing 80.7% of sectoral value added and 73.7% of the workforce. The manufacture, distribution and trade of gas via mains subsector (Group 35.2, hereafter referred to as the gas supply subsector) was next largest in terms of value added with a 14.9% share, with the supply of steam and air conditioning (Group 35.3) generating the remaining 4.4% share.

The EU-27's network energy supply sector as a whole contributed 0.9% of all persons employed in the non-

financial business economy (Sections B to J and L to N and Division 95) in 2009, but accounted for a 3.8% share of non-financial business economy value added. These very different shares indicate a very high apparent labour productivity within the network energy supply sector and reflect its capital-intensive nature.

The workforce of the EU-27's network energy supply sector was the second smallest among the NACE sections within the non-financial business economy in 2009, as only in the mining and quarrying sector were fewer persons employed. However, network energy supply recorded the highest level of **apparent labour productivity** among the NACE sections that compose the non-financial business economy, averaging EUR 180 thousand per person employed in 2009, well above the non-financial business economy average of EUR 41.6 thousand per person employed. **Average personnel costs** for the network energy supply sector were EUR 50 thousand per employee (again the highest level among NACE sections within the non-financial business economy), and some EUR 20 thousand per employee higher than the average for the whole of the non-financial business economy. The **wage-adjusted labour productivity ratio** combines the two previous indicators and shows the extent to which value added per person employed covers average personnel costs per employee. Due to the exceptionally high productivity and somewhat less elevated average personnel costs the EU-27's network energy supply sector also recorded the highest wage-adjusted labour productivity ratio among NACE sections within the non-financial business economy in 2009: 353.6% compared with a non-financial business economy average of 138.8%.

Country analysis

In terms of its contribution to the non-financial business economy the network energy supply sector was generally more important in central and eastern European countries. In value added terms its contribution in 2009 was highest in Slovakia where it accounted for 13.3% of the total and the shares in the Czech Republic (8.5%), Lithuania (7.7%), Latvia (7.5%) and Bulgaria (7.2%) were also well above the EU-27 average (3.8%). In most of the remaining Member States the share ranged from 2.5% in both Denmark (data are for 2008) and the Netherlands to 6.8% in Poland, with Luxembourg (2.1%) below this range. The contribution to non-financial business economy employment reached 2.2% in Romania, 2.1% in Lithuania, and 2.0% in both Latvia and Slovakia, but was less than 0.5% in the Netherlands, Spain and Portugal.

An analysis of the three subsectors shows that the electricity supply subsector was particularly large in Slovakia, where its contribution to non-financial business economy value added was more than double the EU-27 average. Slovakia's specialisation in gas supply was even greater, as this subsector contributed 7.5 times as much to Slovakian non-financial business economy value added as the EU-27 average, while in the Czech Republic this subsector's contribution was 2.6 times the EU-27 average. An analysis of the specialisation in the supply of steam and air conditioning subsector shows a group of very specialised Member States composed mainly of Nordic, Baltic and central European Member States – most notably Lithuania, Estonia, the Czech Republic, Slovakia and Sweden – while there was also a group of countries with very little or no activity in this subsector, including Belgium, Ireland, Cyprus, the Netherlands, Portugal and the United Kingdom; each of these countries reported value added in this subsector of less than EUR 10 million in 2009.

Data sources and availability

Coverage

The electricity, gas, steam and air conditioning supply sector, NACE Rev. 2 Section D, referred to in this article as the network energy supply sector, concerns providing electric power, natural gas, steam, hot water and the like through a network (permanent infrastructure) of lines, mains and pipes. Apart from transmission and distribution through a network, this activity also includes the generation of electric power and the production of steam, hot or chilled water and cooled air.

The network energy supply sector comprises three NACE groups, as follows:

- the production, transmission, distribution and trade of electricity (Group 35.1), which can be generated from **fossil**, nuclear or **renewable fuels** ;

- the manufacture, distribution and trade of gas via mains (Group 35.2), excluding the (typically long-distance) transport of gas through pipelines, the bulk sale and transport of gaseous fuels or its distribution in canisters, and also the manufacture of refined petroleum products and industrial gases;
- the supply of steam and air conditioning (Group 35.3), including the production, collection and distribution of steam and hot water (for example, for heating and power), cooled air, chilled water for cooling and ice; this network distribution of steam and hot water may be for the purpose of [city heating](#) , also known as district heating.

Data sources

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

The EU's gas and electricity internal markets have been changing through the requirements of the second and [third electricity and gas directives](#) adopted in 2003 and July 2009. The aim of opening up European energy markets to competition has been to provide households and business with greater choice, lower prices, better service and improved security of supply. By 3 March 2011, these gas and electricity directives had to be transposed into national law by Member States and three Regulations (one on conditions for access to the natural gas transmission networks, one on conditions for access to the network for cross-border exchanges in electricity, and one on the establishment of an agency for the cooperation of energy regulators) became applicable on that date.

Policies related to energy and to climate change are particularly important for many parts of the network energy supply sector. The EU aims to become a low-carbon, energy-efficient economy in the coming decades. The integrated energy and climate change policy laid out in December 2008 aims to cut [greenhouse gases](#) by 20%, reduce energy consumption by 20% through increased energy efficiency and to meet 20% of the EU's energy needs from renewable sources by 2020 – these goals will have implications on the way network energy suppliers operate.

In March 2010 the [Europe 2020](#) strategy was adopted: this is the EU's strategy for smart, sustainable and inclusive growth. It is a strategy to enhance the competitiveness of the EU and to create more growth and jobs. A [resource-efficient Europe](#) is one of the flagship initiatives of this strategy that aims to support the shift towards a resource-efficient, low-carbon economy to achieve sustainable growth. Within this broad initiative are several energy related initiatives. The [Energy 2020](#) strategy for competitive, sustainable and secure energy was adopted in November 2010 by the European Commission. It defines energy priorities through until 2020 and sets out actions to be taken in order to tackle the challenges of saving energy, achieve a market with competitive prices and secure supplies, boost technological leadership, and effectively negotiate with international partners. The [Energy infrastructure priorities for 2020 and beyond](#) were adopted at the same time and are intended to serve as a blueprint for an integrated European energy network which defines EU priority corridors for the transport of electricity, gas and oil. In March 2011 the European Commission adopted the [Energy Efficiency Plan 2011](#) : energy efficiency is seen as one of the most cost effective ways to enhance security of energy supply and to reduce emissions of greenhouse gases and other pollutants. In April 2011 the European Commission adopted the Communication [Smart Grids: from innovation to deployment](#) which sets out policy directions to stimulate the deployment of electricity networks making use of progress in information and communication technologies to make electricity distribution more efficient and so reduce costs and emissions.

Table 4b: Key indicators, employment activities (NACE Division 78), 2009 - Source: Eurostat (sbs_na_1a_se_r2)

Main statistical findings

Structural profile

There were 65 thousand enterprises operating within the employment activities (Division 78) sector in the EU-27 in 2009. Together they employed 3.71 million persons, equivalent to 2.8% of the non-financial business economy (Sections B to J and L to N and Division 95) workforce and almost one third (31.3%) of the total number of persons employed in administrative and support services (Section N). These enterprises engaged in the EU-27's employment activities sector generated EUR 87456 million of value added in 2009 which was 1.6% of the non-financial business economy total or one quarter (25.0%) of the administrative and support services total.

Many persons employed by employment agencies work either atypical hours, on a part-time basis, or on temporary contracts. For some people this flexibility offers them the possibility to balance work and personal obligations, while for others their recourse to working for an employment agency may be borne out of the necessity to find work, and in this case their employment may be described as being precarious in nature. It is important to note that the statistics presented in this article relate to head counts of persons employed, and as such it is likely that the information presented overstates the volume of labour input, as not all of the persons who are employed by employment agencies are working on a regular, full-time basis. Equally, per head productivity measures such as apparent labour productivity are influenced by the incidence of part-time or temporary work and the low levels of productivity typically observed within this sector should be viewed in this context. The apparent labour productivity ratio stood at EUR 23 thousand of added value per person employed in 2009 for the EU-27's employment activities sector, well below the non-financial business economy average of EUR 41.6 thousand per person employed and some EUR 6 thousand per person employed lower than the average for administrative and support services.

This very low level of apparent labour productivity for the EU-27's employment activities sector – the seventh lowest among any of the NACE divisions that make-up the non-financial business economy – was mirrored in lower than average average personnel costs; this is also a ratio calculated on a per head basis and is therefore pulled downwards by higher levels of part-time and temporary work. In 2009, average personnel costs stood at EUR 21.3 thousand per employee in this sector compared with EUR 30.0 thousand per employee for the non-financial business economy as a whole. In contrast, personnel costs were, on average, higher for the EU-27's employment activities sector than their average for administrative and support services (EUR 20.9 thousand per employee).

The wage-adjusted labour productivity ratio combines the two previous indicators and shows the extent to which the value added generated by each employed person covers the average personnel costs of each employee.

As this indicator combines two ratios that are calculated on a per head basis the impact of part-time and temporary work is eliminated to a large extent, and so this indicator provides a more comparable basis for analysing productivity in this and other sectors. Very low apparent labour productivity and average personnel costs that were proportionally somewhat closer to the non-financial business economy average, resulted in a wage-adjusted labour productivity ratio for the EU-27's employment activities in 2009 of 109.0%. This was the eighth lowest ratio among the NACE divisions that constitute the non-financial business economy and was considerably below either the non-financial business economy average (138.8%) or the administrative or support services average (139.1%).

The **gross operating rate** (the relation between the **gross operating surplus** and **turnover**) is a measure of operating profitability; it stood at 7.3% for the EU-27's employment activities sector in 2009, which was 2.4 percentage points below the non-financial business economy average (9.7%) and less than half the average rate recorded for administrative and support services (15.2%).

Sectoral analysis

Of the three NACE groups that make-up the EU-27's employment activities sector the largest, using any measure of size, was that of temporary employment agency activities (Group78.2). This subsector accounted for just over half (50.3%) of all the enterprises in the EU-27's employment activities sector in 2009. However, its share of sectoral value added (76.7%) and employment (79.1%) was even more pronounced. The next largest subsector concerned the activities of employment placement agencies (Group78.1), which accounted for more than four out of every ten (40.2%) enterprises in 2008, but for much lower shares of sectoral value added (14.4%) and sectoral employment (11.8%) in 2009. The smallest activity (using any of these measures) was that of other human resources provision (Group78.3) which accounted for less than 10% of the sectoral workforce and added value.

The highest apparent labour productivity figure among the three subsectors that make-up the EU-27's employment activities sector was recorded for employment placement agencies, at EUR28 thousand of added value per person employed in 2009. This was EUR5 thousand per person employed higher than for temporary employment agency activities and an additional EUR1 thousand more than the productivity level recorded for other human resources provision.

EU-27 average personnel costs peaked at EUR24.3 thousand per employee for activities of employment placement agencies in 2009, while the remaining two subsectors again reported levels that were somewhat lower and very similar, averaging EUR21.5 thousand per employee for the other human resources provision subsector and EUR20.8 thousand per employee for the temporary employment agency activities subsector. All of these values were well below the non-financial business economy average of EUR30.0 thousand per employee.

The wage-adjusted labour productivity ratios of the subsectors that constitute the employment activities sector were all below the non-financial business economy average (138.8%) and the administrative and support service activities average (139.1%). The highest ratio (116.6%) was recorded for the employment placement agencies subsector, while wage-adjusted labour productivity ratios for temporary employment agency activities and other human resources provision were much lower (108.3% and 102.8% respectively).

For the gross operating rate, there was a wider range in values between the three subsectors within the EU-27, peaking in 2009 at 12.3% for activities of employment placement agencies, which was well above the average for the non-financial business economy (9.7%), whereas the gross operating profitability of the other two subsectors was well below the non-financial business economy average, falling to 6.7% for temporary employment agency activities and to 3.4% for other human resources provision.

Country analysis

More than one quarter (25.8%) of the EU-27's value added within the employment activities sector in 2009 was generated in the United Kingdom, while France (22.1%) and Germany (16.7%) also accounted for high shares; the combined contribution made by these three countries was almost two thirds (64.6%) of the EU-27's total added value. The same three Member States also engaged the highest number of persons; note that the data for France relates to employees and not persons employed. The largest workforce within the EU-27's

employment activities sector was registered in the United Kingdom at 802.9 thousand persons in 2009, ahead of Germany (657.5 thousand) and France (642.9 thousand), while the Netherlands also had a large workforce (566.5 thousand) that was considerably larger than in Italy, Spain or Poland. This is perhaps symptomatic of the relatively low level of recourse made to employment activities in southern Europe and in those Member States that joined the EU in 2004 or 2007, whereas employment agencies are more developed in the north west of Europe, particularly in the Netherlands.

The 6.5% share of EU-27 value added recorded in this sector for Belgium was the highest share for Belgium in any of the non-financial business economy NACE divisions (with data available) in 2009. As a consequence, in value added terms, Belgium was the most specialised Member State in the employment activities sector in 2009, as some 3.5% of its non-financial business economy value added was generated by this sector. The Netherlands (2.8%), the United Kingdom (2.6%) and France (2.4%) were also relatively specialised, whereas the Czech Republic, Latvia, Poland, Romania and Bulgaria each reported that employment activities generated less than 0.5% of their non-financial business economy added value.

Across all of the Member States for which data are available in 2009, wage-adjusted labour productivity ratios for employment activities were consistently lower than national non-financial business economy averages. There were two countries, Italy and Sweden, where the wage-adjusted labour productivity ratio fell below 100% – indicating that, on average, the average value added generated per person employed did not cover average personnel costs per employee. The highest wage-adjusted labour productivity ratio was recorded in Latvia, where the ratio for the employment activities sector was nevertheless more than one tenth lower than the non-financial business economy average.

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

This article presents an overview of statistics for the employment activities sector in the EU, as covered by NACE Rev.2 Division78. The activities of employment placement agencies include personnel search, selection referral and placement activities (including executive placement and search activities), as well as activities of casting agencies and bureaus. Temporary employment agency activities include activities of supplying workers to clients' businesses for limited periods of time to supplement or temporarily replace the workforce of the client, where the individuals provided are employees of the temporary help service unit. However, units classified here do not provide direct supervision of their employees at the clients' work sites. Other human resources provision includes the activities of providing human resources and human resource management services for client businesses. Providers of these services represent the employer of record for the employees on matters relating to payroll, taxes, and other fiscal and human resource issues, but they are not responsible for the direction or supervision of employees.

This NACE division is composed of three groups:

- activities of employment placement agencies (Group78.1);
- temporary employment agency activities (Group78.2);
- other human resources provision (Group78.3).

Activities of agents for individual artists are excluded from the statistics covered in this article (see Division74, part of [other professional, scientific and technical activities](#)).

Energy extraction statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) analysing the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). The present article covers the mining and quarrying sector for energy producing materials, which consist of:

- mining of coal and lignite, corresponding to [NACE](#) Division 10;
- extraction of crude petroleum and natural gas, corresponding to NACE Division 11;
- mining of uranium and thorium ores, corresponding to NACE Division 12.

Official statistics for the mining of uranium and thorium ores are scarce as the activity does not exist in the vast majority of Member States and is often subject to statistical confidentiality where it does exist.

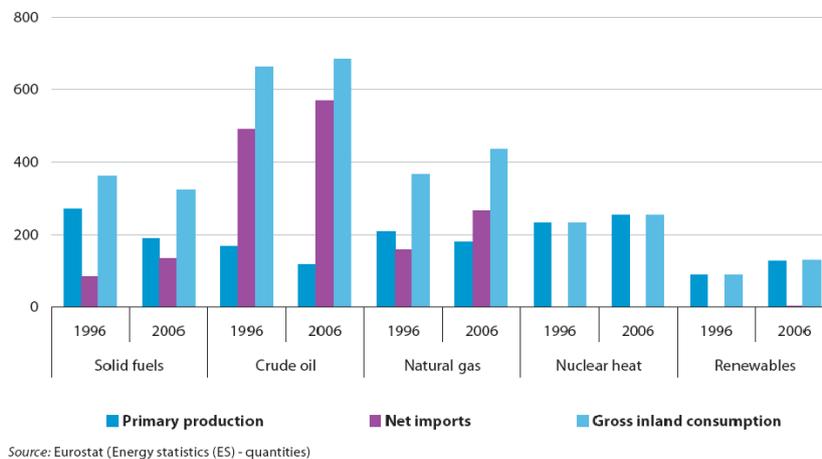

Figure 1: Mining and quarrying of energy producing materials. Main indicators for selected products, EU-27 (million toe)

	Enterprises (thousand)	Turnover (EUR million)	Value added (EUR million)	Persons employed (thousand)	Share in total (%)	
					Value added	Persons employed
Mining and quarrying of energy producing materials	2.4	185 492	69 082	444.6	100.0	100.0

Hard coal

Natural gas

Crude oil

Note that this article covers only extractive activities, and not the [processing of fuel](#) , the [manufacture of non-metallic mineral products](#) , nor the [network supply and distribution of electricity, gas and steam](#) .

Main statistical findings

Eurostat's energy statistics show a decline in the EU-27's [primary production](#) of solid fuels (on average by 3.4% per year between 1996 and 2006), crude petroleum (-3.6% per year) and natural gas (-1.6% per year). During the same period, EU-27 [gross inland consumption](#) increased, on average, by 0.7% per year. This imbalance between supply and demand was resolved through increased primary production of nuclear heat and [renewables](#) , and more significantly, through further reliance on [imports](#) – in particular, those of natural gas. There has been a gradual switch in the EU-27's energy mix during the period from 1996 to 2006, with the consumption of solid fuels falling, that of crude petroleum and nuclear heat increasing slightly, while the relative importance of natural gas and renewables grew at the fastest pace.

Structural profile

The mining and quarrying of energy-producing materials (NACE Subsection CA) was the main activity of 2400 [enterprises](#) in the EU-27 in 2006. Together they generated EUR 69.1 billion of [value added](#) and employed some 444600 persons. In relative terms, the mining and quarrying of energy producing materials sector accounted for 1.2% of the value added in the EU-27's [non-financial business economy](#) , but accounted for just 0.3% of its workforce; relative to mining and quarrying (NACE Section C) the mining and quarrying of energy producing materials accounted for 78.0% of value added and 60.6% of the workforce.

The most important (in value-added terms) subsector was clearly the extraction of crude petroleum and natural gas (NACE Group 11.1), which accounted for 78.7% of the EU-27

total. None of the remaining NACE groups recorded a share in excess of 10%, the next highest being a 9.6% share registered for the mining and agglomeration of hard coal (NACE Group 10.1). In employment terms these figures were reversed, as only 19.0% of the mining and quarrying of energy-producing materials workforce were employed extracting crude petroleum and natural gas, while almost half (48.2%) worked in the mining and agglomeration of hard coal.

In relative terms, Romania (2005) and Denmark were the most specialised Member States, as the mining and quarrying of energy producing materials accounted for 7.5% and 6.5% of the total value added generated within their respective non-financial business economies. However, almost half (47.0%) of the EU-27

's value added for mining and quarrying of energy producing materials was generated in the United Kingdom in 2006, while Denmark had the second highest share of EU-27

output (11.0%); both of these countries were specialised in the extraction of crude petroleum and natural gas. The leading coal and lignite producers within the EU were Poland, Germany and the Czech Republic.

Together, Poland and Romania employed more than half of the EU-27

's mining and quarrying of energy-producing materials workforce (31.9% and 22.2% respectively in 2005). The map shows a few, often isolated regions, where this sector accounted for a relatively important share of the non-financial business economy workforce. The concentration of energy reserves within particular regions is such that upwards of 10% of the non-financial business economy workforce in Eastern Scotland (the United Kingdom), Śląskie (Poland) and Agder og Rogaland (Norway) were employed within the mining and quarrying of energy-producing materials sector in 2006 (compared with an EU-27

average of 0.3%), while several regions in Romania and the Czech Republic were also particularly specialised in these activities.

EU-27

output from the mining and quarrying of energy producing materials fell on average by 3.2% per year in the

ten years to 2007, while employment fell by 6.8% per year; this continued a pattern of steadily falling output and steeper reductions in employment. The decline in output was particularly marked for the mining of coal and lignite (4.9% peryear in the ten years to 2007), while the corresponding figure for the extraction of crude petroleum and natural gas was -2.8% per year.

In contrast, the development of domestic output prices in the EU was less stable, particularly for the extraction of crude petroleum and natural gas for which prices increased strongly in 1999 and 2000, fell slightly for two years, and then increased rapidly through to 2007. Indeed, the increase in the output price for the extraction of crude petroleum and natural gas since 2000 was the second highest recorded among all the NACE divisions within the industrial economy, as prices almost doubled in this seven-year period, rising on average by 10.0% per year. Output prices for the mining and quarrying of coal and lignite followed a similar path, although changes were less volatile and often occurred a year after those witnessed for crude petroleum and natural gas extraction (possibly reflecting a substitution effect); the average increase was 5.5% peryear between 2000 and 2007.

Focus on crude petroleum prices and reserves

As noted above, one of the most visible characteristics of the energy-producing sector is the volatility in the price of oil, which rose from USD 18.7 in December 2001 to a high of more than USD 130 per barrel (of Brent crude) in July 2008. At the time of writing up this analysis, the price had dropped dramatically to around USD 40 a barrel by December 2008. High oil prices have an impact on the price of substitutes, notably natural gas, and also feed into the price of other products that either use considerable amounts of energy or energy products as raw materials in their manufacturing processes.

The BP Statistical Review of World Energy notes that 'proved reserves are generally taken to be those quantities that geological and engineering information indicates with reasonable certainty can be recovered in the future from known reservoirs under existing economic and operating conditions'. The ratio of reserves to production provides confirmation of the dwindling stock of oil reserves in the EU and Norway, which – under current conditions – are likely to dry up by approximately 2015. The estimates suggest that by 2050, on a global level, unless there is a dramatic reduction in the rate at which crude petroleum is consumed, there will be little or no oil left, (unless fresh reserves are discovered and exploited).

Expenditure and productivity

The mining and quarrying of energy-producing materials is a particularly capital-intensive activity, accounting for 1.6% of the EU-27

's non-financial business economy investment in 2006 (compared with its 0.3% share of the workforce). Personnel costs accounted for a 10.9% share of total operating expenditure, compared with an average of 16.1% for the whole of the non-financial business economy.

The mining and quarrying of energy-producing materials sector recorded, by far, the highest level of **labour productivity** among any of the NACE subsections within the non-financial business economy, as each person employed generated an average of EUR 155400 of value added. In contrast, average personnel costs were EUR 31900 per **employee**, which was only 10.8% above the non-financial business economy average. The resulting wage-adjusted labour productivity ratio of 486.5% was also the highest of all industrial NACE subsections – and was more than twice the next highest ratio, recorded for the mining and quarrying of non-energy-producing materials (see [Non-energy mining and quarrying statistics](#)). The highly capital-intensive and productive nature of this sector can be wholly attributed to the performance of the extraction of crude petroleum and natural gas subsector, where apparent labour productivity reached EUR 370000 per person employed in 2005 and the investment rate was 25.1% in 2006. In contrast, both the apparent labour productivity (EUR 300000 per person employed) and investment rate (16.7%) of the mining of coal and lignite subsector were below the non-financial business economy average in 2005.

Almost half (49.7%) of the EU-27

's investment within the mining and quarrying of energy producing materials sector in 2006 was accounted for by the United Kingdom. In Slovakia, the mining and quarrying of energy-producing materials sector accounted for 6.3% of all investment made within the non-financial business economy in 2006. This relative share was somewhat higher than in the United Kingdom (5.3%), while Romania, Denmark and Poland also recorded

a particularly high propensity to invest in these activities.

Focus on imports of energy products

With increasing demand on imports from non-member countries, the Russian Federation has gradually become the most important supplier of a range of energy products to the EU. In 2006, the Russian Federation provided 31.9% of natural gas imports, 30.4% of crude petroleum imports and 22.2% of hard coal imports; all figures are in volume terms (as measured by tonnes of oil equivalents). Aside from the Russian Federation, which is endowed with a full range of energy resources, the origin of imports is generally quite diverse. For example, more than one fifth of the coal imported by the Member States originated from South Africa, while large volumes of coal were also imported from as far as Australia, Colombia or Indonesia. Around one fifth of the imports of crude petroleum that are made by the Member States originated from the North Sea reserves that are shared between Norway and the United Kingdom, while a fairly large proportion of EU imports come from [OPEC](#) countries (that include Libya, Saudi Arabia and Iran).

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics](#) , the [Energy Information Administration](#) (United States) and the [BP Statistical Review of World Energy](#) .

Context

The global mining and quarrying sector is characterised by a relatively small number of international enterprise groups, that operate across the continents – sometimes with only their head office in the EU or another developed economy. These large scale producers are complemented by a large number of smaller enterprises, typically serving a local market in low-value, widely-available products, often for use in construction. The location of mining and quarrying activity generally reflects the spatial distribution of mineral deposits. However, there can be considerable cost differences between mines, for example, in relation to the depth at which deposits are found, or whether they are on land or at sea. Aside from geographical and geological cost differences, the decision of whether or not to (re-)open a mine may also depend, among others, on global, commodity prices, as well as regulations concerning the environmental impact of mining or the disposal of its waste.

The EU aims to become a low-carbon, energy-efficient economy in the coming years. The integrated energy and climate change policy laid out in December 2008 aims to cut [greenhouse gases](#) by 20%, reduce energy consumption by 20% through increased energy efficiency and to meet 20% of the EU's energy needs from [renewable sources](#) by 2020 – these goals will have implications on the way extractive activities operate. Another important aspect in relation to this sector concerns the security of supply for downstream activities. Aside from well-publicised geo-political disputes which have threatened the supply of crude petroleum or natural gas to European markets, there are also a large number of non-energy related minerals, which are often essential for downstream manufacturing activities. There is no indigenous supply for many of these, with the extraction of construction materials being one of the few areas where the EU is largely self-sufficient.

The vast majority of hard coal and lignite that is extracted within the EU is consumed as a transformation input, mostly in conventional thermal power stations, or alternatively transformed in coke oven plants. Crude petroleum is also used as a transformation input, principally in power stations or refineries (see the article on [fuel processing and chemicals production statistics](#) for more details of fuel processing activities).

The EU's coal-mining activity has been in decline for over two decades (aside from breaks in series resulting from German reunification or the adhesion of some Member States). The extraction of crude petroleum and natural gas has also seen a downturn in activity since its production peaked in 1999. This pattern of falling production reflects, at least to some degree, the running down of natural reserves and higher costs associated with extracting increasingly scarce supplies. This may have been accelerated through continued competition from cheaper imports and the substitution of fossil fuels within the energy mix by renewables and cleaner tech-

nologies that promote reduced emissions. On the other hand, the significant increases in global prices for oil and gas in recent years are likely to have improved the economic viability of existing (and potentially new) gas, oil and coal fields, although prices have since fallen considerably since their peak levels in 2008.

Table 4b: Key indicators, extraction of crude petroleum and natural gas (NACE Division06), 2009- Source: Eurostat (sbs_na_ind_r2)

Main statistical findings

Structural profile

There were approximately 290 enterprises operating with the extraction of crude petroleum and natural gas (Division06) as their main activity in the EU-27 in 2009. Together they employed 76 thousand persons, equivalent to 0.1% of all persons employed in the non-financial business economy (Sections B to J and L to N and Division95) and 11.8% of those working in mining and quarrying (SectionB). These enterprises generated EUR43036 million of value added which was 0.8% of the non-financial business economy total, or 59.8% of the mining and quarrying total.

The apparent labour productivity of the EU-27's extraction of crude petroleum and natural gas sector in 2009 was EUR569 thousand per person employed, more than 13 times as high as the non-financial business economy average of EUR41.6 thousand per person employed and five times the mining and quarrying average (EUR112 thousand per person employed). average personnel costs within the EU-27's extraction of crude petroleum and natural gas sector were also high, but not to the same degree, averaging EUR65 thousand per employee compared with an average of EUR30.0 thousand per employee for the whole of the non-financial business economy. The wage-adjusted labour productivity ratio combines the two previous indicators and shows the extent to which value added per person employed covers average personnel costs per employee. Due to the extremely high labour productivity and somewhat less elevated average personnel costs the EU-27's extraction of crude petroleum and natural gas in 2009 had a very high wage-adjusted labour productivity ratio, reaching 875.6%; this was the highest such ratio among all NACE groups in the non-financial business economy, and more than six times as high as the non-financial business economy average (138.8%).

The gross operating rate (the relation between the gross operating surplus and turnover) stood at 30.8% for the EU-27's extraction of crude petroleum and natural gas sector in 2009, a little more than three times as high as the non-financial business economy average (9.7%) – and the fifth highest level of profitability (using this measure) among the 68 NACE divisions within the non-financial business economy for which data are available. It should be noted that this measure does not take account of depreciation or financial expenditure, which are typically higher in capital-intensive activities.

Sectoral analysis

The extraction of crude petroleum (Group06.1) accounted for two thirds of value added and employment in the EU-27's extraction of crude petroleum and natural gas sector, with the extraction of natural gas (Group06.2) responsible for the remaining one third. The relative importance of the two subsectors was quite different in terms of turnover, as the extraction of natural gas accounted for more than half (57.3%) of the sectoral turnover in 2009.

In terms of personnel costs and productivity there was not a great difference between these two subsectors. Both recorded apparent labour productivity around the EUR569 thousand per person employed average of the sector as a whole, with the value for natural gas extraction marginally higher. There was a larger spread in relation to average personnel costs which were as high as EUR76.6 thousand per employee for natural gas extraction compared with EUR59.0 thousand per employee for crude petroleum extraction; both of these values were, nevertheless, well above the averages recorded for the non-financial business economy and for mining and quarrying. The wage-adjusted labour productivity ratio reached 961.0% for crude petroleum in 2009 which was nearly three times the average for mining and quarrying, while the ratio for natural gas extraction was 747.9%, around 2.3 times as high as the mining and quarrying average.

For the gross operating rate there was a much more substantial difference between the two subsectors, ranging from 17.7% for natural gas extraction to 48.3% for crude oil extraction; the latter was the third highest among 218 NACE groups within the non-financial business economy with data available. This relatively large difference in operating profit rates was the result of the compounding effect of higher average personnel costs for natural gas extraction bringing down the gross operating surplus combined with relatively high turnover in this subsector. Nevertheless, the gross operating rate of the natural gas extraction subsector was well above the non-financial business economy average (9.7%), although it was below the mining and quarrying average (26.6%).

Country analysis

As for several other mining and quarrying activities, a small number of Member States accounted for a very large share of EU-27 value added and employment in the extraction of crude petroleum and natural gas sector. This situation results from the uneven geographical distribution of gas and petroleum deposits.

The United Kingdom recorded the highest share (49.3%) of EU-27 value added within the extraction of crude petroleum and natural gas sector in 2009. The Netherlands and Denmark (2008 data) were the next largest producers with shares close to 20% of the total, while the fourth largest contribution was made by Italy (around 9%). Romania had the largest workforce in the extraction of crude petroleum and natural gas, with 35.5thousand persons employed, although it should be noted that recent employment data is not available for the United Kingdom for this sector. Among the non-member countries shown in Tables 4a and 4b Norway had a large crude petroleum and natural gas extraction sector, with 22.4thousand persons employed in 2009, equivalent to 29.6% of the EU-27 total.

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

This article presents an overview of statistics for the extraction of crude petroleum and natural gas sector in the EU, covering NACE Rev. 2 Division 06. This division includes the production of crude petroleum, the mining and extraction of oil from oil shale and oil sands and the production of natural gas and recovery of hydrocarbon liquids. Included are the operation and/or development of oil and gas field properties. Such activities may include drilling, completing and equipping wells as well as other activities in the preparation of oil and gas up

to the point of shipment from the producing property.

This NACE division is composed of two groups:

- the extraction of crude petroleum (Group06.1);
- the extraction of natural gas (Group06.2).

Excluded are: oil and gas field services, performed on a fee or contract basis, oil and gas well exploration, test drilling and boring (all classified to Division09, [mining support services](#)), refining of petroleum products (Division19, the [manufacture of coke and refined petroleum products](#)), the manufacture of industrial gases (Division20, [chemical manufacturing](#)), the operation of pipelines (Division49, [land transport and pipelines](#)) and geophysical, geologic and seismic surveying (Division71, [architectural and engineering activities](#)).

Fabricated metal product manufacturing statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). The present article covers the manufacture of miscellaneous fabricated metal products, corresponding to [NACE Rev 1.1](#) Groups 28.6 and 28.7, which is part of the [metals and metal products](#) sector. Miscellaneous fabricated metal products are finished products for use in other industrial and construction activities, as well as final consumer markets. This article covers the manufacture of:

- cutlery, tools and general hardware, such as locks and hinges (NACE Group 28.6);
- other fabricated metal products, such as metal drums, light metal packaging, wire products, fasteners, baths and sinks, and household articles (NACE Group 28.7).

	Enterprises (thousand)	Turnover (EUR million)	Value added (EUR million)	Persons employed (thousand)	Share in total (%)

Source: Eurostat (SBS).

Table 3: Manufacture of cutlery, tools and general hardware; manufacture of other fabricated metal products (NACE Groups 28.6 and 28.7). Expenditure, productivity and profitability, EU-27, 2006 (1)

There were 106.3 thousand enterprises in the Member States for whom one of the miscellaneous fabricated metal products manufacturing activities (NACE Groups 28.6 and 28.7) was their main activity in 2006. These enterprises provided employment to 1.1 million persons in the EU-27, corresponding to just over one fifth (21.9%) of all persons working in the metals and metal products manufacturing (NACE Subsection DJ) sector in 2006. The added value of EUR 49.7 billion generated by the EU-27's miscellaneous fabricated metal products manufacturing sector also contributed about one fifth (20.3%) of the total value added within the metals and metal products manufacturing sector in 2006.

Looking in more detail, the manufacture of other miscellaneous fabricated metal products (NACE Group 28.7) subsector generated EUR 31.0 billion of value added in the EU-27 in 2006, about two thirds more than the manufacture of cutlery, tools and general hardware (NACE Group 28.6).

Miscellaneous fabricated metal products manufacturing activities in Germany created EUR 16.9 billion of value added, corresponding to about one third (34.0%) of the value added generated in the EU-27 in 2006. The second highest level of activity was in Italy, although it generated less than half of the value added created in Germany. As a proportion of non-financial business economy value added, however, the miscellaneous fabricated metal products manufacturing sector contributed its highest share (2.6%) in Slovenia, three times the average across the EU-27³⁶. The Czech Republic was also relatively specialised in this activity in value added terms, as the contribution made by this sector was almost exactly double the EU-27 average.

³⁶Bulgaria, Poland and Romania, 2005; Denmark, Cyprus, Luxembourg, Malta and the Netherlands, not available.

The development in the EU-27's production indices for the manufacture of cutlery, tools and general hardware (NACE Group 28.6) and the manufacture of other miscellaneous fabricated metal products (NACE Group 28.7) were quite different from those recorded for metals and metal products as a whole – although, in the case of the former, differences were restricted to the period after 2000. In contrast to a relatively unchanged level of [output](#) for metals and metal products manufacturing between 2000 and 2003, the output of cutlery, tools and general hardware continued to increase sharply through until 2002 before a contraction in 2003 and a couple of years of relative stability, just as the output of metals and metal products manufacturing began to grow steadily again. Although, the output of cutlery, tools and general hardware rose sharply in 2006, this was almost completely overturned in 2007, when output fell back to beneath its index level of 2002. Over the ten years through to 2007, the EU-27's output of cutlery, tools and general hardware grew by an average 1.5% per year.

In broad terms, the output of other miscellaneous fabricated metal products was relatively stable (rising and falling within a narrow 5% band) between 1997 and 2005. Output within the EU-27 grew on average by 0.8% per year over the ten years through to 2007 with the overall growth almost entirely due to the expansion in activity in 2006 and 2007.

Expenditure and productivity

[Tangible investment](#) in the EU-27's miscellaneous fabricated metal products manufacturing sector was EUR 5.6 billion in 2005, representing one fifth of the tangible investment made across metals and metal products manufacturing as a whole in the same year. In comparison to the value added generated by this sector in 2005, this corresponded to an [investment rate](#) of 11.7%, a little lower than the corresponding rate (12.2%) for metals and metal products manufacturing.

Despite average [personnel costs](#) of EUR 30.9 thousand per employee in the EU-27's miscellaneous fabricated metal products manufacturing sector in 2006 being about 4% lower than the average across metals and metal products manufacturing, the proportion of [operating expenditure](#) accounted for by personnel costs was higher in the miscellaneous fabricated metal products manufacturing sector (25.4% in comparison with 19.2%), underlining the relatively labour-intensive nature of these activities.

The EU-27's miscellaneous fabricated metal products manufacturing sector generated an average EUR 44.6 thousand of value added per person employed in 2006, which was 7.2% less than the average for all metals and metal products manufacturing activities. This difference in apparent [labour productivity](#) was narrowed when taking account of the lower average personnel costs in this sector, resulting in a [wage-adjusted labour productivity ratio](#) for the EU-27's miscellaneous fabricated metal products manufacturing sector of 144.3% in 2006 (in comparison with a ratio of 149.3% for all metals and metal products manufacturing activities). In the majority of the Member States, the wage-adjusted labour productivity ratio of the miscellaneous fabricated metal products manufacturing sector was lower than the ratio for metals and metal products as a whole (particularly so in Slovakia) but there were a few Member States, namely Belgium, Germany, Estonia, Ireland, Poland (2005), Sweden and the United Kingdom, where it was higher.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#), including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics \(STS\)](#) and the [PRODCOM](#) statistics on the production of manufactured goods.

Context

The metals and metal products manufacturing sector is part of a diverse and interwoven economic network that incorporates upstream sectors and large downstream segments of manufacturing such as the transport equipment manufacturing and construction sectors. The challenges faced by the EU's metals and metal products manufacturing sector therefore have direct and indirect consequences on many other parts of the economy. Looking ahead, a Communication ([COM\(2008\) 108](#)) from the [European Commission](#) to the [Council](#) and the [European Parliament](#) on the competitiveness of the metals industries was adopted in February 2008, and highlighted the challenges to be faced.

The EU-27 is largely dependent on imports of ore and concentrates for steel, ferro-alloys and non-ferrous metals production; it produces only 1.7% of the world's nickel, 2% of its iron ore and 5% of its copper ([SEC\(2007\) 771](#)). Access to minerals and secondary raw materials at competitive prices is important, especially given the exhaustion of certain deposits in the EU-27 over time or their absence, and supply constraints that have been exacerbated by the strong growth in international demand from emerging economies such as China and India. This concern was part of a raw materials initiative of the European Commission ([COM\(2008\) 699](#)).

Parts of the metals and metal products manufacturing sector are highly [energy-intensive](#) . Energy costs for the EU-27's metals and metal products manufacturing sector accounted for 4.4% of purchases of goods and services in 2006, which was the third joint highest proportion among the industrial structural business statistics sectors, albeit well behind non-energy mining and quarrying (10.1%) and other nonmetallic mineral products (9.5%). Within this sector, however, energy costs in the casting of metals subsector accounted for 7.2% of purchases of goods and services in 2006 and in the first processing of ferrous metals as much as 7.9%. This level of energy consumption has important implications for energy and environmental (particularly climate change) policy.

The metals and metal products manufacturing sector is covered by a Directive on [integrated pollution prevention and control \(IPPC\)](#) and [REACH](#) . A proposal from the European Commission on the review of EU [Emissions trading system \(ETS\)](#) adopted in January 2008 ([COM\(2008\) 30](#)) foresees the inclusion of non-ferrous metals from 2013 onwards, along with some transitional measures to avoid 'carbon leakage'.

Notes

Fee and contract wholesale trade statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), the present article covers fee and contract [wholesale trade](#), corresponding to NACE Group 51.1, which is part of the [wholesale trade](#) sector. The activities covered in this article are:

- agents trading on behalf and on account of others;
- agents involved in bringing sellers and buyers together;
- agents undertaking commercial transactions on behalf of a principal.

It does not include financial intermediaries such as insurance or real estate agents, nor retail sale by agents.

	Enterprises (thousand)	Turnover (EUR million)	Value added (EUR million)	Persons employed (thousand)	Share in total (%)	
					Value added	Persons employed

Source: Eurostat (SBS)

Table 2: Wholesale on a fee or contract basis (NACE Group 51.1). Structural profile: ranking of top five Member States in terms of value added and persons employed, 2006

The EU-27's wholesale on a fee or contract basis (NACE Group 51.1) consisted of 548.9 thousand [enterprises](#) in 2006, more than three tenths of all wholesale trade (NACE Division 51) enterprises. On average these enterprises were very small, as collectively they generated EUR 221.6 billion of [turnover](#), resulting in EUR 39.5 billion of [value added](#), equivalent to just 4.8% and 7.6% of the wholesale trade (NACE Division 51) total. The large difference between these two output shares reflects the fact that this type of wholesaling differs from the own-account wholesale activities, in that the turnover generated reflects only the service provided, and not the cost and margin of the goods purchased and resold. This sector's contribution to the wholesale trade workforce was higher than its contribution to output, but far from its share of the enterprise population: the

975.2 thousand persons [employed](#) represented nearly one tenth (9.4%) of the wholesale trade total. It is likely that a high proportion of persons work part-time in this activity and this could account, in part, account for the relatively low level of apparent [labour productivity](#) implied by the high employment and low value added shares.

Italy accounted for slightly less than one third of the EU-27's value added and employment in this sector in 2006. Unsurprisingly, with such a large contribution to the EU-27 total, Italian wholesaling was very concentrated in this form of wholesaling, as this sector generated 2.0% of Italian [non-financial business economy](#) (NACE Sections C to I and K) value added in 2006; this share was higher still in Slovenia, where wholesale on a fee or contract basis accounted for 2.5% of non-financial business economy value added.

Expenditure and productivity

Although not a typical wholesale trade activity, wholesale trade on a fee or contract basis recorded a pattern of operating and [tangible investment](#) expenditure close to the wholesale trade average. The [investment rate](#) was 10.2%, the same as for the wholesale trade sector, while [personnel costs](#) accounted for 7.8% of operating expenditure for wholesale trade on a fee or contract basis, slightly higher than the 6.5% average for wholesale trade. Average personnel costs for wholesale on a fee or contract basis were EUR 30.4 thousand per employee, and therefore close to the wholesale trade average of EUR 32.6 thousand per employee.

In contrast this sector's [productivity](#) level was particularly low, EUR 40.5 thousand per person employed, just over three quarters of the wholesale trade average. As a result, this sector recorded the lowest [wage-adjusted labour productivity ratio](#) of any of the wholesale trade activities, just 133.1%, some 26.7 percentage points below the wholesale trade average.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#), including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Context

The activities in NACE Division 51 cover all wholesale trade except that [concerning motor vehicles and motorcycles](#): the wholesaling of automotive fuel is considered as a wholesale trade rather than a motor trade. This article covers resale (sale without transformation) of new and used products, as well as wholesale activities carried out on a fee or contract basis.

The wholesaling activity consists of selling to retailers or to industrial, commercial, institutional and professional users. Wholesalers can act on a fee or contract basis as agents (as covered by this article) or for their own account, buying and selling goods. The own-account wholesale sub-sectors distinguish the types of product in which the wholesaler is specialised ([agricultural products](#), [consumer goods](#), [intermediate goods](#), [machinery and equipment](#)), while specialised wholesalers of other products are included in [non-specialised wholesalers](#).

In the supply chain, wholesalers are located between producers and users, providing know-how and knowledge in markets for which they have expertise. Competition within the wholesale trade activity is often centred on providing more efficient services or more sophisticated value added services. Wholesalers can provide a range of services from basic storage and break of bulk, sorting, grading and logistics to pre- and post-production operations (for instance, labelling, packaging, bottling and installation).

Financial and insurance sector statistics - NACE Rev. 1.1

Data from January 2009. Most recent data: Further Eurostat information, Main tables and Database

This article introduces a [set of statistical articles](#) which analyse the structure, development and characteristics of the economic activities in the financial and insurance sector in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), this sector covers NACE Divisions 65 to 67, and its activities are treated in more depth in four further articles:

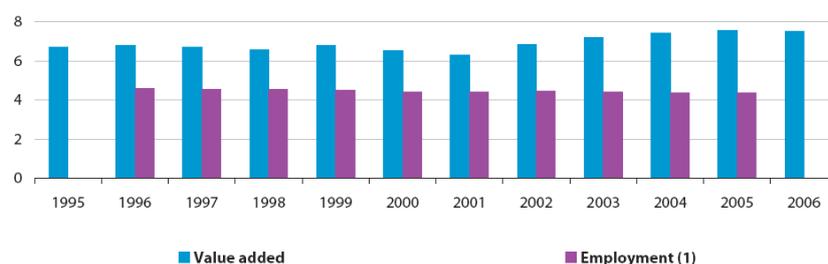

- [Financial intermediation](#) (NACE Division 65), which includes financial and insurance services encompass financial intermediation as offered by credit institutions, financial leasing and other credit granting enterprises, and financial intermediaries such as securities and derivatives dealers;
- [Funds and similar financial entities](#) ;
- [Insurance and pension funding services](#) (NACE Division 66);
- [Activities providing financial auxiliary services](#) (NACE Division 67), such as the administration of financial markets, security brokering, fund management and the various activities of brokers and agents for financial products.

Table 5: Autonomous pension funding (NACE Class 66.02). Main indicators, 2006 (1)

Main statistical findings

Structural profile

Note that within the other structural business statistics sectors, the benchmark used for comparison is the [non-financial business economy](#), which by definition excludes the activities that are covered in this article. To show the relative importance of financial and insurance services within the business economy as a whole, sources other than structural business statistics are used here, namely [national accounts](#) and the [Labour force survey](#).

According to national accounts, the contribution of financial and insurance services (NACE Section J) to [employment](#) within the business economy (NACE Sections C to K) was around 4.3% in the EU³⁷ in 2006, and the level of employment was around 6.0 million persons. According to results from the Labour force survey for 2007 just over three fifths (63.1%) of the persons employed in financial and insurance services were employed in financial intermediation activities other than insurance and pension funding (NACE Division 65), with the remainder split almost equally between insurance and pension funding activities (NACE Division 66) and activities auxiliary to financial intermediation (NACE Division 67).

The EU-27's financial and insurance services generated EUR 588.3 billion of [value added](#) in 2006 according to national accounts: with this sector's contribution to business economy value added falling from a high of 6.8% in 1996 to a low of 6.3% in 2001, before increasing its share in four consecutive years to 7.6% by 2005 and dropping back to 7.5% in 2006.

In value added terms, the largest Member State in the financial and insurance services sector was the United Kingdom, which generated one quarter (24.5%) of the EU-27's value added in 2005, ahead of Germany (16.9%) in 2006. The contribution of this sector to value added within the business economy in 2006 was particularly high in Luxembourg (34.5%), and this sector also contributed more than 10% of business economy value added in Ireland, the United Kingdom, Portugal and Cyprus. Its contribution was lowest in Romania, Lithuania, Finland, the Czech Republic and Estonia where the financial and insurance services sector accounted for less than 5% of value added. The contribution of financial and insurance services to the business economy was greater in value added terms than in employment terms in every Member State.

Employment characteristics

Only in terms of the gender breakdown did the characteristics of the workforce in this sector differ significantly from those displayed by the business economy (NACE Sections C to K). The proportion of the financial and insurance services sector's workforce that was female was 52.0%, well above the 35.9% share recorded for the whole of the business economy. In all Member States the female proportion of the financial and insurance services workforce was above the non-financial business economy average. In three fifths of the Member States more than half of the financial and insurance services workforce was female; the share of women rose to its highest levels in Latvia (74.7%) and Estonia (73.4%), while it was at its lowest in Italy (40.5%).

The lowest rate of female employment among the three NACE divisions within the EU-27's financial and insurance services was recorded for activities auxiliary to financial intermediation (NACE Division 67), where 46.3% of the workforce were women. A majority of the workforce was female in the two other activities, namely insurance and pension funding (NACE Division 66) and financial intermediation activities other than insurance and pension funding (NACE Division 65).

Unlike other sectors where female employment was high (such as retail trade or hotels and restaurants), the rate of full-time employment in the EU-27's financial and insurance services sector was also relatively high in 2007, as 86.0% of those employed worked on a full-time basis, almost the same as the 85.7% average for the business economy. Among the three NACE divisions covered in this sector the highest full-time employment rate was recorded for financial intermediation activities other than insurance and pension funding (87.1%), whereas the proportion of persons working full-time was just above 84% in the other two activities.

The age structure of the EU-27's workforce in financial and insurance services displayed a relatively low proportion of younger workers (less than 30 years of age) compensated by a slightly larger share of workers aged between 30 and 49. In 2007 some 21.4% of the workforce was aged less than 30, which was 2.8 percentage points lower than the business economy average; 57.0% were aged between 30 and 49, which was 3.1 percentage points above the business economy average. In all three financial and insurance services' NACE divisions the proportion of workers aged less than 30 was below the business economy average, but it was particularly low in

³⁷EU average, 2006; excluding Malta and Romania; 2005 data for the United Kingdom.

insurance and pension funding activities at 19.2%.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include the Labour force survey (LFS) and Eurostat economy and finance statistics.

Context

Financial and intermediation services provide instruments to businesses and households in the form of products that are essentially savings or loans, or products to transfer and pool risk. Changes in financing techniques have increased the possibilities open to business to fund investment, while consumers have a wider array of choices for credit, savings and payment methods. At the time of writing this sector is the focus of worldwide attention due to the financial crisis widely experienced across the globe and the impact that this has had on other parts of the economy. This crisis has led to national governments taking over some financial institutions, and providing massive amounts of financial support to others. The crisis has provoked widespread calls for reforms to regulatory bodies and new ways for overseeing the operations and practices of this sector.

There has been considerable EU legislative activity in the sphere of financial and insurance services centred upon the creation of an internal market for financial and insurance services. This work has been conducted through the Financial services action plan (FSAP), which was published by the [European Commission](#) in 1999 and the legislative phase completed in 2006.

The absence of cross-border consolidation within the financial and insurance services sector has drawn attention and in September 2007 a Directive of the [European Parliament](#) and of the [Council](#) was adopted ([COM\(2007\) 44](#)) that would tighten the procedures that Member States' supervisory authorities have to follow when assessing proposed mergers and acquisitions in banking, insurance and securities activities. The directive aims to clarify the criteria against which supervisors should assess possible mergers and acquisitions in order to improve clarity and transparency in supervisory assessment and help to ensure a consistent handling of mergers and acquisitions requests across the EU.

Notes

Financial auxiliaries statistics - NACE Rev. 1.1

Data from January 2009. Most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), the present article covers financial auxiliaries statistics, corresponding to NACE Rev 1.1 Division 67, which is part of the [financial and insurance](#) sector.

Activities auxiliary to financial intermediation have a supporting function in capital markets, performing a complementary role to banking and insurance activities. They include the provision of services involved in or closely related to financial intermediation, but not themselves involving financial intermediation. Activities included are:

- the administration of financial markets, securities and mortgage broking, and fund management (NACE Group 67.1);
- activities of insurance brokers and agents (NACE Group 67.2).

Table 2: Financial auxiliaries. Bond turnover, 2007 (EUR million)

Main statistical findings

Employment

According to the results of the [Labour force survey](#), employment in the EU-27's financial auxiliaries sector (NACE Division 67) covered 1.2 million persons in 2007. This sector was dominated by the United Kingdom and Germany, with workforces of 420.0 thousand and 248.8 thousand persons employed respectively, accounting for more than one third and more than one fifth of the EU-27's workforce: Italy (12.2%) was the only other Member State with a double digit share of the EU-27

's financial auxiliaries' employment. Although in the EU-27

as a whole this sector contributed 18.4% of financial and insurance services (NACE Section J) employment, in most Member States³⁸ this sector's contribution was less than 15% and the relatively high EU-27

average was influenced by the dominance of the United Kingdom, Germany and Italy where this sector contributed 32.9%, 18.9% and 22.1% of financial and insurance services employment respectively. The financial auxiliaries sector contributed 2.6% of the business economy's workforce in Luxembourg and 2.2% in the United Kingdom, with the next highest share being around half this level.

Focus on exchanges

In recent years, European exchanges have undergone a period of consolidation, most notably with the creation of Euronext (equity exchanges in Amsterdam, Brussels, Lisbon and Paris and a derivatives exchange in London) and OMX (which has exchanges in Copenhagen, Helsinki, Riga, Stockholm, Tallinn, Vilnius and Iceland) and the takeover of the Borsa Italiana by the London stock exchange in 2007. However, this period of consolidation has extended to include trans-Atlantic consolidation, with the completion in 2007 of the New York Stock Exchange's merger with Euronext and Nasdaq's purchase of OMX which was completed in 2008.

According to the [Federation of European Securities Exchanges \(FESE\)](#), the main equity exchanges in the EU in 2007 in terms of capitalisation and trading were London, Euronext, the Deutsche Börse and the Spanish exchanges (BME, which include Barcelona, Bilbao, Madrid and Valencia).

In turnover terms, the Spanish exchanges, London and OMX had the largest bond markets in the EU: together these exchanges accounted for 94% of bond-trading among the exchanges listed.

³⁸Portugal, 2006; Bulgaria, Lithuania and Malta, not available.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include the [Federation of European Securities Exchanges \(FESE\)](#) .

Context

Financial and intermediation services provide instruments to businesses and households in the form of products that are essentially savings or loans, or products to transfer and pool risk. Changes in financing techniques have increased the possibilities open to business to fund investment, while consumers have a wider array of choices for credit, savings and payment methods. At the time of writing this sector is the focus of worldwide attention due to the financial crisis widely experienced across the globe and the impact that this has had on other parts of the economy. This crisis has led to national governments taking over some financial institutions, and providing massive amounts of financial support to others. The crisis has provoked widespread calls for reforms to regulatory bodies and new ways for overseeing the operations and practices of this sector.

There has been considerable EU legislative activity in the sphere of financial and insurance services centred upon the creation of an internal market for financial and insurance services. This work has been conducted through the Financial services action plan (FSAP), which was published by the [European Commission](#) in 1999 and the legislative phase completed in 2006.

The absence of cross-border consolidation within the financial and insurance services sector has drawn attention and in September 2007 a Directive of the [European Parliament](#) and of the [Council](#) was adopted ([COM \(2007\) 44](#)) that would tighten the procedures that Member States' supervisory authorities have to follow when assessing proposed mergers and acquisitions in banking, insurance and securities activities. The directive aims to clarify the criteria against which supervisors should assess possible mergers and acquisitions in order to improve clarity and transparency in supervisory assessment and help to ensure a consistent handling of mergers and acquisitions requests across the EU.

Data from January 2009. Most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#) . According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), the present article covers financial credit and leasing sector statistics, corresponding to NACE Division 65, which is part of the [financial and insurance](#) sector. The activities covered in this article include:

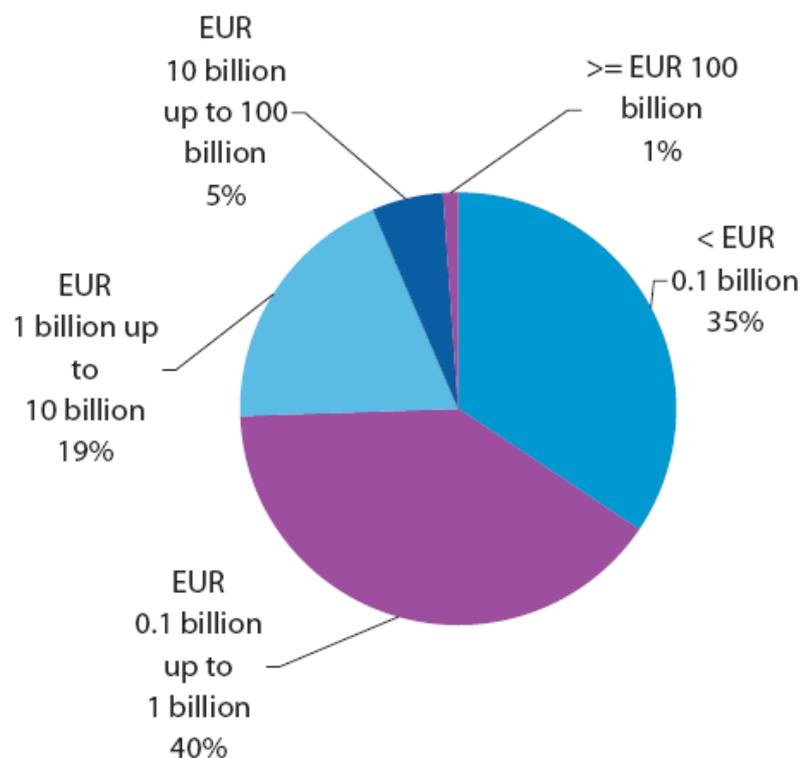

- monetary financial intermediation (NACE Group 65.1);
- non-monetary financial intermediation (NACE Group 65.2).

In particular, it includes credit institutions and financial leasing.

Table 6: Credit institutions (NACE Class 65.12 and Group 65.2). Main indicators, 2006 (1)

Main statistical findings

Focus on Internet financial services

One particular characteristic of the development of the Internet has been the use of e-banking. Results from Eurostat's information society statistics indicate the use of the Internet for financial services, notably e-banking and share purchasing. In 2008, close to three tenths (29%) of all persons (aged 16 to 74) in the EU-27 used the Internet for banking, a share that was close to one half (47%) when limited to Internet users. In nearly all Member States, even those with already high Internet banking usage, the proportion of persons using the Internet for financial services grew between 2007 and 2008, the exceptions being Bulgaria, Cyprus and Romania.

Employment in financial intermediation

According to [Labour force survey](#) data, the number of persons employed in the EU-27's sector for financial intermediation excluding insurance and pension funding (NACE Division 65) was 4.1 million in 2007. This equated to 63.1% of those employed in the financial and insurance services (NACE Section J) sector as a whole. Germany and the United Kingdom dominated this sector in [employment](#) terms, each with just under one fifth of the EU-27's workforce. In employment terms, the most specialised Member State in this sector was, by far, Luxembourg, where 13.8% of those employed within the business economy were working in financial intermediation excluding insurance and pension funding. The next highest share was 6.0% in Cyprus, while the lowest shares were 1.3% in Estonia and 1.4% in Bulgaria and Romania.

Credit institutions

Credit institutions are defined in the first indent of Article 1 of Council directive 77/780/EEC: 'credit institution means an undertaking whose business is to receive deposits or other repayable funds from the public and to grant credits for its own account'. In terms of the NACE Rev. 1.1 classification, credit institutions mainly correspond to NACE Class 65.12 (other monetary intermediation). However, due to the different implementation of the EU directives into national law, in some Member States credit institutions might also comprise a number of enterprises whose main activity should be classified under NACE Class 65.22 (other credit granting).

An analysis of the number of credit institutions according to the size of their balance sheets in 2006 indicates that on average approximately 1% had a balance sheet total that was EUR 100 billion or more, while around three quarters of credit institutions reported a balance sheet total of less than EUR 1 billion. An analysis of the legal status of credit institutions in 2006 shows that the most common legal form was a co-operative enterprise, followed by incorporated enterprises.

Access to the retail banking network has changed, with a move away from services provided in branches to services provided through automatic teller machines (ATMs), phone and Internet banking. There were about 294.6 thousand ATMs in the EU-27 by 2006, and that in only five of the 25 Member States with data available were there less ATMs than local units. Estonia, Bulgaria, Finland and Portugal reported the highest ratios of ATMs to local units, while the lowest ratios were in Cyprus and Austria.

Looking at the output of credit institutions, the United Kingdom and Germany recorded the highest [value added](#) in the EU-27 in 2006, with EUR 115.6 billion and EUR 86.7 billion respectively. These two same Member States also reported the largest credit institutions workforces, with the German workforce of 679.8 thousand persons employed clearly dominant.

There was a high degree of importance for the United Kingdom in the credit institutions sector: for example, capital and reserves in British credit institutions were valued at EUR 532.7 billion in 2006, whereas capital and reserves in the next largest Member States, namely Italy (2005), Germany and France ranged between EUR 259.5 billion and EUR 276.6 billion. The combined net income (income less payments) of interest and commissions was particularly low relative to equity (capital and reserves) in Sweden, the Netherlands, Finland, France and the United Kingdom (18% or lower), whereas it was highest in Hungary, Bulgaria, Romania, Greece and the Czech Republic (45% or more). In all Member States net income from interest (essentially income from lending) was higher than net income from commissions (fee based business) except in Luxembourg where these values were almost the same; Greece and Cyprus reported the highest ratios of net interest to net commissions. For the Member States for which data are available the total value of loans to customers was around 7.0% higher than the value of amounts owed to customers. By far the highest ratios of loans to amounts owed were recorded in Denmark and Sweden.

Financial leasing

Financial leasing is classified under NACE Class 65.21 and covers leasing where the term of the lease approximately covers the expected life of the asset and the lessee acquires substantially all the benefits of its use and takes all the risks associated with its ownership: the asset may or may not eventually be transferred to the lessee. No structural business statistics are available for this activity, but [Leaseurope](#) provide information on the value of newly leased assets and on outstanding leases. The largest markets in 2007 in terms outstanding leases were Germany, Italy, France and the United Kingdom, while for new leasing a similar order was observed,

except that the Spanish market had over taken that in the United Kingdom.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include Eurostat information society statistics and Leaseurope.

Context

Financial and intermediation services provide instruments to businesses and households in the form of products that are essentially savings or loans, or products to transfer and pool risk. Changes in financing techniques have increased the possibilities open to business to fund investment, while consumers have a wider array of choices for credit, savings and payment methods. At the time of writing this sector is the focus of worldwide attention due to the financial crisis widely experienced across the globe and the impact that this has had on other parts of the economy. This crisis has led to national governments taking over some financial institutions, and providing massive amounts of financial support to others. The crisis has provoked widespread calls for reforms to regulatory bodies and new ways for overseeing the operations and practices of this sector.

There has been considerable EU legislative activity in the sphere of financial and insurance services centred upon the creation of an internal market for financial and insurance services. This work has been conducted through the Financial services action plan (FSAP), which was published by the [European Commission](#) in 1999 and the legislative phase completed in 2006.

The absence of cross-border consolidation within the financial and insurance services sector has drawn attention and in September 2007 a Directive of the [European Parliament](#) and of the [Council](#) was adopted ([COM\(2007\) 44](#)) that would tighten the procedures that Member States' supervisory authorities have to follow when assessing proposed mergers and acquisitions in banking, insurance and securities activities. The directive aims to clarify the criteria against which supervisors should assess possible mergers and acquisitions in order to improve clarity and transparency in supervisory assessment and help to ensure a consistent handling of mergers and acquisitions requests across the EU.

In response to the financial crisis that started in 2007 and intensified throughout 2008, the European Commission adopted in October 2008 a proposal ([COM\(2008\) 602](#)) to amend the so-called capital requirements Directive. The aims of the proposal are to reinforce stability in the financial system, reduce exposure to risk and improve supervision of banks operating across borders.

In November 2007, a Directive of the European Parliament and of the Council ([COM\(2007\) 64](#)) of the European Parliament and of the Council of 13 November 2007 on payment services in the internal market was adopted to create a new legal framework for payments, with the objectives to make payments quicker and easier, to guarantee fair and open access to payments markets, and to increase and standardise consumer protection. Although wider in scope this Directive also provided the legal basis for the [single euro payments area \(SEPA\)](#) : SEPA credit transfers were launched in January 2008, with direct debits expected by November 2009.

In April 2008, a Directive of the European Parliament and of the Council on credit agreements for consumers ([COM\(2008\) 48](#)) of the European Parliament and of the Council of 23 April 2008 on credit agreements for consumers was adopted. The Directive covers consumer credit (not mortgages) of up to EUR 75.0 thousand and aims to introduce a harmonised method for calculating the cost of credit and to establish a set of rights for all borrowers.

In December 2007, the European Commission published a White paper on the integration of EU mortgage credit markets ([COM\(2007\) 807](#)). This paper proposes to improve the competitiveness and efficiency of mortgage markets by facilitating the cross-border supply and funding of mortgage credit as well as by increasing the diversity of products available.

Fish production and processing statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#) . According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), the present article covers fish production and processing, corresponding to NACE Group 15.2, which is part of the [food, beverages and tobacco - NACE Rev.1.1](#) sector. The activities covered in this article are:

- the preparation and preservation of fish, crustaceans and molluscs (be they fresh, frozen, smoked, salted or canned);
- the manufacture of prepared fish and seafood dishes.

It should be noted that this article excludes the agricultural activities of growing, farming, rearing and hunting and also fishing (NACE Divisions 01 and 05).

Table 1: Processing and preserving of fish and fish products (NACE Group 15.2). Structural profile: ranking of top five Member States in terms of value added and persons employed, 2006.

Main statistical findings

Structural profile

The processing and preserving of fish and fish products (NACE Group 15.2, hereafter termed the fish processing sector) is relatively small. In 2006, it consisted of an estimated 4.0 thousand [enterprises](#) across the whole of the [EU-27](#) , employing 129.4 thousand persons, and generated EUR 4.0 billion of [value added](#) (equivalent to 2.0% of the value added generated across the whole of the food, beverages and tobacco manufacturing sector).

Source: Eurostat (STS)

Figure 1: Processing and preserving of fish and fish products (NACE Group 15.2). Index of production, EU-27 (2000=100)

The fish processing sectors of Spain, France and the United Kingdom generated more than half (51.6%) of the total value added in the EU-27 in 2006. They also had the largest workforces in these activities (a combined 42.0% of the fish processing workforce), while there was also a relatively sizeable fish processing workforce in Poland (11.7% of the EU-27 total in 2005).

In terms of the relative contribution of fish processing to [non-financial business economy](#) value added, Lithuania and Latvia were by far the most specialised Member States. Although fish processing contributed no more than 0.4% of value added within their respective non financial business economies, this share was, nevertheless, about five times as high as the EU-27 average. Estonia, Denmark, Portugal and Spain were also relatively specialised in fish processing activities in 2006.

The [output](#) of the EU-27's fish processing sector in 2007 was down sharply (4.9%) on the level for 2006, the first significant cut-back in production since 1997. This downturn in output came after a period of sustained growth, despite concerns that several important fish stocks have been on the verge of collapse. The fish processing sector recorded an average rate of growth between 2000 and 2006 that was equivalent to 4.0% per year, one of the highest rates among any of the food, beverage and tobacco manufacturing subsectors. It is likely that this growth in the activity of fish processing has been underpinned by a relatively high increase in fish imports from areas outside of the EU.

Expenditure and productivity

[Personnel costs](#) in the fish processing sector accounted for 12.0% of total operating costs in 2006, a slightly lower proportion than the average for the whole of the food, beverages and tobacco manufacturing sector. This characteristic was common to almost all of the Member States for which data are available. The relative importance of personnel costs as a share of total operating costs was particularly low in Denmark (9.7% compared with an average of 15.7% for the whole of the food, beverages and tobacco manufacturing sector), as well as in Portugal and the United Kingdom. In part, this reflects relatively low average personnel costs, which stood at EUR 20.8 thousand per employee for the EU-27 in 2006 – the lowest level among the ten NACE groups that are covered by the food, beverages and tobacco manufacturing sector – and about 20% below the average for all of these activities.

The apparent [labour productivity](#) of the fish processing sector in the EU-27 was EUR 30.6 thousand per person employed in 2006; this was the second lowest level among the food, beverages and tobacco manufacturing subsectors. Despite relatively low average personnel costs, the wage adjusted labour productivity ratio of the fish processing sector in the EU-27 was, at 146.6%, beneath the average for the whole of the food, beverages and tobacco manufacturing sector in 2006. The wage-adjusted labour productivity ratios for the fish processing sectors of Hungary, Poland and Ireland were particularly low.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics \(STS\)](#) .

Context

The food, beverages and tobacco manufacturing sector in the EU is comprised of a relatively small number of enterprises that have a considerable global market presence, which operate alongside a high number of relatively small enterprises that serve more local, regional and national markets.

As these enterprises not only produce goods for final consumption but also intermediate products for other manufacturing activities, they are affected by a broad scope of legislation. The main legislative areas affecting the EU's food, beverages and tobacco manufacturing sector, however, tend to involve international trade

agreements, or food and feed legislation. As a majority of the EU's agricultural production is processed by the food, beverages and tobacco manufacturing sector ([Confederation of Food and Drink Industries \(CIAA\)](#)), developments in [Common Agricultural Policy](#) and associated Common Market Organisations can have important implications for costs and processes in the food chain. Regarding food legislation, the [European Parliament and the Council](#) proposed an update of the laws regarding the provision of information to consumers ([COM\(2008\) 40 final](#)) in 2008, in order to clarify and consolidate existing regulations. In part, this proposal was built on a 2007 White Paper covering a Strategy for Europe on Nutrition, Overweight and Obesity ([COM\(2007\) 279 final](#)), which stressed the need for consumers to have access to clear, consistent and evidence-based nutritional information.

The [European Commission](#) is reviewing its [Common Fisheries Policy](#) , in order to try to make it more efficient in ensuring the economic viability of European [fishing fleets](#) , conserving fish stocks, integrating it with Maritime Policy and providing good quality food to consumers. A review was launched at an informal Council meeting on 29 September 2008. Indeed, conservation policies have dominated recent legislative developments in this area: a series of long-term stock plans were launched in 2008, such as for [cod](#) , [herring](#) and [bluefin tuna](#) , as well as regulations on mesh size and the thickness of twine to be used in fishing nets. There have also been new rules on the control, monitoring and enforcement of fishing activities, as well as structural measures regarding the fishing fleet. These regulations have an impact on supplies to and costs of the EU fish processing sector.

Table 4b: Key indicators, food and beverage service activities (NACE Division 56), 2009 - Source: Eurostat (sbs_na_1a_se_r2)

Main statistical findings

Structural profile

There were almost 1.5 million enterprises that reported having food and beverage services (Division 56) as their principal activity in the EU-27 in 2009. They employed 7.6 million persons, equivalent to 5.7% of the total number of persons employed in the non-financial business economy (Sections B to J and L to N and Division 95) and just over three quarters (76.8%) of those employed within accommodation and food services (Section I). The food and beverage services sector generated EUR125028 million of value added which was 2.2% of the non-financial business economy total or two thirds (66.9%) of the accommodation and food services total.

With a higher share of the non-financial business economy workforce than of its value added, the apparent labour productivity of the EU-27's food and beverage services sector in 2009 was, at EUR16 thousand per person employed, considerably below the non-financial business economy average of EUR41.6 thousand per person employed. Indeed, this was the lowest level of apparent labour productivity among any of the NACE divisions that make-up the non-financial business economy. Note that this indicator is based on a head count of employment and that there is a relatively high propensity to employ persons on a part-time basis within the food and beverage services sector – as such, a simple count of employment is likely to over-state labour input, resulting in a comparatively low apparent labour productivity ratio.

Average personnel costs within the EU-27's food and beverage services sector were also very low when compared with other activities: EUR14.6 thousand per employee for food and beverage services compared with an average of EUR30.0 thousand per employee for the whole of the non-financial business economy. As such, food and beverage services recorded the second lowest level of average personnel costs per employee across those NACE divisions that constitute the non-financial business economy, higher only than wearing apparel manufacturing (Division 14).

The wage-adjusted labour productivity ratio combines the two previous indicators and shows the extent to which value added per person employed covers average personnel costs per employee. Given that this indicator is based on expenditure rather than a headcount of labour input, it is more relevant for comparisons across activities or countries where there are different incidences of part-time employment or self-employment. Nevertheless, the EU-27's food and beverage services sector reported a relatively low wage-adjusted labour productivity ratio of 112.1% in 2009, compared with the non-financial business economy average of 138.8%. Indeed, this was the ninth lowest value for wage-adjusted labour productivity across the NACE divisions that compose the non-financial business economy.

The **gross operating rate** shows the relationship between the **gross operating surplus** and **turnover**). The gross operating rate for the EU-27's food and beverage services sector in 2009 was 11.1%, which was slightly higher than the non-financial business economy average (9.7%).

Sectoral analysis

More than half (55.1%) of all the enterprises within the EU-27's food and beverage services sector were classified as belonging to the restaurants and mobile food services (Group56.1) subsector. Beverage serving activities (Group56.3) accounted for the vast majority of the remaining enterprises (40.6%), while the event catering and other food services (Group56.2) subsector had a share of food and beverage services enterprises that was below 5%.

In output terms, the relative importance of restaurants and mobile food services was even greater, accounting for 61.3% of sectoral value added, almost three times as high as the share for beverage serving activities (22.5%), while the share for event catering and other food services was 16.2%. The distribution of employment between the three different subsectors showed that restaurants and mobile food services accounted for 59.7% of the sectoral workforce, while 27.3% of the workforce were engaged within beverage serving activities and some 13.1% within event catering and other food services.

The low apparent labour productivity for the whole of the food and beverage services sector was pulled downwards, in particular, by beverage serving activities, where EU-27 apparent labour productivity was EUR13 thousand per person employed in 2009. This low level of apparent labour productivity was less than one third of the non-financial business economy average (EUR41.6 thousand per person employed) and resulted in beverage serving activities recording the second lowest level of productivity (using this measure) across any of the NACE groups that compose the non-financial business economy.

Average personnel costs per employee reached EUR17.9 thousand per employee for the EU-27's event catering and other food service activities subsector in 2009, EUR14.7 thousand per employee for restaurants and mobile food service activities and EUR12.2 thousand per employee for beverage serving activities. As such, beverage serving activities recorded the lowest level of average personnel costs among any of the NACE groups in the non-financial business economy. All three food and beverage services subsectors were ranked within the bottom 15 NACE groups, as restaurants and mobile food service activities occupied the sixth lowest position and event catering and other food service activities the fourteenth lowest position.

The food and beverage services sector reported a relatively low wage-adjusted labour productivity ratio in 2009 and this was repeated across each of the three subsectors. Furthermore, the individual ratios were within a relatively narrow range, from 114.1% for the EU-27's restaurants and mobile food services subsector to 110.6% for beverage serving activities. All three ratios were considerably below the average wage-adjusted labour productivity ratio for the non-financial business economy (138.8%).

For the gross operating rate, there were two food and beverage services subsectors that reported rates above the EU-27 non-financial business economy average (9.7%) in 2009. This was the case for beverage serving activities (12.7%) and for restaurants and mobile food service activities (11.2%), while the wage-adjusted labour productivity ratio for event catering and other food service activities (8.0%) was some 1.7 percentage points less than the non-financial business economy average.

Country analysis

France had the highest level of value added among the Member States for the food and beverage services sector in 2009, accounting for an 18.5% share of the EU-27 total. The United Kingdom (17.0%), Germany (16.1%), Spain (13.4%) and Italy (11.9%) all reported double-digit shares of EU-27 value added, while the next highest share was recorded by the Netherlands (4.5%).

The relatively high share of EU-27 value added for France in the food and beverage services sector could be attributed to the restaurants and mobile food service activities subsector, where France accounted for more than one fifth (21.6%) of the EU-27's added value in 2009. For event catering and other food service activities, the highest share of EU-27 value added was recorded in Germany (19.4%), while more than one quarter (25.7%)

of the EU-27's value added for beverage serving activities was registered in the United Kingdom.

In terms of relative specialisation, the food and beverage services sector accounted for as much as 5.8% of national non-financial business economy value added in Cyprus in 2009, this was almost three times as high as the EU-27 average. At the other end of the range, the food and beverage services sector accounted for 0.6% of non-financial business economy added value in Poland and its share was also below 1% in Slovakia and Romania. Within beverage serving activities the highest degrees of specialisation were recorded in Cyprus, Spain and Ireland, where the contribution to non-financial business economy was at least twice as high as the EU-27 average. No recent data are available for Malta and this Member State is known to be specialised in the food and beverage services sector.

Most Member States reported low wage-adjusted labour productivity ratios for food and beverage services in 2009, with the highest ratio being registered for Romania (149.4%). There were four Member States that recorded ratios below 100%, namely Spain, Lithuania, Hungary and Italy, where the lowest ratio was registered (81.7%) – as such, apparent labour productivity in these countries did not cover average personnel costs.

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

This article presents an overview of statistics for the food and beverage services sector in the EU, as covered by NACE Rev.2 Division56. This division includes food and beverage serving activities providing complete meals or drinks fit for immediate consumption, whether in traditional restaurants, self-service establishments, or take-away restaurants, whether as permanent or temporary stands, with or without seating. The most important factor used to determine whether an enterprise should be classified under this heading is that meals that are produced are fit for immediate consumption, rather than any selection being made upon the basis of the kind of facility producing them.

Restaurants and mobile food service activities include restaurants, cafeterias, fast-food restaurants, food delivery services (such as pizza), take-out eating places, ice cream van vendors, mobile food carts, food preparation in market stalls, restaurant and bar activities connected to transportation (for example, on boats or trains), when carried out separately from the provision of transport services.

Event catering activities include the provision of food services based on contractual arrangements with the customer, at the location specified by the customer, for a specific event. Other food services include industrial catering, in other words the provision of food services based on contractual arrangements with the customer, for a specific period of time; examples are the operation of canteens or cafeterias in factories, offices, hospitals or schools, as well as the operation of food concessions at sports and similar facilities.

Beverage serving activities include preparing and serving beverages for immediate consumption on the premises. Included are bars, taverns, cocktail lounges, coffee shops, fruit juice bars, mobile beverage vendors.

This NACE division is composed of three groups:

- restaurants and mobile food service activities (Group56.1);
- event catering and other food service activities (Group56.2);
- beverage serving activities (Group56.3).

The information presented in this article excludes the production of meals not fit for immediate consumption or not planned to be consumed immediately, as well as prepared food which is not considered to be a meal

(these activities are covered within Divisions 10 and 11, and are included within the NACE as part of the [manufacture of food products](#) and the [manufacture of beverages](#)). The sale of not self-manufactured food which is not considered to be a meal, as well as the sale of meals which are not fit for immediate consumption are also excluded from the statistics that are presented in this article. These activities are classified as part of the reselling of packaged/prepared beverages and the retail sale of food or beverages through vending machines: these are classified to Divisions 46 and 47 ([wholesale](#) and [retail](#) trade).

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article introduces a [set of statistical articles](#) which analyse the structure, development and characteristics of the economic activities in the food, beverages and tobacco sector in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), this sector covers NACE Divisions 15 and 16, and its activities are treated in more depth in seven specific articles, divided by product:

- [Meat](#) ;
- [Fish](#) ;
- [Dairy products](#) ;
- [Bread, sugar, confectionery and other food products](#) ;
- [Miscellaneous food products](#) ;
- [Beverages](#) ;
- [Tobacco](#) .

	Country	Main products	Food sales (EUR billion)
Nestlé	CH	Multi-product	58.5
Unilever	NL/UK	Multi-product	21.4
Diageo	UK	Alcoholic beverages	14.3
Danone	FR	Dairy products; multi-product	14.1
InBev	BE	Beer	13.4
Cadbury Schweppes	UK	Beverages, confectionery	10.9
Heineken	NL	Beer	8.7
Lactalis	FR	Dairy products	7.5
Associated British Foods	UK	Sugar, starches, prepared foods	8.8

Table 8: Manufacture of tobacco products (NACE Division 16). Main indicators, 2006 (1)

It should be noted that this article does not cover the agricultural activities of growing, farming, rearing and hunting and also fishing (NACE Divisions 1 and 5). A number of products, such as wine, olive oil, eggs or cheese are also sold directly by [agricultural holdings](#). As such, their weight is likely to be under-reported in this article, as part of their production is recorded as an agricultural activity.

Main statistical findings

Structural profile

The [EU-27](#)

's food, beverages and tobacco (NACE Subsection DA) manufacturing sector comprised 308.6 thousand [enterprises](#) in 2006 and employed 4.7 million persons (the equivalent of 3.6% of the [non-financial business economy](#) (NACE Sections C to I and K) workforce). This sector generated EUR 197 billion of [value added](#) in 2006, which was equivalent to 3.5% of the value added generated across the non-financial business economy. The largest activity (at the NACE group level of detail) within the food, beverages and tobacco manufacturing sector was the manufacture of bread, sugar, confectionary and other food products (NACE Group 15.8); it contributed almost EUR 72.0 billion of value added (36.6% of sectoral value added) and employed 2.1 million persons (43.8% of sectoral [employment](#)).

The second and third largest subsectors, in terms of employment, were meat processing (NACE Group 15.1) and beverages manufacturing (NACE Group 15.9), together employing a combined 1.5 million persons in 2006 and individually accounting for 21.3% and 9.8% of sectoral employment, as well as a third of sectoral value added (15.3% and 17.3% respectively).

The remaining third of sectoral value added and quarter of sectoral employment was shared among the remaining food and tobacco subsectors, of which the manufacture of dairy products (NACE Group 15.5) was the next largest (accounting for 8.9% of sectoral value added in 2005 and 8.5% of sectoral employment in 2006).

Around one half (49.4%) of the value added generated by the food, beverages and tobacco manufacturing sector within the [EU-27](#)

in 2006 came from just three Member States; these were Germany (17.7%), the United Kingdom (16.5%) and France (15.2%). In each of these countries, the contribution made by this sector to total value added within

the non-financial business economy was broadly in line with the EU-27

average of 3.5%. Among the remaining Member States for which information is available³⁹, relative specialisation was highest in Poland (2005) and Ireland, where these activities accounted for 9.2% and 7.0% respectively of total value added within the non-financial business economy.

In terms of employment, the two most specialised regions (at the NUTS 2 level of detail shown in the map) for food, beverages and tobacco manufacturing were Bretagne (France) and Podlaskie (Poland). In both of these, about one in nine persons employed in the non-financial business economy was working in the food, beverages and tobacco manufacturing sector. The figures for both of these regions were synonymous with wider trends, as several regions in France and Poland reported a relatively high degree of employment specialisation for these activities.

There was a slow and relatively steady increase in the level of **output** of food, beverages and tobacco across the EU-27

during the ten years through to 2007. The production index rose by an average of 1.4% per year, which was less than the average for total industry (2.3% per year). The uniform nature of the evolution of output reflects a relatively constant level of demand across the EU for food and beverages, whereby many products are protected from broader **economic cycles** as people continue to eat more or less the same amount of food during periods of rapid expansion or recession.

With the exception of 1998, there was a relatively steady decline in the level of employment within the EU-27

's food, beverages and tobacco manufacturing sector between 1997 and 2007. The average rate of decline (0.6% per year) was about half that noted across the whole of the industrial economy.

In the ten years up until 2007, there were production increases in the EU-27

for eight of the ten NACE groups that make up the food, beverages and tobacco manufacturing sector. The principal exception was the output of tobacco manufacturing (NACE Division 16) where production decreased, on average, by 3.4% per year, in part reflecting health concerns and associated Community legislation. The other decline was for vegetable and animal oils and fats manufacturing (-0.3% per year). In contrast, the strongest rates of increase were recorded for the processing and preserving of fruit and vegetables subsector (NACE Group 15.3), where **production** expanded by 2.2% per year, and for the processing and preserving of fish and fish products (NACE Group 15.2), despite a relatively sharp fall in output in 2007 (-4.9%).

Small and medium-sized enterprises (SMEs) generated a relatively low proportion of EU-27

value added (45.5%) within the food, beverages and tobacco manufacturing sector in 2006 when compared with the non-financial business economy as a whole (57.9%). Much of this difference concerned the relative contributions of **micro-enterprises** (those employing less than ten persons); they contributed just over a fifth (21.0% in 2005) of total value added within the non-financial business economy, but only 8.2% of the added value within the food, beverages and tobacco sector. It is possible that the relative weight of micro-enterprises is understated, as some small agricultural holdings choose to process and sell their own-production directly (and it is therefore likely that their output is not included within the statistics for Division 15).

There was less difference in terms of employment structures, as SMEs within the food, beverages and tobacco manufacturing sector in 2006 accounted for 62.5% of the workforce, compared with an average of 67.4% for the non-financial business economy. When combining these relative shares (for value added and employment), the resulting apparent labour productivity ratio for SMEs in the EU-27

's food, beverages and tobacco sector stood at EUR 30500 of value added per person employed, significantly lower than the average for SMEs in the whole of the non-financial business economy (EUR 37.8 thousand per person employed).

Among the Member States for which size-class data are available, it was only in Slovakia that the contribution of SMEs (57.5% of value added in 2005) to the food, beverages and tobacco manufacturing sector far

³⁹Bulgaria, Poland and Romania, 2005; Cyprus, Latvia, Lithuania, Malta and the Netherlands, not available.

exceeded the corresponding contribution of SMEs to the total non financial business economy (44.5% in 2005). The relative importance of SMEs in terms of their contribution to sectoral value added was particularly low in the United Kingdom (22.7% in 2006), which was less than half the average (50.7%) for the total non-financial business economy.

Employment characteristic

The food, beverages and tobacco manufacturing sector is atypical in terms of the number of women who are employed in this activity. The female share of the EU-27

workforce was 42.4% in 2007, which was well above the non-financial business economy average of 35.1%. This characteristic was apparent for the majority of the Member States in 2007, the exceptions being Ireland, the Netherlands and the United Kingdom⁴⁰. Indeed, women represented at least 50% of the workforce in the food, beverages and tobacco manufacturing sector in Germany, the Czech Republic, Lithuania and Latvia, and almost two thirds (63.9%) of the total workforce in Estonia.

While there is often a link between female and part-time employment rates, the food, beverages and tobacco manufacturing sector reported a relatively low proportion of persons employed on a part-time basis in 2007 (11.2% of the workforce compared with 14.3% for the EU-27's non-financial business economy). This distinction was most apparent in the United Kingdom (12.1% compared with 21.4%), but was also notable in Ireland and the Netherlands. Indeed, it was only in Latvia, Germany and Hungary that the proportion of part-time workers in the food, beverages and tobacco manufacturing sector was at the same level or above the average of the non-financial business economy.

The age profile of those working in the EU-27

's food, beverages and tobacco manufacturing sector was very similar to that across the broader non-financial business economy in 2007; a little under one quarter (23.9%) of all persons employed in this sector were under the age of 30, while more than one fifth (21.1%) were aged over 50, leaving the majority (55.1%) aged between 30 and 49. In Sweden and Finland, the proportion of younger workers (under the age of 30) in the food, beverages and tobacco manufacturing sector was notably higher than the averages recorded for each of their respective non-financial business economies in 2007 (by 5 to 6 percentage points). In contrast, the share of younger workers was relatively low in each of the **Baltic Member States** (by about 6 to 7 percentage points) when compared with non-financial business economy averages.

Expenditure, productivity and profitability

The share of total operating expenditure accounted for by personnel costs within the EU-27

's food, beverages and tobacco sector was 13.8% in 2006, which was a little less than the averages for total industry (16.4%) or the non-financial business economy (16.1%). At a more detailed level, there were some notable differences; the relative share of **personnel costs** at the NACE group level⁴¹ ranged from a low of 5.3% for the manufacture of vegetable and animal oils and fats to a high of 20.7% for the manufacture of bread, sugar, confectionary and other food products.

Tangible investment within the EU-27

's food, beverages and tobacco sector accounted for 3.4% of the total within the non-financial business economy in 2006, which was a similar share to that recorded for food, beverages and tobacco manufacturing in terms of value added (3.5% of the non-financial business economy total). The relative importance of tangible investment within these activities was highest in Cyprus (7.7% of the non-financial business economy total in 2005) and in Poland (7.2% in 2005).

The **investment rate**, which corresponds to the ratio of tangible investment compared with value added, was 17.9% in 2006 for the EU-27

⁴⁰Malta not available.

⁴¹Manufacture of dairy products, 2005; manufacture of prepared animal feeds, 2004.

's food, beverages and tobacco manufacturing sector. This was a similar rate to that recorded for the whole of the non-financial business economy (18.4%). The investment rate of the manufacture of beverages (NACE Group15.9), the manufacture of vegetable and animal oils and fats (NACE Group15.4), as well as the manufacture of grain mill products, starches and starch products (NACE Group15.6) stood, in each case, at just under 25%. Among the Member States, the highest investment rates for the food, beverages and tobacco manufacturing sector were recorded in the two Member States that joined the EU in 2007; namely, Romania (76.7%) and Bulgaria (67.3%). In contrast, the lowest investment rate was registered in Ireland (7.3%).

The apparent **labour productivity** of theEU-27

's food, beverages and tobacco manufacturing sector was EUR 41.8 thousand per person employed in 2006, a similar level to the average for the non-financial business economy. However, average personnel costs (EUR 26.0 thousand per employee in 2005) were about 10% below the non-financial business economy average. As a result, the wage-adjusted labour productivity ratio (163.0%) of the EU-27's food, beverages and tobacco sector in 2006 was higher than the average for the whole of the non-financial business economy (146.5%). At a more detailed level, the highest wage adjusted labour productivity ratios were recorded for tobacco manufacturing (364.5% in 2004) and for beverages manufacturing (203.3%), while the lowest ratio was registered for the production, processing and preserving of meat and meat products (134.1% in 2005). Among the Member States, the highest wage adjusted productivity ratios for the food, beverages and tobacco manufacturing sector were recorded in Poland (361.7% in 2005) and Ireland (332.5%).

As an indicator of profitability, the **gross operating rate** of theEU-27

's food, beverages and tobacco sector in the EU-27 was 9.0% in 2006, below the average recorded for the whole of the non-financial business economy (10.8%). This characteristic was repeated in almost all of the Member States (the main exceptions being Romania and Luxembourg). Among those countries for which data are available⁴², the gross operating rate of the food, beverages and tobacco manufacturing sector was highest in Poland (21.8% in 2005) and Ireland (18.4%), and lowest in France, Slovakia and Slovenia (all between 6% and 7%). Gross operating rates (for theEU-27

) were particularly low for the manufacture of vegetable and animal fats and oils (4.6%), as well as for the production, processing and preserving of meat and meat products (4.9% in 2005); while they were highest for the manufacture of beverages (13.3%).

External trade

TheEU-27

Member States had a combined **trade surplus** of EUR 5.7 billion for food products, beverages and tobacco (CPA Subsection DA) in 2007, **exporting** goods that were valued at EUR 238.9 billion and **importing** goods to the value of EUR 233.2 billion. Almost three quarters of the trade (76.2% based on export values) conducted in these goods in 2007 was carried out within theEU-27

(**intra-EU** -27 trade), a much higher proportion than the average for all industrial products (67.6% for CPA Sections C to E).

Nevertheless, the lion's share (EUR 4.1 billion) of theEU-27

's trade surplus for food, beverages and tobacco products came from trade with the rest of the world (**extra-EU** -27 trade). The positive trade situation resulted from EU-27 exports of EUR 56.9 billion (a 4.9% share of all industrial exports) and imports of food products, beverages and tobacco to the value of EUR 52.8 billion (4.0%). The trade surplus narrowed significantly in 2007 (falling by 27.4%), perhaps reflecting a steep increase in the price of many raw and/or semi-processed food items.

At a more detailed level (CPA groups), the largestEU-27

⁴²The Netherlands and Poland, 2005; Lithuania, 2004; Latvia and Malta, not available.

trade surplus (EUR 12.8 billion) was recorded for beverages (CPA Group 15.9). Indeed, the surplus for beverages was more than the combined surpluses of the next two largest contributors – bread, sugar, confectionary and other food products (CPA Group 15.8) and dairy products (CPA Group 15.5). In contrast, there was a considerable trade deficit in the EU-27

for fish and fish products (CPA Group 15.2), valued at EUR 11.7 billion.

The value of EU-27

exports and imports of food, beverages and tobacco products grew strongly in 2007 (up by 5.0% and 8.8% respectively on 2006), maintaining the growth in the trade of these products with non-EU countries that has been in evidence since 2003. During the five-year period through until 2007, the main structural change in exports concerned the increase in the relative importance of beverages, whose share of total exports rose by almost two percentage points to 31.5% in 2007 (mainly at the expense of meat and meat products and tobacco). As regards imports, the main change between 2002 and 2007 was the growth in the relative importance of vegetable and animal oils and fats (up 2.6 percentage points), which was mainly at the expense of fish and fish products and prepared animal feed.

As a proportion of total industrial exports, food, beverage and tobacco products were particularly important for Denmark (accounting for 17.6% in 2007) and Greece (14.7%). In terms of imports, these products were also important in Denmark (10.4%) and Malta (10.3%).

The United States, Russia, Japan and Switzerland were key export markets for EU-27

food, beverage and tobacco products in 2007, although the relative share of exports to the United States declined from 21.2% in 2006 to 19.6% in 2007. Russia accounted for 9.7% of all EU-27

exports of food, beverage and tobacco products, which was higher than the Russian share of all EU-27 industrial exports (7.2%). The share of imports of food, beverages and tobacco products into the EU-27

from Brazil and Argentina continued to grow, accounting for a little over one fifth (20.6%) of the total in 2007.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics \(STS\)](#) , the [Labour force survey \(LFS\)](#) , the [COMEXT](#) database for external trade, and the [Confederation of Food and Drink Industries \(CIAA\)](#) .

Context

The food, beverages and tobacco manufacturing sector in the EU is comprised of a relatively small number of enterprises that have a considerable global market presence, which operate alongside a high number of relatively small enterprises that serve more local, regional and national markets.

As these enterprises not only produce goods for final consumption but also intermediate products for other manufacturing activities, they are affected by a broad scope of legislation. The main legislative areas affecting the EU's food, beverages and tobacco manufacturing sector, however, tend to involve international trade agreements, or food and feed legislation. As a majority of the EU's agricultural production is processed by the [food, beverages and tobacco manufacturing sector](#) , developments in [Common Agricultural Policy](#) and associated Common Market Organisations can have important implications for costs and processes in the food chain. Regarding food legislation, the [European Parliament](#) and the [Council](#) proposed an update of the laws regarding the provision of information to consumers ([COM\(2008\) 40 final](#)) in 2008, in order to clarify and consolidate existing regulations. In part, this proposal was built on a 2007 White Paper covering a Strategy for Europe

on Nutrition, Overweight and Obesity ([COM\(2007\) 279 final](#)), which stressed the need for consumers to have access to clear, consistent and evidence-based nutritional information.

Notes

Foreign affiliates statistics - FATS

Foreign-owned multinationals play an increasingly important role in the economies of many developed and developing countries, with the level of [foreign direct investment](#) increasing consistently over the past few decades.

There is competition among countries to attract affiliates of foreign multinationals as they contribute to the welfare of the host economy. Foreign affiliates of European companies also play a very important role in the global economy.

[Foreign affiliates statistics \(FATS\)](#) describe the activities of an economy's affiliates based abroad ([outward FATS](#)) and the contribution made by foreign affiliates resident in that economy ([inward FATS](#)).

This article considers data on the role of European-controlled foreign affiliates - outward FATS - and examines the contribution made by European-controlled affiliates both within and outside the [European Union \(EU\)](#) .

FATS measure the commercial presence, as clarified by the [General Agreement on Trade in Services \(GATS\)](#) , through affiliates in foreign markets. This article discusses statistics on the number of people employed and the turnover for foreign affiliates.

Main statistical findings

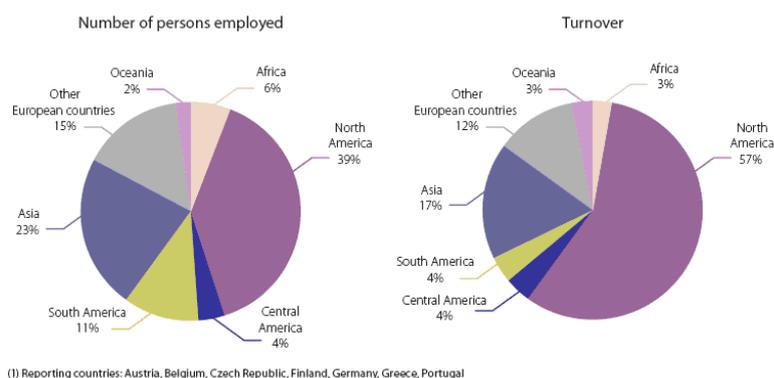

Figure 1: Number of persons employed and turnover in foreign affiliates located outside the EU-27, 2004, shares by region (%) (1)

The scale of activities of European-controlled foreign affiliates was bigger within the EU than outside it in the year 2004. The intra-EU share of the number of people employed by European-controlled foreign affiliates was 57.7%, with figures ranging from 34.5% for Portugal to 81.2% for Austria. The share of turnover was 54.5%, ranging from 50.9% for Germany to 89.8% for the Czech Republic. The only exception was in relation to the number of people employed in Portuguese-controlled foreign affiliates, where the extra-EU share was 65.5% (see Figure 1).

Foreign affiliates were most active in neighbouring countries (France for Belgium, Slovakia for the Czech Republic, Cyprus for Greece, Germany for Austria, Spain for Portugal, and Sweden for Finland). However, the United States was the principal destination in terms of both turnover and number of people employed for German foreign affiliates. The activity of European affiliates outside the EU was highest in North America, with shares of 38.6% for the number of persons employed and 57% for turnover (the USA accounted for 91% of the total).

In terms of turnover, the services sector was the main field of activity for EU affiliates in 2004, with 54.7% of total, followed by manufacturing with 40.9%. Only in Finland did manufacturing take a higher share of total turnover than services. However, in terms of the number of people employed in foreign affiliates, the manufacturing sector accounted for 54.8% of the total, compared with 41% for services.

Among the activity categories of the services sector, 'Trade and repairs' had the biggest share in terms of

both number of people employed and turnover (47.6% and 67.2% respectively). However, this share differed from country to country, ranging from 10.4% in Greece to 62.5% in Finland for the number of people employed. For turnover, the share ranged from 12.9% in Greece to 88.3% in the Czech Republic. 'Trade and repairs' was followed by 'Transport and communication' in terms of the number of workers employed and by 'Financial intermediation' in terms of turnover.

The impact of foreign affiliates on the labour market differs significantly from country to country, being substantial in some countries and almost negligible in others. While German affiliates were by far the biggest employer abroad, Finland had the highest proportion of people employed by foreign affiliates, accounting for 13.9% of total employment in the country. It was followed by Austria and Germany, both with a ratio of about 11% of people employed by foreign affiliates to total employment. At the other end of the scale, the ratio for the Czech Republic was only 0.3% and for Portugal 0.6%. Taking only affiliates outside the EU into account, these figures ranged from 5% for Finland and Germany to 0.1% for the Czech Republic and 0.4% for Portugal.

Data sources and availability

Foreign direct investment (FDI) and FATS reflect two different aspects of the role of multinationals in the global economy. While FDI provides data on the monetary value of investment flows and stocks, FATS describe the economic activity of companies receiving the investment.

FATS focus on affiliates that are majority-owned by a single investor or group of associated investors acting in concert and owning more than 50% of ordinary shares or voting power. However, other criteria may also be relevant for defining foreign control, and thus other cases (multiple minority ownership and joint ventures, for example) should be covered when considering assessment of control. Control is defined in this context as the ability to determine the general policy of an enterprise by choosing appropriate directors, if necessary. However, control is often difficult to determine and, in practice, the share of ownership is often used as a proxy for control.

FATS encompass inward and outward FATS data. Similarly, FDI contains inward and outward investment.

Inward FATS describe the overall activity of foreign affiliates resident in the compiling economy. A foreign affiliate within the terms of inward FATS is an enterprise resident in the compiling country over which an institutional unit not resident in the compiling country has control. In simpler terms, inward FATS describe how many jobs, how much turnover, etc. are generated by foreign investors in a given EU host economy. While FDI statistics give an idea of the total amount of capital invested by foreigners in the EU economy, FATS add to that information by providing insight into the economic impact those investments have in the EU in terms of job creation, etc.

Outward FATS describe the activity of foreign affiliates abroad controlled by the compiling country. A foreign affiliate within the terms of outward FATS is an enterprise not resident in the compiling country over which an institutional unit resident in the compiling country has control. In simpler terms, outward FATS data describe, for example, how many employees work for affiliates of EU enterprises based abroad. In this case, outward FATS give an idea of the economic impact of EU investments abroad (e.g. how many employees work for affiliates of German enterprises in China, what the exports of affiliates of British firms based in India are, etc.).

FDI versus FATS

FDI and (outward) FATS are closely related statistical domains. Their subject of interest is the same – businesses investing abroad in other business units, existing ones and/or newly founded ones. This similarity in substance is also expressed in compilation practice, as outward FDI stock and outward FATS data are often compiled with the help of the same survey. Yet, despite all these similarities, there are a number of important methodological differences between them. These differences limit the scope of comparability between the two datasets. The most important methodological differences are:

50% (FATS) rule versus 10% (FDI) rule

FATS comprise all affiliates that are foreign-controlled (where foreign investors have more than 50% of the

voting rights) while FDI statistics include all foreign interests amounting to 10% or more of the voting power. Broadly speaking, it could be said that the outward FATS population is a sub-group of the population of foreign direct investments relevant for FDI statistics.

The principle of the Ultimate Controlling Institution (UCI) versus immediate counterparty country

FATS are based on the concept of control when assigning statistical values to institutional units. According to Eurostat's FATS recommendations manual, control is defined as "the ability to determine the general policy of an enterprise by choosing appropriate directors, if necessary". Typically, equity ownership is taken as a proxy to determine control and, while cases of minority ownership are also acknowledged, the ownership of more than 50% of the voting power or of the shares (directly or indirectly) is generally taken as an indication of effective control over another institutional unit. As control and ownership chains often extend across a number of institutional units, FATS statistics according to the 'FATS Recommendations Manual' are always assigned to the Ultimate Controlling Institution (UCI), which is colloquially (although less accurately) referred to as the 'parent company'. The core FDI statistics, on the other hand, are based on the immediate counterparty country principle. FDI flows and positions are attributed to the country of the immediate investor or recipient of the investment, even if the capital may be passing through to a third country.

Context

The EU is one of the world's biggest investors and foreign affiliates of European companies play a very important role in the global economy. Therefore, outward Foreign Affiliates Statistics (FATS), which can be defined as statistics describing the activity of foreign affiliates abroad controlled by the compiling economy, are increasingly relevant to the formulation of the EU's economic policies as they provide information on the role that European capital plays in the world's economy, especially in terms of sales and employment.

Reporting of outward FATS data in Europe still takes place on a voluntary basis only, and for most countries the variables covered are turnover and number of people employed. For 2004, which is the most recent year for which figures are available, seven Member States provided data.

In 1994, the United Nations Statistical Commission established a task force to develop a 'Manual on statistics of international trade in services' (MSITS) that would provide guidelines for definitions, classification and coverage for statistics in this area. It also provides guidance and assistance to countries in the implementation of the recommendations contained in the manual, with particular emphasis on the compilation of statistics on foreign affiliates trade in services. The manual was revised in 2010 in order to incorporate important changes in related international standards (BPM6, BD4). MSITS 2010 is available [online](#). The task force comprises Eurostat, the International Monetary Fund (IMF), the Organisation for Economic Co-operation and Development (OECD), the United Nations Statistical Division (UNSD), the United Nations Conference on Trade and Development (UNCTAD), and the World Trade Organization (WTO), with the OECD as chair and secretariat.

Foreign-controlled enterprises

Statistics on the structure and activity of [foreign affiliates \(FATS\)](#) provide information that can be used to assess the impact of foreign-controlled [enterprises](#) on the economy of the [European Union \(EU\)](#) . The data may also be used to monitor the effectiveness of the [internal market](#) and the gradual integration of economies within the context of globalisation.

Main findings

- In general, foreign-controlled enterprises are few in number, but due to their larger than average [size](#) they have a significant economic impact.
- In all countries participating, foreign-controlled enterprises accounted on average for less than 1% of the total enterprise population within the [non-financial business economy](#) in 2006, but usually generated more than 15% of [value added](#) and contributed more than 10% of total [employment](#) .
- When ranking countries according to the contribution of foreign-controlled enterprises, the highest shares were registered in Hungary, Slovakia and Estonia, where foreign-controlled enterprises accounted for about 40-45% of the value added that was generated in the non-financial business economy.
- The activity (at the [NACE Rev. 1.1](#) section level) where foreign-controlled enterprises generated their highest proportion of total value added was the [manufacturing sector](#) , while hotels and restaurants and the construction sector reported the lowest shares. The mining and quarrying sector recorded one of the lowest shares in terms of value added but one of the highest in terms of employment, which in part reflected the exclusion of confidential figures for Romania from the EU average for value added.
- In 2006 foreign affiliates of enterprises originating from Belgium, the Czech Republic, Germany, Greece, Italy, Latvia, Austria, Portugal, Slovakia, Finland and Sweden employed almost 8.2 million people and generated a combined [turnover](#) (excluding data for Sweden) of about EUR 2300 billion.

Inward FATS

A foreign affiliate as defined in [inward FATS](#) statistics is an enterprise resident in a country which is under the control of an institutional unit not resident in the same country. Control is determined according to the concept of the 'ultimate controlling institutional unit' (UCI). The UCI is the institutional unit, proceeding up a foreign affiliate's chain of control, which is not controlled by another institutional unit. Note that commercial presence in the territory of another country is only one of the modes of delivery of economic activities abroad. Data on inward FATS has been collected on a voluntary basis since reference year 1996. Currently, some 21 countries participate in this data collection exercise.

Outward FATS

[Outward FATS](#) are statistics describing the activity of foreign affiliates abroad controlled by UCIs located in the declaring country. In total, 13 countries provide these data on a voluntary basis, for some the first reference year dates back to 1995.

Legislative developments

[Regulation 716/2007](#) of 20 June 2007 on Community statistics on the structure and activity of foreign affiliates ('FATS Regulation') foresees the availability, at EU level, of annual data on foreign affiliates from [reference year](#) 2007 onwards - covering all statistics on foreign affiliates - in other words, both inward and outward FATS.

Methodological background

The FATS recommendations manual provides the definitions and guidelines for national compilers and ensures meaningful and harmonised statistics at an EU level. Further information on methodology is available in the SDMX metadata for inward FATS and for outward FATS.

Forging, metal coating and mechanical engineering statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). The present article covers forging, metal coating and mechanical engineering, which is part of the [metals and metal products](#) sector. The activities covered in this article correspond to two different [NACE Rev 1.1](#) groups, which are:

- forging, pressing, stamping and roll forming of metal (which corresponds to NACE Group 28.4);
- the treatment and coating of metal and general mechanical engineering, such as turning, milling, welding or planing (NACE Group 28.5).

Note that there are no external trade statistics for forging, pressing, stamping and roll forming metal services (CPA Group 28.4) or for treatment and coating of metal services and general mechanical engineering services (CPA Group 28.5).

	Enterprises (thousand)	Turnover (EUR million)	Value added (EUR million)	Persons employed (thousand)	Share in total (%)	
					Value added	Persons employed

Table 3: Forging, pressing, stamping and roll forming of metal; powder metallurgy; treatment and coating of metals; general mechanical engineering (NACE Groups 28.4 and 28.5). Expenditure, productivity and profitability, EU-27, 2006

Among the activities presented in the seven subsectors of the metals and metal products sector, the EU-27's forging, metal coating and mechanical engineering sector (NACE Groups 28.4 and 28.5) was the largest in terms of enterprise numbers, persons employed and value added. The activities grouped within forging, metal coating and mechanical engineering were the principal activities of an estimated 158.0 thousand enterprises throughout the EU-27, providing employment for 1.4 million persons, about one in every four (28.2%) of the metals and metal products (NACE Subsection DJ) workforce. The EU-27's forging, metal coating and mechanical engineering sector generated EUR 60.2 billion of added value in 2006, about one quarter (24.6%) of the total value added for metals and metal products manufacturing. About three quarters (72.2%) of the EU-27's value added in the forging, metal coating and mechanical engineering sector in 2006 came from the treatment and coating of metal and general mechanical engineering (NACE Group 28.5) subsector, the remaining share coming from the forging, pressing, stamping and roll forming of metal (NACE Group 28.4) subsector.

Germany made the largest contribution (23.7%) to the value added created by the forging, metal coating and mechanical engineering sector across the EU-27 in 2006. It was only a little more than the contribution from Italy (22.1%), the most specialised Member State in forging, metal coating and mechanical engineering, where these activities contributed 2.1% of non-financial business economy value added in 2006, which was almost double the EU-27 average.

The development of the EU-27 production indices for the two NACE groups that make up forging, metal coating and mechanical engineering were very similar in the ten years through until 2007. They were also similar to the developments observed for metals and metal products as a whole until 2003, after which the rate of output growth was much faster for forging, metal coating and mechanical engineering. Over the period between 1997 and 2007, the average rate of growth in the output of forging, pressing, stamping and roll forming of metal was 4.2% per year for the EU-27, while the corresponding rate for the treatment and coating of metal and general mechanical engineering was 4.4%.

Expenditure and productivity

One quarter (24.6%) of the tangible investment made in the EU-27's metals and metal products manufacturing sector in 2006 was made in the forging, metal coating and mechanical engineering sector. In comparison with value added generated, the tangible investment of this sector (EUR 8.2 billion) corresponded to an investment rate of 13.6%, identical to that recorded for metals and metal products manufacturing as a whole.

Although average [personnel costs](#) of EUR 31.1 thousand per employee in the EU-27's forging, metal coating and mechanical engineering sector were a little below the average for metals and metal products manufacturing in 2006, the proportion of operating expenditure accounted for by personnel costs was much higher (27.9% compared with 19.2%). This was the highest share among the activities covered in the seven subsectors of the metals and metal products sector, reflecting the industrial service nature of the sector.

The apparent [labour productivity](#) of those employed across the EU-27 in the forging, metal coating and mechanical engineering sector was EUR 42.1 thousand per person employed in 2006, which covered average personnel costs by 135.0%. This [wage-adjusted labour productivity ratio](#) was beneath the average for the whole of metals and metal products manufacturing (149.3%), a characteristic that was noted in all Member States for which data is available⁴³, with the exception of Ireland where it was slightly higher.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#), including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics \(STS\)](#).

Context

The metals and metal products manufacturing sector is part of a diverse and interwoven economic network that incorporates upstream sectors and large downstream segments of manufacturing such as the transport equipment manufacturing and construction sectors. The challenges faced by the EU's metals and metal products manufacturing sector therefore have direct and indirect consequences on many other parts of the economy. Looking ahead, a Communication ([COM\(2008\) 108](#)) from the [European Commission](#) to the [Council](#) and the [European Parliament](#) on the competitiveness of the metals industries was adopted in February 2008, and highlighted the challenges to be faced.

The EU-27 is largely dependent on imports of ore and concentrates for steel, ferro-alloys and non-ferrous metals production; it produces only 1.7% of the world's nickel, 2% of its iron ore and 5% of its copper ([SEC\(2007\) 771](#)). Access to minerals and secondary raw materials at competitive prices is important, especially given the exhaustion of certain deposits in the EU-27 over time or their absence, and supply constraints that have been exacerbated by the strong growth in international demand from emerging economies such as China and India. This concern was part of a raw materials initiative of the European Commission ([COM\(2008\) 699](#))

Parts of the metals and metal products manufacturing sector are highly [energy-intensive](#). Energy costs for the EU-27's metals and metal products manufacturing sector accounted for 4.4% of purchases of goods and services in 2006, which was the third joint highest proportion among the industrial structural business statistics sectors, albeit well behind non-energy mining and quarrying (10.1%) and other nonmetallic mineral products (9.5%). Within this sector, however, energy costs in the casting of metals subsector accounted for 7.2% of purchases of goods and services in 2006 and in the first processing of ferrous metals as much as 7.9%. This level of energy consumption has important implications for energy and environmental (particularly climate change) policy.

The metals and metal products manufacturing sector is covered by a Directive on [integrated pollution prevention and control \(IPPC\)](#) and [REACH](#). A proposal from the European Commission on the review of EU [Emissions trading system \(ETS\)](#) adopted in January 2008 ([COM\(2008\) 30](#)) foresees the inclusion of non-ferrous metals from 2013 onwards, along with some transitional measures to avoid 'carbon leakage'.

Notes

Fruit, vegetable, oil and grain processing statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). The present article covers four of the smaller food processing activities, which are part of the [food, beverages and tobacco](#) sector. These four activities are:

- fruit and vegetables, corresponding to [NACE Rev 1.1](#) Group 15.3;
- vegetable and animal oils and fats, corresponding to NACE Group 15.4;
- grain mill and starch products, corresponding to NACE Group 15.6;
- prepared animal feed, corresponding to NACE Group 15.7.

It should be noted that this article excludes the agricultural activities of growing, farming, rearing and hunting and also fishing (NACE Divisions 01 and 05). A number of products, such as olive oil, are also sold directly by [agricultural holdings](#). As such, their weight is likely to be under-reported in this article, as part of their production is recorded as an agricultural activity.

Source: Eurostat (SBS)

Table 3: Fruit, vegetable, oil and grain products (NACE Groups 15.3, 15.4, 15.6 and 15.7). Expenditure and productivity, EU-27, 2006

Main statistical findings

Processing and preserving of fruit and vegetables (NACE Group 15.3)

There were an estimated 10.0 thousand enterprises across the EU-27 whose main activity was the processing and preserving of fruit and vegetables, employing 280.6 thousand persons. These enterprises generated EUR 11.4 billion of value added in 2006, representing 5.8% of the total value added generated by food, beverages and tobacco manufacturing enterprises. In terms of the relative contribution of the processing and preserving of fruit and vegetables sector to total value added in the non-financial business economy, Poland was by far the most specialised Member State⁴⁴, followed by Greece and Hungary.

The EU-27 production index for processed and preserved fruit and vegetables grew relatively strongly and steadily in the period between 2000 and 2007 (rising, on average, by 3.4% per year). Growth was particularly strong in Poland (10.8% per year).

The apparent labour productivity of those working in the processing and preserving of fruit and vegetables sector in 2006 was EUR 40.6 thousand per person employed, only very slightly below the average recorded across the whole of the EU-27's food, beverages and tobacco manufacturing sector. The operating cost structure of this subsector was very similar to that for the whole of food, beverages and tobacco manufacturing (as personnel costs accounted for 13.8% of total operating costs in both cases). Average personnel costs of EUR 24.9 thousand per employee, also meant that wage costs within the EU-27's processing and preserving of fruit and vegetables sector closely resembled those for the whole of the food, beverages and tobacco manufacturing. Hence, there was no surprise to find that there was also little difference in wage-adjusted labour productivity ratios (162.9% compared with an average of 163.0%).

Vegetable and animal oils and fats (NACE Group 15.4)

The vegetable and animal oils and fats manufacturing sector was the smallest of the NACE groups within food, beverages and tobacco manufacturing (NACE Subsection DA) in 2006, both in terms of value added and

⁴⁴Bulgaria, Cyprus, Poland and Romania, 2005; Luxembourg, Malta, the Netherlands and Slovakia, not available.

employment. There were 9.1 thousand enterprises across the EU-27 that manufactured vegetable and animal oils and fats as their principal activity. These enterprises together employed 71.5 thousand persons (equivalent to 1.5% of the food, beverages and tobacco manufacturing workforce) and generated EUR 4.0 billion of added value (2.0% of the sectoral total). A little more than half (53.2%) of the value added generated by vegetable and animal oils and fats manufacturing across the EU-27, came from production in Germany, Spain and Italy. However, among the Member States for which data are available⁴⁵, Greece was by far the most specialised country in the production of vegetable and animal oils and fats, as this subsector contributed over five times as much to non-financial business economy value added as the EU-27 average. Hungary was also relatively specialised (about three and a half times the average).

There were strong fluctuations in the [production index](#) for vegetable and animal oils and fats across the EU-27 in the ten years through until 2007. A relatively steep but unsteady decline through until 2004 was followed by a strong upsurge in growth thereafter. Over the period as a whole, EU-27 [output](#) declined on average by 0.3% per year.

Average personnel costs of EUR 32.9 thousand per employee across the EU-27's vegetable and animal oils and fats manufacturing sector in 2006 were above the average recorded for the whole of the food, beverages and tobacco manufacturing sector. Personnel costs accounted for a particularly low proportion of total operating expenditure, some 5.3%, compared with an average share of 13.8% across food, beverages and tobacco manufacturing, suggesting a small, but relatively well-paid workforce.

The apparent labour productivity of the EU-27's vegetable and animal oils and fats manufacturing sector was EUR 55.8 thousand per person employed in 2006, which was almost a third (33.4%) more than the average for food, beverages and tobacco manufacturing as a whole. When adjusted to take account of relatively high average personnel costs, much of this differential was eroded, with the wage adjusted labour productivity ratio for the vegetable and animal oils and fats manufacturing sector at 166.0% (compared with 163.0% for the whole of the food, beverages and tobacco manufacturing sector).

Grain mill and starch products (NACE Group 15.6)

The manufacture of grain mill and starch products was the principal activity of an estimated 8.0 thousand enterprises across the EU-27 in 2006. These enterprises employed 121.2 thousand people and generated EUR 6.6 billion of added value, the equivalent of 2.6% of the employment and 3.4% of the value added within the food, beverages and tobacco manufacturing sector. Almost two thirds (67.3%) of the value added generated by grain mill and starch products manufacturing came from activities in the United Kingdom, France, Germany and Italy. Nevertheless, it was Hungary and Bulgaria (2005) that were the countries within the EU that were most specialised in the manufacture of grain mill and starch products; the contribution of these activities to their respective non-financial business economy value added was about two and a half times the EU-27 average.

There was an upward trend in the output of grain mill and starch products during the period between 1997 and 2007, with average growth of 0.8% per year. However, most of this growth was founded on a relatively steep increase in output in 2000 and a more concerted period of expansion since 2004. Among the principal producers within the EU, there were contrasting trends; output levels in the United Kingdom remained little changed from year-to-year, while growth averaged 1.6% per year in both Germany (mainly due to an expansion after 2003) and France (where the evolution of output closely followed the trend seen for the whole of the EU-27).

The share of personnel costs in the total operating expenditure of the EU-27's grain mill and starch products manufacturing sector was lower than the average for the food, beverages and tobacco manufacturing sector (11.4% compared with 13.8% in 2006), despite average personnel costs of EUR 30.5 thousand per employee being almost a fifth higher than the sectoral average.

The apparent labour productivity of those working in the EU-27's grain mill and starch products manufacturing sector was EUR 54.8 thousand per person employed in 2006, about one third higher than the average across the whole of the food, beverages and tobacco manufacturing sector. The resultant wage adjusted labour productivity ratio of 179.6% for the grain mill and starch products manufacturing sector in 2006, was the highest among the EU-27's food manufacturing activities.

⁴⁵Bulgaria, Cyprus, Poland and Romania, 2005; Estonia, France, Latvia, Luxembourg, Malta and the Netherlands, not available.

Prepared animal feed (NACE Group 15.7)

The manufacture of animal feed was the principal activity of 5.2 thousand enterprises throughout the EU-27 in 2006. These enterprises employed an estimated 130.0 thousand people in 2006 and generated an estimated EUR 7.0 billion of value added in 2005 (the equivalent of 3.5% of the total value added generated across food, beverages and tobacco manufacturing). Animal feed manufacturing in France accounted for one fifth (20.1%) of all of the value added generated across the EU-27 in 2005, the largest contribution among the Member States, ahead of the United Kingdom (14.2%) and Germany (14.1%). Nevertheless, Poland, Lithuania and Hungary were the Member States that were most specialised in the manufacture of animal feed, as these activities contributed about two and a half times more than the EU-27 average to the total value added generated within their respective non-financial business economies.

During the ten years through until 2007, there was almost no change in the level of output of animal feed in the EU-27 (growth average 0.4% per year). Among the Member States, growth was particularly strong in Poland (averaging 11.1% per year), which was in marked contrast to a declining index of production in France (particularly from 2001 onwards).

The apparent labour productivity of the EU-27's animal feed sector was EUR 55.0 thousand per person employed in 2005, about one third more than the corresponding average for the food, beverages and tobacco manufacturing sector. However, with average personnel costs in animal feed manufacturing also higher than the sectoral average at EUR 33.3 thousand per employee in 2006, these two relatively high ratios cancelled each other out, such that the resulting wage adjusted labour productivity ratio stood at 165.0% in 2005, almost identical to the average for the food, beverages and tobacco manufacturing sector. This relative parity in wage adjusted labour productivity ratios at the level of the EU-27 was also observed in France, the leading producer among the Member States.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics \(STS\)](#) .

Context

The food, beverages and tobacco manufacturing sector in the EU is comprised of a relatively small number of enterprises that have a considerable global market presence, which operate alongside a high number of relatively small enterprises that serve more local, regional and national markets.

As these enterprises not only produce goods for final consumption but also intermediate products for other manufacturing activities, they are affected by a broad scope of legislation. The main legislative areas affecting the EU's food, beverages and tobacco manufacturing sector, however, tend to involve international trade agreements, or food and feed legislation. As a majority of the EU's agricultural production is processed by the [food, beverages and tobacco manufacturing sector](#) , developments in [Common agricultural policy](#) and associated Common Market Organisations can have important implications for costs and processes in the food chain. Regarding food legislation, the [European Parliament](#) and the [Council](#) proposed an update of the laws regarding the provision of information to consumers([COM\(2008\) 40 final](#)) in 2008, in order to clarify and consolidate existing regulations. In part, this proposal was built on a 2007 White Paper covering a Strategy for Europe on Nutrition, Overweight and Obesity ([COM\(2007\) 279 final](#)), which stressed the need for consumers to have access to clear, consistent and evidence-based nutritional information.

For the varied food processing activities covered in this article, there are a number of relevant policy developments. Regarding prepared animal feed, the European Commission recently proposed a simplification to the rules regarding the placing on the market and use of feed in March 2008 ([COM\(2008\) 124 final](#)), in an attempt to increase the competitiveness of the EU's feed and farming sectors, whilst maintaining a high level of animal health protection. Regarding fruit and vegetables, the reform of the Common market organisation

(CMO) for the fruit and vegetables sector was adopted in [two stages](#) at the end of 2007; among other objectives, it aims to encourage a higher level of consumption. Natural fats and vegetable oils are used not only in food and feed (for which there are regulations on levels of erucic acid) but also in a number of other manufactured products (such as soaps, paints, cosmetics and pharmaceuticals). The push to use more oils and fats as a biofuel has, therefore, had important implications for many manufacturing sectors.

Notes

Fuel processing and chemicals production statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article introduces a [set of statistical articles](#) which analyse the structure, development and characteristics of the economic activities in the fuel processing and chemicals production sectors in the [European Union \(EU\)](#). These sectors correspond to [NACE Rev 1.1](#) Subsections DF and DG, and their activities are treated in more depth in four further articles:

- [Fuel processing activities](#), corresponding to NACE Subsection DF, which covers the processing of energy producing minerals such as coal, crude oil and nuclear fuels, and the manufacture of coke oven products and refined petroleum products;

There are also three articles covering the manufacture of chemicals, including man-made fibres, which together comprise NACE Subsection DG:

- [Petrochemicals and basic chemical production](#) ;
- [Pesticide, paint, soap and fibre production](#) ;
- [Pharmaceuticals production](#) .

The mixture of volatile liquid hydrocarbons (such as naphtha and kerosene) that comprises crude oil is one of the key raw materials for chemicals manufacturing, along with natural gas. A number of enterprises that are involved in fuel processing, and particularly the manufacture of refined petroleum products, are also involved in the manufacture of chemicals: for this reason these two types of manufacturing have been put together in this article. Indeed, Royal Dutch/Shell and Total were amongst both the largest global fuel processors and chemical enterprises in the world.

		World ranking	Chemical sales (EUR million) (1)	Chemical sales as a proportion of total sales (%)
BASF	DE	1	47 455	82
Royal Dutch / Shell	UK / NL	3	33 499	13
Ineos Group	UK	4	27 498	100
Total	FR	9	21 004	13
Bayer	DE	11	16 522	51
Basell	NL	13	12 123	97
Evonik	DE	15	11 654	81
Akzo Nobel	NL	17	10 222	100
Air Liquide	FR	18	10 004	85
Linde	DE	22	9 213	75

(1) Data in US dollars converted to EUR, using the average exchange rate of EUR 1 = 1.3705 USD for 2007.

(1) Netherlands and Poland, 2005; Portugal, 2005 except for enterprises: unless otherwise stated, values refer to EUR million; number of enterprises and number of persons employed are given in thousands; average personnel costs and apparent labour productivity are given in EUR thousand per person; wage adjusted labour productivity, gross operating rate and investment are ratios expressed as percentages.

Source: Eurostat (SBS)

Table 7: Manufacture of chemicals and chemical products (NACE Division 24). Main indicators, 2006 (1)

As many as ten of the world's twenty-five largest chemical manufacturing [enterprise](#) groups, in terms of chemical sales, were from the [EU-27](#). This helps explain how [EU-27 chemical manufacturers](#) accounted for about 30% of world sales in 2007.

Fuel processing and the manufacture of chemicals (NACE Subsections DF and DG) were the main activities of 34.9 thousand enterprises across the EU-27 in 2006. These enterprises had a turnover of EUR 1098.7 billion in 2005, from which EUR 217.0 billion of [value added](#) was generated, which was the equivalent of 4.0% of the value added generated across the [non-financial business economy](#) in 2005. These enterprises employed just over 2 million persons in 2006, the equivalent of 1.6% of the total workforce of the EU-27's non-financial business economy. Almost all of these workers were paid [employees](#) (98.8%, 2005), indicating a very low incidence of self-employed persons in this sector.

The manufacture of chemicals (NACE Subsection DG) generated an estimated EUR 190.0 billion of value added in 2006, over four fifths of sectoral value added. Within chemicals manufacturing, the manufacture of pharmaceuticals subsector (NACE Group 24.4) was the largest in terms of the EUR 70.5 billion of value added generated, followed by the manufacture of basic chemicals (NACE Group 24.1) which generated a further EUR 65.0 billion of value added. The manufacture of miscellaneous chemical products (NACE Groups 24.2, 24.3, 24.5, 24.6 and 24.7) was the smallest of the three chemicals subsectors in terms of value added (EUR 51.4 billion); more details concerning the composition of this varied range of activities is provided in the article on Pesticide, paint, soap and fibre production statistics. However, this subsector was the largest in terms of its workforce; the 708.0 thousand persons employed in the manufacture of miscellaneous chemical products accounted for a little over one third of all those working across the EU-27 in the fuel processing and chemicals manufacturing sector. The three chemicals subsectors dwarfed the fuel processing subsector in terms of enterprise numbers, value added and persons employed. However, fuel processing enterprises generated more turnover (40% of the sectoral total in 2005) than any of the three chemicals subsectors. Although fuel processing enterprises represented only 3.7% of all enterprises within the sector in 2006, they employed 8.1% of its workforce and generated a little more than double this proportion (17.8%, 2005) in terms of value added.

The fuel processing and chemicals manufacturing sector in Germany was by far the largest among the Member States, generating a little over one fifth (22.7%) of total value added across the EU-27 in 2006 and accounting for a similar share of employment. Ireland was the Member State most specialised in fuel processing and the manufacture of chemicals in value added terms, as the value added generated in this sector accounted for 12.8% of the value added of its non-financial business economy in 2006. Other Member States in which there was also strong specialisation in these activities included Belgium, Poland (2005) and Hungary.

There was a high share of regional employment in the fuel processing and chemicals manufacturing sector

in Köln (Germany), where about one in every eight (12.4%) persons employed in the non-financial business economy were engaged in these activities. Although this was by far the strongest regional concentration of fuel processing and chemicals manufacturing workers, there were a number of other regions across Germany as well as France, as well as other hotspots including Antwerp in Belgium and Cheshire in the United Kingdom, where there was also high employment specialisation.

The [production index](#) for chemicals manufacturing across the EU-27 rose continuously and strongly (an average of 3.4% per year) during the period between 1997 and 2007, far outpacing the growth recorded across industry (NACE Sections C to E), particularly when industrial [output](#) as a whole went through a period of stagnation between 2001 and 2003. In contrast to chemicals manufacturing, the output of fuel processing across the EU-27 was relatively unchanged during much of the period considered. There was relatively strong output growth in 2004, however, after which output levels were maintained; this growth spurt was enough to raise the average rate of output growth to 0.5% per year for the ten years through to 2007.

In addition to output growth, there were some strong price rises during the same period. The EU-27 price index for fuel processing almost doubled between 1997 and 2007 (an average rise of 6.9% per year), while that for chemicals manufacturing rose more moderately (an average increase of 1.9% per year). For both activities, there were strong rises in 2000 and from 2004 onwards.

Although output and prices for both fuel processing and chemicals manufacturing increased over the period between 1997 and 2007, there was a different development in terms of [employment](#). EU-27 employment within chemicals manufacturing enterprises and fuel processing enterprises declined continuously and relatively steadily in the period between 1997 and 2006, before levelling off in 2007. The rate of loss of employment within fuel processing (an annual average -2.7% per year) during the ten year period was almost twice the rate recorded in chemicals manufacturing (an average -1.4% per year), both being faster than the average rate of employment losses across industry as a whole (-1.2% per year).

Fuel processing and the manufacture of chemicals within the EU-27 was not only concentrated in the larger Member States but it was also focused within [large enterprises](#) (those employing 250 or more persons); they accounted for a little over three quarters (77.7%) of the total value added generated in 2005 and two thirds of employment within the sector. The shares of value added and employment accounted for by [SMEs](#) (employing less than 250 persons) within this sector were both the third lowest of the structural business statistics sectors (only higher than for the network supply of electricity, gas and steam, and for transport equipment manufacturing).

Employment characteristics

The gender breakdown of the fuel processing and chemicals manufacturing workforce was almost identical to that across the non-financial business economy of the EU-27 in 2007; as a little under two thirds (65.0%) of the sectoral workforce were male. However, there was a much clearer distinction between the two regarding the proportion of workers in part-time employment. Only about one in every 15 (6.8%) workers within the fuel processing and chemicals manufacturing sector worked on a part-time basis in 2007, about half the share (14.3%) across the EU-27's non-financial business economy. There was also a notable difference in age profile, as the proportion of young workers under the age of 30 was much smaller in the fuel processing and chemicals manufacturing sector (17.9%) than was the case across the non-financial business economy (24.3%).

This characteristic of a relatively low presence of young workers in the sectoral workforce was common among all of the Member States for which data are available⁴⁶, but notably so in Romania, Sweden, Denmark and the Netherlands where the share of this age group was between 12 and 17 percentage points lower than their average share across their respective non-financial business economies in 2007.

There were stark contrasts in the gender breakdown of the fuel processing and chemicals manufacturing workforce among Member States. In France, Latvia, Denmark and Cyprus, the share of women in the sectoral workforce was high relative to the breakdown across their respective non-financial business economies, and in the case of Latvia and Cyprus there were almost as many women as men employed in this sector.

⁴⁶Estonia, Cyprus, Latvia, Lithuania, Luxembourg and Malta, not available.

Expenditure, productivity and profitability

There was **tangible investment** to the value of EUR 33.4 billion across the EU-27

's fuel processing and chemicals manufacturing sector in 2006. This level of investment corresponded to 3.2% of investment within the non-financial business economy, a slightly lower proportion than the relative contribution of the sector's value added. In this respect, the investment rate of the fuel processing and chemicals manufacturing sector was relatively low (14.4%) in comparison to the rate across the EU-27

's non-financial business economy (18.0%). This lower rate of sectoral investment was common to a majority of Member States (particularly Greece, Sweden, Belgium and Estonia) although there were others (including the Czech Republic, Germany, Italy Finland and, in particular, Luxembourg) where it was somewhat higher.

Average **personnel costs** across the fuel processing and chemicals manufacturing sector (EUR 54.1 thousand per employee) in 2005 approached double the average across the EU-27

's non-financial business economy (EUR 28.9 thousand per employee), and were higher than those of any of the other sectoral aggregates of the structural business statistics sectors. Despite the fact that average personnel costs in the fuel processing subsector were particularly high (an average EUR 63.7 thousand per employee), they only accounted for 3.0% of operating expenditure in 2005, underlining the perception of a highly capital-intensive activity with a relatively small but well remunerated workforce. To a lesser extent, this characterisation also appears to apply to the EU-27's chemicals manufacturing activities; average personnel costs were also high (an average EUR 53.2 thousand per employee) in 2005 but accounted for a slightly lower proportion (15.4% in 2006) of operating expenditure than the average (16.1%) across the non-financial business economy.

The value added generated by each member of the EU-27

's fuel processing and chemicals manufacturing workforce was EUR 105.5 thousand in 2005, more than double the non-financial business economy average, and the third highest level in the structural business statistics sectors (only less than mining and quarrying, and the network supply of electricity, gas and steam). The apparent **labour productivity** of the fuel processing subsector was particularly high (an average EUR 227.2 thousand per person employed).

Even when taking into account the relatively high average personnel costs, the resulting wage adjusted labour productivity of the fuel processing and chemicals manufacturing sector remained relatively high (194.9% in 2005 compared with 146.5% for the non-financial business economy in the same year). This characteristic was common among all the Member States for which data are available⁴⁷ but particularly in Poland (579.7% compared with 210.7% in 2005), the only exception being in Luxembourg where the wage adjusted labour productivity ratio of the sector was much lower than the ratio across its non-financial business economy.

The gross operating rate of the EU-27's fuel processing and chemicals manufacturing sector was 9.7% in 2005, moderately less than the non-financial business economy average (10.0%). The gross operating rate of the chemicals manufacturing activity (13.1% in 2006) was almost double that, however, of the fuel processing subsector (6.3% in 2005), with the rate for pharmaceuticals subsector (18.7%) particularly high.

External trade

Almost two thirds (65.1%) of the total **exports** by EU-27 Member States in coke, refined petroleum products, nuclear fuel, chemicals, chemical products and man-made fibres (CPA Subsections DF and DG, hereafter referred to as processed fuels and chemicals) was to other Member States, a slightly smaller share than for industrial goods (CPA Sections C to E) as a whole. The remaining one third of exports to non-member countries (**extra-EU-27** trade) generated a surplus of EUR 57.8 billion in 2007, the third highest surplus in the industrial structural business statistics sectors.

The **trade surplus** in 2007 was slightly less than that in 2006, although it was still more than one quarter (27.4%) higher than the surplus five years earlier (2002). The general widening of the trade surplus over this period reflected the faster rate of export value growth than **import** value growth. The value of processed fuels

⁴⁷ Austria, Poland, Romania and Slovenia, 2005; Bulgaria, Denmark, Ireland, Cyprus, Latvia, Lithuania, Malta, the Netherlands, Portugal and Slovakia, not available.

and chemicals exports from the EU-27 rose continuously between 2002 and 2007, to a value of EUR 235.1 billion, which represented about one fifth (20.2%) of the total value of EU-27

industrial exports. There was a continual increase in the value of imports over the same period, to reach a level of EUR 177.3 billion by 2007.

Within this broad range of products, there was a trade deficit of EUR 1.3 billion in coke, refined petroleum products and nuclear fuel. The bulk of the overall trade surplus recorded for 2007 came from the EUR 34.7 billion surplus recorded for pharmaceutical products (CPA Group 24.4) and the surplus of EUR 21.9 billion recorded for the group of miscellaneous chemical products (CPA Groups 24.2, 24.3, 24.5, 24.6 and 24.7), which covers pesticides and agro-chemicals, paints and varnishes, and soaps and detergents among many other products.

Germany was the largest exporter of processed fuels and chemicals as a whole; the value of German exports (intra- and extra-EU) was EUR 126.9 billion in 2007, a little under one fifth (18.8%) of all trade by the EU Member States. Belgium was the next largest exporter of these products and had a slightly higher trade surplus (EUR 18.8 billion) than Germany (17.8 billion). However, Ireland had the highest trade surplus (EUR 32.9 billion) in these products. Exports of processed fuels and chemicals as a whole accounted for a little over one half (51.8%) of all industrial exports from Ireland in 2007, by far the highest proportion among the Member States. By far the largest trade deficits in these products were recorded in Spain (EUR 12.2 billion) and Poland (EUR 9.4 billion).

A little more than one third (37.4%) of imports of coke, refined petroleum products and nuclear fuel came from Russia in 2007. Almost one half of the imports of chemicals, chemical products and man-made fibres came from the United States (28.7%) and Switzerland (20.1%). The United States and Switzerland were also the main destination for EU-27 exports of both coke, refined petroleum products and nuclear fuel on the one hand and chemicals, chemical products and man-made fibres on the other.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics \(STS\)](#) , the [COMEXT](#) database for external trade, and [Chemical & Engineering News](#) .

Context

Enterprises in the fuel processing and chemicals sector operate within a highly regulated framework that extends from the supply of the raw materials, through their processing to the treatment of waste. The Registration, Evaluation and Authorisation of Chemical substances (the so-called [REACH](#) Regulation) came into force on 1 July 2007, with the main aims of improving the protection of human health and the environment from risks posed by chemicals. The first list of 15 chemicals to undergo scrutiny was published by the [European Chemicals Agency](#) in October 2008. A new [European Parliament](#) and [Council Regulation](#) on the classification, labelling and packaging of chemical substances and mixtures (CLP) was adopted in December 2008, in order to align the labelling and description of hazards around the world. The CLP Regulation entered into force on 20 January 2009, with the deadline for substance classification according to the new rules by 1 December 2010 and for mixtures by 1 June 2015.

The fuel processing and chemicals sector faces a number of key challenges; these are energy and raw materials supply, climate change and barriers to market entry in emerging countries. Against this background, the High Level Group on the Competitiveness of the European Chemicals Industry, which was first proposed by the [European Commission](#) in June 2007 ([COM\(2007\) 418](#)), released its final strategy report in February 2009. The strategies focus on more innovation and research (see the importance of this in the article called [Pharmaceuticals production statistics - NACE Rev. 1.1](#)), the responsible use of resources and a level playing field for sourcing energy and raw materials, and a drive to open world markets.

Notes

Fuel processing statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). The present article covers fuel processing, corresponding to [NACE Rev 1.1 Subsection DF](#), which is part of the [fuel and chemicals production](#) sector. The activities covered in this article are:

- the manufacture of coke oven products, corresponding to NACE Group 23.1;
- the manufacture of refined petroleum products, corresponding to NACE Group 23.2;
- the processing of nuclear fuels, corresponding to NACE Group 23.3.

Note that these activities essentially involve the processing of products such as coal, crude oil and ores, whose extraction is covered in the article on [energy extraction statistics](#).

	Enterprises (thousand)	Turnover (EUR million)	Value added (EUR million)	Persons employed (thousand)	Share in total (%)	
					Value added	Persons employed
Fuel processing (2)	1.3	439 831	38 515	168.4	100.0	100.0
Coke oven products (2)	0.1	2 826	559	10.0	1.5	5.9
Refined petroleum products	1.1	476 213	30 232	128.4	92.8	76.2
Processing of nuclear fuel (3)	0.1	8 679	3 232	30.0	5.8	17.8

Source: Eurostat (SBS)

Table 3: Manufacture of coke, refined petroleum products and nuclear fuel (NACE Division 23). Expenditure, productivity and profitability, EU-27, 2006

Crude oil and semi-finished petroleum feedstocks are key inputs into the fuel processing process. The net transformation output of all petroleum products from refineries across the [EU-27](#)

was 720.1 million tonnes in 2006. The three main final products of the fuel processing sector were diesel oil, which accounted for a little over one third (36.9%) of net transformation output in 2006, motor spirits (a further 21.0%) and residual fuel oils (another 15.5%). Refinery gas, liquid petroleum gas (LPG), jet fuel kerosenes and naphtha together accounted for a combined 17.2% of total net transformation output.

Structural profile

There were 1.3 thousand enterprises across the EU-27 for which fuel processing (NACE Subsection DF) was their main activity in 2006 and they employed 168.4 thousand persons, the equivalent of 8.1% of the fuel processing and chemicals manufacturing (NACE Subsections DF and DG) workforce. From a turnover of EUR 439.8 billion in 2005, the EU-27's fuel processing sector generated EUR 38.5 billion of **value added**, which represented a 17.8% share of the value added generated across fuel processing and chemicals manufacturing, double the **employment** share.

Activities concerning the refinement of petroleum products (NACE Group 23.2) were by far the largest within the fuel processing sector; they accounted for about three quarters (76.2%) of those employed in 2006 and an overwhelming majority (92.8%) of value added in 2005. A little less than one fifth (17.8%) of the sector's workforce was employed in the processing of nuclear fuel (NACE Group 23.3) and they contributed 5.8% of value added. The remainder, 5.9% of the workforce and 1.5% of value added, was recorded in the manufacture of coke oven products (NACE Group 23.1).

Among the Member States, Spain had the largest fuel processing sector in terms of value added generated (EUR 7.2 billion in 2006), accounting for a little less than one fifth (18.4% in 2005) of the EU-27 total. Behind Spain, the next largest Member States in these terms were Poland (13.5% of the EU-27 total) and Germany (12.9%). Indeed, the EUR 5.2 billion of value added that the fuel processing sector generated in Poland in 2005 represented 4.3% of the total value added of its **non-financial business economy**, about six times the average contribution across the EU-27. There was also strong specialisation in Hungary, the relative value added contribution being about four times the EU-27 average.

The level of the **production index** for fuel processing was almost the same in 2003 as in 1997, despite alternating growth and decline in **output** in the intervening years. However, in 2004 the output of fuel processing rose relatively strongly and output was then maintained at this higher level through to 2007. This pattern of output development largely reflected the production index for refined petroleum products, for which average growth over the ten year period through until 2007 was 0.8% per year. During the same period, the production index of coke oven products appeared to follow a four year cycle of rising production and then declines, with growth in 2006 and 2007 confirming an overall upward development in output (at an average growth rate of 2.0% per year).

Expenditure and productivity

Tangible investment in the EU-27

's fuel processing sector was EUR 6.4 billion in 2006. This corresponded to about one fifth (19.2%) of all tangible investment across fuel processing and chemicals manufacturing, a slightly higher share than this sector's share of value added.

A very high share (97.0% in 2005) of operating expenditure in the EU-27's fuel processing sector was committed to purchases of goods and services (including, in particular, the purchase of energy products to be processed); this was the highest share of expenditure on goods and services among all NACE divisions in the non-financial business economy with data available for 2005 or 2006.

Although a relatively small share of operating expenditure went on **personnel costs** (3.0% in 2005), average personnel costs in the sector were particularly high, an average EUR 63.7 thousand per employee in 2005 for the EU-27. Within the sector, however, there were large differences in average personnel costs; those for the manufacture of coke oven products subsector were as low as EUR 20.4 thousand per employee (in 2005), while those for the manufacture of refined petroleum products subsector averaged EUR 63.5 thousand per employee

in 2006 and the nuclear fuels subsector EUR 70.5 thousand per employee in 2006. The low average costs in coke oven products manufacturing can, in large part, be attributed to average personnel costs in Poland (EUR 14.4 thousand per employee in 2005), as this Member State dominated the subsector, accounting for about two thirds (61.6%) of EU-27 value added.

The average amount of value added generated by each person employed within the EU-27's fuel processing sector was EUR 227.2 thousand in 2005, the second highest amount among industrial NACE divisions after the extraction of crude petroleum and gas (NACE Division 11). Despite relatively high average personnel costs, the wage adjusted labour productivity ratio of the sector remained high (356.6% in 2005), again the second highest of the industrial NACE divisions. Among the individual Member States, Poland recorded a wage adjusted labour productivity ratio of 1955.5% in 2005, Spain also recorded a remarkably high level for this indicator (1252.2% in 2006).

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#), including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Context

Enterprises in the fuel processing and chemicals sector operate within a highly regulated framework that extends from the supply of the raw materials, through their processing to the treatment of waste. The Registration, Evaluation and Authorisation of Chemical substances (the so-called [REACH](#) Regulation) came into force on 1 July 2007, with the main aims of improving the protection of human health and the environment from risks posed by chemicals. The first list of 15 chemicals to undergo scrutiny was published by the [European Chemicals Agency](#) in October 2008. A new [European Parliament](#) and [Council Regulation](#) on the classification, labelling and packaging of chemical substances and mixtures (CLP) was adopted in December 2008, in order to align the labelling and description of hazards around the world. The CLP Regulation entered into force on 20 January 2009, with the deadline for substance classification according to the new rules by 1 December 2010 and for mixtures by 1 June 2015.

The fuel processing and chemicals sector faces a number of key challenges; these are energy and raw materials supply, climate change and barriers to market entry in emerging countries. Against this background, the High Level Group on the Competitiveness of the European Chemicals Industry, which was first proposed by the [European Commission](#) in June 2007 ([COM\(2007\) 418](#)), released its final strategy report in February 2009. The strategies focus on more innovation and research (see the importance of this in the article called [Pharmaceuticals production statistics - NACE Rev. 1.1](#)), the responsible use of resources and a level playing field for sourcing energy and raw materials, and a drive to open world markets.

Fuel retail and service station statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), the present article covers statistics for fuel and service stations, corresponding to NACE Group 50.5, which is part of the [motor trades](#) sector. The activities covered in this article are the retail sale of automotive fuel, lubricating and cooling products for motor vehicles and motorcycles. It does not include the [wholesale trade](#) of automotive fuel.

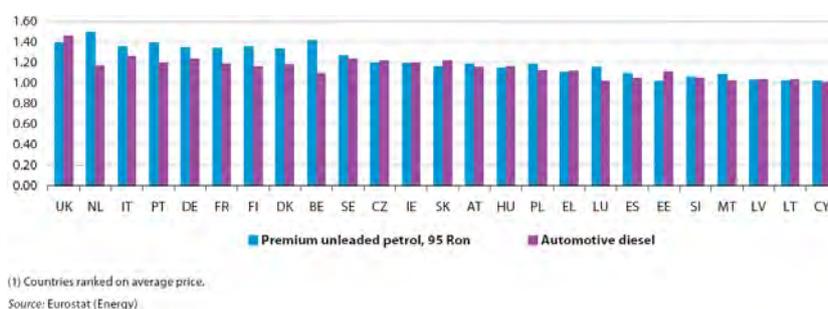

Figure 1: Retail sale of automotive fuel. At the pump prices of petroleum products, first half of 2008 (EUR/litre) (1)

Table 1: Retail sale of automotive fuel (NACE Group 50.5). Structural profile: ranking of top five Member States in terms of value added and persons employed, 2006

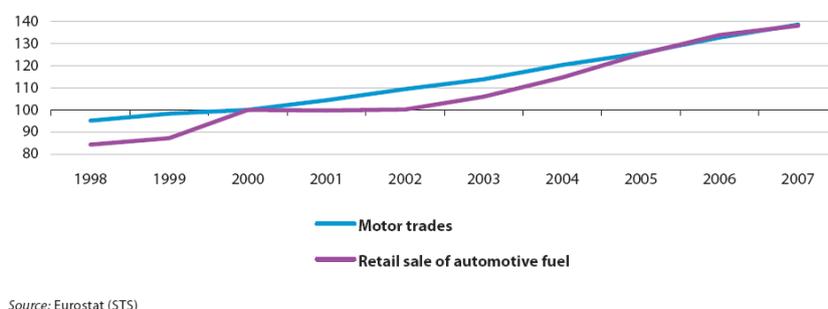

Figure 2: Retail sale of automotive fuel (NACE Group 50.5). Index of turnover, EU-27 (2000=100)

During 2007 and 2008, the retail price for automotive fuel changed greatly, reflecting the volatility in the price of crude oil. The [EU-27 harmonised index of consumer prices](#) for fuels and lubricants for personal transport equipment grew by just over 32% between January 2007 and its peak in July 2008, but by December 2008 the

index had fallen back to a level just below that at the start of 2007.

The retail (pump) price (including VAT and other taxes) was generally lower, in most Member States, for a litre of automotive diesel than for a litre of unleaded petrol, with Belgium and the Netherlands recording diesel prices more than 20% lower than petrol prices. In contrast, Estonia, Slovakia and the United Kingdom recorded diesel prices 5% or more higher than petrol prices.

One of the main energy policy targets of the EU is to increase the share of renewable energy sources in gross inland consumption . In January 2008, the European Commission proposed Directive COM(2008) 19 on renewable energy sources that included a target that renewable energy should account for 10% of transport fuel in each Member State by 2020. Biofuels are among the main renewable energy sources used for transport. The proposed increase in the use of biofuels has led, however, to concerns about its impact on food prices and deforestation, and to proposals to support the development of biofuels that are more sustainable and do not compete with food and animal feed production.

Structural profile

In 2006, there were 73.8 thousand enterprises classified to the retail sale of automotive fuel (NACE Group 50.5) in the EU-27, less than 10% of all motor trades enterprises. These enterprises generated EUR 178.0 billion of turnover , from which resulted EUR 14.0 billion of value added , 13.4% and 8.6% of the motor trades (NACE Division 50) total respectively. This sector employed half a million people, 11.8% of the motor trades workforce.

The United Kingdom recorded EUR 3.0 billion of value added in the retail sale of automotive fuel in 2006, some 21.8% of the EU-27 total. Note that the contribution of France to the EU-27 total for this sector was as low as 5.7% in terms of value added, reflecting the fact that in France (and a number of other Member States) a large proportion of fuel is sold through service stations that belong to retailers classified within retail trade (NACE Division 52) rather than the retailing of automotive fuels.

The development of the EU-27 turnover index for the retail sale of automotive fuels was not as steady as that of motor trades as a whole, particularly in the period between 1998 and 2005. The retail sale of automotive fuels grew strongly in 1999 before flattening out between 2000 and 2002, at a time of continued growth across motor trades as a whole. This was followed by four years of much stronger growth through to 2005. It should be noted that this turnover index is only provided in current prices and therefore reflects price changes. As such, changes in oil prices have to be considered when analysing this data, as the volume of automotive fuel may have fallen while sales in value terms rose (due to significant price increases).

Expenditure and productivity

Purchases of goods and services represented 96.0% of total operating expenditure for the EU-27's retail sale of automotive fuel, and correspondingly personnel costs accounted for the remaining 4.0%. This share of personnel costs was the second lowest of all NACE groups within the non-financial business economy for which 2005 or 2006 data are available, higher only than for petroleum refining.

The wage-adjusted labour productivity of the EU-27's automotive fuel retailing sector was 171.1% in 2006, practically the same as recorded for the sale of motor vehicles subsector (see Car and motorcycle trade statistics - NACE Rev. 1.1). This relatively high ratio resulted from a relatively low apparent labour productivity of EUR 27.8 thousand per person employed, and a particularly low average personnel cost of EUR 16.3 thousand per employee, which was the eighth lowest of the non-financial business economy NACE groups.

Data sources and availability

The main part of the analysis in this article is derived from structural business statistics (SBS) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics \(STS\)](#) and Eurostat energy statistics.

Context

The activities within this sector are very different in terms of the frequency of purchase of the goods and services offered. In contrast to the retail of automotive fuel, the purchase of motor vehicles is usually the result of a long-term process, the collection of information and comparison between different vehicles and different suppliers. However, retailing and repair of motor vehicles are to some extent substitutes, in that the purchase of a replacement vehicle may often be postponed, particularly in times of economic hardship.

Funds and asset management statistics - NACE Rev. 1.1

Data from January 2009. Most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), the present article covers funds and asset management statistics, which is part of the [financial and insurance](#) sector.

The activities covered by this article include legal entities organised to pool securities or other financial assets, without management, on behalf of shareholders or beneficiaries. The portfolios are customised to achieve specific investment characteristics, such as diversification, risk, rate of return and price volatility. These entities earn interest, dividends and other property income, but have little or no employment and no revenue from the sale of services.

The management of funds, as opposed to the funds themselves, is not included in this activity – see [Financial auxiliaries statistics - NACE Rev. 1.1](#).

An investment fund is a financial investment vehicle designed to spread risks by use of a portfolio, with investments spread for example across shares, bonds or property. Funds can be distinguished between open-ended funds and closed-ended ones, the latter having a fixed number of shares/units that are quoted on an exchange, and the former having an unlimited number of shares/units.

Source: European Fund and Asset Management Association, Fact Book 2008

Figure 2: Funds and similar financial entities. Total net assets of UCITS, Europe (%) (1)

The growth in net assets of investment funds is shown over more than a decade (from 1992 to 2007) for UCITS and non-UCITS funds among 25 European countries, according to the [European Fund and Asset Management Association \(EFAMA\)](#) ; data refer to the [EU-15](#) , the Czech Republic, Hungary, Poland, Romania, Slovenia, Slovakia, Turkey, Liechtenstein, Norway and Switzerland. Together the two categories of assets recorded year on year growth during the whole of this period, except in 2002. Growth averaged 14.7% per year, which could be broken down as 16.1% per year for non-UCITS net assets and 14.4% per year for UCITS net assets. By 2007, the net assets managed in investment funds in the 25 European countries for which information are available were valued at EUR 7909 billion, of which 77.9% were UCITS.

The level of net assets in investment funds among the Member States for 2007 shows that the largest values of UCITS funds managed in the EU were in Luxembourg and France, while the relatively high value of UCITS assets managed in Ireland is also worth noting, as it exceeded the levels in the United Kingdom, Germany or Spain. As well as the classification between open and closed-ended funds, a further distinction can be made between funds specialising in investments in equities, bonds and money markets, or balanced funds with a mix of these three types of investments. There was a considerable change in the composition of UCITS assets, notably an increase in the importance of equity funds throughout the 1990s and their subsequent decline in 2001 and 2002 as stock market indices fell, followed by a more modest increase in their share in the next four years before falling back again in 2007. The relative importance of bond funds fell in each of the last five years, from 30.9% in 2002 to 21.7% in 2007. Money market funds fell from a 39.5% share in 1992 to just 12.0% in 2000, and stabilised with a share around 17% in the last three years for which data are available.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other sources of data include the European Fund and Asset Management Association, Fact Book 2008.

Context

Financial and intermediation services provide instruments to businesses and households in the form of products that are essentially savings or loans, or products to transfer and pool risk. Changes in financing techniques have increased the possibilities open to business to fund investment, while consumers have a wider array of choices for credit, savings and payment methods. At the time of writing this sector is the focus of worldwide attention due to the financial crisis widely experienced across the globe and the impact that this has had on other parts of the economy. This crisis has led to national governments taking over some financial institutions, and providing massive amounts of financial support to others. The crisis has provoked widespread calls for reforms to regulatory bodies and new ways for overseeing the operations and practices of this sector.

There has been considerable EU legislative activity in the sphere of financial and insurance services centred upon the creation of an internal market for financial and insurance services. This work has been conducted through the Financial services action plan (FSAP), which was published by the [European Commission](#) in 1999 and the legislative phase completed in 2006.

The absence of cross-border consolidation within the financial and insurance services sector has drawn attention and in September 2007 a Directive of the [European Parliament](#) and of the [Council](#) was adopted ([COM \(2007\) 44](#)) that would tighten the procedures that Member States' supervisory authorities have to follow when assessing proposed mergers and acquisitions in banking, insurance and securities activities. The directive aims to clarify the criteria against which supervisors should assess possible mergers and acquisitions in order to improve clarity and transparency in supervisory assessment and help to ensure a consistent handling of mergers and acquisitions requests across the EU.

A major step in the development of open-ended funds within Europe came with the introduction of Council directive 85/611/EEC of 20 December 1985 on the co-ordination of laws, regulations and administrative provisions relating to undertakings for collective investment in transferable securities (UCITS). Other funds are permitted within the EU, according to national regulations. In July 2008, following on from the 2006 White paper on investment funds ([COM\(2006\) 686](#)), the European Commission adopted a proposal to recast the Council Directive on UCITS ([COM \(2008\) 458](#)). The proposals aim to remove administrative barriers, create a framework for mergers of funds, improve information for retail investors, and improve cooperation between national regulators.

Table 4: Manufacture of furniture; manufacturing n.e.c. (NACE Division 36). Main indicators, 2006 (1)

In 2006, furniture manufacturing (NACE Group 36.1) consisted of 150.4 thousand enterprises which generated EUR 38.0 billion of value added in the EU-27, equivalent to 71.2% of the total for furniture and other manufacturing activities (NACE Division 36). There were 1.3 million persons employed in the EU-27's furniture manufacturing sector, which was 74.8% of the furniture and other manufacturing activities workforce.

Just less than one quarter of the sector's value added was in the manufacture of chairs and seats (NACE

Class 36.11), just under one fifth in the manufacture of other office and shop furniture (NACE Class 36.12), and just over one tenth in the manufacture of other kitchen furniture (NACE Class 36.13). Smaller than these was the manufacture of mattresses (NACE Class 36.15) with just under 5% of the sector's value added. The miscellaneous grouping of the manufacture of other furniture (NACE Class 36.14) was the largest subsector, with a 42% share of value added and 52% of the workforce.

Germany made the largest contribution to EU-27 value added in the furniture manufacturing sector in 2006 followed closely by Italy, with the United Kingdom and Spain the only other Member States with a double-digit share of EU-27 value added. Italy had the largest workforce, just over 200 thousand persons employed, followed by Germany and Poland. In value added terms, the relative importance of the furniture manufacturing sector was highest in Lithuania in 2006, as furniture manufacturing accounted for 1.7% of Lithuanian non-financial business economy (NACE Sections C to I and K) value added. Most of the [other Member States that joined the EU in 2004 or 2007](#) were relatively specialised in furniture manufacturing: the only ones that were relatively unspecialised were Cyprus and Hungary. Italy, Denmark, Austria, Portugal and Spain were the only [EU-15](#) Member States where the furniture manufacturing sector's contribution to non-financial business economy value added was above the EU-27 average.

Expenditure and productivity

EU-27 gross [tangible investment](#) in furniture manufacturing was valued at EUR 4.1 billion in 2006, equivalent to 10.9% of the sector's value added. Bulgaria (56.5%) and Romania (52.4%) recorded particularly high [investment rates](#) for furniture manufacturing in 2006. This sector's expenditure on [personnel costs](#) was 23.0% of all operating expenditure in the EU-27 in 2006, 1.4 times as high as the average share for the non-financial business economy. This high share was achieved despite relatively low average personnel costs of EUR 22.0 thousand per employee in the EU-27's furniture manufacturing sector, which when combined with apparent [labour productivity](#) of EUR 28.2 thousand per person employed, led to a [wage-adjusted labour productivity ratio](#) of 128.1%. In all Member States with data available this ratio for furniture manufacturing was below the average ratio for their non-financial business economies.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#), including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include the [PRODCOM](#) statistics on the production of manufactured goods.

Context

The EU's furniture manufacturing activity draws on a variety of materials to manufacture its products, including wood, metal, leather, glass and synthetic materials; material innovation along with design are key factors within the EU's furniture activity in the face of competition from countries that are characterised by low labour costs.

Furniture, jewelry, musical instruments, sports goods, toy production statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article introduces a [set of statistical articles](#) which analyse the structure, development and characteristics of the economic activities in the for a number of unrelated manufacturing activities in the [European Union \(EU\)](#) . According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), this sector covers NACE Division 36, and is treated in more depth in two further articles:

- [furniture manufacturing](#) , corresponding to NACE Group 36.1, which is the largest of these activities;
- [jewelry, musical instruments, sports goods, toys and other manufacturing](#) , corresponding to NACE Groups 36.2-36.6.

Table 5: Manufacture of furniture; manufacturing n.e.c. (NACE Division 36). Main indicators, 2006 (1)

Main statistical findings

Structural profile

The furniture and other manufacturing sector (NACE Division 36) comprised 235.2 thousand enterprises in the EU-27 in 2006. These enterprises generated EUR 53.4 billion of value added and employed 1.8 million persons. These figures equate to a 0.9% share of non-financial business economy (NACE Sections C to I and K) value added and a 1.4% share of the workforce. The furniture and other manufacturing activities sector had the second smallest level of value added among the industrial structural business statistics sectors.

The furniture subsector (NACE Group 36.1) accounted for over two thirds (71.2%) of the value added generated in the EU-27 in this sector in 2006 and closer to three quarters (74.8%) of employment. Among the other activities (see jewellery, musical instruments, sports goods, toys and other manufacturing) the largest in employment terms were miscellaneous manufacturing (NACE Group 36.6) with 2311 thousand persons employed and jewellery manufacture (NACE Group 36.2) with 115.4 thousand persons employed.

Germany generated the largest share of EU-27 value added in this sector in 2006, slightly more than the Italian share. In employment terms this situation was reversed, with more than one quarter of a million persons employed in the Italian furniture and other manufacturing sector. Poland also recorded a large workforce in this sector, the third largest in the EU-27. Many of the Member States that joined the EU in 2004 or 2007 were relatively specialised in these activities, mainly due to a specialisation in one or two particular subsectors, as were Italy and to a lesser extent Austria and Denmark.

The specialisation in the furniture and other manufacturing sector in some regions within these countries (in some cases the whole country is treated as one region) can clearly be seen from the map which is based on the non-financial business economy employment share of this sector. Many of the most specialised regions were in Italy, Poland and Romania. The Czech Republic, Spain, Slovakia and Sweden also had several regions specialised in these activities in employment terms, while the Baltic Member States and Slovenia (each treated as one region in the map) were also among the most specialised regions.

The EU-27's index of production for furniture and other manufacturing activities rose on average by 0.8% per year during the period 1997 to 2007, compared with an industrial (NACE Sections C to E) average of 2.1%. Only once in the ten years between 1997 and 2007 did the furniture and other manufacturing activities record year on year growth above the industrial average, and that was back in 1998. After peaking in 2000, output from furniture and other manufacturing activities declined for three years. Output grew each year thereafter, averaging 1.6% per year between 2003 and 2007.

EU-27 **employment** in furniture and other manufacturing activities declined relatively gently between 1997 and 2007, falling an average of 0.8% per year compared to an industrial average rate of change of -1.2%. Nevertheless, in 2005 and 2006 employment fell more quickly in furniture and other manufacturing activities than in industry as a whole, and employment was stable in 2007 in furniture and other manufacturing compared with growth in industry as a whole.

The EU-27's furniture and other manufacturing activities were particularly concentrated in **medium-sized enterprises** (with between 50 and 249 persons employed), as they accounted for 27.9% of the sector's value added and 25.5% of the workforce in 2006. **Small enterprises** (with between 10 and 49 persons employed) were also relatively more important, also contributing more than one quarter of the sector's value added and workforce.

Employment characteristics

The EU-27's furniture and other manufacturing activities employed a relatively high proportion of men (71.9%) and had a high proportion of full-time employment (89.9%) in 2007, both well above the equivalent figures for the non-financial business economy as a whole. However, these characteristics were fairly typical for the industrial economy (NACE Sections C to E), with male employment in the furniture and other manufacturing activities sector 2.0 percentage points above the industrial average and full-time employment 2.8 percentage points below the average.

The age profile of the workforce in this sector was fairly close to the non-financial business economy average based on the age classes presented, with a slightly higher proportion of workers aged 30 to 49, and lower proportions in both of the other two age classes.

Expenditure, productivity and profitability

The EU-27's furniture and other manufacturing sector recorded EUR 6.0 billion of **tangible investment** in 2006, resulting in an **investment rate** of 11.3%, about three fifths the average within the non-financial business economy. **Personnel costs** accounted for a large part of the furniture and other manufacturing sector's **operating expenditure** in the EU-27, 22.9% compared with a non-financial business economy average of 16.1%. This share was particularly high in the musical instruments manufacturing subsector where it reached 34.8%, while it was around half this level (17.5%) in the jewellery manufacturing subsector.

Apparent **labour productivity** of the EU-27's furniture and other manufacturing activities workforce was EUR 29.7 thousand per person employed in 2006 and average personnel costs equated to EUR 22.8 thousand per employee. Both of these ratios were well below the non-financial business economy averages, in particular the apparent labour productivity. As a result, the EU-27 **wage-adjusted labour productivity ratio** was also considerably below average, 129.9% for furniture and other manufacturing activities compared with the non-financial business economy average of 151.1%. None of the subsectors recorded a wage-adjusted labour productivity ratio above the non-financial business economy average, the highest being 137.3% for sports goods manufacturing. In all Member States⁴⁸ the wage-adjusted labour productivity ratio for the furniture and other manufacturing sector was below the non-financial business economy average; in Sweden and Luxembourg this ratio was below 100%, indicating that average personnel costs exceeded average value added per person employed.

The **gross operating rate** (the ratio of gross operating surplus to turnover, expressed as a percentage) was 9.6% for the EU-27's furniture and other manufacturing sector in 2006, only slightly below the 10.8% average for the non-financial business economy. The jewellery manufacturing subsector recorded a gross operating rate equal to the non-financial business economy average, while the musical instruments manufacturing subsector exceeded this average, with a rate of 14.6%.

External trade

Just under two thirds (66.2%) of furniture and other manufactured goods (CPA Division 36) exported by the EU-27 Member States was **intra-EU** trade and the remainder was exported outside of the EU-27. This share

⁴⁸Cyprus, Poland and Romania, 2005; Bulgaria, Ireland, Greece, Malta and the Netherlands, not available or incomplete.

was slightly lower than the average for all industrial products (CPA Sections C to E). Furniture and other manufactured goods accounted for 5% or more of industrial [exports](#) in Poland, Lithuania and Slovenia. Italy and Poland recorded the largest [trade surplus](#) for these products, with the United Kingdom and France recording the largest [trade deficits](#) .

The EU-27 exported EUR 31.5 billion of furniture and other manufactured goods outside of the EU in 2007, equivalent to a 2.7% share of industrial exports. With [imports](#) valued at EUR 47.2 billion the EU-27 recorded a trade deficit of EUR 15.6 billion in 2007 for furniture and other manufactured goods. A large trade deficit was recorded for games and toys (CPA Group 36.5) – while the only trade surplus (at the CPA group level) was recorded for jewellery and related articles (CPA Group 36.2).

China was the dominant partner for EU-27 imports, supplying more than half (51.9%) of all furniture and other manufactured goods imported in 2007, far ahead of any other country. To put this into context, the Chinese share of all industrial imports by the EU-27 was 17.1%. At the [CPA](#) group level, China dominated EU-27 imports for several products, notably games and toys (85.1%), miscellaneous manufactured goods (CPA Group 36.6, 66.0%), and sports goods (CPA Group 36.4, 60.7%). The only CPA group where China was not the main origin of EU-27 imports was jewellery, where India (17.0%) had the largest share.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics \(STS\)](#) , the [Labour force survey \(LFS\)](#) and the [COMEXT](#) database for external trade.

Notes

General construction statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), the present article covers general construction, corresponding to NACE Group 45.2, which is part of the [construction](#) sector.

General construction comprises the building of complete constructions (or parts thereof) and civil engineering, and constitute the core activities of the construction sector. These two activities are the first stages of most construction activities, following on from the activities of architects, structural engineers and landscape designers. At the four-digit level of NACE, there are five parts to general construction:

- general construction of buildings and civil engineering (NACE Class 45.21), which includes most building work as well as engineering projects such as bridges, tunnels, and cable and pipe networks;
- the erection of roof covering and frames (NACE Class 45.22);
- the construction of motorways, roads, airfields and sports facilities (NACE Class 45.23);
- the construction of water projects (NACE Class 45.24), including waterways, locks and ports, as well as dredging work;
- other special trades construction work (NACE Class 45.25), including, for example, foundations work, pile-driving and scaffolding.

	Enterprises (thousand)	Turnover (EUR million)	Value added (EUR million)	Persons employed (thousand)	Share in total (%)	
					Value added	Persons employed
General construction	1 186.6	1 020 772	300 000	7 749.0	100.0	100.0

Table 3: General construction (NACE Group 45.2). Expenditure and productivity, EU-27, 2006

General construction (NACE Group 45.2) was the largest NACE group within construction (NACE Section F), larger than all of the other construction activities combined in terms of [turnover](#) , [value added](#) and [employment](#) , but not in terms of a simple count of the number of [enterprises](#) . Close to 1.2 million enterprises were active in this sector in 2006, around two fifths of the construction total. These enterprises generated around EUR 300 billion of value added in the [EU-27](#) in 2006, and employed 7.7 million persons.

A more detailed analysis of the EU-27's general construction sector in 2006 shows that the construction of buildings and civil engineering work (NACE Class 45.21) dominated the sector, with 70.5% of value added and 71.6% of employment. Other construction work involving special trades (NACE Class 45.25) was the second largest NACE class with 11.7% of value added and 11.2% of employment, larger than the specialised civil engineering activity of road building and the construction of airfields and sports facilities (NACE Class 45.23), and the erection of roof coverings and frames (NACE Class 45.22). By far the smallest activity within general construction activities was the construction of water projects (NACE Class 45.24).

The largest general construction sector in the EU-27 was in Spain; it generated EUR 62.7 billion of value added and employed 1.7 million workers, accounting for a little more than one fifth (20.9%) of the EU-27's value added and 21.9% of its workforce. The United Kingdom's general construction sector was only slightly smaller than the Spanish one in terms of value added, but the workforce was much smaller. The general construction sector in Italy contributed a further 13% of EU-27 value added, with both France and Germany contributing about 10% each. The very large Spanish general construction sector was reflected in its high specialisation in this activity, as this single NACE group alone contributed 11.7% of total value added in the Spanish [non-financial business economy](#) , although this was lower than the 12.7% recorded in Cyprus.

In most of the Member States, general construction activities generated half or more of the construction sector's value added, although Sweden (45.3%), France (44.9%) and Denmark (44.4%) were all below this level. Particular specialisations among other subsectors can be noted: the construction of water projects in Romania and the Netherlands; the erection of roof coverings and frames in Germany, Austria and France; road building and the construction of airfields and sports facilities in Hungary and Slovenia.

Expenditure and productivity

[Tangible investment](#) made by the EU-27's general construction sector was EUR 32 billion in 2006, around two thirds of the tangible investment made in construction as a whole, which was a higher share than the sector contributed in terms of either value added or employment. This sector's [investment rate](#) in the EU-27 was 10.7% in 2006, only marginally above the average rate for construction as a whole, and well below the non-financial business economy average. In 2006, only Belgium and Italy⁴⁹ recorded an investment rate in general construction that was above the national non-financial business economy average.

General construction recorded the lowest share of [personnel costs](#) in operating expenditure (19.5% in the EU-27 in 2006) among the NACE groups covered by construction, although this was still above the average for the non-financial business economy. Apparent [labour productivity](#) in this sector averaged EUR 38.7 thousand per person employed, some EUR 2.5 thousand higher than the construction average. In contrast, average personnel costs were EUR 27.7 thousand per employee, slightly below the construction average. The combination of a higher apparent labour productivity and average personnel costs that were typical for the construction sector as a whole, led to a [wage-adjusted labour productivity ratio](#) of 139.7%, some 10.0 percentage points higher than the construction average, but 11.4 percentage points below the non-financial business economy average.

⁴⁹Bulgaria, Cyprus, Poland and Romania 2005; Ireland, Malta and the Netherlands, not available.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Context

Building and civil engineering projects typically take much longer from conception to completion than in many other sectors, and often involve a large number of sub-contracting enterprises with various specialisations. Construction projects are often a key factor in urban regeneration, and also in maintaining or developing transport and communication infrastructure. Nevertheless, construction projects impact upon the environment in a number of ways, notably the change in land use, the consumption of materials and fuel, the production of waste, as well as noise and air emissions.

Another characteristic of construction activity is that it is particularly cyclical, influenced by business and consumer confidence, interest rates and government programmes. The level of confidence among construction enterprises, according to the [European Commission's Directorate-General for Economic and Financial Affairs](#) is presented in terms of a balance of positive compared with negative responses. This measure turned positive in July 2006 for the first time since June 1990, peaked in September 2006 and then became negative again in November 2007. During 2008, the fall in construction confidence accelerated and fell particularly strongly in the final quarter of 2008, such that by December 2008 the balance was down to -32.3%. At the time of writing, with overall economic activity declining in many Member States, major public sector funding for infrastructure projects has been proposed by a number of governments as one means of stimulating activity and creating jobs.

General purpose machinery production statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), the present article covers the production of general purpose machinery, corresponding to NACE Groups 29.1 and 29.2, which are part of the [machinery and equipment](#) sector. The activities covered in this article are:

- Power machinery, which comprises machinery for the production and use of mechanical power (NACE Group 29.1). This includes internal combustion engines, as well as steam, gas, wind and hydraulic turbines, pumps, compressors, taps, valves, bearings and transmission equipment, but excludes the manufacture of propulsion engines for aircraft, vehicles or cycles.
- Other general purpose machinery (NACE Group 29.2), which includes furnaces and burners, lifting and handling equipment and non-domestic cooling and ventilation equipment.

	Enterprises (thousand)	Turnover (EUR million)	Value added (EUR million)	Persons employed (thousand)	Share in total (%)	
					Value added	Persons employed
General purpose machinery	81.3	314 730	100 549	1 792.5	100.0	100.0
Machinery for the production and use of mechanical power, except aircraft, vehicle and cycle engines	14.5	136 000	43 200	722.0	43.0	40.3
Other general purpose machinery	66.7	178 730	57 349	1 070.5	57.0	59.7

Table 3: Manufacture of machinery for the production and use of mechanical power, except aircraft, vehicle and cycle engines; manufacture of other general purpose machinery (NACE Groups 29.1 and 29.2). Expenditure, productivity and profitability, EU-27, 2006 (1)

General purpose machinery manufacturing (NACE Groups 29.1 and 29.2) was the principal activity of 81.3 thousand enterprises throughout the EU-27 in 2006, providing employment for almost 1.8 million persons (about one half of the EU-27's machinery and equipment workforce). These enterprises generated EUR 100.5 billion of value added in 2006 from a turnover of EUR 314.7 billion. A majority (57.0%) of the value added within this sector came from the other general purpose machinery subsector (NACE Group 29.2), the remainder (43.0%) coming from the manufacture of power machinery subsector (NACE Group 29.1). Among the eight NACE classes that comprise the general purpose machinery sector, the manufacture of lifting and handling equipment was the largest in terms of value added, contributing a little over one fifth (20.4%) of sectoral value added. This was closely followed by the manufacture of other general purpose machinery not elsewhere classified (NACE Class 29.24) – including the manufacture of gas generators, oil filters and weighing machinery – which contributed just under one fifth (19.7%) of sectoral value added.

The general purpose machinery sectors in Germany and Italy together contributed more than half (52.2%) of the EU-27's value added generated in 2006. Germany had by far the highest level of activity, however, with EUR 35.9 billion of value added generated in 2006, which was more than double the EUR 16.6 billion recorded for Italy. These two countries were the most specialised Member States in the manufacture of general purpose machinery, as the relative contributions of this sector to non-financial business economy value added stood at 3.1% for Germany and 2.6% for Italy, well above the EU-27 average (1.8%).

Annual short-term statistics show that the staggered growth in both the production indices for the manufacture of power machinery (NACE Group 29.1) and other general purpose machinery (NACE Group 29.2) followed a similar pattern, although slightly more pronounced, than the index of production for machinery and equipment manufacturing (NACE Subsection DK) as a whole during the ten-year period between 1997 and 2007. The growth in EU-27 output of power machinery was particularly strong from 2003 onwards, raising the average rate of growth over the ten years considered to 3.2% per year. In contrast, the strongest growth in output for other general purpose machinery was recorded in the period between 1997 and 2000, which lifted its average rate of growth over the ten years through to 2007 to 3.0% per year. As such, both rates were above the average (2.6% per year) recorded for the whole of machinery and equipment manufacturing.

Expenditure and productivity

A majority (58.1%) of the tangible investment made in the EU-27's machinery and equipment manufacturing (NACE Subsection DK) activities in 2006 could be attributed to general purpose machinery manufacturing (NACE Groups 29.1 and 29.2). In comparison to the value added generated by the sector, tangible investment of EUR 8.9 billion corresponded to an investment rate of 9.7%, which although relatively low in comparison with the non-financial business economy was a little higher than the average (9.0%) for the whole of machinery and equipment manufacturing.

The structure of operating expenditure in the EU-27's general purpose machinery sector was very similar to that across machinery and equipment manufacturing as a whole, with 23.8% of the total being accounted for by personnel costs in 2006. Average personnel costs of EUR 40.8 thousand per employee were recorded in the EU-27 for general purpose machinery manufacturing which was about EUR 12.0 thousand per employee higher than the average for the EU-27's non-financial business economy.

The apparent labour productivity of each person employed within the EU-27's general purpose machinery manufacturing sector averaged EUR 56.1 thousand of value added in 2006. However, the resulting wage-adjusted

[labour productivity ratio](#) of 137.6% was roughly equal to the machinery and equipment manufacturing average (135.8%) and was relatively low in terms of a comparison with the non-financial business economy average (151.1%). This characteristic was common for the majority of Member States, with exceptions limited to Belgium, Greece, France, Italy and Austria, where the wage-adjusted labour productivity ratio for the general purpose machinery sector was higher than the non-financial business economy average.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Context

Technological advancements in the machinery and equipment that is used in other sectors of the economy (particularly in mining, manufacturing, energy provision and construction) can have a considerable impact upon the speed, quality and quantity of what is produced, thereby impacting on downstream productivity and profitability. The machinery and equipment sector is sensitive, therefore, to overall economic conditions and investment patterns both within the European Union and across the world (the two arguably being more intertwined than ever).

Glass production statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). The present article covers the production of glass and glass products, corresponding to [NACE Rev 1.1 Group 26.1](#), which is part of the [other non-metallic minerals](#) sector. Glass products include:

- flat glass;
- container glass;
- glass fibres;
- specialised glass.

	Enterprises (thousand)	Turnover (EUR million)	Value added (EUR million)	Persons employed (thousand)	Share in total (%)	
					Value added	Persons employed
Glass and glass products (1)	17.7	48 458	16 683	371.6	100.0	100.0

Source: Eurostat (SBS)

Table 3: Manufacture of glass and glass products (NACE Group 26.1). Expenditure, productivity and profitability, EU-27, 2006

Glass comes in a range of forms for a range of functions. The majority of EU-27 glass production in 2007 was in the form of container glass (bottles and jars used for preserving and packaging drinks, food and perfumes among other products), the production of flat glass (principally float glass for buildings and automotive vehicles in the form of windows and windscreens) being about one half of that of container glass. The combined production of domestic tableware glass (for example, drinking glasses and oven dishes), special glass (for example, optical glass, electrical equipment screens and lighting glass) and filament glass fibre (principally for the reinforcement of composite materials) was about one third of that of flat glass in 2007.

Structural profile

There were 17.7 thousand enterprises in the EU-27 for whom the manufacture of glass and glass products (NACE Group 26.1, hereafter referred to as glass manufacturing) was their main activity in 2005. These glass manufacturing enterprises employed 371.6 thousand persons in the Member States in 2006, about one in four (23.4%) of all those working in other non-metallic mineral products manufacturing activities. The EU-27's glass manufacturing sector had a turnover of EUR 48.5 billion in 2006, of which EUR 16.7 billion was added value, representing one fifth (20.9%) of the value added generated by all other non-metallic mineral product activities.

The two largest subsectors within the EU-27's glass manufacturing sector were the manufacture of hollow glass (NACE Class 26.13) and the shaping and processing of flat glass (NACE Class 26.12), which were of similar size and together generated about three fifths (60.4%) of the total value added of the glass manufacturing sector in 2006. The manufacture and processing of other glass, including technical glassware (NACE Class 26.15) subsector and the slightly smaller manufacture of flat glass (NACE Class 26.11) subsector accounted together for a further three tenths of the value added of the sector, with the remainder (one tenth) coming from the glass fibres manufacturing (NACE Class 26.14) subsector.

Among the Member States, Germany had the largest glass manufacturing sector in 2006, contributing just over one fifth (20.9%) of the value added generated in the EU-27, followed by France and Italy. However, it was in the Czech Republic that the value added created by the glass manufacturing sector contributed most⁵⁰ to the value added of the non-financial business economy (NACE Sections C to I and K) in 2006, almost three and a half-times the EU-27 average.

⁵⁰Belgium, Bulgaria, Cyprus, Poland and Romania, 2005; Malta, the Netherlands and Portugal, not available.

During the period between 1997 and 2007, the development of the EU-27's [production index](#) for glass manufacturing activities was very similar to the development in [output](#) already described for other non-metallic mineral products as a whole, albeit with notably stronger growth in three years through until 2000. Over the ten years through until 2007, growth in the output of glass manufacturing in EU-27 was on average 2.2% per year, a very similar rate of growth to the industrial average (2.1% per year). Within glass manufacturing, the development in the output of hollow glass stood apart from the broadly upward growth recorded for other activities; there was a relatively gentle but steady decline in the EU-27's production index of hollow glass at an average -0.6% per year.

Expenditure and productivity

There was [tangible investment](#) of EUR 3.1 billion in the EU-27's glass manufacturing sector in 2006. This represented about one fifth (20.3%) of the tangible investment across all the other non-metallic mineral products manufacturing activities, a very similar share to the relative contribution made by this sector to value added (20.9%). The [investment rate](#) in the EU-27's glass manufacturing sector (18.6%) was similar, therefore, to the investment rate noted across all other non-metallic mineral products manufacturing activities (19.1%) in 2006.

About one quarter (24.9%) of the glass manufacturing sector's operating expenditure went on [personnel costs](#) in 2006, a higher share than the average (21.6%) across all of the other non-metallic mineral products manufacturing activities, despite average personnel costs in the sector (EUR 30.2 thousand per employee) being marginally lower.

Each person employed in the EU-27's glass manufacturing sector generated an average of EUR 44.9 thousand of added value in 2006, which was about 10% less than the corresponding level of apparent [labour productivity](#) among those working within other non-metallic mineral products manufacturing, while the corresponding ratio for average personnel costs showed that employees within glass manufacturing received, on average, EUR 14.7 thousand more than their counterparts across all other non-metallic mineral products manufacturing activities. The resulting wage-adjusted labour productivity ratio for the EU-27's glass manufacturing sector was 147.8% which was, by way of comparison, below the ratio (164.5%) for other non-metallic mineral products manufacturing as a whole. Among the glass manufacturing activities, wage-adjusted labour productivity ratios varied from just under 142% for the shaping and processing of flat glass and for the manufacture and processing of other glass, including technical glassware to a high of 179.8% for the manufacture of flat glass.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#), including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics \(STS\)](#) and the [PRODCOM](#) statistics on the production of manufactured goods.

Context

The processes of transforming mineral raw materials such as clay, lime, sand or stone into other non-metallic mineral products (for use, among others, by construction, food and beverages manufacturing, or households in the form of consumer durables) tend to be energy-intensive. Indeed, energy costs accounted for 9.5% of the purchases of goods and services in the EU's other non-metallic mineral products manufacturing sector in 2006, the second highest ratio after non-energy mining and quarrying (NACE Subsection CB) among the industrial structural business statistics sectors. Within this sector, the share of energy costs in purchases of goods and services reached 14.9% for the EU-27's ceramic goods and clay products manufacturing subsector.

Current policy initiatives are focused on environmental impacts, energy strategies, and health and safety. Under the Competitiveness and Innovation Programme (CIP), independent consultants delivered studies to the [European Commission's](#) Directorate-General for Enterprise and Industry on the competitiveness of the [ceramics](#)

and glass sectors in October 2008.

Challenges were identified, including ensuring the availability of energy and raw materials at affordable prices, the need to minimise energy waste, reduce energy use, as well as maintaining emissions within targets and removing tariff and non-tariff international barriers to trade. Suggested areas of development were a focus on the high quality and high value products end of the market, investment in cleaner technologies and environmental management systems, investment in more efficient and flexible automation technologies, improved and more targeted skills training programmes and efforts at a policy level to establish EU environmental regulations on a global platform.

Glass, ceramic, clay and cement production statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article introduces a [set of statistical articles](#) which analyse the structure, development and characteristics of the economic activities in the non-metallic minerals sector in the [European Union \(EU\)](#) . This sector covers [NACE Rev 1.1 Division 26](#), and its activities consist of the following groups, which are dealt with in more detail in separate articles:

- the [manufacture of glass](#) (corresponding to NACE Group 26.1);
- the [manufacture of ceramic and clay products](#) (NACE Groups 26.2 to 26.4);
- the [manufacture of cement and concrete](#) (NACE Groups 26.5 and 26.6);
- the [working of stone and miscellaneous non-metallic mineral products](#) (NACE Groups 26.7 and 26.8).

Note that the quarrying of non-metallic mineral products is covered in the articles on [Mining and quarrying statistics - NACE Rev. 1.1](#) and [Non-energy mining and quarrying statistics - NACE Rev. 1.1](#) .

	Enterprises		Turnover		Value added		Persons employed	
	(% of thousand)	(% of total)	(EUR million)	(% of total)	(EUR million)	(% of total)	(thousand)	(% of total)
Other non-metallic mineral products	106.6	100.0	242 196	100.0	79 824	100.0	1 586.5	100.0

Table 5: Manufacture of other non-metallic mineral products (NACE Division 26). Main indicators, 2006 (1)

There were 106.6 thousand **enterprises** across the **EU-27** for whom the manufacture of other non-metallic mineral products (NACE Division 26) was their principal activity in 2006. With a workforce of 1.6 million persons, the EU-27's other non-metallic mineral products sector accounted for 1.2% of those working across all the **non-financial business economies** (NACE Sections C to I and K) of the Member States. From a **turnover** of EUR 242.2 billion in 2006, the enterprises in the EU-27

's other non-metallic mineral products sector generated EUR 79.8 billion of **value added**, which was equivalent to 1.4% of the EU-27's value added in the non-financial business economy.

The EU-27's cement and concrete manufacturing subsector (NACE Groups 26.5 and 26.6) generated EUR 35.4 billion of value added in 2006, the largest contribution (44.3%) to the value added of the other non-metallic mineral products manufacturing sector. Just over one fifth (20.9%) of sectoral value added in 2006 came from the activities of glass manufacturing (NACE Group 26.1), with just under a fifth (19.5%) coming from the ceramic goods and clay products manufacturing subsector (NACE Groups 26.2 to 26.4). The remaining share of sectoral value added came from the activities of stone and miscellaneous non-metallic mineral products (NACE Groups 26.7 and 26.8).

The other non-metallic mineral products manufacturing sectors in Germany and Italy were the largest among the Member States, generating EUR 13.9 billion and EUR 13.2 billion of value added respectively in 2006; together they contributed a little over one third (33.9%) of the value added generated across the EU-27. However, the contribution made by the other non-metallic mineral products manufacturing sector to the total value added of the non-financial business economy was highest (2.7%) in the Czech Republic, followed by Cyprus and Bulgaria (both 2.5% in 2005). In the Czech Republic, this share was almost double the EU-27 average of 1.4%.

There were many regions in Poland, Italy, Germany, the Czech Republic, Slovakia, Spain and Belgium in which **employment** in other non-metallic mineral products manufacturing represented at least 2.0% of the non-financial business economy workforce in 2006. There were also regional pockets in a number of other Member States with relatively high employment in the sector. One of these was the Centro region of Portugal, which was one of only three regions across the EU-27, behind the Province of Namur (Belgium) and Świętokrzyskie (Poland), in which just over 5.0% of the non-financial business economy workforce was engaged in other non-metallic mineral products manufacturing.

Between 1997 and 2007 the **production index** of other non-metallic mineral products developed in a similar way to the corresponding index for industry as a whole (NACE Sections C to E); in both cases, relatively strong growth in **output** came to an end in 2000 before resuming in 2003 through to 2007. Where the production indices of the two differed was in 2001 and 2002; whereas industrial output changed only slightly, the output of

other non-metallic mineral products contracted.

The domestic output price index for the manufacture of other non-metallic mineral products rose continuously and remarkably steadily (at an average 2.1% per year) during the ten years through to 2007. In these respects, it differed from the development of the domestic [output price index](#) for industry as a whole, for which periods of steep price increases (2000 and 2001, and again from 2003) were preceded by one or more years of relative price stagnation.

A small majority (52.6%) of the value added generated within the EU-27's other non-metallic mineral products manufacturing sector in 2006 came from [small and medium-sized enterprises](#) (SMEs, employing less than 250 people). This majority was less than that (57.9%) across the EU-27's non-financial business economy, but contrasted with the situation within industry as a whole, where a minority (42.5%) of value added was from SMEs. Romania and France stood apart from the other Member States, in that SMEs made a particularly small contribution within their other non-metallic mineral products manufacturing sectors, as they contributed closer to one third (32.6% and 37.8% respectively) of sectoral value added in 2006.

Employment characteristics

The profile of workers within the EU-27's other non-metallic mineral products manufacturing sector was rather different to that of the non-financial business economy in terms of gender breakdown, part-time status and age profile.

There was a much higher proportion of men in the EU-27's other non-metallic mineral products manufacturing workforce than across the non-financial business economy workforce (78.1% compared with 64.9%) in 2007. This characteristic was common across almost all of the Member States, but was particularly evident in Estonia, the Netherlands and Greece. It was only in the Czech Republic that the proportion of men working in this sector was relatively similar (albeit 2.8 percentage points higher) to that of its non-financial business economy.

Full-time employment within the EU-27's other non-metallic mineral products manufacturing workforce (94.5% in 2007) was also much more common than it was across the non-financial business economy as a whole (85.7%).

The proportion of workers in the EU-27's other non-metallic mineral products manufacturing sector under the age of 30 (19.7%) was notably smaller than the proportion (24.3%) within the non-financial business economy. This characteristic was particularly pronounced in Denmark, where the share of young workers was almost one half of that for young workers across its non-financial business economy, and was also quite pronounced in the Netherlands, the United Kingdom and Ireland.

Expenditure, productivity and profitability

[Personnel costs](#) in the EU-27's other non-metallic mineral products manufacturing sector accounted for 21.6% of operating expenditure in 2006, a notably higher share than that (16.1%) for the non-financial business economy as a whole. Personnel costs in the glass manufacturing subsector (NACE Group 26.1) and the ceramic goods and clay products manufacturing subsector (NACE Groups 26.2 to 26.4) accounted for even higher proportions of operating expenditure (24.9% and 28.7% in 2005).

[Tangible investment](#) in the EU-27's other non-metallic mineral products manufacturing sector was EUR 15.3 billion in 2006. This investment was the equivalent of 19.1% of the value added generated by the sector in 2006, which was a slightly higher investment rate than that (18.4%) across the EU-27's non-financial business economy. The level of tangible investment in other non-metallic mineral products manufacturing activities was almost the same as the value added generated by the sector in Romania (a corresponding investment rate of 109.2%) and Lithuania (96.6%), these investment rates being much higher than those of their non-financial business economies.

The apparent [labour productivity](#) of the EU-27's other non-metallic mineral products manufacturing sector was EUR 50.3 thousand per person in 2006, which was about EUR 6.8 thousand per person more than the average for the non-financial business economy. This average amount of value added generated by each person

within the EU-27's other non-metallic mineral products manufacturing sector was also substantially more than average personnel costs (EUR 30.6 thousand per employee); the resulting [wage adjusted labour productivity ratio](#) was 164.5% in 2007, which was higher than the average ratio (151.1%) for the EU-27's non-financial business economy. This characteristic was common to most of the Member States and was most notable in Bulgaria where the wage adjusted labour productivity ratio for the non-metallic mineral products manufacturing sector was 108 percentage points higher than the non-financial business economy average in 2005. Differences of between 40 and 60 percentage points were also noted for Hungary, Cyprus (2005), Greece, Estonia, Luxembourg and Spain. In contrast, the wage adjusted labour productivity ratio for the other non-metallic mineral products manufacturing sector was notably lower than that of the non-financial business economy in Denmark and the United Kingdom.

The gross [operating rate](#) of the EU-27's other non-metallic mineral products manufacturing sector was 14.2% in 2006, higher than the average for the non-financial business economy (10.8%). This characteristic was noted for most of the Member States⁵¹, the only exception being in Germany where it was fractionally lower.

External trade

Just over two thirds (68.4%) of the value of [exports](#) of other non-metallic mineral products (CPA Division 26) by EU-27

Member States was as a result of trade with other Member States (so-called [intra-EU](#) trade) in 2007. EU-27 exports of other non-metallic mineral products to non-member countries ([extra-EU-27](#) trade) were valued at EUR 18.4 billion in 2007, representing 1.6% of the value of industrial (CPA Sections C to E) exports. With imports of other non-metallic mineral products into the EU-27 valued at EUR 12.3 billion in 2007, this resulted in the EU-27 having a [trade surplus](#) of EUR 6.1 billion in these products. Just over one half (EUR 3.2 billion) of this trade surplus came from ceramic goods and clay products (CPA Groups 26.2 to 26.4) and about one third (EUR 1.9 billion) from glass and glass products (CPA Group 26.1). The EU-27 also recorded relatively small trade surpluses for the two other CPA aggregates within other non-metallic mineral products in 2007. The overall trade surplus for other non-metallic mineral products in 2007 represented, however, a further narrowing of the surplus from its relative peak of EUR 8.4 billion in 2002. In the five years that followed, the value of imports grew much more strongly than exports (total growth of 73.0% compared with 18.7%). Much of this growth in imports was from other non-metallic mineral products from China. By 2007, just under two fifths (38.8%) of all extra-EU-27 imports other non-metallic mineral products came from China. Although the value of EU-27 exports of other non-metallic mineral products grew by 4.4% between 2006 and 2007, exports to the United States (the EU-27

's principal partner, accounting for a fifth of the market) declined by about one tenth.

Among the Member States, the largest exporters (intra- and extra-EU trade) of other non-metallic mineral products in 2007 were Germany (EUR 12.1 billion) and Italy (EUR 9.9 billion), both of whom recorded significant trade surpluses (EUR 4.2 billion and EUR 6.3 billion respectively). The largest [trade deficits](#) in other non-metallic mineral products were recorded for the United Kingdom (EUR 1.8 billion) and France (EUR 1.5 billion).

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics \(STS\)](#) , the [Labour force survey \(LFS\)](#) and the [COMEXT](#) database for external trade.

⁵¹Bulgaria, Cyprus, Poland and Romania, 2005; Ireland, Malta and the Netherlands, not available.

Context

The processes of transforming mineral raw materials such as clay, lime, sand or stone into other non-metallic mineral products (for use, among others, by construction, food and beverages manufacturing, or households in the form of consumer durables) tend to be energy-intensive. Indeed, energy costs accounted for 9.5% of the purchases of goods and services in the EU's other non-metallic mineral products manufacturing sector in 2006, the second highest ratio after non-energy mining and quarrying (NACE Subsection CB) among the industrial structural business statistics sectors. Within this sector, the share of energy costs in purchases of goods and services reached 14.9% for the EU-27's ceramic goods and clay products manufacturing subsector.

Current policy initiatives are focused on environmental impacts, energy strategies, and health and safety. Under the Competitiveness and Innovation Programme (CIP), independent consultants delivered studies to the [European Commission's Directorate-General for Enterprise and Industry](#) on the competitiveness of the ceramics and glass sectors in October 2008.

Challenges were identified, including ensuring the availability of energy and raw materials at affordable prices, the need to minimise energy waste, reduce energy use, as well as maintaining emissions within targets and removing tariff and non-tariff international barriers to trade. Suggested areas of development were a focus on the high quality and high value products end of the market, investment in cleaner technologies and environmental management systems, investment in more efficient and flexible automation technologies, improved and more targeted skills training programmes and efforts at a policy level to establish EU environmental regulations on a global platform.

Hotel and accommodation statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), the present article covers accommodation services, corresponding to NACE Groups 55.1 and 55.2, which are part of the [hotel, restaurant and catering services](#) sector. The activities covered in this article are:

- the provision of short-stay lodging in [hotels, motels and inns](#), corresponding to NACE Group 55.1, which excludes the rental of long-stay accommodation and timeshare operations;
- camping sites and other short-stay accommodation, including self-catering holiday chalets or cottages, corresponding to NACE Group 55.2.

Table 3: Accommodation services (NACE Groups 55.1 and 55.2). Structural profile: ranking of top five Member States in terms of value added and persons employed, 2006

Main statistical findings

On-line booking has grown to account for a significant proportion of revenue for the accommodation services sector. According to Eurostat's annual survey on [e-commerce](#), the share of [turnover](#) generated via the Internet in the accommodation services sector (NACE Groups 55.1 and 55.2) rose from just 3% in 2004 to 14% by 2008; over the same period the share within the [non-financial business economy](#)⁵² as a whole increased more moderately from 9% to 12%. Note that this survey is limited to [enterprises](#) with 10 persons employed and more.

Hotels and similar establishments are one of four main types of accommodation, the others being camping sites, holiday dwellings and other collective establishments. The Member States that had the largest number of hotels and similar establishments in 2007 were the United Kingdom, Germany and Italy with over 34 thousand establishments each, which combined accounted for more than half the total number in the [EU-27](#).

In terms of the number of arrivals in hotels and similar establishments, France and Germany were the largest markets. A number of southern Member States recorded the longest average stays (nights per arrival) for non-residents, notably in Cyprus, Malta, Greece and Bulgaria where this exceeded 5 nights.

An analysis of the seasonality of demand for hotels and similar accommodation shows the lowest point in January and a peak in August: the number of nights spent in hotels and similar establishments in the EU-27 in August 2007 was 2.5 times that recorded in January of the same year. An overview of the supply of other

⁵²Defined as NACE Sections D to G, I, K, Groups 55.1 and 55.2, and Division 92 for the purpose of this analysis.

types of collective accommodation shows there were approximately 15.8 million bed-places in the EU-27 in 2006, around 36% more than in hotels and similar establishments.

Structural profile

There were 259.3 thousand enterprises in the EU-27's accommodation services (NACE Groups 55.1 and 55.2) sector in 2006, and they employed 2.3 million persons. This was equivalent to 15.4% of all enterprises classified within the whole of the accommodation and food services (NACE Section H) and to 24.7% of the workforce. In **output** terms, the accommodation services sector's contribution was greater, reaching 31.2% of accommodation and food services' turnover and 36.0% of **value added** .

The United Kingdom created the highest value added for accommodation services among the Member States in 2006, but its workforce was smaller than that in Germany. In Cyprus, 6.1% of the value added in the non-financial business economy (NACE Sections C to I and K) was derived from accommodation services, making this by far the most specialised Member State in this activity⁵³. Greece and Austria were also relatively highly specialised in accommodation services.

Expenditure and productivity

The accommodation services sector recorded a particularly high level of **investment** , a total of EUR 19.5 billion within the EU-27 in 2006. This was equivalent to 29.8% of the sector's own value added, 11.4 percentage points higher than the non-financial business economy average. Turning to **operating expenditure** , the share of **personnel costs** in total operating expenditure was particularly high in accommodation services, reaching 37.4%, one of the highest shares in the non-financial business economy. Indeed, this share exceeded 40% in several Member States, reaching a maximum of 49.3% in Cyprus (2005).

In the EU-27's accommodation services sector each person employed generated on average EUR 28.6 thousand of value added in 2006, while average personnel costs per employee reached EUR 19.5 thousand. For both of these indicators the levels recorded for accommodation services were far greater than in the restaurants, bars and catering sector, but were nevertheless only around one third of the non-financial business economy averages. The low average personnel costs roughly compensated for the low apparent **labour productivity** ; when combined the resulting **wage-adjusted labour productivity ratio** for the accommodation services sector (146.5%) was only slightly below the non-financial business economy average (151.1%), and well above the ratio for restaurants, bars and catering (118.5%).

None of the Member States⁵⁴ recorded a wage-adjusted labour productivity ratio below parity (100%) in this sector, and the lowest ratio was recorded in Sweden (112.6%). In a few Member States the level of this ratio in accommodation services was above that in the non-financial business economy, most notably in Latvia where it was nearly 20% higher.

Data sources and availability

The main part of the analysis in this article is derived from **structural business statistics (SBS)** , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include Eurostat tourism statistics.

⁵³Bulgaria, Cyprus, Poland and Romania, 2005; Malta and the Netherlands, not available.

⁵⁴Bulgaria, Cyprus, Poland and Romania, 2005; Ireland, Malta and the Netherlands, not available.

Context

One of the main characteristics of tourism is the high income elasticity of demand, which increases or reduces more easily than for many other products or services. As such, spending on tourism generally decreases proportionally faster than consumers' income during times of economic slowdown. Moreover, political or economic uncertainties tend to lead to a diversion of tourism demand, leading for example to shifts between outbound tourism and domestic tourism, for example when exchange rates change rapidly. Furthermore, a downturn in economic fortunes is also likely to result in reduced business activity; likely to be reflected in fewer business trips and nights spent in hotels, as well as less business lunches and dinners.

Hotel, restaurant and catering services statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

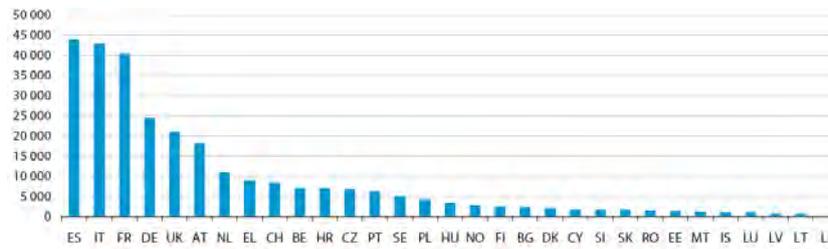

This article introduces a [set of statistical articles](#) which analyse the structure, development and characteristics of the economic activities in the hotel, restaurant and catering sector in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), this sector covers NACE Section H or Division 55. It covers activities that make up a significant part of the tourism supply, although also serving local clients, namely hotels and other provision of short-stay accommodation, restaurants, bars, canteens and catering. This sector's activities are treated in more depth in two further articles:

Table 6: Accommodation and food services (NACE Section H). Main indicators, 2006 (1)

- accommodation ;
- food services .

Main statistical findings

Germany and France recorded the largest number of tourists in 2007, each with just over 127 million tourist arrivals (including both residents and non-residents). Spain, Italy and France welcomed the most non-residents in absolute terms, whereas as a proportion of all tourist arrivals, non-residents were highest in the three smallest Member States (Luxembourg, Malta and Cyprus), followed by Austria.

Structural profile

Accommodation and food services (NACE Section H) recorded value added of EUR 181.9 billion in the EU-27 in 2006, which represented 3.2% of the total for the non-financial business economy (NACE Sections C to I and K). However, it was in terms of the number of enterprises and also employment that this sector's contribution to the non-financial business economy total was greatest. In total, 1.7 million enterprises employed 9.3 million people, equal to 7.1% of the non-financial business economy workforce and 8.3% of the enterprise population; by these two measures the accommodation and food services sector was the sixth largest in terms of the coverage used in the structural business statistics sector articles.

This large workforce contained a relatively low share of paid employees in the EU-27, 82.1%, indicating a large number of working proprietors and unpaid family workers. A more detailed analysis shows that the sub-sector concerning restaurants, bars and catering (NACE Groups 55.3 to 55.5) had a particularly low share of paid employees, just 79.6%, while the 89.9% share recorded for accommodation services (NACE Groups 55.1 and 55.2) was in fact above the non-financial business economy average.

Restaurants, bars and catering was the larger of these two subsectors, as it contributed about two thirds (64.0%) of the value added in the EU-27's accommodation and food services sector in 2006, while providing around three quarters (75.3%) of the sectoral workforce.

With EUR 41.7 billion of value added and 9.3 million persons employed in 2006, the United Kingdom was by far the largest Member State in the accommodation and food services sector, contributing more than a fifth of the EU-27 total for these two measures. In terms of the value added contribution to national non-financial business economy, Cyprus (2005) was by a very large margin the most specialised Member State⁵⁵ in accommodation and food services, with 12.2% of its non-financial business economy value added generated in this sector. In fact, based on the coverage of the structural business statistics sector articles, accommodation and food services was the second largest sector in Cyprus in value added terms. A number of other southern European Member States figured in the list of Member States most specialised in this sector, along with Austria. It should be noted that recent data related to specialisation is not available for Malta, while older data also imply a high specialisation rate for Malta in this sector. Among all the Member States the contribution of accommodation and food services to non-financial business economy value added was lower than the equivalent contribution in terms of employment, reflecting the labour-intensive nature of these activities, although employment figures are boosted by the high degree of part-time employment in this sector (see below).

The map shows the contribution of the accommodation and food services sector to employment within the non-financial business economy (NACE Sections C to I and K) of each region. The importance of this activity in several southern Member States is clear, and the highest proportions of non-financial business economy employment in the accommodation and food services sector were recorded in Ionia Nisia (33.8%) and Notio Aigaio (29.9%), both in Greece, followed by regions in Portugal, Spain and Italy. Nevertheless, this sector also provided 15.0% or more of non-financial business employment in a few regions in the United Kingdom and Austria, one Irish and one German region, as well as in Cyprus.

As regards the development of the accommodation and food services sector in the EU-27 over approximately ten years, in terms of turnover and employment, both of these measures posted uninterrupted growth. The index of turnover grew on average by 3.7% per year between 1998 and 2007, with the lowest year on year growth recorded in 2003 (1.8%) and the highest (5.6%) in 2006. Among the Member States for which the turnover index is available from 2000 to 2007⁵⁶, a rapid increase for accommodation and food services was observed for the three Baltic Member States, Bulgaria and Romania, all recording average growth in excess of 14% per year.

The index of employment for accommodation and food services recorded average growth of 2.2% per year

⁵⁵Bulgaria, Cyprus, Poland and Romania, 2005; Malta and the Netherlands, not available.

⁵⁶Greece, France and Italy, not available; Portugal, unadjusted data rather than working-day adjusted.

in the EU-27 between 1998 and 2007, roughly in line with the 2.3% average growth recorded for non-financial services (NACE Sections G to I and Divisions 72 and 74). In 2007, EU-27

employment growth of 3.7% was recorded in this sector, the fastest rate of growth throughout this period.

In terms of enterprise size, a large proportion of wealth created in the EU-27's accommodation and food services sector was concentrated within **micro** and **small enterprises** (with less than 10 and 10 to 49 persons employed respectively): micro and small enterprises generated 62.8% of the sector's value added in 2006, and employed 70.9% of the workforce in 2005, approximately 20 percentage points higher than the equivalent shares for the non-financial business economy as a whole. Among the Member States⁵⁷, the United Kingdom (44.9%) and to a lesser extent the Netherlands (34.6%) stood out from the other countries, as **large enterprises** (with 250 and more persons employed) made significant contributions to the accommodation and food services sector's value added in 2006.

Employment characteristics

The accommodation and food services workforce was atypical, with high proportions of women, part-time workers, and younger workers in the workforce. In 2007 women made up 55.6% of the workforce in this sector in the EU-27, a share that was 20.5 percentage points higher than the non-financial business economy average. Moreover, this pattern was widespread, as the proportion of female employment was higher than the non-financial business economy national average in every Member State.

Among the EU-27's accommodation and food services workforce in 2007 some 71.9% worked on a full-time basis, a share that was clearly below the non-financial business economy average (85.6%). In fact, this was the second lowest full-time **employment rate** among all the NACE divisions within the non-financial business economy, higher only than in retail trade (NACE Division 52). This low proportion of full-time employment reflects the need for employment flexibility in this sector, including adaptability to atypical working hours. In all of the Member States, except for Romania, the proportion of the persons working full-time in the accommodation and food services sector was below the national average for the non-financial business economy.

The workforce in this sector tended to be younger than in other activities within the non-financial business economy, a characteristic linked to the relatively low-skilled and low paid nature of many of the jobs, as well as to the flexibility and irregularity of working hours, and to the seasonal nature of work in this sector that often peaks during periods when higher education establishments are closed. In 2007, those aged 15 to 29 accounted for over one third (35.7%) of the sector's workforce in the EU-27

, the highest share of younger workers in the workforce of all of the NACE divisions within the non-financial business economy. The share of younger workers in the workforce of accommodation and food services was systematically higher than the average in the non-financial business economy in all of the Member States, except in Cyprus.

Expenditure, productivity and profitability

Investment by the accommodation and food services sector was relatively high in 2006, EUR 35.2 billion. This was equivalent to 3.4% of the non-financial business economy total, slightly more than the sector's value added share and as a result the investment rate in the accommodation and food services sector (19.4%) was above the non-financial business economy average (18.4%). A more detailed analysis reveals that the accommodation services subsector recorded a particularly high level of investment, equivalent to 29.8% of its own value added, while the restaurants, bars and catering subsector had an investment rate of 13.5%. Lithuania and Greece both recorded relatively high rates of investment in the accommodation and food services sector, to the extent that the investment rate recorded here was approximately 1.7 times the rate recorded for the non-financial business economy. However, the highest investment rates were recorded in Bulgaria and Romania, and were in excess of 100%, indicating that in this sector investment outstripped value added in 2006.

An analysis of expenditure shows that **personnel costs** accounted for slightly less than one third (32.7%) of the total operating expenditure in the EU-27's accommodation and food services sector in 2006. This share was

⁵⁷Cyprus, Poland and Slovakia, 2005; Malta, not available.

approximately double the non-financial business economy average (16.1%), and was the third highest share in terms of the coverage used for the structural business statistics sector articles, underlying the labour-intensive nature of accommodation and food services. In the accommodation services subsector the share of personnel costs was particularly high, reaching 37.4%, compared with 30.7% for restaurants, bars and catering.

Apparent [labour productivity](#) in the EU-27's accommodation and food services sector was EUR 19.6 thousand per person employed in 2006, this low level reflecting, at least to some extent, the high use of part-time and seasonal employment. Equally, these characteristics and the relatively low or unskilled workforce have an impact on average personnel costs per employee which were EUR 15.6 thousand in the accommodation and food services sector. For both of these indicators the accommodation and food services sector recorded the lowest values among all of the sectors covered by the structural business statistics sectors; both of these indicators were even lower in the restaurants, bars and catering subsector.

The [wage-adjusted labour productivity ratio](#) is less affected by the incidence of part-time and seasonal employment. For the EU-27's accommodation and food services sector this ratio was 126.2% in 2006, still well below the equivalent ratio for the non-financial business economy (151.1%). Again this ratio was lower for restaurants, bars and catering than it was for accommodation services. In all Member States⁵⁸ this ratio was lower in the accommodation and food services sector than in the non-financial business economy as a whole, although only the Greek ratio of 79.5% was below parity (100%).

Despite the relatively low [productivity](#) figures, the EU-27's accommodation and food services sector recorded a [gross operating surplus](#) (value added less personnel costs) equivalent to 14.6% of turnover in 2006. Once more, a lower level for this indicator was registered for the restaurants, bars and catering subsector, but at 12.8% it was still above the non-financial business economy average of 10.8%.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics \(STS\)](#) , the [Labour force survey \(LFS\)](#) and Eurostat tourism statistics.

Context

One of the main characteristics of tourism is the high income elasticity of demand, which increases or reduces more easily than for many other products or services. As such, spending on tourism generally decreases proportionally faster than consumers' income during times of economic slowdown. Moreover, political or economic uncertainties tend to lead to a diversion of tourism demand, leading for example to shifts between outbound tourism and domestic tourism, for example when exchange rates change rapidly. Furthermore, a downturn in economic fortunes is also likely to result in reduced business activity; likely to be reflected in fewer business trips and nights spent in hotels, as well as less business lunches and dinners.

Notes

Industrial processing machinery production statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), the present article covers the production of industrial processing machinery, corresponding to NACE groups 29.4 and 29.5, which are part of the [machinery and equipment](#) sector. The activities covered in this article are the manufacture of:

- machine-tools (corresponding to NACE Group 29.4);
- other special purpose machinery (NACE Group 29.5).

	Enterprises (thousand)	Turnover (EUR million)	Value added (EUR million)	Persons employed (thousand)	Share in total (%)	
					Value added	Persons employed
Industrial processing machinery	64.0	200 688	65 400	1 215.0	100.0	100.0
Machine-tools	14.3	47 688	16 400	315.0	25.1	25.9
Other special purpose machinery	49.7	153 000	49 000	900.0	74.9	74.1
For metallurgy	3.1	7 700	2 600	60.0	4.0	4.9
For food, beverage & tobacco processing	9.8	19 300	6 600	130.0	10.1	10.7
For textile, apparel & leather production	4.7	12 600	3 800	81.7	5.8	6.7
For paper & paperboard production	1.2	8 952	2 808	45.8	4.3	3.8
Other special purpose machinery n.e.c.	24.0	66 178	22 949	435.1	35.1	35.8
For mining, quarrying and construction	6.9	38 504	10 420	191.4	15.9	15.8

Source: Eurostat (SBS)

Table 4: Manufacture of machine-tools; manufacture of other special purpose machinery (NACE Groups 29.4 and 29.5). Expenditure, productivity and profitability, EU-27, 2006 (1)

There were 64.0 thousand enterprises in the EU-27 whose main activity was the manufacture of industrial processing machinery (NACE Groups 29.4 and 29.5) in 2006; together they generated EUR 65.4 billion of value added from sales of EUR 200.7 billion. As such, industrial processing machinery contributed just over one third (34.0%) of the total value added that was generated across the whole of the machinery and equipment (NACE Subsection DK) manufacturing sector. The 1.2 million persons employed in the industrial processing machinery manufacturing sector within the EU-27 in 2006 also represented around a third (33.3%) of the machinery and equipment workforce.

Of the two NACE groups that make up the manufacture of industrial processing machinery, the largest sub-sector (using any of the standard indicators to measure size) was the manufacture of other special purpose machinery (NACE Group 29.5), which accounted for a about three quarters of EU-27 sectoral value added (74.9%) and employment (74.1%), the remainder being attributed to the manufacture of machine tools (NACE Group 29.4). The largest of the six NACE classes within the other special purpose machinery subsector was the miscellaneous category of other special purpose machinery not elsewhere classified (NACE Class 29.56), which accounted for almost half of the value added (46.8%) within this subsector, while the manufacture of special purpose machinery for mining, quarrying and construction (NACE Class 29.52, 21.3%) and for food, beverage and tobacco processing (NACE Class 29.53, 13.5%) were also relatively important.

The EU-27's industrial processing machinery manufacturing sector was dominated by output from Germany, which contributed 42.2% of sectoral value added in 2006 (some EUR 27.6 billion). The German share of EU-27

value added was almost three times as high as the next biggest share, recorded in Italy (15.3%), which in turn was twice as high as the third highest share in the United Kingdom (7.5%). When restricting the analysis to just the machine tools subsector, Germany had an even greater presence, providing more than half (51.5%) of the EU-27's value added in 2006.

Germany was also the most specialised Member State for industrial processing machinery manufacturing, as this sector contributed 2.4% to German non-financial business economy (NACE Sections C to I and K) value added

in 2006, which was double the EU-27 average (1.2%); other Member States⁵⁹ that were relatively specialised included Finland and Austria (both 2.0%).

The [production indices](#) for the two NACE groups that comprise industrial processing machinery manufacturing followed a similar path in the past decade. Growth was, on average, relatively modest within the EU-27, averaging 1.7% per year during the ten-year period from 1997 to 2007 for machine tools, while the corresponding rate for other special purpose machinery was 1.6% per year. Both of these values were considerably lower than the average rates of growth recorded for the whole of machinery and equipment manufacturing over the same period (2.6% per year).

Expenditure and productivity

EU-27 gross [tangible investment](#) in the industrial processing machinery manufacturing sector was EUR 5.5 billion in 2006, almost one third (31.4%) of all investment in the machinery and equipment manufacturing sector. The [investment rate](#) for the industrial processing machinery manufacturing sector (8.3%) was slightly lower than the machinery and equipment average (9.0%).

[Personnel costs](#) accounted for 25.0% of operating expenditure in the EU-27's industrial processing machinery manufacturing sector in 2006, which was somewhat higher than the machinery and equipment average of 23.6%. Average personnel costs in the EU-27's industrial processing machinery manufacturing sector were EUR 38.6 thousand per employee in 2006 (almost the same as the machinery and equipment average). Each person employed within the EU-27's industrial processing machinery manufacturing sector generated an average of EUR 53.8 thousand of added value in 2006, which was EUR 1.1 thousand more than the average recorded for the whole of the machinery and equipment sector. Combining these two ratios results in a [wage-adjusted labour productivity ratio](#) of 139.3% for the industrial processing machinery manufacturing sector in 2006, which – although the highest ratio among the subsectors covered by [Machinery and equipment production statistics](#) – was well below the non-financial business economy average (151.1%).

Looking in more detail at these productivity measures, the highest level of [labour productivity](#) in the EU-27 was recorded for the manufacture of special purpose machinery for paper and paperboard production (NACE Class 29.55), where each person employed generated an average of EUR 61.3 thousand of value added in 2006. This disparity was however reflected in the average personnel costs for this subsector, which stood at EUR 49.9 thousand per employee, again by far the highest level among the NACE classes covered.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#), including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include the [PRODCOM](#) statistics on the production of manufactured goods.

Context

Technological advancements in the machinery and equipment that is used in other sectors of the economy (particularly in mining, manufacturing, energy provision and construction) can have a considerable impact upon the speed, quality and quantity of what is produced, thereby impacting on downstream productivity and profitability. The machinery and equipment sector is sensitive, therefore, to overall economic conditions and investment patterns both within the European Union and across the world (the two arguably being more intertwined than ever).

Industrial processing machinery covers the manufacture of a wide range of products that are destined for specific purposes within downstream manufacturing sectors. As such, demand is closely linked to general economic developments, as during periods of recession manufacturers in other areas of the industrial economy are

⁵⁹Bulgaria, Cyprus, Latvia, Poland and Romania, 2005; Luxembourg, Malta and the Netherlands, not available.

unlikely to invest in or renew their machinery and equipment. Industrial processing machinery producers make specialist machines and applications to aid the manufacturing processes in a range of diverse sectors: for example, special purpose machinery for mining and quarrying, metallurgy, food and beverages processing, textiles and clothing production, paper and paperboard production, or construction.

(DS-066341)

This article examines recent statistics on industrial production in the [European Union \(EU\)](#) . PRODCOM is the name given to the EU's system of industrial production statistics which covers mining and quarrying and manufactured products.

Main statistical findings

PRODCOM covers mining and quarrying as well as manufacturing, in other words, [NACE Rev. 2](#) Sections B and C. PRODCOM statistics are based on a list of products called the PRODCOM List which consists of about 3900 headings and is revised every year. Products are detailed at an 8-digit level – only information at this detailed level can be found in the PRODCOM database, as production data for different products cannot always be meaningfully aggregated. The purpose of PRODCOM statistics is to report, for each product in the PRODCOM List, how much production has been sold during the reference period. This means that PRODCOM statistics relate to products (not to activities) and are therefore not strictly comparable with activity-based

statistics such as structural business statistics.

PRODCOM information is currently requested for each heading in terms of the value of production sold during the survey period. Table 1 shows the level of production in the EU-27 for a selection of products. As can be seen, transport equipment products (within Divisions 29 and 30) dominated the list of the most sold manufacturing products in the EU-27 in value terms in 2011, occupying the top two places with a number of further products among the top 15 shown, while there were also several manufactured food products (within Division 10) and a couple of fabricated metal products (Division 25).

As well as data by value, information on the physical quantity (also referred to as volume) of production sold during the survey period is also requested. Table 2 shows the quantity of production sold for a selection of products. In certain circumstances this information can be supplemented by the physical quantity of actual (total) production during the survey period, including therefore any production which is used (as an intermediate product) by the enterprise in the manufacture of other products in the List.

Data sources and availability

The PRODCOM List is linked to the activity classification NACE and to the [classification of products by activity \(CPA\)](#) : the first four digits of each PRODCOM code refer to a NACE class, the fifth and sixth digits relate to a CPA subcategory, and the seventh and eighth digits are specific to the PRODCOM List. Most headings correspond to one or more [combined nomenclature \(CN\)](#) codes: some headings (mostly industrial services) do not correspond to a CN heading at all. The relationship with CN enables the calculation of apparent consumption by linking production statistics to international trade statistics.

The production surveyed covers only the production actually carried out on the territory of the reporting country. This means that the production of subsidiaries which takes place outside an enterprise's territory is not included in the survey for that country. As a general principle, when a production process takes as an input a material that does not match the description of the product, and produces as an output something that does, then production of the product should be recorded. On the other hand, if the processing merely works on a product without changing the heading under which it is listed, it should not be recorded, since this would result in double-counting. This means that the link to turnover is tenuous, since some activity does not result in new products and should not be recorded in PRODCOM statistics.

PRODCOM data are available for all of the EU Member States, Iceland, Norway and Croatia, and Eurostat produces aggregates for the EU-27 and the EU-25. Data are available during the year following the reference year, with the first release by Eurostat normally in July. As more complete and revised data becomes available updates are released on a monthly basis.

Context

The development of PRODCOM dates back to 1985 when there were the first meetings of a working party on production statistics, whose objective was to harmonise the various ways industrial production statistics were collected in the EU Member States. Although statistics were collected on production in most countries, these covered the national situation, and national classifications were used and different survey methods applied. The basis of PRODCOM is to enable these national statistics to be compared and where possible aggregated geographically to give a picture relating to the output of a product within the EU context. This aim became more urgent with the creation of the single European market in 1992, such that the statistical system had to adapt.

Production statistics are used by the [European Commission](#) and national administrations for policymaking and by professional/trade associations and their members. The use of the data in climate change statistics is increasing, as well as in other environmental statistics such as the analysis of [material flows](#) or [chemicals management](#) .

Information and communication service statistics - NACE Rev. 2

Data from June 2011, most recent data: Further Eurostat information, Main tables and Database

This article presents an overview of statistics for the [European Union's \(EU's\)](#) information and communication services sector, as covered by [NACE Rev. 2](#) Section J. Information and communication services concern the production and distribution of information and cultural products, the provision of the means to transmit or distribute these products as well as data or communications, information technology activities, and the processing of data and other information service activities.

The sector is composed of six separate NACE divisions and includes:

- publishing activities (Division 58);
- motion picture and sound recording activities (Division 59);
- programming and broadcasting activities (Division 60);
- wired, wireless and satellite telecommunications activities (Division 61);
- computer programming and consultancy statistics (Division 62);
- information service activities such as data processing, hosting, web portals, news agencies, information search (Division 63).

Note that this article does not cover printing or the mass reproduction of recorded media, both of which are considered as part of the [manufacturing](#) sector (Section C). The activities of call centres are included within the [administrative and support services sector](#) (Section M).

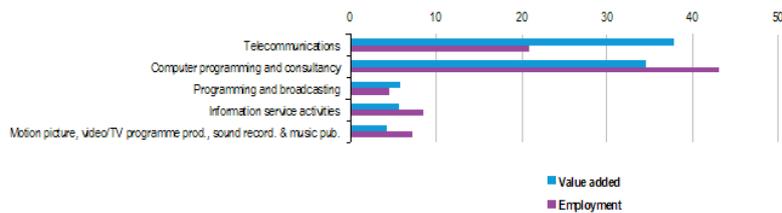

Publishing includes the acquisition of copyrights to content (information products) and making this content available to the general public by engaging in or arranging for the reproduction and distribution of this content in various forms; all types of media are included. Different types of content are considered, with the publishing activity as presented in this article including content such as books, newspapers, magazines and software, while the production of audio and visual content is included within motion picture and sound recording activities.

Programming and broadcasting activities cover the production and distribution of TV programming and involves different stages: production of individual items (such as films or television series); the creation of a complete television channel programme (including live news programming) and broadcasting; distribution of complete television programmes by third parties without any alteration of the content, for example through broadcasting, satellite or cable systems.

Table 4b: Key indicators, information and communication (NACE Section J), 2009 - Source: Eurostat (sbs_na_1a_se_r2)

Main statistical findings

Structural profile

The EU-27's information and communication services sector (Section J) numbered some 794 thousand enterprises in 2009, employing 5.7 million persons and contributing EUR 477500 million value added. This sector's contribution to the non-financial business economy (Sections B to J and L to N and Division 95) was 3.8% of the enterprise population, 4.3% of the workforce, and 8.6% of value added.

The apparent labour productivity of the EU-27's information and communication services sector in 2009 was EUR 83 thousand per person employed, which was double the non-financial business economy average of EUR 41.6 thousand per person employed. Alongside this relatively high apparent labour productivity – joint third

highest among the NACE sections that make-up the non-financial business economy – [average personnel costs](#) within the information and communication services sector were EUR 48.6 thousand per employee, which was also well above the average for the non-financial business economy (EUR 30.0 thousand per employee) and the second highest among the NACE sections.

The [wage-adjusted labour productivity ratio](#) shows that value added per person employed was equivalent to 171.2% of average personnel costs per employee across the EU-27 in 2009. This ratio was substantially higher than the non-financial business economy average (138.8%). Equally the EU-27's information and communication services sector recorded a [gross operating rate](#) of 20.9% in 2009, just over double the 9.7% average for the whole of the non-financial business economy and lower only than the rates recorded for real estate (40.3%) and for mining and quarrying (26.6%).

Sectoral analysis

Two of the six subsectors (at the division level) dominate the information and communication services sector in the EU-27, namely telecommunications (Division 61) and computer programming and consultancy (Division 62). These two subsectors generated close to three quarters (72.2%) of sectoral value added and employed almost two thirds (63.9%) of the workforce. The third largest subsector was publishing (Division 58) – although data for this activity are only available for 2008 when publishing activities employed 16.6% of the information and communication services workforce and contributed 11.9% to sectoral value added. Telecommunications and programming and broadcasting activities were the only two of the six subsectors where the share of sectoral employment was lower than the value added share, suggesting that these two activities had relatively high apparent labour productivity.

Indeed, the high apparent labour productivity figure for the whole of the EU-27's information and communication services sector in 2009 was pulled upwards by the relatively high values for the telecommunications subsector (EUR 150000 per person employed) and the programming and broadcasting activities subsector (Division 60) where apparent labour productivity was EUR 109 thousand per person employed. Among the four other subsectors within the information and communication services sector, apparent labour productivity was below the sectoral average of EUR 83 thousand per person employed, but above the non-financial business economy average of EUR 41.6 thousand per person employed. Equally all of the subsectors recorded average personnel costs per employee above the non-financial business economy average, ranging from EUR 39.6 thousand for information service activities (Division 63) to EUR 53.4 thousand for computer programming and consultancy. Due to their very high apparent labour productivity the telecommunications and the programming and broadcasting activities subsectors recorded the highest levels of wage-adjusted labour productivity among the six subsectors within the information and communication services sector. This ratio for telecommunications was 294.6%, which was the fifth highest wage-adjusted labour productivity ratio at the NACE division level within the non-financial business economy in 2009. For the programming and broadcasting activities subsector the wage-adjusted labour productivity ratio was 210.3%, the only other activity within the information and communication services sector that had a ratio well above the non-financial business economy average (138.8%). The lowest ratio was recorded for motion picture and sound recording activities (Division 59), at 124.7%.

The telecommunications subsector also recorded the highest gross operating rate (29.7%) among the NACE divisions that compose the EU-27's information and communication services sector; it was followed (again) in the ranking by programming and broadcasting activities (24.2%). None of the remaining four subsectors reported a gross operating rate above the information and communication services sectoral average, underlining the size of these two subsectors and the extent to which their performance generally exceeded that of the other subsectors.

Country analysis

The United Kingdom made the largest contribution among the Member States to sectoral value added and employment within the EU-27's information and communication services sector in 2009, accounting for a 20.1% of value added and an 18.9% share of the information and communication services workforce. Collectively the five largest Member States accounted for 72.8% of the EU-27's value added in the information and communication services sector, compared with a combined share of 71.5% for the non-financial business economy as a whole, indicating a slightly higher than average concentration of this activity within the largest Member States. Infor-

mation and communication services accounted for a double-digit share of non-financial business economy value added in Luxembourg (14.6%), Ireland (11.1%) and the United Kingdom (also 11.1%), while its contribution was just 5.3% in Austria – see Figure 2.

In the two largest subsectors, namely telecommunications and computer programming and consultancy statistics, the United Kingdom generated the largest share of EU-27 value added (16.9% and 23.4% respectively in 2009), and the United Kingdom also made the highest contribution to EU-27 value added for programming and broadcasting activities and for information service activities (23.4% and 25.7% respectively). France accounted for the largest share (29.9%) of EU-27 value added in the motion picture and sound recording subsector and was also the most specialised Member State for this subsector. Germany accounted for the highest share of EU-27 value added for publishing activities in 2008 (no data available for the EU-27 for 2009).

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

Technological and regulatory advancements have made it possible for broadcasting to be opened wider than the traditional government-licensed organisations that used to distribute a small number of radio and television channels according to a fixed schedule; using a range of modern technologies broadcasting can be undertaken with far lower entry barriers, providing a wider range of content and services to users.

[Information and communication technologies \(ICT\)](#) affect people's everyday lives in many ways and EU policies in this area range from regulating entire sectors to trying to protect an individual's privacy. The increased availability of broadband services and of wireless devices is transforming economic and societal behaviour. Widespread access to the Internet via rapid broadband connections is seen as essential for the development of advanced services on the Internet.

In May 2010 the European Commission adopted a Communication concerning a [Digital Agenda for Europe](#), a strategy for a flourishing digital economy by 2020, replacing the [i2010 initiative](#); this is one of seven flagship initiatives under the [Europe 2020 strategy](#) for smart, sustainable and inclusive growth. It outlines policies and actions aimed at maximising the benefit of the digital era to all sections of society and the economy. The agenda focuses on seven priority areas for action: creating a digital single market, greater interoperability, boosting Internet trust and security, providing much faster Internet access, encouraging investment in research and development, enhancing [digital literacy](#) skills and inclusion, and applying ICT to address challenges facing society like climate change and the ageing population.

The Digital Agenda for Europe defines roaming as a key performance target for attaining the Digital Single Market, with the aim of making the difference between roaming and national tariffs approach zero by 2015. After having conducted a thorough review, the European Commission found that the roaming market is not yet competitive enough and despite the fact that the cost of using mobile phones or other devices when abroad in the EU has continuously fallen, most operators still propose retail prices that remain around the maximum legal caps. For this reason the Commission has proposed to extend the [Roaming Regulation](#) until 30 June 2022, along with a series of new measures to increase competition and encourage operators to offer attractive consumer deals. The European Parliament has approved these [new rules](#), which are likely to enter into effect as of 1 July 2012.

Table 4b: Key indicators, information service activities (NACE Division63), 2009 - Source: Eurostat (sbs_na_1a_se_r2)

Main statistical findings

Structural profile

There were 101 thousand enterprises operating within the information services (Division63) sector in the EU-27 in 2009. Together they employed 490 thousand persons, equivalent to 0.4% of the total workforce in the non-financial business economy (Sections B to J and L to N and Division95) or 8.5% of those persons employed in information and communication services (Section J). They generated EUR27337 million of value added which was a 0.5% share of the non-financial business economy total and 5.7% of the information and communication services total.

The apparent labour productivity of the EU-27's information services sector in 2009 was EUR56.0 thousand per person employed, which was the second lowest level among the six NACE divisions that constitute information and communication services. While the level of apparent labour productivity was below the EUR83 thousand per person employed average for the whole of information and communication services, it was still some EUR14.4 thousand per person employed higher than the non-financial business economy average.

The EU-27's information services sector recorded average personnel costs in 2009 of EUR39.6 thousand per employee; this was the lowest level among the six subsectors that compose information and communication services, but remained above the non-financial business economy average of EUR30.0 thousand per employee.

The wage-adjusted labour productivity ratio combines the two previous indicators and shows the extent to which value added per person employed covers average personnel costs per employee. This ratio stood at 140.9% for the EU-27's information services sector in 2009, which was slightly above the non-financial business economy average of 138.8%, but well below the information and communication services average of 171.2%.

The gross operating rate (the relation between the gross operating surplus and turnover) stood at 20.1% for the EU-27's information services sector in 2009, slightly more than double the non-financial business economy average (9.7%) and in line with the information and communication services average (20.9%).

Sectoral analysis

Just over three quarters of the enterprises classified within the EU-27's information services sector in 2009 had their principal activity within data processing, hosting and related activities and web portals (Group63.1). The

relative importance of this subsector was almost identical in terms of its contribution to sectoral value added (75.7% or EUR20702 million) and rose still higher in terms of employment, as it accounted for 79.5% of the information services sectoral workforce, equivalent to 389.4 thousand persons.

Given the relatively large weight of the data processing, hosting and related activities and web portals subsector there was not a great deal of difference between the figures recorded for this subsector in relation to average productivity, personnel costs and profitability measures and the figures recorded for the whole of the information services sector. The residual grouping of other information service activities (Group63.2) had higher levels of apparent labour productivity (EUR66.0 thousand per person employed), average personnel costs (EUR41.7 thousand per employee) and wage-adjusted labour productivity (158.9%), as well as a higher gross operating rate (30.0%).

Country analysis

Just over one quarter (25.7%) of the EU-27's value added within the information services sector in 2009 was accounted for by the United Kingdom. While the United Kingdom generated a higher level of value added for information services in 2009 (EUR7037 million) than Italy (EUR5009 million), the latter had a higher degree of specialisation in information services, as these contributed 0.85% of total value added in the Italian non-financial business economy, compared with 0.81% for the United Kingdom. The relative specialisation of Italy was based upon a high share (22.9%) of EU-27 value added for data processing, hosting and related activities and web portals, while the specialisation of the United Kingdom was promoted by its prominent position for other information service activities.

The United Kingdom also recorded the highest level of apparent labour productivity for information services in 2009, reaching EUR110.5 thousand per person employed. This figure was 2.3 times as high as the national average for the non-financial business economy, the biggest differential among any of the Member States. In contrast, Italy was the only Member State where the apparent labour productivity of the information services sector was below the national average for the non-financial business economy.

The highest wage-adjusted labour productivity ratio for information services in 2009 was registered by the United Kingdom (254.2%) which was about 50% higher than the national non-financial business economy average which in turn was again the biggest differential among the Member States. There were only six Member States (among those for which data are available) that reported a higher wage-adjusted labour productivity ratio for information services than for the whole of their non-financial business economy. Despite most Member States recording relatively low wage-adjusted labour productivity rates for information services, none of the Member States recorded a ratio below parity (100%) and as such, the average value added per person employed more than covered average personnel costs in all Member States.

Based on an analysis of the gross operating rate (which is a measure of gross operating profitability) the information services sector was also relatively profitable. The analysis shows that in 2009 this rate ranged from a high of 42.0% for the United Kingdom, and upwards of 30.0% for the Netherlands, Belgium and Cyprus, to lows of 8.8% in Hungary and 5.1% in France. Indeed, France was the only Member State (for which data are available) to record a gross operating rate that was lower for information services than for the non-financial business economy as a whole. In contrast, the gross operating rates for information services in the Netherlands and the United Kingdom were more than three times as high as their respective national averages for the non-financial business economy.

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

This article presents an overview of statistics for the information services sector in the EU, as covered by NACE Rev.2 Division63. This division includes the activities of web search portals, data processing and hosting activities, as well as other activities that primarily supply information.

Data processing, hosting and related activities include the activities of providing infrastructure for hosting, data processing services and related activities. Included are specialised hosting activities such as web hosting, streaming services or application hosting, application service provisioning, and general time-share mainframe facilities to clients. Data processing activities include complete processing and specialised reports from data supplied by clients or providing automated data processing and data entry services including database running activities. Web portals includes the operation of websites that use a search engine to generate and maintain extensive databases of internet addresses and content in an easily searchable format. This activity also includes the operation of other websites that act as portals to the internet, such as media sites providing periodically updated content.

Other information service activities include news agency activities, for example, news syndicate and news agency activities furnishing news, pictures and features to the media, as well as other information service activities not elsewhere classified, such as telephone-based information services, information search services on a contract or fee basis, and news and press clipping services.

This NACE division is composed of two groups:

- data processing, hosting and related activities; web portals (Group63.1);
- other information service activities (Group63.2).

Activities of call centres are excluded (Division82, part of [office administrative, office support and other business support activities](#)).

Instrument engineering statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), the present article covers instrument engineering, corresponding to NACE Division 33, which is part of the [electrical machinery and optical equipment](#) sector. The activities covered in this article are the manufacture of:

- instruments;
- industrial process control equipment;
- watches;
- clocks;
- photographic equipment.

It does not include photo-chemical products, flashbulbs or television cameras.

	Enterprises (thousand)	Turnover (EUR million)	Value added (EUR million)	Persons employed (thousand)	Share in total (%)

Table 5: Manufacture of medical, precision and optical instruments, watches and clocks (NACE Division 33). Main indicators, 2006 (1)

Almost three tenths (29.6%) of the value added generated within the electrical machinery and optical equipment (NACE Subsection DL) sector in the EU-27 in 2006 came from instrument engineering (NACE Division 33). There were and estimated 92.0 thousand enterprises in the EU-27's instrument engineering sector in 2006, employing just over one million persons. In relative terms, these enterprises accounted for close to half (45.4%) of the total number of enterprises within the electrical machinery and optical equipment sector, suggesting that the size of instrument engineering enterprises was well below the average.

The manufacture of instruments and appliances for measuring, checking, testing, navigating and other purposes, except industrial process control equipment (NACE Group 33.2) and the manufacture of medical and surgical equipment and orthopaedic appliances (NACE Group 33.1) together accounted for more than three quarters of the enterprises, turnover, value added or employment in the EU-27's instrument engineering sector. There were, however, some considerable differences between these two subsectors, as almost two thirds (64.1%) of instrument engineering enterprises in 2006 were classified as producing medical and surgical equipment and orthopaedic appliances, while the manufacture of instruments and appliances for measuring, checking, testing, navigating and other purposes accounted for less than one fifth (17.8%). In value added terms, their relative importance was similar, with the manufacture of medical and surgical equipment and orthopaedic appliances accounting for a 38.2% share in 2006, while the corresponding share for the manufacture of instruments and appliances for measuring, checking, testing, navigating and other purposes was 40.4% in 2005. Of the three remaining subsectors, the only other activity to record a double digit share of EU-27 instrument engineering value added in 2006 was the manufacture of optical instruments and photographic equipment (11.4%); industrial process control equipment accounted for a 7.9% share, while the manufacture of watches and clocks was particularly small (1.0%).

The EU-27's instrument engineering sector was dominated by Germany, where value added in 2006 reached EUR 20.1 billion or one third (33.5%) of the EU-27 total. This was well above the next highest levels of value added recorded in France and the United Kingdom (14.1% and 13.9% respectively of the EU-27 total). The instrument engineering sector in Germany accounted for 1.7% of German non-financial business economy value added, the second highest proportion among the Member States, behind Ireland (3.1%).

The production index for instrument engineering in the EU-27 followed a fairly smooth upward development during the period from 1997 to 2007, with a slowdown in activity (albeit with positive rates) in 2002 and 2003. Average growth of 3.5% per year was recorded for the output of instrument engineering during the ten years to 2007, which was slower than the corresponding rate for electrical machinery and optical equipment manufacturing (4.5% per year). Among the NACE groups covered by this article, the fastest expansion in activity was recorded for medical and surgical equipment and orthopaedic appliances manufacturing, where average growth

of 4.7% per year was registered. Three of the four remaining activities reported average growth of between 2% and 3% per year, while the manufacture of watches and clocks registered a fall in production, on average by 3.9% per year.

Expenditure and productivity

The EU-27's instrument engineering sector recorded gross **tangible investment** valued at approximately EUR 4.4 billion in 2006, some 0.4% of the total for the non-financial business economy. The **investment rate** (calculated as the ratio of investment to value added) was particularly low (7.3%) for the EU-27's instrument engineering manufacturing sector in 2006; this was the lowest rate among any of the NACE divisions within the non-financial business economy for which data are available for 2005 or 2006.

Personnel costs accounted for a high proportion (30.8%) of **operating expenditure** in the EU-27's instrument engineering sector in 2006. This was approximately 50% more than the electrical machinery and optical equipment average (20.6%). This pattern was repeated across all five subsectors that make up instrument engineering, as the relative importance of personnel costs in operating expenditure ranged from 28.6% to 30.7%.

While personnel costs accounted for a high proportion of operating expenditure, this could to some extent be explained by relatively high average personnel costs per employee, which stood at EUR 41.5 thousand in the EU-27's instrument engineering sector in 2006, almost 50% above the non-financial business economy average (EUR 28.8 thousand per employee). The apparent **labour productivity** (EUR 57.6 thousand per person employed) of those working in the instrument engineering sector was about a third higher than the non-financial business economy average (EUR 43.5 thousand). Combining these two ratios, the **wage-adjusted labour productivity ratio** of the EU-27's instrument engineering sector stood at 138.8%, somewhat below the non-financial business economy average (151.5%).

Among the Member States for which data are available⁶⁰, the apparent labour productivity of the instrument engineering sector was highest in Ireland (EUR 107.3 thousand per person employed) in 2006. Ireland also featured among a group of Member States that reported labour productivity within the instrument engineering sector at least 20% above the national non-financial business economy average – the other countries were Denmark, Italy, Sweden and the United Kingdom, as well as Greece and Romania (both 2005). Ireland and Greece (2005) also reported the highest gross operating rates within the instrument engineering sector, with rates close to 30%, while Latvia was the only other country (additionally no information for the Czech Republic) to record a gross operating rate in excess of 20%.

Data sources and availability

The main part of the analysis in this article is derived from **structural business statistics (SBS)**, including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include **short-term statistics (STS)** and the **PRODCOM** statistics on the production of manufactured goods.

Context

The electrical machinery and optical equipment sector is an important and strategic part of Europe's manufacturing sector, producing a wide range of mostly high-technology products (for example, computers, switchgears or semi-conductors). This sector has been cited as being at the centre of industrial development, as almost every other sector depends, at least to some degree, on the capital equipment, technology, end-products, research and innovations that are provided by the electrical machinery and optical equipment sector. It is therefore often referred to as one of the main drivers of **productivity** gains and central to the EU's objective of creating more and better jobs.

⁶⁰Greece, Poland and Portugal, 2005; Malta and the Netherlands, not available.

The goods and services made within the electrical machinery and optical equipment sector range from capital goods used in energy and primary transformation activities, transport manufacturing (motor vehicles, aeronautics and rail equipment producers) or process manufacturing sectors (agro-industries, chemicals, plastics or wood), through intermediate goods (such as electronic components or wiring) that are often used by other manufacturers, to consumer goods (such as consumer electronics, mobile phones and household appliances).

This sector operates within a long-established legislative framework that covers issues such as product safety, energy labelling, minimum efficiency requirements, eco-design and waste.

Two Directives ([2008/34](#) and [2008/35](#)) on waste electrical and electronic equipment (WEEE) and the restriction of the use of certain hazardous substances in electrical and electronic equipment were introduced in 2008. The EU aims to take measures to prevent the generation of electrical and electronic waste and to promote reuse, recycling and other forms of recovery in order to reduce the quantity of such waste by encouraging manufacturers to design products with the environmental impacts in mind throughout their entire life cycle.

The potential role that may be played by the electrical machinery and optical equipment sector with respect to energy efficiency has also been highlighted in recent years. Indeed, considerable effort has gone into reducing the energy consumption of appliances, although changes in lifestyle and working practices have sometimes offset these, for example, while changes to the manufacture of domestic and office appliances has made these more energy efficient, rising equipment rates and the introduction of new technologies may result in higher overall energy consumption. Several directives cover this area of energy saving, in particular a Directive on eco-design requirements for energy-using products, a Directive on the energy labelling of domestic appliances and a Regulation on the energy efficiency labelling programme for office equipment.

Medical instruments manufacturing is one of the largest subsectors of the instrument engineering sector and may be expected to continue growing in the coming years as a result of Europe's slowly ageing society leading to increased demand, while scientific breakthroughs translate into new products, more complex treatments, and new ways of curing certain conditions. However, with pressure on budgets, many healthcare providers are trying to reduce the length of hospital stays and promote homecare treatment, while at the same time healthcare policy increasingly stresses prevention-orientated, consumer-driven healthcare models. Medical devices are regulated by three main Directives ([90/385](#) , [93/42](#) and [98/79](#)) that cover active implantable medical devices, medical devices and in vitro diagnostic medical devices, while similar legislation exists for other subsectors, such as Directive [2004/22](#) on measuring instruments.

Table 7: Autonomous pension funding (NACE Class 66.02). Main indicators, 2006 (1)

The activities covered in this article include:

- insurance fund services;
- pension fund services.

Compulsory social security services are excluded.

Main statistical findings

Employment

The number of persons employed in the EU-27's insurance and pension funding sector (NACE Division 66) was 1.2 million in 2007 according to Labour force survey data. This equated to 18.5% of those employed in all financial and insurance services (NACE Section J). Germany dominated this sector in employment terms with 293.7 thousand persons employed, just less than one quarter (24.3%) of the EU-27's workforce. France (17.4%) and Spain (10.8%) were the only other Member States with a double digit share of EU-27 employment. The

most specialised Member States⁶¹, in terms of this sector's contribution to business economy employment, were the Netherlands (1.7%) and Luxembourg (1.5%).

Insurance and reinsurance enterprises

In most Member States, the workforce of non-life insurance enterprises is larger than that of life insurance enterprises, often considerably so, as in Denmark and Cyprus. In contrast, Slovakia, Greece, Hungary and Luxembourg reported larger life insurance workforces. Among the Member States with data available there was either no employment in composite insurance enterprises (the case in at least five Member States), or the level of employment was larger in composite insurance enterprises than in life and non-life insurance enterprises combined, with only occasional exceptions to this rule.

One measure often used to indicate the size of the insurance subsector is the value of gross premiums written (which may be viewed as a proxy for turnover that is used in the other structural business statistics sectors): it should be noted that no recent data is available for the United Kingdom or Germany which play a large role in insurance markets. Relative to population, the level of gross premiums written was highest in Luxembourg both for life and non-life insurance, followed by Denmark, the Netherlands and Sweden. Despite limited data availability, the importance of the reinsurance market in Luxembourg was clear.

The ratio of capital and reserves to gross premiums written varies greatly between Member States, particularly for life insurance enterprises where it was less than 20% in Luxembourg, Austria, Hungary and Italy, yet reached 100% or more in Sweden, the Netherlands and the Czech Republic, as well as Iceland.

Pension funds

Official statistics on autonomous pension funds are relatively scarce. The information presented indicates that Hungary, Spain, the Netherlands and the United Kingdom were among the Member States where this activity was most important, and Ireland (no recent data available) is also known to be particularly specialised in this activity.

Data sources and availability

The main part of the analysis in this article is derived from structural business statistics (SBS), including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Context

Financial and intermediation services provide instruments to businesses and households in the form of products that are essentially savings or loans, or products to transfer and pool risk. Changes in financing techniques have increased the possibilities open to business to fund investment, while consumers have a wider array of choices for credit, savings and payment methods. At the time of writing this sector is the focus of worldwide attention due to the financial crisis widely experienced across the globe and the impact that this has had on other parts of the economy. This crisis has led to national governments taking over some financial institutions, and providing massive amounts of financial support to others. The crisis has provoked widespread calls for reforms to regulatory bodies and new ways for overseeing the operations and practices of this sector.

There has been considerable EU legislative activity in the sphere of financial and insurance services centred upon the creation of an internal market for financial and insurance services. This work has been conducted through the Financial services action plan (FSAP), which was published by the European Commission in 1999 and the legislative phase completed in 2006.

⁶¹Malta, not available

The absence of cross-border consolidation within the financial and insurance services sector has drawn attention and in September 2007 a Directive of the [European Parliament](#) and of the [Council](#) was adopted ([COM\(2007\) 44](#)) that would tighten the procedures that Member States' supervisory authorities have to follow when assessing proposed mergers and acquisitions in banking, insurance and securities activities. The directive aims to clarify the criteria against which supervisors should assess possible mergers and acquisitions in order to improve clarity and transparency in supervisory assessment and help to ensure a consistent handling of mergers and acquisitions requests across the EU.

In July 2007, the European Commission adopted a proposal for a directive on the taking-up and pursuit of the business of Insurance and Reinsurance (Solvency II) which aims to change the way enterprises in these activities are regulated in terms of capital requirements and supervision. In February 2008, an amended proposal was adopted by the European Commission to take account of other legislative developments ([COM\(2008\) 119](#)).

Notes

Inter-enterprise relations

[Eurostat](#) launched a one-off survey with qualitative questions on relationships between enterprises. This approach is in contrast to the normal [SBS](#) framework where respondents are usually asked to deliver input and output data on their own enterprise, rather than information relating to any relations they have with other enterprises.

Data was collected on a voluntary basis in six [Member States](#) (Denmark, Germany, France, Portugal, Finland and Sweden). Since the origin of the idea to launch the project came from a French project and the methodological model had already been developed in France before its agreement and adaptation with the other five countries, the French data set is somewhat different and is not 100% comparable.

Methodological work concentrated on the definition of types of inter-enterprise relationships. It is evident that a variety of subcontracting and outsourcing relationships exist, and that franchising is also an option in some business models, but an all-encompassing definition for all types of relationships was not agreed. As a result, only the most prevalent forms of co-operation and dependencies were defined for the survey.

The normal relationship between an enterprise and its suppliers/clients was not the focus of this survey. Large enterprises, in particular, tend to have different internal functions, for example [R&D](#) , [ICT](#) , or ancillary functions, for which different types of inter-enterprise relationships may exist. The main idea of the survey was to separate these from the core activities of the enterprise and to study the types of relationships involved. Linkages that exist between inter-dependent enterprises, such as between the headquarters of an enterprise and its subsidiaries were also excluded from the reference population.

As such, the pilot survey concentrated on questions such as how enterprises evaluate the importance of their relationships with others in terms of their own competitiveness, and which barriers are identified as preventing them from engaging in inter-enterprise relationships or obstructing the development of their enterprise.

Main findings

- A large majority of respondents believe that the development of inter-enterprise relationships has an important effect on their future competitiveness.
- In general, enterprises in central and southern European countries tend to prefer structured types of relationships (like subcontracting and licensing) over informal types of relationship (that are prevalent in Scandinavia), such as networking.
- The [size of an enterprise](#) determines the extent and nature of its inter-enterprise relations, but size, as such, is not a limiting factor for the development of relationships.
- Some of the main reasons for engaging in inter-enterprise relations include increased flexibility and the ability to counteract a lack of in-house resources.
- More than 50% of respondents cited the lack of suitable partners, the desire to remain independent, and concerns about losing core competence as obstacles against establishing inter-enterprise relations.

Data

Data on inter-enterprise relations are broken down by:

- country;
- enterprise size class, and by;
- economic activity ([NACE](#)).

Intermediate goods wholesale trade statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), the present article covers intermediate goods [wholesale trade](#), corresponding to NACE Group 51.5, which is part of the [wholesale trade](#) sector. The activities covered in this article are the wholesaling of non-agricultural intermediate products, waste and scrap, which includes the wholesale of all products used as production materials, fuel or other consumables, except for agricultural products (which are treated in [Agricultural wholesale trade statistics - NACE Rev. 1.1](#)). It includes, for example, the wholesaling of:

- fuels;
- construction materials;
- hardware;
- chemicals;
- scrap.

	Enterprises (thousand)	Turnover (EUR million)	Value added (EUR million)	Persons employed (thousand)	Share in total (%)

Table 2: Wholesaling of intermediate goods (NACE Group 51.5). Structural profile: ranking of top five Member States in terms of value added and persons employed, 2006

The EU-27's wholesaling of intermediate goods sector (NACE Group 51.5) consisted of 247.0 thousand enterprises in 2006, approximately one in seven of all wholesaling (NACE Division 51) enterprises. This sector's significance was greater in output and employment terms, as it generated EUR 1548.0 billion of turnover, one third of the wholesale trade total, and also contributed more than one fifth of wholesale trade value added and employment.

Among the seven NACE classes that make up the wholesale of intermediate goods, almost half (49.5%) of the EU-27's turnover, but less than one fifth (18.1%) of its value added was generated by the wholesale of fuels and related products (NACE Class 51.51), while the wholesale of wood, construction materials and sanitary equipment (NACE Class 51.53) contributed just 16.1% of turnover, but 29.9% of value added, and 40.5% of its workforce.

Among the Member States⁶², Germany and the United Kingdom were by far the largest contributors to the EU-27's output: the United Kingdom generated 25.3% of the EU-27's turnover in 2006 and Germany 18.0%, while these positions were reversed in terms of value added, whereby Germany's share was 20.0% compared with the United Kingdom's 17.4%. However, these two Member States were relatively unspecialised in this activity in terms of its contribution to national non-financial business economy (NACE Sections C to I and K) value added; in each country, the wholesale of intermediate goods generated no more than 2.1% of non-financial business economy value added. In contrast, the Baltic States were the three most specialised Member States⁶³, as their intermediate goods wholesaling sectors contributed at least 3.8% of non-financial business economy value added.

Annualised short-term statistics provide information on the evolution of the turnover index for the wholesale trade of intermediate goods – see Wholesale trade statistics - NACE Rev. 1.1. The wholesaling of intermediate goods recorded the strongest year on year growth during each of the last five years (2003 to 2007) among wholesale trade NACE groups. Growth was particularly strong in 2005 (17.0%) and 2006 (13.8%), but lower in 2007 (7.7%). Over the period 2000 to 2007 sales within this sector grew on average by 7.3% per year, the highest average annual growth rate over this period of all available non-financial services. These high increases may well reflect, in part, above average price increases – notably those concerning the wholesaling of fuel which makes up a large part of intermediate goods wholesaling.

Expenditure and productivity

Gross tangible investment by the EU-27's intermediate goods wholesalers reached EUR 14.6 billion in 2006, more than one quarter (27.5%) of all the wholesale trade investment. This represented the equivalent of 11.8% of value added, slightly above the 10.2% average investment rate for wholesale trade. The highest investment rate within the intermediate goods wholesaling sector was recorded for the wholesale of waste and scrap (NACE Class 51.57) where tangible investment was equivalent to 21.1% of value added.

The proportion of operating expenditure allocated to personnel costs was 4.2% for the EU-27's intermediate goods wholesaling sector, the lowest of all of the wholesale trade NACE groups, and the third lowest of all of the non-financial business economy NACE groups (with 2005 or 2006 data available). This extremely low share of personnel costs in operating costs for the intermediate goods wholesaling sector was, in large part, due to the wholesaling of fuels (NACE Class 51.51) where the share was only 0.8%, as all other subsectors recorded shares above the average for the intermediate goods wholesaling sector, reaching 11.9% for the wholesaling of hardware, plumbing and heating equipment and supplies (NACE class 51.54).

⁶²Bulgaria and Poland, 2005; Malta, not available.

⁶³Bulgaria, Cyprus, Poland and Romania, 2005; Malta and the Netherlands, not available.

Apparent [labour productivity](#) in the EU-27's intermediate goods wholesaling sector was EUR 58.4 thousand per person employed, while average [personnel costs](#) stood at EUR 32.2 thousand per employee. While the apparent labour productivity was above the wholesale trade average, average personnel costs were relatively lower, resulting in a [wage-adjusted labour productivity ratio](#) of 181.6%, well above the wholesale trade ratio (159.8%) and second highest within the wholesale trade activities, behind that achieved in other wholesale trade (see [Non-specialised wholesale trade statistics - NACE Rev. 1.1](#)). This ratio was remarkably high in the EU-27's wholesale of fuels and related products subsector (332.7%), and also very high in the subsectors of metal and metal ores wholesaling (NACE Class 51.52, 221.6%) and waste and scrap (210.9%).

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#), including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Context

The activities in NACE Division 51 cover all wholesale trade except that concerning motor vehicles and motorcycles (see [Fuel retail and service station statistics - NACE Rev. 1.1](#)): the wholesaling of automotive fuel is considered as a wholesale trade rather than a motor trade. This article covers resale (sale without transformation) of new and used products, as well as wholesale activities carried out on a fee or contract basis.

The wholesaling activity consists of selling to retailers or to industrial, commercial, institutional and professional users. Wholesalers can act on a [fee or contract basis as agents](#) or for their own account, buying and selling goods. The own-account wholesale sub-sectors distinguish the types of product in which the wholesaler is specialised ([agricultural products](#), [consumer goods](#), intermediate goods (this article), [machinery and equipment](#)), while specialised wholesalers of other products are included in [non-specialised wholesalers](#).

In the supply chain, wholesalers are located between producers and users, providing know-how and knowledge in markets for which they have expertise. Competition within the wholesale trade activity is often centred on providing more efficient services or more sophisticated value added services. Wholesalers can provide a range of services from basic storage and break of bulk, sorting, grading and logistics to pre- and post-production operations (for instance, labelling, packaging, bottling and installation).

Notes

International sourcing

Industrial restructuring has been one of the main economic developments in the EU in recent decades, especially influencing the manufacturing sector, leading to debate over the deindustrialisation of Europe. A more recent trend, which has received a great deal of political and media attention, is the apparent increase in the international sourcing of services. The international sourcing of services is facilitated by technological developments, especially within **Information and communication technology (ICT)**, allowing enterprises to codify and transfer information and knowledge globally. Another significant facilitator is increased globalisation within services markets as a consequence of market deregulation and trade liberalisation, including recent measures taken within the EU.

As the majority of service functions require a proximity to markets and clients, the initial focus of international sourcing within services was centred on back-office functions (for example, IT services or finance/accounting), enabled by the increased use of ICT and Internet connectivity. However, enterprises have more recently moved to delocalise various functions that focus on customer contacts (for example, the use of intelligent telephone software since the late 1990s, especially for call centres).

The phenomenon of international sourcing has a variety of labels and terms (often used without explicit definitions), such as:

- **off-shoring** ;
- **near-shoring** ;
- **delocalisation** ;
- relocalisation;
- **outsourcing** , or;
- insourcing.

The somewhat generic heading of international sourcing has been chosen for this development project as there is no generally accepted definition for these phenomena.

The objective of this development project on international sourcing, which was launched in 2006, is to provide policy makers at a national and European level with relevant statistical information on the reasons for, the extent of, and the consequences of, international sourcing.

The project concentrates on international sourcing of existing functions/activities that are performed in-house or domestically sourced to either non-affiliated (external suppliers) or affiliated enterprises located abroad. It is important to emphasise that studies relating to the magnitude and impact of international sourcing are mainly based on anecdotal evidence, as no harmonised and internationally comparable official statistics are currently available.

Main findings

Based on the initial results for 12 European countries (in enterprises with 100 or more persons employed) between 2001 and 2006:

- most international sourcing of core business and/or support functions remained within the EU;
- international sourcing was most common among Irish, British, Danish, Finnish and Slovenian enterprises;
- manufacturing enterprises sourced far more than enterprises active in other sectors of the economy: well over 50% of Irish and British manufacturing enterprises participated in this process, and over one third of Danish manufacturing enterprises;

- in Ireland, Italy, Sweden and the United Kingdom more core business than support business functions were internationally sourced;
- among supporting business functions, the international sourcing of distribution and logistics, as well as marketing and (after-) sales was most widespread;
- over the period 2001-2006, 16% of enterprises surveyed moved some of their business functions abroad;
- the main motivation for moving functions abroad was to benefit from a reduction in labour costs (45% of enterprises – multiple answers possible).

International sourcing statistics

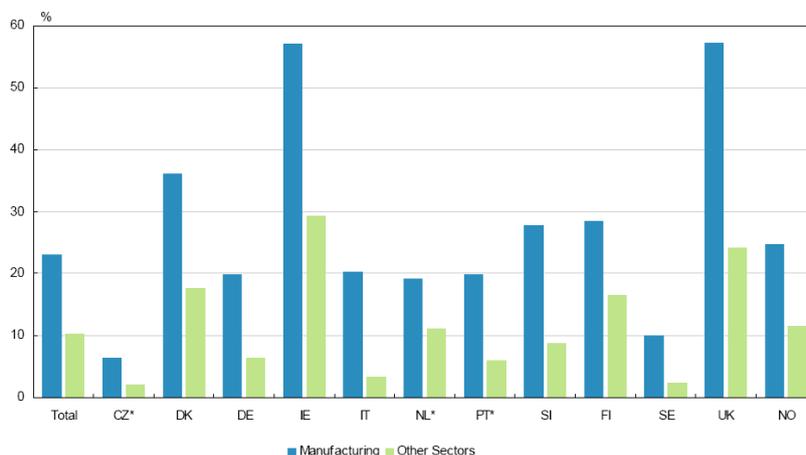

Data from September 2008, most recent data: Further Eurostat information, Main tables and Database .

Graph 1: Level of International Sourcing of enterprises during 2001-2006 and planned International Sourcing 2007-2009 - Share of surveyed enterprises with 100 or more persons employed

This article is based on the results of an ad hoc survey of [international sourcing](#) carried out in 11 [European Union](#) countries and one non-EU country (Norway). The survey investigated the magnitude and impact of international sourcing by enterprises of both their core business and support functions. Although sourcing abroad can result in the loss of domestic jobs, it can also improve an enterprise’s competitiveness, and hence both secure existing jobs and create new ones.

Table 3: Motivation factors of International Sourcing activities by country - Share of enterprises carrying out International Sourcing

Graph 8: Positive impacts of International Sourcing - Share of enterprises having sourced internationally and considering the following impacts positively

Graph 9: Barriers met on International Sourcing activities - Share of enterprises carrying out International Sourcing

Graph 10: Destination for International Sourcing – core and/or support functions planned for 2007-2009 - Share of answers given by the enterprises planning to carry out International Sourcing

The continuous globalization of the economy has pushed many enterprises to adopt international sourcing as a business model, i.e. to move certain **business functions** that were performed in-house or domestically sourced by the resident **enterprise** to either non-affiliated (outsourcing to external suppliers) or affiliated enterprises abroad (insourcing). This article is based on the results of an ad hoc survey of international sourcing in 12 European countries.

Essentially, the survey results reveal that:

- Most international sourcing of core business, or support functions, or both, remain intra-EU.
- It is most common among Irish, UK, Danish, Finnish and Slovenian enterprises.
- Manufacturing enterprises source far more than those active in other sectors: well over 50% of Irish and UK enterprises and over one third of Danish enterprises do so.
- In Ireland, Italy, Sweden and the UK, more core business functions than support business functions are sourced.

- Among the support business functions, the international sourcing of 'distribution and logistics' as well as 'marketing and (after-) sales' is most widespread.

Graph 1 shows the shares of enterprises which, during 2001-2006, sourced internationally, and those that did not but were planning to do so during 2007-2009.

During 2001-2006, 16% of the surveyed⁶⁴ enterprises had moved certain business functions abroad. More than twice as many enterprises in Ireland and the United Kingdom⁶⁵ did so (38.3% and 34.7% respectively). The two small and open Nordic economies, Denmark (25.4%) and Finland (22%), were also significantly above the average.

With the exception of Slovenia (19.7%), the remaining countries participating in the survey were either at the average level (Norway 16%), or under it, the lowest share being registered in the Czech Republic (4.5%).

When enterprises that did not source internationally were asked about their plans in the near future (2007-2009), relatively few Irish (3.1%) and UK enterprises (2.4%) intended to do so, as these countries already had high sourcing levels. Conversely, 12.0% of Swedish⁶⁶ and 7.2% of Danish and Finnish enterprises not currently sourcing certain business functions abroad were planning to do so. The remaining countries had shares ranging from 1.5% to 5.5%.

Limited to 2001-2006, Graph 2 outlines the share of enterprises that had sourced internationally, according to their main activity. Without exception, manufacturing enterprises had adopted it to a far larger extent (often three or four times more), than those active in other sectors. Indeed, the majority of Irish (57.1%) and UK manufacturing enterprises (57.3%), and over one third of the manufacturing enterprises in Denmark were sourcing internationally. At the other end of the scale, only 6.3% of Czech manufacturing enterprises surveyed had adopted it, which is three times more than Czech enterprises active in other sectors (2.1%). These rather low levels may indicate that the Czech Republic is still more of a receiver of international sourcing than active in it.

Core functions have surprisingly high shares

One might expect that enterprises would more often source support functions than core ones. Support functions are those not directly linked to core functions, such as the production of final goods or services which are intended for the market and produce income. However, as can be seen in Graph 3, relatively significant shares of enterprises have sourced core business functions internationally. In addition, some countries have a larger share of enterprises that are sourcing core functions than support ones.

The latter aspect is particularly clear in the United Kingdom where 27.2% of the enterprises surveyed had sourced core functions, whereas 23.2% did so for support functions. The picture is more balanced for Ireland where enterprises sourced both core business and support functions to a fairly large extent (29.9% versus 28.7%). In Italy and Sweden, a larger proportion sourced core business functions as well but, generally, at a lower level. In Graph 3, the displayed shares are not mutually exclusive, i.e. a surveyed enterprise may have sourced both function types.

The rather large difference noted for UK enterprises has had an impact on the overall average of the participating countries. At the aggregated level, a marginally larger proportion of enterprises sourced core business functions abroad.⁶⁷

Table 1 provides further details on this aspect and looks at the international sourcing of core business and support functions by sector. The highest shares were noted for Ireland and the UK. However, whereas the former also displays similar high shares for support functions, the UK enterprises source these functions to a lesser extent, although they are still sourced at more than double the average value of all the participating countries.

⁶⁴The survey was economy-wide and covered enterprises with 100 or more employees.

⁶⁵[2.1]Results from Sweden and the UK are affected by the special set-up used when determining target populations. In Sweden, international sourcing is probably underestimated, while in the UK it may be overestimated.

⁶⁶[2.1]Results from Sweden and the UK are affected by the special set-up used when determining target populations. In Sweden, international sourcing is probably underestimated, while in the UK it may be overestimated.

⁶⁷The average has a somewhat limited reliability as the data from certain countries are provisional (Czech Republic and Portugal) or are unreliable (the Netherlands).

Unsurprisingly, considering the nature of their business, non-manufacturing enterprises source their core business functions internationally to a far lesser extent. Among the 12 countries, once again Ireland and the UK come top, having the highest share of non-manufacturing enterprises that source abroad. However, these sourcing levels are only about half (or even less) as high as the manufacturing ones. In addition, in Ireland and in the UK there is a fairly small difference between the share of enterprises sourcing core business functions and those sourcing support ones.

Focusing on support business functions only, regardless of the sector, Table 2 reveals that 'Distribution and logistics' and 'Marketing, sales and after-sales services' are the functions most frequently sourced internationally. Certain particularities appear: Danish, Dutch and Finnish enterprises source ICT services more than other functions, and Ireland and the UK source significant shares of engineering and related technical service functions.

European destination for international sourcing

The choice of destination for international sourcing is influenced by a multitude of factors, such as:

- availability of appropriate labour;
- infrastructure in the country selected;
- a possible network of affiliated enterprises; or even
- language and cultural barriers.

The destination for the international sourcing of all functions, either core business or support, or both, is shown in Graph 4. A first glance reveals that for those countries for which data are available, at least 40% of the internationally sourced functions remain 'intra-EU'. The exception is Slovenia where the proportion amounts to just over 30%. Intra-EU sourcing can reach values as high as 69% in Sweden, 64% in the Netherlands, 63% in the Czech Republic and 66% in the non-EU Norway (in the latter, the term 'EU sourcing' is more appropriate than 'intra-EU' sourcing).

For Slovenia, 'other European countries' are the main destination of either core or support functions, or both. The destination is most likely to be their neighbour, Croatia. Sourcing to the USA and Canada had the highest shares in the UK and Ireland (19.5% and 12.6% of all enterprises respectively), followed by Italy, (10.0%). Among the former countries, this is presumably due to the lack of a language barrier.

International sourcing to India, traditionally linked with ICT services, is not as common as might be expected. With the exception of the Netherlands and the UK, sourcing to China is more widespread. Here, too, enterprises' declarations of their sourcing destinations are not mutually exclusive. This means that overlaps can occur as enterprises source functions to various countries/country groups.

Types of sourcing business patterns

It is normal for an enterprise that its choice of sourcing destination will be influenced by the location of its international network of branches or affiliated companies. This has to be taken into account when looking at the results in the previous sections. Comparing international insourcing (sourcing within the enterprise group) and outsourcing (sourcing outside the enterprise group), Graph 5 shows that, regardless of the business sector, insourcing is generally more common than outsourcing. At the aggregated level, close to 70% of all those surveyed enterprises which stated they were sourcing internationally did so within their own group of affiliated enterprises - insourcing. It should also be taken into account that among these groups an enterprise's degree of ownership may vary. Overall, just over 36% of enterprises were outsourcing. But here again, enterprises might use both in- and out-sourcing, which explains why the cumulated proportions frequently exceed 100%. Although insourcing is often twice as common as outsourcing, in Denmark and Ireland they both have similar proportions. Conversely, the gap between them is particularly wide in the Czech Republic, Germany and Sweden.

Focus on sourcing ICT services

During 2001-2006 in the 12 countries, among the surveyed enterprises which internationally sourced services effectively that were linked to [information and communication technologies](#) , an average of three quarters (75.2%) did so within their own enterprise group - insourcing (see Graph 6). The outsourcing of ICT services was performed by just over 30% of enterprises.

Among the participating countries, Danish, Dutch and Finnish enterprises sourced ICT services more often than other support functions (see Table 2).

Insourcing proportions of over 80% were found in:

- Czech Republic
- Italy
- the Netherlands
- Portugal
- Slovenia
- Germany

In Germany, a value of close to 97% was registered. At the other end of the scale, the lowest share for insourcing was seen in Denmark (61.5%).

Outsourcing ICT services, which always carries more business risk than insourcing, was less widespread, displaying shares ranging between 16.2% in Slovenia and 41.3% in Denmark. In order to maintain competitiveness, and often limited to highly-specialised tasks, enterprises sometimes have to hire the services of specialised IT companies that are not part of their enterprise group (outsourcing).

Impact of international sourcing activities

International sourcing is essentially driven by cost-efficiency concerns or to gain access to new markets (see next section).

When a manufacturing enterprise decides to source core business functions internationally (i.e. the manufacturing of goods), it is feared that jobs will be lost in the enterprise's [home] country. International sourcing has received and continues to receive a lot of policy and media attention. The word 'outsourcing' often has a negative perception in public opinion. Indeed, international sourcing can result in a loss of domestic jobs, but it can also improve an enterprise's competitiveness and hence secure existing jobs, as well as create new and higher-value-added jobs. These latter aspects are far less visible as it is a more indirect and long-term process.

Both aspects are reflected in the survey results on this issue, although data are not shown in detail because of data quality and confidentiality problems. It appears that the Czech Republic and Slovenia have taken advantage of the international sourcing process, as the majority of their enterprises (51% and 60% respectively) have had employment creations, and far more highly skilled jobs were created than lost. In the high-wage countries of Denmark, Finland and Sweden, more enterprises have had losses of highly skilled jobs than creations. In these three countries, between 20% and 28% of the enterprises had created jobs through international sourcing. In Germany and the United Kingdom, the situation appears more balanced between job losses and creations. In general, in all participating countries, available job loss and creation figures show that overall employment effects remain at low levels.

Main motivation is reduction of labour costs

During 2001-2006 in the 12 countries, the main motivation among the surveyed enterprises that internationally sourced services was the 'reduction of labour costs' (45% of the enterprises – see Graph 7, although multiple

answers were possible). 'Access to new markets' and 'strategic decisions taken by the Group head' followed, both with shares of around 36%. 'Reduction of costs other than labour costs' was the reason in over 30% of the enterprises.

Globally, the least-motivating reasons were 'Following the behaviour/example of competitors/clients'(14%), and 'Tax or other financial incentives' (9%).

Investigating the same motives nationally, it appears that the picture is quite mixed. Among the 12 countries, five feature the highest percentages for the 'reduction of labour costs' but only one (Slovenia) ranks 'access to new markets' as the most important motivation factor, although it ranks second at the aggregate level.

'Strategic decisions taken by the Group head' came first in the Czech Republic, Portugal and the United Kingdom, whereas it was 'other motivations' in Germany, the Netherlands and Sweden.

Turning from the motivation for international sourcing to the perception of its actual impact, Graph 8 outlines the impacts of international sourcing considered as 'positive' at aggregate level.

Most enterprises in the surveyed countries considered 'competitiveness' as a positive impact (65%). Almost 60% of the enterprises surveyed in the 12 countries (except for Portugal whose data is confidential), found the reduction of labour costs to be a positive consequence of international sourcing (not shown in Graph 8). 'Access to new markets' was mentioned by another 46%. The remaining four impacts stayed close together, all being mentioned by roughly a quarter of the enterprises.

Furthermore, the survey revealed that relatively few barriers were met during the process of international sourcing (Graph 9). Between 2001 and 2006, among the enterprises that did so, the obstacle that was most often given as being 'very important' was that of the 'Legal and administrative' kind, which was given by 12% of the enterprises. All other barriers had values of 10% or less, including that of 'linguistic or cultural barriers' which was given by 8% of the enterprises. 'Uncertainty of international standards' was the least problem: only five out of 100 enterprises considered that as a disturbing or blocking factor.

International sourcing plans for 2007-2009

Graph 10 shows the proportion of enterprises which intend to internationally source business functions between 2007 and 2009. One question referred to the destination of future sourcing activities, and another the business support functions that would likely be concerned. Compared to 2001-2006, the destination of sourcing activities appears to be slightly different. Sourcing within the EU still shows the highest shares in most of the countries for which data are available, but there are clear particularities: Slovenian enterprises will most likely continue to source mainly to 'other European countries' as many enterprises have done in the past. As a destination, India is of interest for Denmark and Portugal. The highest proportion of enterprises intending to source to China were in Italy (around a quarter). China was also an important destination of planned sourcing for Germany and Denmark (shares close to 20%).

Asked about what support business functions would likely be sourced abroad in the next years (2007-2009), manufacturing enterprises generally continued to display higher proportions of planned international sourcing than those active in other sectors (data not shown). Enterprises in the United Kingdom had proportions between 20% and 25% in several categories (see the category labels displayed in Table 2), with a particularly high 35% for 'distribution and logistics'. Ireland followed with lower shares overall, but nevertheless 29% for 'distribution and logistics' and 23% for 'engineering and related technical services'. Manufacturing enterprises in Slovenia and Germany were mainly interested in the future sourcing of 'marketing, sales and after sales services' (17% for both countries).

Non-manufacturing enterprises intend to internationally source far less: The only countries where these enterprises scored proportions of over 10% were Germany and Ireland, and this was only for 'Marketing, sales and after sales services' (12% and 11% respectively).

Data sources and availability

The data presented in this article are from a survey on the relocation of the domestic production of goods and services to producers abroad. This results from a decision taken by a resident producer to stop their domestic production. The data, which cover the period 2001-2006, has been collected on a voluntary basis in 13 countries:

- Czech Republic
- Denmark
- Germany
- Ireland
- Spain⁶⁸
- Italy
- the Netherlands
- Portugal
- Slovenia
- Finland
- Sweden
- United Kingdom
- Norway.

The international sourcing statistics cover [NACE Rev.1.1](#) (Statistical Classification of Economic Activities in the European Community) sections C to I and K which, broadly speaking, cover [Non-financial market activities](#). The data refers to enterprises with 100 or more employees.

Iron and steel production and processing statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). The present article covers iron and steel production and processing, corresponding to [NACE Rev 1.1](#) Groups 27.1 to 27.3, which is part of the [metals and metal products](#) sector. The activities covered in this article are collectively referred to as the first processing of ferrous metals, and consist of:

- the manufacture of basic iron and steel and ferro-alloys (corresponding to NACE Group 27.1);
- the manufacture of tubes, both iron or steel (NACE Group 27.2);
- other first processing activities associated with iron and steel (NACE Group 27.3), which includes drawing, rolling, forming and wire drawing.

	2006	2007
Arcelor Mittal	117.2	116.4

Table 4: Manufacture of basic iron and steel and of ferro-alloys (ECSC); manufacture of tubes; other first processing of iron and steel and production of non-ECSC ferro-alloys (NACE Groups 27.1, 27.2 and 27.3). Expenditure, productivity and profitability, EU-27, 2006 (1)

The first processing of ferrous metals sector is one that requires very large investments in technology and equipment. Due to these significant capital requirements, **large enterprises** (groups) tend to dominate the market. Global consolidation and restructuring has intensified in recent years. Within the European Union, **enterprise** groups have moved from a national base to a Europe-wide base and more recently have reinforced their global nature through acquisitions outside Europe, or have themselves been acquired by companies of non-European background (such as the takeover of Estonia's Galvex by ArcelorMittal in March 2008). The merger of Mittal Steel and Arcelor in 2006 created the world's largest steel producing enterprise group; in 2007 it produced 116.4 million tonnes of crude steel output, over three times the output of the second largest enterprise group, Nippon Steel. After the buy-out of the Corus Group in 2007, Tata steel became the sixth largest global steel producing enterprise group.

Structural profile

There were 6.7 thousand enterprises throughout the EU-27 for whom the first processing of ferrous metals (NACE Groups 27.1 to 27.3) was their main activity in 2006. This corresponded to only 1.6% of all enterprises

in the metals and metal products manufacturing (NACE Subsection DJ) sector. The first processing of ferrous metals sector was much larger, however, in terms of **employment** and **value added**. It employed 612.6 thousand persons in the Member States, corresponding to a little less than one in every eight (12.1%) of the metals and metal products manufacturing workforce. From a **turnover** of EUR 237.1 billion in 2006, the sector generated EUR 49.6 billion of added value, just over one fifth (20.3%) of the total value added of metals and metals products manufacturing in the EU-27.

By far the largest of the three NACE group activities covered by the first processing of ferrous metals sector was the manufacture of basic iron and steel (NACE Group 27.1); it accounted for just under three quarters (72.6%) of value added and two thirds (66.9%) of employment in 2006. The next largest activity was the manufacture of tubes (NACE Group 27.2), which generated a little less than one fifth (18.2%) of sectoral value added and accounted for about one in every five persons employed (21.2%). The smallest activity was other first processing of iron and steel (NACE Group 27.3).

About one quarter (24.8%) of the value added generated by the first processing of ferrous metals sector across the EU-27 came from Germany, the next largest contributions coming from Italy (14.4%) and France (10.0%). However, it was Slovakia that was by far the most specialised Member State in the first processing of ferrous metals sector; this activity contributing 5.3% to **non-financial business economy** value added in 2006, which was just over six times the EU-27 average (0.9%). In these terms, the Czech Republic, Finland, Belgium, Austria and Romania (2005) were also relatively specialised in this activity - as each of these countries reported that the first processing of ferrous metals sector contributed between 1.8% and 2.0% of the value added in their respective non-financial business economies.

The **production indices** of all three of the NACE group activities within the first processing of ferrous metals fluctuated more than the overall index for metals and metal products manufacturing during the period between 1997 and 2007. This was particularly the case regarding the manufacture of tubes and the other first processing of iron and steel activities. Without strong upswings in 2006 and 2007, the production indices of both these activities would have been below 1997 levels and well below their respective peaks (1998 for tubes and 2000 for the other first processing of iron and steel activities). However, the rises in **output** at the end of this ten-year period pushed the production indices for the EU-27 above 1997 levels; on average, the output of tubes manufacturing rose by 1.1% per year between 1997 and 2007 and that of the other first processing of iron and steel activities by 0.8% per year. The upward trend in the production index for the manufacture of basic iron and steel was clearer, particularly from a relative trough in 1999, despite cutbacks in 2001 and 2005. Over the ten years through to 2007, basic iron and steel output in the EU-27 increased by an average 1.0% per year.

Expenditure and productivity

Tangible investment in the EU-27's first processing of ferrous metals sector was EUR 25.2 billion in 2006, representing about over one quarter (27.7%) of all investment made in the metals and metal products manufacturing sector. This level of tangible investment corresponded to an **investment rate** of 18.6%, which was significantly higher than the average rate (13.6%) across metals and metal products manufacturing as a whole, and marginally above the average rate for the non-financial business economy.

Within the EU-27's first processing of ferrous metals sector a much higher proportion of **operating expenditure** went on the purchase of goods and services (88.5%) than was the case (80.8%) for metals and metal products manufacturing as a whole. Although the proportion of operating expenditure going on personnel costs in the first processing of ferrous metals sector was relatively low (11.5%), average **personnel costs** of EUR 42.2 thousand per employee in 2006 were relatively high, being about EUR 10.0 thousand per employee more than the average across metals and metal products manufacturing.

Each person employed in the EU-27's first processing of ferrous metals sector contributed added value of EUR 80.9 thousand in 2006, about two thirds more than the average across metals and metal products manufacturing. This relatively high level of apparent **labour productivity** was close to twice the level of average personnel costs. The resulting **wage-adjusted labour productivity ratio** of 191.5% for the EU-27's first processing of ferrous metals sector in 2006 was notably higher than the ratio (149.3%) for the whole of the metals and metals products manufacturing sector. This characteristic was common to most of the Member States with the notable exceptions of Sweden, the United Kingdom and particularly Bulgaria, where the wage-adjusted labour productivity ratio was almost 100 percentage points lower than for metals and metal products manufacturing as a whole.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics \(STS\)](#) , and the [World Steel Association](#) (worldsteel) .

Context

The metals and metal products manufacturing sector is part of a diverse and interwoven economic network that incorporates upstream sectors and large downstream segments of manufacturing such as the transport equipment manufacturing and construction sectors. The challenges faced by the EU's metals and metal products manufacturing sector therefore have direct and indirect consequences on many other parts of the economy. Looking ahead, a Communication ([COM\(2008\) 108](#)) from the [European Commission](#) to the [Council](#) and the [European Parliament](#) on the competitiveness of the metals industries was adopted in February 2008, and highlighted the challenges to be faced.

The EU-27 is largely dependent on imports of ore and concentrates for steel, ferro-alloys and non-ferrous metals production; it produces only 1.7% of the world's nickel, 2% of its iron ore and 5% of its copper ([SEC\(2007\)771](#)). Access to minerals and secondary raw materials at competitive prices is important, especially given the exhaustion of certain deposits in the EU-27 over time or their absence, and supply constraints that have been exacerbated by the strong growth in international demand from emerging economies such as China and India. This concern was part of a raw materials initiative of the European Commission ([COM\(2008\) 699](#)).

Parts of the metals and metal products manufacturing sector are highly energy-intensive. Energy costs for the EU-27's metals and metal products manufacturing sector accounted for 4.4% of purchases of goods and services in 2006, which was the third joint highest proportion among the industrial structural business statistics sectors, albeit well behind non-energy mining and quarrying (10.1%) and other nonmetallic mineral products (9.5%). Within this sector, however, energy costs in the casting of metals subsector accounted for 7.2% of purchases of goods and services in 2006 and in the first processing of ferrous metals as much as 7.9%. This level of energy consumption has important implications for energy and environmental (particularly climate change) policy.

The metals and metal products manufacturing sector is covered by a Directive on Integrated Pollution Prevention and Control (IPPC) and [REACH](#) . A proposal from the European Commission on the review of EU [Emissions Trading Scheme \(ETS\)](#) adopted in January 2008 ([COM\(2008\) 30](#)) foresees the inclusion of non-ferrous metals from 2013 onwards, along with some transitional measures to avoid 'carbon leakage'.

Jewelry, musical instruments, sports goods, toy production statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), the present article covers the manufacture of items corresponding to NACE Groups 36.2 to 36.6, which are part of the [furniture, jewellery, musical instruments, sports goods and toys](#) sector. The activities covered in this article are the manufacture of:

- jewellery and related articles (corresponding to NACE Group 36.2);
- musical instruments (NACE Group 36.3);
- sports goods (NACE Group 36.4);
- games and toys including electronic games (NACE Group 36.5);
- miscellaneous items such as brushes, pens, umbrellas and candles (NACE Group 36.6).

Note that the article does not cover the manufacture of sports clothes or footwear (which are classified within NACE Divisions 18 and 19, and not in Division 36).

	Enterprises (thousand)	Turnover (EUR million)	Value added (EUR million)	Persons employed (thousand)	Share in total (%)

Source: Eurostat (SBS)

Table 3: Other manufacturing activities (NACE Groups 36.2 to 36.6). Expenditure, productivity and profitability, EU-27, 2006 (1)

In 2006, the other manufacturing activities sector (NACE Groups 36.2 to 36.6) generated around EUR 15.4 billion of value added in the EU-27 and employed under half a million persons.

Jewellery

The EU-27's jewellery (NACE Group 36.2) subsector consisted of 30.3 thousand enterprises which generated EUR 3.2 billion of value added in 2005 and employed 115.4 thousand persons in 2006, which was about one quarter of the other manufacturing activities workforce and a slightly smaller share of value added.

Italy accounted for the highest share of EU-27 value added in this subsector with 35.9%, more than double the share of France, the next largest. Italy was also the most specialised Member State in jewellery manufacturing, followed by Greece and Cyprus, with none of the other Member States⁶⁹ registering even one tenth of 1% of their non-financial business economy value added in this subsector.

Investment in the EU-27's jewellery subsector was valued at EUR 371 million in 2006. Personnel costs made up 17.5% of this subsector's operating expenditure, the lowest share of any of the other manufacturing subsectors; this was the result of relatively high purchases of goods and services, reflecting the high value of many of the materials used in this activity. Low apparent labour productivity (EUR 26.7 thousand per person employed) in 2005 contributed to a particularly low wage-adjusted labour productivity ratio (115.2%), the second lowest ratio among all of the industrial (NACE Sections C to E) NACE groups in 2005 or 2006.

Musical instruments

Musical instruments manufacturing (NACE Group 36.3) was the smallest subsector within the EU-27's other manufacturing activities sector, with value added of EUR 740 million and a workforce of 24.9 thousand persons. Germany alone generated more than two fifths of the EU-27's value added in this sector, and was the second most specialised Member State⁷⁰ in musical instrument manufacturing, behind the Czech Republic.

⁶⁹Cyprus, the Netherlands and Poland, 2005; Denmark, Estonia, Ireland and Malta, not available.

⁷⁰Ireland, Greece, the Netherlands, Poland and Portugal, 2005; Estonia and Malta, not available.

Tangible investment in the EU-27's musical instruments subsector was valued at EUR 53 million in 2006, resulting in an **investment rate** of 7.1%, the lowest among the other manufacturing activities subsectors. The labour-intensive nature of this activity can be seen from the extremely high share of personnel costs in total operating expenditure, which reached 34.8% in 2006, the third highest among all of the industrial NACE groups in 2005 or 2006. Apparent labour productivity (EUR 29.8 thousand per person employed) was below the average for the other manufacturing activities sector (EUR 33.9 thousand per person employed), while average personnel costs (EUR 25.1 thousand per employee) were almost identical to the sectoral average: the resulting wage adjusted labour productivity ratio was 119.1% in 2006.

Sports goods

Sports goods manufacturing (NACE Group 36.4) in the EU-27 consisted of 4.3 thousand enterprises which recorded a value added of EUR 1.7 billion in 2006 and employed 43.6 thousand persons. France, the United Kingdom, Italy and Austria had the largest sports goods manufacturing subsectors in terms of value added, all generating at least EUR 200 million of value added in this subsector. As a result, Austria recorded by far the highest value added specialisation ratio for this subsector⁷¹.

Investment in sports goods manufacturing in the EU-27 was valued at EUR 193 million in 2006, leading to an investment rate of 11.1%, slightly below the average for the other manufacturing activities sector (12.2%). This subsector is most notable for having by far the highest apparent labour productivity (EUR 40.0 thousand per person employed) and average personnel costs (EUR 29.1 thousand per employee) among the EU-27's other manufacturing activities NACE groups; this was the only subsector where average personnel costs were above the non-financial business economy average. The wage-adjusted labour productivity ratio of 137.3% was also the highest within the other manufacturing activities sector, but still 13.8 percentage points below the non-financial business economy average.

Games and toys

One of the key issues for toys is safety. In January 2008 the European Commission adopted proposals (COM(2008) 9) to revise the legislation on this issue, in particular with respect to the use of chemical substances in toys.

The EU-27's toys and games manufacturing (NACE Group 36.5) subsector consisted of over six thousand enterprises, which employed 61.3 thousand persons in 2005. Germany recorded value added of EUR 697.5 million in games and toys manufacturing in 2006, with the United Kingdom, Italy and Austria generating more than EUR 200 million of value added each in this subsector, and Spain just under this amount. Austria and the Czech Republic were relatively specialised in this activity, as this subsector contributed much more to their non-financial business economy value added than in any other Member State⁷². Note that no recent data are available for either Denmark or Malta, both of whom are known to be relatively highly specialised in games and toys manufacturing. Tangible investment in the EU-27's toys and games manufacturing subsector was valued at EUR 441 million in 2006, just under one quarter (23.4%) of the total for the other manufacturing activities sector.

Miscellaneous manufacturing

The activity of miscellaneous manufacturing (NACE Group 36.6) was the largest of the five NACE groups covered within this article as it generated 45.3% of the EU-27's value added in the other manufacturing activities sector, and employed 50.9% of its workforce. The estimated 38.0 thousand enterprises in this subsector generated a value added of EUR 7.0 billion with a workforce of 231.1 thousand persons employed. Germany, Italy and the United Kingdom had the largest miscellaneous manufacturing subsectors in 2006, each contributing around one fifth of EU-27 value added.

⁷¹The Netherlands and Poland, 2005; Malta, not available.

⁷²Greece, the Netherlands, Poland and Portugal, 2005; Denmark, Ireland, Cyprus, Luxembourg and Malta, not available.

The miscellaneous manufacturing activity recorded tangible investment valued at EUR 827 million in 2006. Personnel costs represented one quarter (25.8%) of operating expenditure in this subsector in the EU-27, considerably higher than the average share within the non-financial business economy (16.1%). Apparent labour productivity (EUR 30.2 thousand per person employed) and average personnel costs (EUR 24.5 thousand per employee) were both below the average for other manufacturing activities, as was the wage-adjusted labour productivity ratio of 123.2%.

Data sources and availability

Table 4b: Key indicators, land transport and transport via pipelines (NACE Division49), 2009 - Source: Eurostat (sbs_na_1a_se_r2)

Main statistical findings

Structural profile

There were 920 thousand enterprises operating with land transport services (Division49) as their main activity in the EU-27 in 2009. Together they employed 5.8 million persons, equivalent to 4.3% of the non-financial business economy (Sections B to J and L to N and Division95) workforce, or some 54.8% of those employed in the whole of the transportation and storage sector (Section H). The land transport services sector generated EUR190812 million of value added in 2009, which was 4.4% of the non-financial business economy total and 43.7% of the transportation and storage sectoral total.

These relative shares suggest that the land transport services sector was relatively labour-intensive in comparison with other transportation and storage sectors and further evidence was provided by the apparent labour productivity of the EU-27's land transport services sector in 2009 which stood at EUR33 thousand per person employed, which was below the non-financial business economy average of EUR41.6 thousand per person employed and the transportation and storage average of EUR41 thousand per person employed. The relatively low level of apparent labour productivity was analogous with average personnel costs which stood at EUR26.9 thousand per employee for land transport services, compared with EUR30.0 thousand per employee for the non-financial business economy and EUR31.2 thousand per employee for the transportation and storage sector. The wage-adjusted labour productivity ratio combines these two previous indicators and shows the extent to which value added per person employed covers average personnel costs per employee. Due to the lower than average productivity and average personnel costs that were slightly inferior to the non-financial business economy average, EU-27 land transport services had a relatively low wage-adjusted labour productivity ratio, reaching 122.4% in 2009, below the corresponding ratios that were registered for the non-financial business economy (138.8%) or the whole of transportation and storage (132.1%).

The gross operating rate (which shows the relation between the gross operating surplus and turnover) is one measure of profitability; it stood at 13.0% for the EU-27's land transport services sector in 2009, around 1.3 times as high as the non-financial business economy average of 9.7% and also higher than the transportation and storage average (12.2%). This was the second highest level of profitability (using this measure) among the five transportation and storage NACE divisions, behind the 15.6% rate recorded for warehousing and support activities for transportation (Divisions52).

Sectoral analysis

Almost two thirds of all the enterprises within the EU-27's land transport services sector in 2009 were engaged in freight transport by road and removal services (Group49.4); this was equivalent to an estimated 600 thousand enterprises, while there were 332 thousand other passenger land transport enterprises (Group49.3). These relatively high levels were in stark contrast to the enterprise structure within the remaining three NACE Groups that make-up the land transport services sector, namely, passenger rail transport (Group49.1), freight rail transport (Group49.2) and transport via pipelines (Group49.5), where there was a total of one thousand enterprises across the whole of the EU-27.

The two largest subsectors in terms of numbers of enterprises also reported the highest shares of EU-27 employment and value added in 2009; as enterprises operating within the freight transport by road and removal services subsector and the other passenger land transport subsector accounted for more than 85% of the land transport services workforce and just over 80% of its output. The next largest subsector, using either of these measures, was the passenger rail transport subsector that accounted for almost 10% of the EU-27's land transport services workforce and for 12.4% of its added value. The 3.9% share of land transport services' value added that was accounted for by the transport via pipelines subsector was almost ten times as high as its share of the land transport services' workforce.

The relatively low apparent labour productivity figure for the whole of the land transport services sector (EUR33 thousand per person employed) was pulled down by the apparent labour productivity of the two largest subsectors, and by that of the freight rail transport subsector – in 2009 all three of these subsectors recorded apparent labour productivity within the EU-27 that was below the non-financial business economy average. In contrast, the passenger rail transport subsector recorded a level of apparent labour productivity (EUR43 thousand per person employed) that was slightly higher than the non-financial business economy average. The largest deviation was recorded for the transport via pipelines subsector, which registered the third highest level of labour productivity (EUR324 thousand per person employed) among any of the NACE groups within the non-financial business economy, almost eight times as high as the non-financial business economy average.

Average personnel costs per employee peaked at EUR41.1 thousand for transport via pipelines in 2009, ahead of those for the passenger rail transport subsector (EUR38.3 thousand per employee). These were the only two NACE groups within land transport services to report average personnel costs above the non-financial business economy average. The remaining three subsectors each recorded average personnel costs that were within the range of EUR23 thousand to EUR26 thousand per employee.

In all but one of the five land transport services subsectors, the wage-adjusted labour productivity ratio was below the non-financial business economy average of 138.8%; the lowest ratio was recorded for the other passenger land transport subsector (110.9%). As with apparent labour productivity, the transport via pipelines subsector recorded by far the highest wage-adjusted labour productivity ratio, at 787.9%, which was the second highest among all NACE groups within the non-financial business economy.

The EU-27's transport via pipelines subsector recorded the highest level of operating profitability among all of the NACE groups covered by the non-financial business economy, with a gross operating rate of 54.8% in 2009; this was 5.7 times as high as the non-financial business economy average (9.7%). The two largest subsectors also recorded gross operating rates that were above the non-financial business economy average, at 14.7% for other passenger land transport and 12.5% for freight transport by road and removal services. On the other hand, the profitability of rail transport activities was relatively low, with gross operating rates of 8.3% for freight rail transport, falling to 4.8% for passenger rail transport.

Country analysis

France recorded the highest share (18.4%) of EU-27 value added within the land transport services sector in 2009. Germany, the United Kingdom, Italy and Spain were also relatively important producers – each accounting for double-digit shares of EU-27 value added. The German land transport services workforce of 758 thousand persons was equivalent to almost one in eight (13.1%) of the EU-27 total, and was followed by France (12.4%), the United Kingdom (10.5%) and Spain (10.1%); note that the employment share for France is based upon the number of employees.

In value added terms, the Baltic Member States and Luxembourg were most specialised in the land trans-

port services sector in 2009, with in excess of 5% of non-financial business economy value added being generated by land transport services. This specialisation was particularly strong in Lithuania where the share of land transport services rose to 8.2% of non-financial business economy value added, over half of which came from freight transport by road and removal services.

France accounted for 41.7% of EU-27 added value within the passenger rail transport subsector in 2009 and was the most specialised Member State for this activity, while Romania was most specialised in freight rail transport. Italy accounted for almost one fifth of the EU-27's value added for transport via pipelines, although Poland and Austria were more specialised than Italy for this activity.

The highest wage-adjusted labour productivity ratios for land transport services in 2009 were recorded in Latvia, Bulgaria and Romania, with ratios of 203.7%, 186.4% and 182.9% respectively. There were two Member States that reported wage-adjusted labour productivity ratios below 100%; they were the Netherlands (95.8%) and Hungary (91.4%). Both of these countries also recorded very low gross operating rates, at 1.2% in the Netherlands and 1.5% in Hungary.

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

This article presents an overview of statistics for the land transport services sector in the EU, as covered by NACE Rev.2 Division49. This division includes all land transport services; it excludes own account transport. A distinction is made between the transport of passengers and freight. For passengers a split is then made between interurban rail transport (in other words, rail travel between towns and cities) and other land transport, the latter including road transport (taxis, buses and coaches for example) as well urban and suburban rail transport (within the same city or conurbation). For freight a distinction is made between rail transport, road transport (including removal services) and pipelines.

This NACE division is composed of five groups:

- passenger rail transport, interurban (Group49.1);
- freight rail transport (Group49.2);
- other passenger land transport (Group49.3);
- freight transport by road and removal services (Group49.4);
- transport via pipelines (Group49.5).

Transport by pipelines excludes the network distribution of gas, water or steam (Divisions35 and 36, [electricity](#), [gas](#), [steam and air conditioning supply](#) and [water collection, treatment and supply](#)).

Leather and shoe production statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). The present article covers leather and leather products manufacturing, corresponding to [NACE Rev 1.1 Subsection DC](#), which is part of the [textiles, clothing, leather and shoe production](#) sector. The activities covered in this article include:

- tanning and dressing;
- the manufacture of luggage;
- the manufacture of handbags;
- the manufacture of footwear.

	Enterprises (thousand)	Turnover (EUR million)	Value added		Share in total (%)

Table 4: Tanning and dressing of leather; manufacture of luggage, handbags, saddlery, harness and footwear (NACE Division 19). Main indicators, 2006 (1).

Leather manufacturing (NACE Subsection DC) in the EU-27 was carried out as a main activity by about 44.0 thousand enterprises in 2006. These enterprises employed 548.8 thousand persons and generated EUR 11.9 billion of value added, representing 18.4% of the total value added for textiles, clothing and leather manufacturing (NACE Subsections DB and DC).

The manufacture of footwear (NACE Group 19.3) was the largest activity within the leather manufacturing sector, accounting for about seven tenths (70.7%) of employment and a smaller majority (58.2%) of value added. The manufacture of luggage, handbags and the like (NACE Group 19.2) accounted for a further quarter (25.4%) of the leather manufacturing sector's value added in 2006, the rest (16.4%) coming from the activity of tanning and dressing leather (NACE Group 19.1).

Almost one half (49.5%) of all the value added generated by the EU-27's leather manufacturing sector came from Italy – this was its largest share of any EU-27

industrial (NACE Sections C to E) subsection. The EUR 5.9 billion of value added generated by the sector in Italy was the equivalent of 0.9% of the value added generated across the non-financial business economy, about four and a half times the average contribution in the EU-27. In these relative terms, the only Member State that was more specialised in leather manufacturing was Romania, where the value added from leather manufacturing accounted for 1.1% of non-financial business economy added value in 2005. Whereas Italy was relatively specialised in all activities within leather manufacturing, the focus of Romania's specialisation was very much on footwear manufacturing.

There was a sharp downward trend in the production index of leather manufacturing in the EU-27

during the period between 1997 and 2007 (an average decline of 5.4% per year). Between 2001 and 2005, the rate of decline was particularly strong (an average -8.5% per year), mainly as a result of the steep falls noted for footwear manufacturing (an average -10.2% per year during this period). Declines in footwear output continued in 2006 and 2007, although at about half the rate of the preceding four years. In 2006, there was a rebound in the output of tanning and dressing of leather, while the manufacture of luggage, handbags and the like recorded stable output in 2006 and strong growth in 2007.

Expenditure and productivity

Across the EU-27, [tangible investment](#) in the leather manufacturing sector was EUR 1.1 billion in 2006, by far the smallest share (14.4%) of such investment across textiles, clothing and leather manufacturing as a whole. Indeed, when compared with the value added that the leather manufacturing sector generated, the corresponding [investment rate](#) of 8.9% was among the very lowest across the NACE divisions that comprise industry and about one half of the rate recorded for the non-financial business economy. As with the clothing sector, this low investment rate may at least partly reflect a further shift in [production](#) to non-member countries.

The apparent [labour productivity](#), average personnel costs and [wage-adjusted labour productivity ratio](#) of the leather manufacturing sector in the EU-27 were almost identical to those recorded for textiles, clothing and leather manufacturing as a whole but, as a result, were considerably less than the averages across the non-financial business economy. Only in France and Germany did the wage-adjusted labour productivity ratios of the leather manufacturing sector equal or slightly exceed the corresponding ratio for the non-financial business economy.

Average personnel costs in the EU-27's footwear subsector of EUR 13.3 thousand per employee were particularly low, as was the average value added generated by each person employed (EUR 17.9 thousand). These figures were about one half of the corresponding averages recorded for the tanning and dressing of leather subsector. However, the wage adjusted labour productivity ratios of each were very similar and almost the same as that for textiles, clothing and leather manufacturing as a whole.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#), including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Context

Since the closure of the World Trade Organisation's ([WTO](#)) ten-year, transitional Agreement on Textiles and Clothing (ATC) at the end of 2004, the European Union market for textiles, clothing, leather and footwear has been open to far more global competition, particularly from China and other Far Eastern countries. The [European Commission](#) published a study on the competitiveness, economic situation and location of production in the [textiles and clothing, footwear, leather \[and furniture\]](#) industries in 2007, which put forward some ideas for consideration: to upgrade knowledge and skills within the sector; to enhance the value added of EU manufactured products, perhaps through emphasising social ethics, environmental and health considerations and ethical sourcing; to enhance the protection of intellectual property; to foster trade and eliminate trade barriers; to improve the integration of fashion and design in the sector and better support young designers.

There are four key processes in leather manufacturing: hide and skin storage and beamhouse operations, such as sorting, trimming and curing; tannery operations, such as delimiting and tanning; post-tanning operations, such as washing and neutralisation; and finishing operations with respect to gloss, handle and colour. There is now strong environmental legislation through these processes, whether concerning best available techniques (BAT) for the tanning of hides and skins, the restriction of various dangerous substances and preparations in the process, or waste water legislation. There are other key policies on trade that greatly impact upon the sector, such as access to raw hides and skins (bovine and ovine), market access, trade distortions and possible non-member country protectionism, which are of increasing concern in the current economic climate.

Main statistical findings

Structural profile

Almost one million enterprises operated in the legal and accounting services sector (Division69) in the EU-27 in 2009. Together they employed 3.3 million persons, estimated to be around 2.5% of the non-financial business economy (Sections B to J and L to N and Division95) workforce and 30.3% of those persons employed within professional, scientific and technical activities (Section M). The value added generated by the EU-27's legal and accounting services was EUR156941 million in 2009, approximately 2.8% of the non-financial business economy total and 30.1% of the professional, scientific and technical activities total. As such, based on value added and employment measures, this sector was the largest among the seven NACE divisions within professional, scientific and technical activities.

The apparent labour productivity of the EU-27's legal and accounting services sector in 2009 was EUR47 thousand of value added per person employed, the same as the professional, scientific and technical activities average and above the non-financial business economy average of EUR41.6 thousand per person employed. Average personnel costs were EUR35.2 thousand per employee, midway between the non-financial business economy average (EUR30.0 thousand per employee) and the professional, scientific and technical activities average (EUR40.5 thousand per employee). The wage-adjusted labour productivity ratio, which combines the two previous indicators and shows the extent to which value added per person employed covers average personnel costs per employee, was 133.7% for the EU-27's legal and accounting services in 2009. This was somewhat below the non-financial business economy average of 138.8% but, due to the lower average personnel costs, was well above the 117.0% average for professional, scientific and technical activities average.

The gross operating rate, which is the relation between the gross operating surplus and turnover, is a measure of operating profitability and was 32.5% for the EU-27's legal and accounting services sector in 2009. This rate was around 3.4 times as high as the non-financial business economy average (9.7%) and around 1.8 times as high as the professional, scientific and technical activities average (17.8%). This was the highest level of operating profitability (using this measure) for the EU-27 in 2009 among the seven NACE divisions within the professional, scientific and technical activities and the fourth highest among all NACE divisions within the non-financial business economy.

Sectoral analysis

The legal and accounting services sector is composed of two groups, namely legal activities (Group69.1) and accounting, bookkeeping and auditing activities and tax consultancy (Group69.2). In the EU-27 these two subsectors contributed very similar levels of value added but employment was much greater for accounting, bookkeeping and auditing activities and tax consultancy – see Figure 1.

The relatively high EU-27 apparent labour productivity figure for the whole of the legal and accounting services sector in 2009 was pulled upwards by the legal activities subsector where the apparent labour productivity was EUR56 thousand per person employed; for accounting, bookkeeping and auditing activities and tax consultancy, the apparent labour productivity was EUR41 thousand per person employed, broadly in line with the non-financial business economy average (EUR41.6 thousand).

Despite having higher apparent labour productivity, the legal activities subsector had slightly lower average personnel costs than the accounting, bookkeeping and auditing activities and tax consultancy subsector in the EU-27, although average personnel costs per employee remained above the non-financial business economy average in 2009. The combination of higher apparent labour productivity and lower average personnel costs resulted in a much higher wage-adjusted labour productivity ratio for the EU-27's legal activities subsector (161.2%) than for the accounting, bookkeeping and auditing activities and tax consultancy subsector (114.6%). For the legal activities subsector the wage-adjusted labour productivity ratio was above the non-financial business economy average (138.8%), whereas for the accounting, bookkeeping and auditing activities and tax consultancy subsector it was below the professional, scientific and technical activities average (117.0%).

A large difference in the two subsector's EU-27 gross operating rates was also observed in 2009, although both subsectors recorded relatively high rates. The 24.8% rate that was recorded for the accounting, bookkeeping and auditing activities and tax consultancy subsector was above the professional, scientific and technical activities average (17.8%), while the 40.8% rate for the legal activities subsector was the fourth highest among all of the NACE groups within the non-financial business economy in 2009.

Country analysis

The largest legal and accounting services sector among the EU Member States in 2009 was in the United Kingdom which contributed 23.2% of EU-27 value added. This large share was boosted by the United Kingdom's 26.2% share of EU-27 value added in the legal activities subsector; the United Kingdom's 20.2% share of EU-27 value added in the accounting, bookkeeping and auditing activities and tax consultancy subsector was the second largest share behind Germany (20.9%).

In relative terms, Luxembourg was the most specialised Member State in 2009 for both subsectors, as 10.1% of non-financial business economy value added in Luxembourg was derived from legal and accounting services, split 6.5% for the accounting, bookkeeping and auditing activities and tax consultancy subsector and 3.6% for legal activities. The level of specialisation in these services in Luxembourg was far greater than in any other Member State, as the next most specialised Member States, namely Cyprus and the United Kingdom, generated less than 5% of their non-financial business economy value added in the legal and accounting services sector. Romania was the least specialised Member State with respect to legal and accounting services, as this sector contributed 0.5% of Romanian non-financial business economy value added in 2009.

A majority of the Member States recorded wage-adjusted labour productivity ratios for legal and accounting services that were below their non-financial business economy average. The largest difference was in Hungary, where the wage-adjusted labour productivity ratio for the legal and accounting services sector was 88.4% compared with a non-financial business economy average of 160.1%; this was the only Member State where the wage-adjusted labour productivity ratio for this sector was below 100% in 2009. In contrast, Portugal recorded a wage-adjusted labour productivity ratio of 187.8% for legal and accounting services and this was 31.3 percentage points above the average Portuguese ratio for the whole of the non-financial business economy (156.5%).

The high gross operating rate observed across the EU-27 for the legal and accounting services sector in 2009 was repeated for all Member States. The highest rate was 43.8% in Italy, which was 4.8 times as high as the average rate for the Italian non-financial business economy. The second highest gross operating rate in the legal and accounting services sector in 2009 was 39.0% in Ireland, which was the highest gross operating rate recorded in Ireland among all of the NACE divisions in the non-financial business economy in 2009. As was the case

for the wage-adjusted labour productivity ratio, Hungary recorded the lowest gross operating rate for legal and accounting services among the Member States, but the 13.4% rate for this sector was well above the average rate of 8.4% that was recorded for the whole of the Hungarian non-financial business economy.

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

This article presents an overview of statistics for the legal and accounting services sector in the EU, as covered by NACE Rev.2 Division69.

Legal activities include legal representation of one party's interest against another party, such as advice and representation in civil cases, criminal actions, and labour disputes. It also includes preparation of legal documents, such as articles of incorporation, partnership agreements or similar documents in connection with company formation, patents and copyrights, preparation of deeds, wills, trusts and so on, as well as other activities of notaries, bailiffs, arbitrators, examiners and referees.

Accounting, bookkeeping, auditing and tax consultancy activities include the recording of commercial transactions, the preparation or auditing of financial accounts, the examination of accounts and certification of their accuracy, the preparation of personal and business income tax returns, as well as advisory activities and representation (other than legal representation) on behalf of clients before tax authorities.

This NACE division is composed of two classes organised into two groups:

- legal activities (Group69.1);
- accounting, bookkeeping and auditing activities; tax consultancy (Group69.2).

Table 4: Business and management consultancy activities (NACE Class 74.14), 2005

Main statistical findings

Legal services cover the activities of advocates, barristers, solicitors, notaries, registered lawyers and legal consultants. **Enterprises** in this sector are generally small, and a common legal form is that of partnerships. Another characteristic of these activities is that they are used by **households**, for instance when they need an accountant, a lawyer, a notary or a tax adviser.

Structural profile

The 1.6 million enterprises active in the EU's professional business services sector (NACE Group 74.1) employed 5.1 million persons in 2006. As such this sector accounted for more than one third (36.7%) of all enterprises in the business services (NACE Divisions 72 and 74) population in 2006, and provided **employment** for just under one quarter (23.1%) of the business services workforce. Paid **employees** accounted for a relatively low proportion (75.7%) of the EU's professional services workforce, indicating a large proportion of working proprietors and unpaid family workers: the average proportion of paid employees for all business services was 84.5%.

This sector's contribution to business services was greater when measured in output rather than employment terms: professional business services generated EUR 525.2 billion of **turnover** and EUR 279.2 billion of value added in 2006, accounting for 29.8% of the business services turnover and 31.3% of its **value added**. Professional business services had therefore the largest turnover and value added among the business services activities.

The United Kingdom generated more than one quarter (27.0%) of the EU's value added in this sector in 2006, the largest contribution among the Member States, followed by France and Germany that each contributed between 17% and 18%. Along with Italy, the only other Member State with a double digit share of EU value added, the four largest Member States dominated this sector, collectively accounting for 72.1% of EU value added; for comparison, their share within business services was 70.6% and within the **non-financial business economy** (NACE Sections C to I and K) as a whole it was 64.6%. These four Member States were also the largest employers in the sector. This activity was also particularly important in Belgium and Luxembourg: indeed, the professional business services sector accounted for 9.2% of non-financial business economy value added in Luxembourg, some way ahead of the 7.0% share in the United Kingdom and the 6.6% share in Belgium.

A product analysis

Data are available for a limited set of countries to allow a product analysis for three of the five NACE classes covered by the professional business services sector. Legal advisory and representation services accounted for the highest proportion of turnover in all of the countries concerning the legal activities subsector, except in Latvia, Lithuania and Malta. For enterprises in accounting, book-keeping, auditing and tax consultancy activities, four fifths of turnover was derived from the main products associated with these activities, with a further 13% derived from business and management consultancy. The turnover derived by those enterprises operating within business and management consultancy activities was spread across a wide range of products, with just over three fifths of turnover derived from the main business and management consultancy services.

Expenditure and productivity

The EU's professional business services sector invested around EUR 27.2 billion in 2006, approximately two fifths (40.9%) of the business services total, a greater share than this sector contributed in value added terms. Consequently this sector recorded an above average investment rate, 9.7% compared with the business services average of 7.5%. As for computer and related activities, professional business services also reported above average apparent [labour productivity](#) (EUR 54.5 thousand per person employed) and average [personnel costs](#) (EUR 41.5 thousand per [employee](#)), in both cases the second highest among the business services activities. The wage adjusted labour productivity ratio that resulted from the combination of these two indicators was 131.4%, marginally above the business services average. Among the Member States only the Hungarian professional business services sector had a wage adjusted labour productivity ratio below 100% in 2006, meaning that apparent labour productivity was lower than average personnel costs.

Data sources and availability

The main part of the analysis in this article is derived from structural business statistics (SBS), including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other possible data sources include [short-term statistics](#) and the [Labour force survey](#) . In addition, use has also been made of specialist sources for particular areas, notably transport, energy, [research and development](#) , environment, tourism and information society statistics.

Context

The freedom to provide services and the freedom of establishment are central principles to the [internal market](#) for services and are set out in the [EC Treaty](#) . They guarantee EU enterprises the freedom to establish themselves in other Member States, and the freedom to provide services on the territory of another EU Member State. The Directive on services in the internal market ([COM\(2006\) 123](#)) aims to achieve a genuine internal market in services, removing legal and administrative barriers to the development of services activities between Member States. The Directive was to be implemented by Member States by the end of 2009 at the latest. As well as covering most [business services](#) (with the notable exception of services of temporary work agencies), the Directive applies to a wide variety of services including industrial and construction activities, as well as distributive trades, hotels and restaurants, travel agents, real estate and renting services.

Machinery and equipment production statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article introduces a [set of statistical articles](#) which analyse the structure, development and characteristics of the economic activities in the machinery and equipment sector in the [European Union \(EU\)](#), except for transport equipment. According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), this sector covers NACE Division 29.

This sector of the industrial economy provides equipment for use in many mining, manufacturing, energy and construction sectors, as well as producing domestic appliances. Furthermore, the machinery and equipment manufacturing sector covers arms and ammunition, whether for military or sporting uses, including some military vehicles such as tanks, but not military aircraft or warships (which are classified under the manufacture of transport equipment – see [Transport equipment production statistics - NACE Rev. 1.1](#)).

The activities of the machinery and equipment sector are treated in more depth in five further articles:

- [General purpose machinery production](#), corresponding to NACE Groups 29.1 and 29.2;
- [Agricultural and forestry machinery production](#), corresponding to NACE Group 29.3;
- [Industrial processing machinery production](#), corresponding to NACE Groups 29.4 and 29.5;
- [Arms and ammunition production](#), corresponding to NACE Group 29.6;
- [Domestic appliances production](#), corresponding to NACE Group 29.7.

(1) The Netherlands and Poland, 2005; unless otherwise stated, values refer to EUR million; number of enterprises and number of persons employed are given in thousands; average personnel costs and apparent labour productivity are given in EUR thousand per person; wage adjusted labour productivity, gross operating rate and investment are ratios expressed as percentages.

Source: Eurostat (585)

Table 5: Manufacture of machinery and equipment n.e.c. (NACE Division 29). Main indicators, 2006 (1)

Machinery and equipment manufacturing (NACE Subsection DK) was the core business activity of 174.0 thousand enterprises across the EU-27 in 2006. These enterprises provided employment for 3.6 million persons in the Member States, corresponding to 2.8% of those employed in the EU-27's non-financial business economy (NACE Sections C to I and K) in 2006. The EU-27's machinery and equipment manufacturing sector generated turnover of EUR 621.3 billion in 2006, of which a little less than one third (31.0%) remained as added value; the EUR 192.6 billion of value added generated by the sector in 2006 corresponded to 3.4% of the total value added within the non-financial business economy.

Within the subsectors of machinery and equipment production, the manufacture of general purpose machinery (NACE Groups 29.1 and 29.2, as presented in [General purpose machinery production statistics - NACE Rev. 1.1](#)) was the largest in terms of wealth creation, accounting for about one half (52.2%) of the value added generated in the EU-27's machinery and equipment manufacturing sector. The next largest subsector was that of industrial processing machinery (NACE Groups 29.4 and 29.5, as presented in [Industrial processing machinery production statistics - NACE Rev. 1.1](#)), which generated just over one third (34.0%) of the value added of the machinery and equipment manufacturing sector. By way of comparison, the contributions made by the activities presented in the remaining three subsectors ([Agricultural and forestry machinery production statistics - NACE Rev. 1.1](#), [Arms and ammunition production statistics - NACE Rev. 1.1](#) and [Domestic appliances production statistics - NACE Rev. 1.1](#)) were relatively small, none contributing more than 7% of sectoral value added in 2006.

Machinery and equipment manufacturing activities in Germany made the largest contribution (36.6%) of any Member State to EU-27 value added within this sector in 2006. Indeed, German value added was more than twice that of the second largest contribution (16.2%) from Italy. No other Member State⁷³ generated a double-digit share of EU-27 value added. Among the subsectors of machinery and equipment production, Germany was the largest manufacturing Member State in value added terms for all but one of the machinery and equipment manufacturing subsectors, the exception being the manufacture of arms and ammunition (NACE Group 29.6, see [Arms and ammunition production statistics - NACE Rev. 1.1](#)). The value added generated by the machinery and equipment manufacturing sector in Germany accounted for 6.1% of its non-financial business economy value added total in 2006, which was the highest share among any of the Member States and much more than the EU-27 average (3.4%) in 2006. In comparison to most other Member States, Italy and Finland were also relatively specialised in machinery and equipment manufacturing, as this sector provided 4.9% and 4.7% respectively of their non-financial business economy value added.

The map shows the contribution of the machinery and equipment manufacturing sector to employment within the non-financial business economy (NACE Sections C to I and K) of each region. This sector was unsurprisingly

⁷³The Netherlands and Poland, 2005; Malta, not available.

particularly important in a number of German regions and in four of them (Unterfranken, Tübingen, Stuttgart and Schwaben) provided employment for about one in every nine or ten people within the non-financial business economy workforce. There were also a number of regions in the Czech Republic, Italy, Slovakia, Finland and Sweden that were also particularly specialised in this sector.

For much of the period between 1997 and 2007, the EU-27's [production index for machinery and equipment manufacturing](#) followed closely the development for industry (NACE Sections C to E) as a whole. Differences were principally restricted to the first and last two years of the period; the [output](#) of machinery and equipment manufacturing remained relatively stable between 1997 and 1999 when industrial output rose, but increased much more sharply than industrial output in 2006 and 2007. Over the ten-year period, the output of machinery and equipment manufacturing rose by an average 2.6% per annum in the EU-27, which was faster than the rate (2.1% per annum) for industry as a whole. Among the NACE groups that make up the manufacture of machinery and equipment, growth in the production index for the manufacture of power machinery (NACE Group 29.1) was strongest in the period between 1997 and 2007 (an average 3.2% per year).

The EU-27's index of [domestic output prices](#) for machinery and equipment manufacturing rose continuously throughout the ten years through until 2007, at a remarkably steady rate as prices rose by an average of 1.5% per annum. This contrasted with the more uneven development for industry as a whole, for which there were some declines in output prices in 1998 and 1999 (compared with a year before) and much stronger price increases in the period between 2005 and 2007. There were steady annual price rises in line with the average for development for machinery and equipment manufacturing as a whole for all the NACE groups that comprise machinery and equipment manufacturing, with the exception of the domestic appliances subsector (NACE Group 29.7), for which prices remained relatively unchanged through until 2005 before relatively modest price increases through to 2007. It should be noted that data are not available for the price developments of arms and ammunition manufacturing (NACE Group 29.6).

About one half (50.7%) of the value added generated across the EU-27's machinery and equipment manufacturing sector came from its [small and medium-sized enterprises](#) (SMEs employing less than 250 persons), which was a slightly lower proportion than the average for the EU-27's non-financial business economy (57.9%). The relative contribution of the value added of enterprises within the machinery and equipment manufacturing sector tended to increase with size, which was not the case across the non-financial business economy. In part, this reflects the relatively small proportion (6.3%) of value added generated by [micro enterprises](#) (those employing less than 10 persons) within the machinery and equipment manufacturing sector in comparison to the share (21.0%) generated by all micro enterprises within the non-financial business economy. There were a few Member States where [large enterprises](#) within the machinery and equipment manufacturing sector generated a majority of sectoral value added within the machinery and equipment manufacturing sector, among which Bulgaria, Germany and Romania were the most noteworthy.

Employment characteristics

A much higher proportion of the workforce of the EU-27's machinery and equipment manufacturing sector in 2007 were men (81.9%) than was the case across the non-financial business economy as a whole (64.9%). This was a characteristic noted in all of the Member States for which data is available⁷⁴, although most notably in Cyprus and Estonia. In common with most industrial activities, a much higher proportion of the EU-27's machinery and equipment workforce were engaged on a full-time basis (94.8%) in 2007 than was the case across the non-financial business economy (85.7%). This was also a characteristic noted among all of the Member States for which data is available⁷⁵.

About one in every five (20.1%) workers within the EU-27's machinery and equipment manufacturing sector was aged under 30 years, whereas such so-called young workers represented closer to one in every four workers (24.3%) within the EU-27's non-financial business economy as a whole. The relatively older profile of the machinery and equipment manufacturing sector was underlined by a higher share of workers aged over 50 years (25.1% compared with 21.9% for the non-financial business economy).

⁷⁴Malta, not available.

⁷⁵Malta, not available.

Expenditure, productivity and profitability

Only 1.8% of all the **tangible investment** in the EU-27's non-financial business economy (NACE Sections C to I and K) in 2006 was made in the machinery and equipment manufacturing (NACE Subsection DK) sector. This represented a much lower share than the contribution that this sector made to non-financial business economy value added (3.4%). The corresponding **investment rate** for the EU-27's machinery and equipment manufacturing sector was a little less than half the average across the EU-27's non-financial business economy in 2006 (9.0% compared with 18.4%).

Purchases of goods and services accounted for just over three quarters (76.4%) of operating expenditure within the EU-27's machinery and equipment manufacturing sector. As such, the proportion of operating expenditure that went on personnel costs (23.6%) was much higher than the average share (16.1%) across the EU-27's non-financial business economy in 2006. In part, this reflected the fact that average personnel costs of EUR 38.8 thousand per employee in the machinery and equipment manufacturing sector were about one third (34.8%) or EUR 10.0 thousand per employee higher than the non-financial business economy average.

The average amount of value added generated per person employed in the EU-27's machinery and equipment manufacturing sector was EUR 52.8 thousand in 2006, a little over a fifth more than the average for the non-financial business economy. However, after taking into account the relatively high level of average personnel costs, the **wage-adjusted labour productivity ratio** for the machinery and equipment sector fell well beneath the corresponding ratio for the non-financial business economy (135.8% compared with 151.1%). Among the activities presented in the subsectors of machinery and equipment production, even the highest wage-adjusted labour productivity ratio of 139.3% for the manufacture of industrial processing machinery (NACE Groups 29.4 and 29.5) was notably lower than the non-financial business economy average.

The rate of **profitability** across the EU-27's machinery and equipment sector was also relatively low; the **gross operating rate** was 9.2% in 2006 compared with a rate of 10.8% for the non-financial business economy. Again, none of the activities presented in the subsectors of machinery and equipment production had a gross operating rate that exceeded the average for the non-financial business economy in 2006, and in the case of the domestic appliances subsector (NACE Group 29.7) this ratio fell as low as 6.8%.

External trade

The EU's **internal market** accounted for a relatively small majority (55.6%) of the EU-27's total trade in machinery and equipment (CPA Subsection DK) in 2007. Trade with non-member countries generated a **trade surplus** of EUR 108.5 billion in 2007, by far the largest trade surplus of any CPA subsection for industrial (CPA Sections C to E) goods. It also represented a fourth consecutive annual widening of the trade surplus from a level of EUR 65.2 billion in 2003.

The EU-27's trade surplus for machinery and equipment in 2007 reflected **extra-EU -27 exports** valued at EUR 193.4 billion (corresponding to 16.6% of the value of industrial exports) and **imports** of EUR 84.9 billion (corresponding to 6.4% of the value of industrial imports). Among the products presented in the subsectors of machinery and equipment production, the only trade deficit recorded in 2007 concerned domestic appliances n.e.c. (CPA Group 29.7) and this was relatively small at EUR 0.9 billion. In contrast, the EU-27's trade surpluses for industrial processing machinery (CPA Groups 29.4 and 29.5) and general purpose machinery (CPA Groups 29.1 and 29.2) both exceeded EUR 50 billion.

In this growing export market for EU-27 machinery and equipment, the value of exports to the United States stabilised between 2006 and 2007. Although, the United States remained the largest export market for these goods in value terms, its share of the export market fell to 16.7%. In contrast, the share of exports to Russia rose sharply to 9.3%, moving it ahead of China as the EU-27's second biggest export market in 2007. This change reflected a steep jump (28.9%) in the value of machinery and equipment exports to Russia between 2006 and 2007. A little more than seven tenths (71.2%) of all the imports of machinery and equipment into the EU-27 came from just four countries in 2007; the value of imports from China (21.3% of the total) was almost identical to those from the United States (21.1%), followed by Japan (16.0%) and Switzerland (12.6%).

Germany was the largest exporter of machinery and equipment in 2007, accounting for a third (32.5%) of all intra- and extra-EU exports by the Member States. However, exports of machinery and equipment from Italy (valued at EUR 74.3 billion) represented the highest proportion (21.6%) of national industrial exports in

2007, ahead of Germany (15.9%). These two Member States recorded the highest trade surpluses for machinery and equipment; in Germany the surplus reached EUR 82.7 billion and in Italy it reached EUR 47.5 billion, dwarfing the next highest surplus of EUR 7.0 billion in the Netherlands.

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Other data sources include [short-term statistics\(STS\)](#) , the [Labour force survey\(LFS\)](#) and the [COMEXT](#) database for external trade.

Context

Technological advancements in the machinery and equipment that is used in other sectors of the economy (particularly in mining, manufacturing, energy provision and construction) can have a considerable impact upon the speed, quality and quantity of what is produced, thereby impacting on downstream productivity and profitability. The machinery and equipment sector is sensitive, therefore, to overall economic conditions and investment patterns both within the European Union and across the world (the two arguably being more intertwined than ever).

Notes

Machinery and equipment wholesale trade statistics - NACE Rev. 1.1

Data from January 2009, most recent data: Further Eurostat information, Main tables and Database

This article belongs to a [set of statistical articles](#) which analyse the structure, development and characteristics of the various economic activities in the [European Union \(EU\)](#). According to the statistical classification of economic activities in the EU ([NACE Rev 1.1](#)), the present article covers machinery and equipment [wholesale trade](#), corresponding to NACE Group 51.8, which is part of the [wholesale trade](#) sector. The activities covered in this article concern the wholesaling of capital goods and other final durable goods for industrial use, except those covered by motor trade. This includes the wholesaling of:

- installation equipment;
- electrical and electronic products for industrial use;
- office furniture.

	Enterprises (thousand)	Turnover (EUR million)	Value added (EUR million)	Persons employed (thousand)	Share in total (%)	
					Value added	Persons employed
Wholesale of machinery and equipment	196.8	693 757	109 078	1 687.3	100.0	100.0
Machine-tools (1)	12.7	24 000	3 837	75.1	3.8	4.5
Mining and construction machinery (2)	9.0	39 001	6 069	88.1	5.6	5.2
Textile machinery and sewing and knitting machines (2)	2.7	2 748	479	12.1	0.4	0.7
Computers, peripherals and software (3)	34.2	217 715	24 934	330.0	24.9	19.6
Other office machinery and equipment	16.3	37 834	7 035	134.8	6.4	8.0

Table 2: Wholesaling of machinery and equipment (NACE Group 51.8). Structural profile: ranking of top five Member States in terms of value added and persons employed, 2006

Value added in the EU-27's wholesaling of machinery and equipment sector (NACE Group 51.8) was EUR 109.1 billion in 2006, derived from **turnover** valued at EUR 693.8 billion. As such, the wholesaling of machinery and equipment represented 21.0% of wholesale trade (NACE Division 51) value added and 15.1% of wholesale turnover. The wholesaling of machinery and equipment workforce numbered 1.7 million persons in the EU-27 in 2006, corresponding to 16.9% of the wholesale trade workforce. By all three of these measures, this was the third largest wholesale trade sub-sector.

Across the eight NACE classes that make up the wholesaling of machinery and equipment sector, the miscellaneous category of wholesale of other machinery for use in industry, trade and navigation (NACE Class 51.87) was the largest, accounting for approximately one third of turnover and more than two fifths of value added and **employment** in the EU-27. Wholesaling of computers, peripherals and software (NACE Class 51.84) was the second largest activity in terms of the same indicators (in 2005).

Among the Member States⁷⁶, the United Kingdom had the largest machinery and equipment wholesaling sector in value added terms, ahead of France, while the latter contributed the largest proportion to EU-27 turnover and employment. In value added terms, Denmark, Belgium and the **Baltic Member States** were all relatively specialised in machinery and equipment wholesaling⁷⁷, where these activities contributed at least 2.6% to the **non-financial business economy**'s (NACE Sections C to I and K) value added; turning to older data (2004) the Netherlands was also relatively highly specialised in this sector, as it generated 3.7% of non-financial business economy value added.

Annualised **short-term statistics** provide a relatively long time series for the **turnover index** in the EU-27's machinery and equipment wholesaling sector. An analysis of this for the period from 1997 to 2007 shows a cyclical development that was in contrast to the uninterrupted upward path experienced by the turnover index for wholesale trade. Indeed, the turnover index in machinery and equipment wholesaling sector grew by at least 3.6% each year from 1997 to 2000, after which there were three years of contraction with sales falling on average by 1.7% per year. In the four following years, from 2004 to 2007, there was renewed turnover growth, as the index increased on average by 6.6% per year, but this was nevertheless 0.9 percentage points below the average growth registered for wholesale trade during the same period.

Expenditure and productivity

The EU-27's machinery and equipment wholesaling sector recorded a relatively low level of **tangible investment**: investments were valued at EUR 8.5 billion in the EU-27 in 2006, 16.0% of the wholesale trade total, and equivalent to 7.8% of this sector's value added, the lowest investment rate across all the wholesale trade activities presented in sub-sectors of the wholesale trade sector. Within this sector the lowest investment rate was recorded for the wholesale of other electronic parts and equipment (NACE Class 51.86), just 5.2%, while the wholesaling of mining, construction and civil engineering machinery (NACE Class 51.82) had the highest rate, 18.8%, more than double the average rate for the machinery and equipment wholesaling sector, and slightly higher than the non-financial business economy average.

The machinery and equipment wholesaling sector's share of operating expenditure dedicated to **personnel costs** was the highest (10.4%) among the wholesale trade activities presented in sub-sectors of the wholesale trade sector. Looking in more detail within this sector, the lowest share of personnel costs in operating expenditure

⁷⁶Bulgaria and Poland, 2005; Malta, not available.

⁷⁷Bulgaria, Cyprus, Poland and Romania, 2005; Malta and the Netherlands, not available.

was 7.4% recorded by wholesaling of computers, peripherals and software (NACE Class 51.84), which was nevertheless above the wholesale trade average (6.5%). The highest share was 13.9% recorded by the subsector for the wholesale of other office machinery and equipment (NACE Class 51.85).

Apparent [labour productivity](#) in the EU-27's machinery and equipment wholesaling sector was EUR 64.6 thousand per person employed in 2006, while average personnel costs were EUR 43.3 thousand per employee – these were, by some way, the highest levels recorded for these two indicators among any of the wholesale trade activities in sub-sectors of the wholesale trade sector. The apparent labour productivity of this sector was the fourth highest among the NACE groups within the non-financial services economy (NACE Sections G to I and K), while the average personnel costs were the third highest, although for both indicators there were several more industrial activities with higher ratios. The resulting [wage-adjusted labour productivity ratio](#) for EU-27 machinery and equipment wholesaling (149.4%) was the lowest of the wholesale trade NACE groups, and was also lower than the ratio for the non-financial business economy (151.5%).

Data sources and availability

The main part of the analysis in this article is derived from [structural business statistics \(SBS\)](#) , including core, business statistics which are disseminated regularly, as well as information compiled on a multi-yearly basis, and the latest results from development projects.

Context

The activities in NACE Division 51 cover all wholesale trade except that [concerning motor vehicles and motorcycles](#) : the wholesaling of automotive fuel is considered as a wholesale trade rather than a motor trade. This article covers resale (sale without transformation) of new and used products, as well as wholesale activities carried out on a fee or contract basis.

The wholesaling activity consists of selling to retailers or to industrial, commercial, institutional and professional users. Wholesalers can act on a [fee or contract basis as agents](#) or for their own account, buying and selling goods. The own-account wholesale sub-sectors distinguish the types of product in which the wholesaler is specialised ([agricultural products](#) , [consumer goods](#) , [intermediate goods](#) , machinery and equipment (this article)), while specialised wholesalers of other products are included in [non-specialised wholesalers](#) .

In the supply chain, wholesalers are located between producers and users, providing know-how and knowledge in markets for which they have expertise. Competition within the wholesale trade activity is often centred on providing more efficient services or more sophisticated value added services. Wholesalers can provide a range of services from basic storage and break of bulk, sorting, grading and logistics to pre- and post-production operations (for instance, labelling, packaging, bottling and installation).

Main statistical findings

Structural profile

The 17 thousand enterprises in the EU-27's basic metals manufacturing sector (Division24) in 2009 made up 0.1% of all enterprises in the non-financial business economy (Sections B to J and L to N and Division95). However, in terms of employment this sector was far more significant, as 1.03 million persons worked in basic metals manufacturing, equivalent to 0.8% of the non-financial business economy workforce and 3.4% of manufacturing (Section C) employment. In 2008 approximately EUR80000 million of value added was generated through basic metals manufacturing, around 4.8% of the manufacturing total.

The apparent labour productivity of the EU-27's basic metals manufacturing sector in 2008 was EUR70 thousand per person employed, above the manufacturing average of EUR51 thousand per person employed. Equally, average personnel costs within this sector were above the manufacturing average, reaching EUR40.0 thousand per employee for basic metals manufacturing in 2009 which was EUR5.5 thousand per employee higher than the manufacturing average.

The gross operating rate (the relation between the gross operating surplus and turnover) was 8.0% in 2008 for the EU-27's basic metals manufacturing sector, marginally lower than the manufacturing average (8.3%).

Sectoral analysis

Within the EU-27's basic metals manufacturing sector the three largest subsectors in terms of employment were the manufacture of basic iron and steel and of ferro-alloys (Group24.1), the casting of metals (Group24.5) subsector and the manufacture of basic precious and other non-ferrous metals (Group24.4), each occupying more than one fifth of the basic metals manufacturing workforce in 2009.

In output terms, the relative importance of the manufacture of basic iron and steel and of ferro-alloys was greater than in employment terms, accounting for almost half (49.3%) of the sectoral value added in 2008. Particular care has to be taken comparing information on value added between 2008 and 2009 as the impact of the financial and economic crisis was strong. For example, although precise data for 2009 are not available, the share of the manufacture of basic iron and steel and of ferro-alloys subsector fell in 2009 to about one third of sectoral value added, compared with a share of almost one half in 2008.

In 2009 the only subsector to record an apparent labour productivity figure above the manufacturing and non-financial business economy averages was the manufacture of basic precious and other non-ferrous metals where value added per person employed within the EU-27 averaged EUR59 thousand. The lowest level of apparent labour productivity among the basic metals manufacturing subsectors was EUR37 thousand recorded for the casting of metals. Note that 2009 data is not available for the manufacture of tubes, pipes, hollow profiles and related fittings, of steel (Group24.2) and that the 2008 apparent labour productivity (EUR70 thousand) for this subsector should not be directly compared with the 2009 values for the other subsectors.

At the NACE group level, personnel costs per employee peaked in 2009 at an average of EUR46.5 thousand for the EU-27's manufacture of basic precious and other non-ferrous metals subsector. Average personnel costs per employee exceeded the non-financial business economy average (EUR30 thousand) for all basic metals manufacturing subsectors and also exceeded the manufacturing average (EUR34.5 thousand) for all subsectors except the casting of metals.

The [wage-adjusted labour productivity](#) was particularly low for the EU-27's manufacture of basic iron and steel and of ferro-alloys subsector, where a ratio of 94.3% was recorded, indicating that apparent labour productivity exceeded average personnel costs in 2009; this was the lowest wage-adjusted labour productivity ratio among all of the manufacturing NACE groups in 2009 and the fifth lowest among the non-financial business economy NACE groups. The three other subsectors for which 2009 data are available (see Table 2b) recorded wage-adjusted labour productivity ratios above 100% but below the manufacturing and non-financial business economy averages.

In all of the four basic metals manufacturing NACE groups for which data are available for 2009 the EU-27 gross operating rate was below the non-financial business economy average (9.7%). For three of the subsectors this ratio ranged from 2.7% to 3.9%, with the manufacture of tubes, pipes, hollow profiles and related fittings, of steel recording an EU-27 gross operating rate of 7.4%, just above the manufacturing average (7.0%). The manufacture of basic iron and steel and of ferro-alloys recorded a gross operating rate of 9.7% in 2008, which was above the manufacturing average (8.3%) for that year.

Country analysis

Germany had the highest value added of any Member State in each of the basic metals manufacturing subsectors in 2009: Germany's share of EU-27 value added ranged from 30.7% for the manufacture of other products of first processing of steel (Group24.3) to 36.9% for the casting of metals.

The relative importance of the basic metals manufacturing sector was highest in Austria where it accounted for 2.3% of non-financial business economy value added in 2009, a far greater share than in the next most specialised Member States, namely Slovakia (1.7%) and Belgium (1.4%). Austrian specialisation was particularly strong in the manufacture of basic iron and steel and of ferro-alloys.

The wage-adjusted labour productivity ratios available for most Member States for 2009 reflect the economic situation: Estonia recorded a negative rate due to its negative value added. The wage-adjusted labour productivity ratio for this sector failed to reach 100% for ten Member States in 2009, the second highest frequency among all of the NACE divisions within the non-financial business economy. Nevertheless, the wage-adjusted labour productivity ratio for basic metals manufacturing was above the manufacturing average for four Member States in 2009, most notably in Cyprus and Austria, but also in Bulgaria and Germany.

A broadly similar situation was observed for the gross operating rate, where Cyprus and Austria were the only Member States to record a gross operating rate for this sector that was above their national manufacturing averages. A total of 11 Member States recorded a negative gross operating rate in 2009, as did Croatia: in Estonia this again reflected the negative value added, while in the other ten Member States and Croatia value added did not cover the personnel costs. This represented the highest number of Member States with a negative gross operating rate across all of the non-financial business economy NACE divisions in 2009.

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

This article presents an overview of statistics for the basic metals manufacturing sector in the EU, as covered by NACE Rev.2 Division24. This division includes the activities of smelting and/or refining ferrous and non-ferrous metals from ore, pig or scrap, using electrometallurgic and other process metallurgic techniques.

This division also includes the manufacture of metal alloys and super-alloys by introducing other chemical elements to pure metals.

The output of smelting and refining, usually in ingot form, is used in rolling, drawing and extruding operations to make products such as plate, sheet, strip, bars, rods, wire or tubes, pipes and hollow profiles and in molten form to make castings and other basic metal products.

The manufacture of other products from the first processing of steel (such as bars, strips, sheets or wire) includes manufacturing by cold processing of steel. The manufacture of basic precious and non-ferrous metals includes gold, silver, platinum, aluminium, lead, zinc, tin, copper, chrome, manganese, nickel, nuclear fuel (uranium).

This NACE division is composed of five groups:

- the manufacture of basic iron and steel and of ferro-alloys (Group24.1);
- the manufacture of tubes, pipes, hollow profiles and related fittings, of steel (Group24.2);
- the manufacture of other products of first processing of steel (Group24.3);
- the manufacture of basic precious and non-ferrous metals (Group24.4);
- the casting of metals (Group24.5) as semi-finished products.

Excluded are the manufacture of finished metal products (which from part of the [manufacture of fabricated metal products](#) , Division25) and metal jewellery (which is classified as part of [other manufacturing](#) , Division32).

Table 4b: Key indicators, manufacture of beverages (NACE Division11), 2009 - Source: Eurostat (sbs_na_ind_r2)

Main statistical findings

Structural profile

There were 23 thousand enterprises operating with beverages manufacturing (Division11) as their main activity in the EU-27 in 2009. Together they employed 479.7 thousand persons in 2008, equivalent to 0.3% of all persons employed in the non-financial business economy (Sections B to J and L to N and Division 95) and 1.5% of those persons employed in manufacturing (Section C). They generated EUR33898 million of value added which was 2.0% of the manufacturing total in 2008.

The apparent labour productivity of the EU-27's beverages manufacturing sector in 2009 was EUR70 thousand per person employed, above the non-financial business economy average of EUR41.6 thousand per person employed and the manufacturing average of EUR46 thousand per person employed. Average personnel costs within the EU-27's beverages manufacturing sector were also relatively high, at EUR40 thousand per employee in 2009 compared with EUR30.0 thousand per employee for the non-financial business economy and EUR34.5 thousand per employee for manufacturing.

Sectoral analysis

Four of the seven subsectors (at the NACE class level) within the EU-27's beverages manufacturing sector were dominant, namely those concerning the production of spirits (Class 11.01), wine (Class 11.02), beer (Class 11.05) and soft drinks, mineral waters and other bottled waters (Class 11.07). These four subsectors accounted for 96.1% of this sector's enterprise population and 95.1% of its turnover in 2009.

An analysis of value added and employment in 2009 (see Figure 1) can be made excluding the smallest subsector (in turnover terms), namely other non-distilled fermented beverages manufacturing (Class 11.04); this missing subsector accounted for 0.5% sectoral turnover. The two largest subsectors within beverages manufacturing were the manufacture of beer and the manufacture of soft drinks, the first of which had the largest share of sectoral value added while the latter had the largest share of the sector's workforce. Spirits manufacturing had the third largest value added, while wine manufacturing had the third largest workforce. The variation in the rankings based on value added and employment underlines differences in apparent labour productivity which can be seen in Table 2b. The high apparent labour productivity figure for the whole of the beverages manufacturing sector reflected relatively ratios across all subsectors. The production of wine recorded an apparent labour productivity ratio of EUR46 thousand per person employed, which was the lowest of the six subsectors

for which data are available, but even this was in line with the manufacturing average. The small activity of malt manufacturing (Class11.06) recorded the highest apparent labour productivity ratio among the subsectors, reaching EUR99 thousand per person employed, just ahead of beer manufacturing (EUR96 thousand per person employed). In contrast, average personnel costs for the various subsectors ranged from EUR28.6 thousand per employee for the manufacture of cider and other fruit wines (Class11.03) – which was below the non-financial business economy average – to EUR45.6 thousand per employee for beer manufacturing. In fact, most subsectors recorded average personnel costs that were above the manufacturing average, the only exceptions being wine production and the aforementioned manufacture of cider and other fruit wines.

In all six beverages manufacturing NACE classes for which data are available for 2009 EU-27 [wage-adjusted labour productivity ratios](#) exceeded the manufacturing average (132.1%) and the non-financial business economy average (138.8%). This ratio ranged from 148.6% for wine production to 262.3% for malt manufacturing.

In contrast, malt manufacturing recorded the lowest [gross operating rate](#) (the relation between the [gross operating surplus](#) and [turnover](#)) among the EU-27's beverages manufacturing subsectors in 2009, 8.6%, above the manufacturing average (7.0%) but below the non-financial business economy average (9.7%). By far the highest gross operating rate was recorded for the production of spirits, where 21.0% of turnover remained as gross operating surplus, three times the manufacturing average.

Country analysis

Among the Member States the largest value added in beverages manufacturing in 2009 was in France (EUR5007 million), followed by Germany (EUR4843 million) and Spain (EUR4634 million). Excluding the production of spirits, value added in beverages manufacturing in the United Kingdom in 2009 was EUR3152 million; value added in spirits production in 2008 was EUR2775 million. An analysis of the beverages manufacturing workforce shows a different ranking of the largest Member States. In Germany, 75700 persons were employed in this sector, far ahead of Spain (48500) and France (45000 employees), which in turn had notably larger workforces than in Italy (36000), Poland (30400) or Romania (26700). Again, data for the United Kingdom for 2009 are not available, but this sector employed 45700 persons in 2008.

Looking at the relative importance of beverages manufacturing value added in the non-financial business economy as a whole, Romania was the most specialised Member State in 2009, with 1.4% of its non-financial business economy value added generated in this sector, a share that was also reached in Lithuania and Poland. In contrast, Sweden and Denmark were the least specialised, generating 0.3% of their non-financial business economy value added in beverages manufacturing.

As can be seen from Table 3, the largest Member State in the beer, malt and soft drinks (including bottled waters) manufacturing subsectors was Germany, while France had the highest share of EU-27 value added for wine production and also the production of other fermented beverages. The United Kingdom had the largest subsector for cider and other fruit wine production. For spirits production, France had the largest value added in 2009 (EUR1241 million), but this was less than half the 2008 (latest data available) level of value added (EUR2775 million) recorded for the United Kingdom.

The gross operating rate and the wage-adjusted labour productivity ratio for beverages manufacturing varied greatly between Member States in 2009, more so than in the non-financial business economy as a whole. Particularly high wage-adjusted labour productivity ratios were recorded in Poland (453.8%) and Romania (305.9%), while the Czech Republic, Lithuania and the Netherlands also recorded ratios in excess of 250%; for Poland this was the highest wage-adjusted labour productivity ratio for any of the NACE divisions within the non-financial business economy in 2009. The lowest wage-adjusted labour productivity ratios were recorded in Denmark (2008 data), Germany, Ireland and Sweden, all below 150%. The gross operating rate indicates that operating profitability in beverages manufacturing was highest in Greece, where the gross operating surplus was equivalent to 30.6% of turnover, far above the rates recorded in Poland (22.1%) and the Czech Republic (20.3%). The four Member States with the lowest wage-adjusted labour productivity ratios in this sector recorded gross operating rates below 10%, as did Latvia and Italy.

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

This article presents an overview of statistics for the beverages manufacturing sector in the EU, as covered by NACE Rev.2 Division11. This division includes the manufacture of non-alcoholic beverages and mineral water and alcoholic beverages mainly through fermentation or distillation.

This NACE division is composed of seven classes organised into one group:

- the distilling, rectifying and blending of spirits (Class11.01);
- the production of wine from grape (Class11.02);
- the production of cider and other fruit wines (Class11.03);
- the production of other non-distilled fermented beverages (Class11.04) such as vermouth;
- the production of beer (Class11.05), including low alcohol or non-alcoholic beer;
- the manufacture of malt (Class11.06);
- the manufacture of soft drinks, mineral waters and other bottled waters (Class11.07).

This division excludes:

- the production of fruit and vegetable juices, milk-based drinks, coffee, tea and mate products (which forms part of [food manufacturing](#) , Division10);
- the production of synthetic ethyl alcohol and ethyl alcohol from fermented materials (which is part of [chemical manufacturing](#) , Division20).

Note that merely bottling and labelling is classified to either [wholesaling](#) (Division46) or [office administrative, office support and other business support activities](#) (Division82) if performed on a fee or contract basis.

Table 4b: Key indicators, manufacture of chemicals and chemical products (NACE Division20), 2009 - Source: Eurostat (sbs_na_ind_r2)

Main statistical findings

Structural profile

There were 28 thousand enterprises operating within the chemicals and chemical products manufacturing (Division20) sector in the EU-27 in 2009. Employment in this sector reached 1.18 million persons, equivalent to 0.9% of all persons employed in the non-financial business economy (Sections B to J and L to N and Division95) and 3.8% of the manufacturing (Section C) workforce. The chemicals and chemical products manufacturing sector generated EUR91700 million of value added which was a much higher share of the non-financial business economy (1.6%) and manufacturing (6.6%) totals than in recorded for employment.

This relatively high value added resulted in a high apparent labour productivity ratio for the EU-27's chemicals and chemical products manufacturing sector in 2009, EUR78 thousand per person employed, well above the non-financial business economy average (EUR41.6 thousand per person employed) and the manufacturing average (EUR46 thousand per person employed). This was the fourth highest apparent labour productivity ratio recorded for any manufacturing NACE division in 2009. Personnel costs within the EU-27's chemicals and chemical products manufacturing sector were also relatively high, averaging EUR50.2 thousand per employee, the third highest among the manufacturing NACE divisions in 2009. The wage-adjusted labour productivity ratio that resulted from the combination of these two indicators shows that value added per person employed was equivalent to 155.2% of average personnel costs per employee. The wage-adjusted labour productivity ratio for the EU-27's chemicals and chemical products manufacturing sector was the fourth highest among the manufacturing NACE divisions and was above the non-financial business economy average (138.8%).

The gross operating rate (the relation between the gross operating surplus and turnover) stood at 8.1% for the EU-27's chemicals and chemical products manufacturing sector in 2009, between the non-financial business economy average (9.7%) and the manufacturing average (7.0%).

Sectoral analysis

Four of the six subsectors which constitute the EU-27's chemicals and chemical products manufacturing sector were dominant – see Figure 1. The largest, in terms of the number of enterprises, employment and value added was the manufacture of basic chemicals, fertilisers and nitrogen compounds, plastics and synthetic rubber in primary forms (Group20.1, hereafter referred to as basic chemicals manufacturing); this subsector contributed 46.1% of sectoral employment and 53.5% of sectoral value added. According to the same measures, the next

largest subsectors were: the manufacture of soap and detergents, cleaning and polishing preparations, perfumes and toilet preparations (Group20.4, hereafter referred to as the manufacture of cleaning products and toiletries); the manufacture of other chemical products (Group20.5); and the manufacture of paints, varnishes and similar coatings, printing ink and mastics (Group20.3, hereafter referred to as paint and ink manufacturing). These four activities collectively made up 95% or more of the chemicals and chemical products manufacturing sector's enterprise population, employment and value added in 2009. The chemicals and chemical products manufacturing sector was completed by the manufacture of pesticides and other agrochemical products (Group20.2) and the manufacture of man-made fibres (Group20.6).

Despite their relatively different sizes, the six subsectors within the EU-27's chemicals and chemical products manufacturing sector recorded relatively similar values for a range of expenditure, productivity and profitability indicators, as shown in Table 2b. In 2009, all six subsectors recorded values above the manufacturing and non-financial business economy averages for apparent labour productivity, average personnel costs and wage-adjusted labour productivity ratios.

The highest apparent labour productivity for one of the EU-27's chemicals and chemical products manufacturing subsectors in 2009 was recorded for basic chemicals manufacturing, with EUR90 thousand of value added per person employed. The lowest values were recorded for the manufacture of cleaning products and toiletries, as well as the manufacture of man made fibres, both averaging EUR60.3 thousand per person employed. Personnel costs per employee also peaked for the basic chemicals manufacturing subsector, at EUR57.5 thousand per employee, with the lowest average recorded for the manufacture of cleaning products and toiletries (EUR40.1 thousand per employee). In general, the ranking of the six subsectors for the EU-27 was the same whether based on apparent labour productivity or average personnel costs, with the exception of relatively high average personnel costs for the manufacture of man-made fibres. As a result, wage-adjusted labour productivity ratios for these subsectors were generally in a narrow range, from 152.0% to 157.6%, with the ratio for man-made fibres manufacturing (143.7%) pulled below this range by its higher average personnel costs.

The gross operating rate for the six chemicals and chemical products manufacturing subsectors in the EU-27 was more diverse. The highest rate in 2009 was recorded for paint and ink manufacturing (10.0%), and this was the only subsector where the rate exceeded the non-financial business economy average (9.7%). The remaining five subsectors recorded gross operating rates that were situated between the non-financial business economy average and the manufacturing average, ranging from 7.3% for basic chemicals manufacturing to 9.6% for the manufacture of cleaning products and toiletries.

Country analysis

In value added terms, the largest Member State within the EU-27's chemicals and chemical products manufacturing sector in 2009 was Germany, followed at some distance by France and the United Kingdom. These three Member States collectively contributed 57.7% of the EU-27's value added in this sector, higher than their share of manufacturing as a whole (50.5%). The same three Member States also had the largest workforces in the chemicals and chemical products manufacturing sector, ranging from 326.9 thousand in Germany to 119.8 thousand in the United Kingdom, with the Italian workforce only slightly smaller (115.6 thousand). These four Member States provided 60.7% of the EU-27's workforce, again above their corresponding share of the EU-27's manufacturing workforce (53.8%).

The relative importance of the chemicals and chemical products manufacturing sector was highest in Belgium where it accounted for 3.4% of non-financial business economy value added, ahead of Germany (2.4%) and the Netherlands (2.0%). Switzerland was also relatively highly specialised in chemicals and chemical products manufacturing as this sector contributed 1.9% of Swiss non-financial business economy value added. The least specialised Member States in value added terms in 2009 were Cyprus, Latvia, Slovakia, Portugal, Estonia, Bulgaria and Ireland, where this sector contributed less than 1% of non-financial business economy value added.

Belgium's high specialisation in chemicals and chemical products manufacturing was broadly based. Belgium was the most specialised Member State in 2009 (in value added terms) for three subsectors: basic chemicals manufacturing, the manufacture of pesticides and other agrochemical products, and the other chemical products manufacturing. Furthermore, in each of the three remaining subsectors Belgium generated a greater share of its non-financial business economy value added than the average recorded for the EU-27 as a whole. In contrast, Estonia, Ireland and Austria were each the most specialised Member State in one of the subsectors (see Table 3), despite being relatively unspecialised in chemicals and chemical products manufacturing as a whole.

The high wage-adjusted labour productivity ratio for chemicals and chemical products manufacturing that was observed for the EU-27 in 2009 was repeated across nearly all of the Member States: among those with data available, only Slovakia, Bulgaria and Germany recorded wage-adjusted labour productivity ratios for the chemicals and chemical products manufacturing sector that were below their respective averages for the non-financial business economy. The highest wage-adjusted labour productivity ratio for the chemicals and chemical products manufacturing sector was recorded for Poland, where apparent labour productivity was 2.4 times (241.1%) as high as average personnel costs per employee. Wage-adjusted labour productivity ratios for Ireland, the United Kingdom, Greece and Romania were the next highest, at just over 200%.

The highest gross operating rates for chemicals and chemical products manufacturing in 2009 were reported for Greece, Denmark, Ireland, the United Kingdom and Poland, all at least 14%. In most of the other Member States this measure of operating profitability ranged from 6.0% to 12.7%; Slovakia, Lithuania and France recorded gross operating rates below this range, as did Croatia.

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

This article presents an overview of statistics for the chemicals and chemical products manufacturing sector in the EU, as covered by NACE Rev.2 Division20. This division includes the transformation of organic and inorganic raw materials by a chemical process and the formation of products.

The manufacture of basic chemicals includes the manufacture of industrial gases, dyes, pigments, other inorganic basic chemicals (including inorganic acids), other organic basic chemicals (such as acyclic and cyclic hydrocarbons, acyclic and cyclic alcohols, mono- and polycarboxylic acids, synthetic glycerol, nitrogen-function organic compounds, other organic compounds, or synthetic aromatic products).

The manufacture of other chemical products includes the manufacture of explosives and pyrotechnic products, glues, essential oils and other chemical products such as photographic chemical material and composite diagnostic preparations.

This NACE division is composed of six groups:

- the manufacture of basic chemicals, fertilisers and nitrogen compounds, plastics and synthetic rubber in primary forms (Group20.1);
- the manufacture of pesticides and other agrochemical products (Group20.2);
- the manufacture of paints, varnishes and similar coatings, printing ink and mastics (Group20.3);
- the manufacture of soap and detergents, cleaning and polishing preparations, perfumes and toilet preparations (Group20.4);
- the manufacture of other chemical products (Group20.5);
- the manufacture of man-made fibres (Group20.6).

Main statistical findings

Structural profile

There were approximately 1200 enterprises in the EU-27's coke and refined petroleum products manufacturing sector (Division 19) in 2009. These enterprises generated EUR 15085 million of value added and employed 133 thousand persons. As such the coke and refined petroleum products manufacturing sector contributed 0.1% of the non-financial business economy (Sections B to J and L to N and Division 95) workforce and 0.3% of its value added; alternatively, this sector represented 0.4% of manufacturing (Section C) employment and 1.1% of manufacturing value added.

The fact that this sector's shares of manufacturing and non-financial business economy value added were higher than the corresponding shares based on employment indicate that the coke and refined petroleum products manufacturing sector had an above average apparent labour productivity. In 2009, value added per person employed averaged EUR 113 thousand for the EU-27's coke and refined petroleum products manufacturing sector, about 2.5 times the manufacturing average (EUR 46 thousand) and even further above the non-financial business economy average (EUR 41.6 thousand). This level of apparent labour productivity ranked third highest among the manufacturing NACE divisions, behind tobacco manufacturing (Division 12) and pharmaceuticals manufacturing (Division 21).

Equally, average personnel costs within the EU-27's coke and refined petroleum products manufacturing sector were high, at EUR 66.5 thousand per employee in 2009. This was the highest level among all of the non-financial business economy NACE divisions in 2009; for comparison the manufacturing average was EUR 34.5 thousand per employee and the non-financial business economy average was EUR 30.0 thousand per employee.

The result of these high levels of apparent labour productivity and average personnel costs was a wage-adjusted labour productivity ratio for the EU-27's coke and refined petroleum products manufacturing sector of 170.3%, the third highest among the manufacturing NACE divisions in 2009.

In contrast, the gross operating rate for the EU-27's coke and refined petroleum products manufacturing sector was just 1.6% in 2009, the second lowest among the manufacturing NACE divisions, and the fourth lowest among all non-financial business economy divisions. This rate shows the relation between the gross operating surplus and turnover, and was brought down by this sector's very high turnover: coke and refined petroleum products manufacturing accounted for 1.8% of turnover in the EU-27's non-financial business economy, a far higher share than recorded for value added or employment.

Sectoral analysis

The coke and refined petroleum products manufacturing sector comprises two subsectors: the manufacture of coke oven products (Group19.1) and the manufacture of refined petroleum products (Group19.2). Within the EU-27 the coking subsector is by far the smallest, for example, contributing 7.4% of sectoral employment in 2009, 2.6% of sectoral value added and 0.7% of sectoral turnover.

Because of its dominance, the EU-27's petroleum refining subsector recorded expenditure, productivity and profitability ratios that were similar to those for the sector as a whole: with high apparent labour productivity (EUR 119 thousand per person employed), average personnel costs (EUR 70.2 thousand per employee) and wage-adjusted labour productivity (169.8%) and a very low gross operating rate (1.6%). Among the EU-27's manufacturing NACE groups the petroleum refining subsector recorded the fourth highest apparent labour productivity ratio in 2009, the highest level of average personnel costs (third highest within the non-financial business economy), and the lowest gross operating rate (fifth lowest within the non-financial business economy).

An analysis of the coking subsector shows a very different profile – although it is important to bear in mind that this is a relatively small subsector within the EU-27 and that at least 14 Member States did not have any enterprises in this subsector in 2009. Furthermore, the EU-27's activity in the coking subsector is heavily concentrated in Poland, which accounted for more than two thirds of the EU-27's value added and more than half of the workforce. Apparent labour productivity for the EU-27's coking subsector was EUR 40 thousand per person employed in 2009, slightly below the non-financial business economy average and further below the manufacturing average (EUR 46 thousand). Average personnel costs were particularly low, EUR 21.1 thousand per employee for the coking subsector, around three fifths of the manufacturing average (EUR 34.5 thousand). One characteristic common between the petroleum refining and coking subsectors was a relatively high wage-adjusted labour productivity ratio: for coking this reached 191.0% in 2009, well above the manufacturing and non-financial business economy averages (132.1% and 138.8% respectively). The EU-27 coking subsector recorded a gross operating rate that was typical for a manufacturing activity, as the gross operating surplus for the coking subsector was equivalent to 6.8% of turnover, just 0.2 percentage points below the manufacturing average.

Country analysis

The coke and refined petroleum products manufacturing sector was less concentrated in the largest Member States than is typically the case for manufacturing activities. Germany had the largest share of EU-27 value added in this sector, 15.9% in 2009, marginally larger than the 15.3% share recorded for France. Spain, the United Kingdom, Greece, Italy, Hungary and the Netherlands all recorded shares between 10.0% and 7.5% of the EU-27 total. The 7.6% share of EU-27 value added recorded for Hungary was the highest share for Hungary in any of the non-financial business economy NACE divisions (with data available) in 2009; the same was true of the 8.5% share recorded for Greece, although it should be noted that for Greece data is only available for divisions within industry and construction and that there is no information available for services divisions.

The relative importance of the coke and refined petroleum products manufacturing sector was particularly high in Hungary where it contributed 2.7% of non-financial business economy value added, almost 10 times the average share for the EU-27. Estonia (0.7%), Belgium (0.5%) and the Netherlands (0.4%) were also relatively specialised in this sector. As noted above, Poland dominated the coking subsector within the EU-27: it contributed 67.8% of EU-27 value added in this subsector and 57.8% of the workforce, while Italy had a 10.0% share of the EU-27's value added.

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

This article presents an overview of statistics for the coke and refined petroleum products manufacturing sector in the EU, as covered by NACE Rev.2 Division19. This division includes processing services and own-account manufacture of characteristic products through the transformation of crude petroleum and coal into usable products.

Coke oven products include the operation of coke ovens, the production of coke, semi-coke, pitch, pitch coke, coke oven gas, crude coal and lignite tars and the agglomeration of coke.

Refining crude petroleum includes the manufacture of liquid or gaseous fuels or other products from crude petroleum, bituminous minerals or their fractionation products. Petroleum refining involves one or more of the following activities: fractionation; straight distillation of crude oil; and cracking. Included are the production of motor fuel, light, medium and heavy fuel oil, refinery gases, oil-based lubricating oils or greases, road coverings, the blending of biofuels, and the production of a range of other products such as white spirit, paraffin wax and petroleum jelly.

This NACE division is composed of two groups:

- the manufacture of coke oven products (Group19.1);
- the manufacture of refined petroleum products (Group19.2).

This division includes the manufacture of gases such as ethane, propane and butane if these are produced as products from petroleum refineries; otherwise, the manufacture of these gases is classified as part of [chemical manufacturing](#) (Division20) which also includes the manufacture of petrochemicals from refined petroleum. Furthermore, the manufacture of fuel gas other than petroleum gases (for example, coal gas, water gas, producer gas, gasworks gas) is classified as part of [electricity, gas, steam and air conditioning supply](#) (SectionD).

Table 4b: Key indicators, manufacture of computer, electronic and optical products (NACE Division26), 2009 - Source: Eurostat (sbs_na_ind_r2)

Main statistical findings

Structural profile

The computer, electronic and optical products manufacturing sector (Division26) comprised 44 thousand enterprises in the EU-27 in 2009, employed 1.15 million persons and generated EUR64000 million of value added. As such, this sector employed 0.9% of the non-financial business economy (Sections B to J and L to N and Division95) workforce and generated 1.1% of its value added; its share of manufacturing (Section C) was 3.7% in employment terms and 4.6% in value added terms.

The apparent labour productivity of the EU-27's computer, electronic and optical products manufacturing sector in 2009 was EUR56 thousand per person employed, above the non-financial business economy average of EUR41.6 thousand per person employed and the manufacturing average of EUR46 thousand per person employed. This high apparent labour productivity was accompanied by high average personnel costs of EUR44.2 thousand per employee, nearly 1.5 times the EUR30.0 thousand average for the non-financial business economy and also well above the EUR34.5 thousand average for manufacturing. These relatively high average personnel costs contributed to a wage-adjusted labour productivity ratio for the EU-27's computer, electronic and optical products manufacturing sector of 124.7%, lower than the 138.8% average for the non-financial business economy as a whole and the 132.1% average for manufacturing.

The gross operating rate for the EU-27's computer, electronic and optical products manufacturing sector in 2009 indicated that the gross operating surplus was equivalent to 5.5% of turnover, a lower rate of operating profitability (by this measure) than the average for the whole of the non-financial business economy (9.7%) and the manufacturing average (7.0%).

Sectoral analysis

Based on a simple count of the number of enterprises the three largest subsectors within the EU-27's computer, electronic and optical products manufacturing sector in 2009 were the manufacture of instruments and appliances for measuring, testing and navigation, and watches and clocks (Group26.5, hereafter referred to as the manufacture of measuring instruments), the manufacture of electronic components and boards (Group26.1) and the manufacture of communication equipment (Group26.3). Together, these three subsectors employed more than three quarters of the computer, electronic and optical products manufacturing sector's workforce in

the EU-27. Behind these three large subsectors were the manufacture of computers and peripheral equipment (Group26.2) and the manufacture of consumer electronics (Group26.4), with 8.2% and 7.3% of the sectoral workforce respectively. The three smallest subsectors – the manufacture of irradiation, electromedical and electrotherapeutic equipment (Group26.6), optical instruments and photographic equipment (Group26.7) and magnetic and optical media (Group26.8) – collectively employed 8.3% of the sectoral workforce.

The high level of average personnel costs for the whole of the EU-27's computer, electronic and optical products manufacturing sector in 2009 was pulled upwards by the manufacture of measuring instruments (EUR48.3 thousand per employee) as well as by the relatively small subsector concerning the manufacture of irradiation, electromedical and electrotherapeutic equipment (EUR55.5 thousand per employee). The other large subsectors also recorded average personnel costs per employee that were above the non-financial business economy average, EUR40.0 thousand for electronic components and boards manufacturing and EUR54.1 thousand (2008 data) for communication equipment manufacturing.

Analysis of apparent labour productivity and wage-adjusted labour productivity for the computer, electronic and optical products manufacturing subsectors is hampered by the lack of 2009 data for two of the largest subsectors and the difficulty of comparing 2008 values with those from 2009 due to the impacts of the financial and economic crisis. Among the six subsectors for which 2009 wage-adjusted labour productivity ratios are available for the EU-27 three were above the manufacturing average (132.1%), namely the manufacture of computers and peripheral equipment (159.2%), the manufacture of consumer electronics (157.0%) and the manufacture of irradiation, electromedical and electrotherapeutic equipment (156.3%). The smallest subsector, magnetic and optical media manufacturing, recorded a wage-adjusted labour productivity ratio of 113.9% in 2009, the lowest among the EU-27's computer, electronic and optical products manufacturing subsectors. For the two subsectors for which 2009 data are not available, wage-adjusted labour productivity ratios for 2008 were close to the manufacturing average (145.3%, 2008 data): 139.0% for the manufacture of electronic components and boards and 146.6% for the manufacture of communication equipment.

Country analysis

Within the EU-27's computer, electronic and optical products manufacturing sector the largest Member States in 2009 (in value added terms) were Germany (28.4% of the EU-27 total), France (14.0%) and the United Kingdom (12.5%). All three of these Member States recorded a larger share of the EU-27's total value added in this sector than they did for manufacturing as a whole, a situation that was also true in some of the smaller Member States, most notably Finland, Ireland, Sweden and Hungary.

In 2009, Germany was also the largest Member State, in value added terms, for six of the eight computer, electronic and optical products manufacturing subsectors with its highest share of EU-27 value added recorded for optical instruments and photographic equipment manufacturing (55.8%). The United Kingdom was largest producer for consumer electronics manufacturing, while Finland was largest producer for communication equipment manufacturing – see Table 3.

In value added terms, Finland was the most specialised Member State in the computer, electronic and optical products manufacturing sector, as it generated 3.5% of its non-financial business economy value added in this sector. Hungary and Ireland were the next most specialised Member States, each with 3.3% of their non-financial business economy value added in the computer, electronic and optical products manufacturing sector, followed by Sweden (2.5%), Slovakia and Germany (both 1.5%); Switzerland was also very specialised in this sector where it generated 5.2% of its non-financial business economy value added.

At a more detailed level, Finland was specialised in the manufacture of irradiation, electromedical and electrotherapeutic equipment and in particular in the communications equipment manufacturing subsector. Ireland was highly specialised in the manufacture of computers and peripheral equipment. Hungary was also relatively specialised in the communications equipment manufacturing subsector and the computers and peripheral equipment subsector.

The productivity and profitability of the computer, electronic and optical products manufacturing sector varied greatly between Member States in 2009. The wage-adjusted labour productivity ratio reached in excess of 200% in Cyprus, Latvia, Ireland, Romania and Hungary, and in all of these Member States wage-adjusted labour productivity ratios for this sector were above national non-financial business economy averages, greatly so in Cyprus, Latvia and Ireland; in fact, in Cyprus the computer, electronic and optical products manufacturing

sector recorded the highest wage-adjusted labour productivity ratio for any of the NACE divisions within the non-financial business economy in 2009. In contrast, both the Czech Republic and Slovenia recorded wage-adjusted labour productivity ratios that were below 100%, indicating that average personnel costs per employee were higher than the value added per person employed. The Czech Republic and Slovenia also recorded the lowest gross operating rates for the computer, electronic and optical products manufacturing sector, with Germany, Portugal, Slovakia, Finland and France also recording rates below 5%. At the other end of the ranking, there were seven Member States that recorded a gross operating rate in excess of 10%, as did Switzerland; the highest rate of all was 27.3% in Latvia.

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

This article presents an overview of statistics for the computer, electronic and optical products manufacturing sector in the EU, as covered by NACE Rev.2 Division26. This division includes the manufacture of computers, computer peripherals, communications equipment, and similar electronic products, as well as the manufacture of components for such products; computers can be analogue, digital, or hybrid. Peripherals include, for example, printers, monitors, keyboards, mice, joysticks and projectors.

Telephone and data communications equipment are used to move signals electronically over wires or through the air such as radio and television broadcast and wireless communications equipment. Included are central office switching equipment, private branch exchange (PBX) equipment, telephones, bridges, routers, and gateways, antenna, pagers, mobile communications equipment, studio and broadcasting equipment, modems, transmitters, and remote controls.

The manufacture of consumer electronics includes household products such as televisions, audio recording and duplicating systems, stereo equipment, radio receivers, CD and DVD players, and video game consoles.

Measuring, testing and navigating equipment includes equipment for industrial and non-industrial purposes, including time-based measuring devices such as watches and clocks and related devices.

Irradiation, electromedical and electrotherapeutic equipment includes industrial, medical diagnostic, medical therapeutic, research and scientific equipment, such as X-ray equipment, magnetic resonance imaging (MRI) equipment, medical lasers, pacemakers and hearing equipment.

Optical instruments and lenses include binoculars, microscopes (except electron, proton), telescopes, prisms, lenses (except ophthalmic) and photographic equipment such as cameras and light meters.

The manufacture of magnetic and optical recording media includes blank magnetic audio and video tapes and cassettes, blank diskettes, blank optical discs and hard drive media.

Production processes of this division are characterised by the design and use of integrated circuits and the application of highly specialised miniaturisation technologies.

This NACE division is composed of eight groups:

- the manufacture of electronic components and boards (Group26.1);
- the manufacture of computers and peripheral equipment (Group26.2);
- the manufacture of communication equipment (Group26.3);

- the manufacture of consumer electronics (Group26.4);
- the manufacture of instruments and appliances for measuring, testing and navigation; watches and clocks (Group26.5);
- the manufacture of irradiation, electromedical and electrotherapeutic equipment (Group26.6);
- the manufacture of optical instruments and photographic equipment (Group26.7);
- the manufacture of magnetic and optical media (Group26.8).

Excluded are the reproduction of recorded media (part of [printing and reproduction of recorded media](#) , Division18), the production of electrical relays and wiring devices (part of the [manufacture of electrical equipment](#) , Division27) and ophthalmic goods (classified as part of [other manufacturing](#) , Division32).

Table 4b: Key indicators, manufacture of electrical equipment (NACEDivision27), 2009 - Source: Eurostat (sbs_na_ind_r2)

Main statistical findings

Structural profile

There were 50 thousand enterprises in the EU-27's electrical equipment manufacturing sector (Division27) in 2009. These enterprises employed 1.45 million persons, equivalent to 1.1% of the total number of persons employed in the **non-financial business economy** (SectionsB to J and L to N and Division95) and 4.7% of the **manufacturing** (SectionC) workforce. The value added generated in this sector in 2009 was EUR74500 million, equivalent to 1.3% of the non-financial business economy total and 5.3% of the manufacturing total.

In 2009, the EU-27's electrical equipment manufacturing sector recorded **apparent labour productivity** and **average personnel costs** about EUR10 thousand above the corresponding figures for the non-financial business economy and about EUR5 thousand above manufacturing averages. Apparent labour productivity in the EU-27's electrical equipment manufacturing sector was EUR51 thousand per person employed, while average personnel costs were EUR40.0 thousand per employee. The **wage-adjusted labour productivity ratio** for this sector was 128.4%, 3.7 percentage points below the manufacturing average (132.1%) and 10.3 percentage points below the non-financial business economy average (138.8%).

The **gross operating surplus** in the EU-27's electrical equipment manufacturing sector was 7.1% of the sector's **turnover** in 2009, in line with the average **gross operating rate** for manufacturing (7.0%) and therefore below the non-financial business economy average of 9.7%.

Sectoral analysis

In value added and employment terms, the EU-27's electrical equipment manufacturing sector is made up of one large subsector, one small subsector and four other subsectors between these two extremes. The largest subsector was the manufacture of electric motors, generators, transformers and electricity distribution and control apparatus (Group27.1, hereafter referred to as electric generation and distribution equipment manufacturing) which contributed close to half (48.3%) of the sector's value added in 2009 and employed more than two fifths (43.3%) of the workforce. The smallest subsector was batteries and accumulators manufacturing (Group27.2) which contributed around 2% of sectoral value added and employment. The remaining four subsectors concerned: the manufacture of: wiring and wiring devices (Group27.3); electric lighting equipment (Group27.4); domestic appliances (Group27.5); and other electrical equipment (Group27.9). In 2009, these four subsectors each contributed between 9.4% and 14.8% of EU-27 sectoral value added and between 11.1% and 16.1% of

sectoral employment – see Figure 1.

The electric generation and distribution equipment manufacturing subsector was the only subsector within the EU-27's electrical equipment manufacturing sector that recorded a larger share of sectoral value added than employment in 2009, indicating a higher apparent labour productivity ratio. In fact, with value added per person employed recorded at EUR57 thousand this subsector was the only one that recorded a ratio above the sectoral average (EUR51 thousand). Average personnel costs were EUR45.1 thousand per employee for the electric generation and distribution equipment manufacturing subsector; again this was the only subsector where average personnel costs rose above the sectoral average of EUR40.0 thousand per employee. The relatively high values recorded for the electric generation and distribution equipment manufacturing subsector for these two indicators were balanced out when they were combined to form a wage-adjusted labour productivity ratio, with a ratio of 124.9% in 2009, below the sectoral average of 128.4%, and therefore below the manufacturing and non-financial business economy averages too. The manufacture of domestic appliances subsector and the other electrical equipment subsector both recorded wage-adjusted labour productivity ratios that were marginally above the manufacturing average (132.1%).

In terms of operating profitability, the EU-27's manufacture of other electrical equipment subsector reported a gross operating rate of 9.5% in 2009, close to the non-financial business economy average (9.3%). The 7.3% rate for the electric generation and distribution equipment manufacturing subsector was also above the manufacturing average (7.0%), while all other subsectors recorded gross operating rates below this average.

Country analysis

The highest level of value added in the electrical equipment manufacturing sector was generated in Germany, EUR31084 million, equivalent to 41.7% of the EU-27 total in 2009. For Germany, this was the second largest share of EU-27 value added across any of the non-financial business economy NACE divisions (with data available) in 2009, smaller only than the German share recorded for the [manufacture of motor vehicles, trailers and semi-trailers](#) (Division29). Germany was the largest Member State in value added terms for each of the six electrical equipment manufacturing subsectors, its share of EU-27 value added peaking at 49.1% for the electric generation and distribution equipment manufacturing subsector.

The relative importance of the electrical equipment manufacturing sector was highest in Slovenia where it accounted for 3.1% of non-financial business economy value added, followed by Germany (2.5%), Austria (2.3%) and the Czech Republic (2.2%); as such, EU-27 production was particularly concentrated in central Europe. The Member States least specialised in this sector included Latvia, Lithuania, Ireland and Cyprus where the electrical equipment manufacturing sector contributed less than 0.5% of non-financial business economy value added in 2009; Norway was also relatively unspecialised in this sector.

Germany's specialisation in this sector was broad based, but was particularly high in the electric generation and distribution equipment manufacturing subsector and the wiring and wiring devices manufacturing subsector. Slovenia's position as the most specialised Member State across the whole of the electrical equipment manufacturing sector was boosted by its very high specialisation in the domestic appliances manufacturing subsector and to a lesser extent by a high specialisation in electric lighting equipment manufacturing – where it was the second most specialised behind Slovakia. Bulgaria and Slovenia were, by far, the most specialised countries within the EU-27 for the relatively small subsector of battery and accumulators manufacturing.

Poland and Bulgaria were the only Member States that managed to record a wage-adjusted labour productivity ratio in the electrical equipment manufacturing sector above 200% in 2009, indicating that apparent labour productivity was more than twice as high as average personnel costs per employee. They also recorded the highest gross operating rates for the electrical equipment manufacturing sector among the Member States, although their rates were slightly below the rate recorded in Croatia – see Table 4b.

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for

a wide range of variables.

Context

This article presents an overview of statistics for the electrical equipment manufacturing sector in the EU, as covered by NACE Rev.2 Division27. This division includes the manufacture of products that generate, distribute and use electrical power. Also included is the manufacture of electrical lighting equipment, electric household appliances and other electrical equipment.

Electricity distribution and control apparatus includes, for example, power circuit breakers, control panels, electrical relays, electric fuses, power switching equipment and power switches. Wiring includes the production of electrical wires and cables, the insulation of wire and the manufacture of fibre optic cables. Electric lighting equipment manufacturing includes the manufacture of electric lighting fixtures as well as electric light bulbs and tubes. Domestic appliances include small electric appliances and electric household goods, water heaters, vacuum cleaners and so-called white goods such as cooking appliances, laundry equipment, refrigerators, freezers and dishwashers; appliances with electric, gas or other fuel sources are all included. The manufacture of other electrical equipment includes the manufacture of a wide range of electrical goods for household or industrial use, ranging from typically small items such as battery chargers, door opening and closing devices, bells, sirens and traffic lights to potentially larger items such as scoreboards, signs and particle accelerators.

This NACE division is composed of six groups:

- the manufacture of electric motors, generators, transformers and electricity distribution and control apparatus (Group27.1);
- the manufacture of batteries and accumulators (Group27.2);
- the manufacture of wiring and wiring devices (Group27.3);
- the manufacture of electric lighting equipment (Group27.4);
- the manufacture of domestic appliances (Group27.5);
- the manufacture of other electrical equipment (Group27.9).

This division excludes the manufacture of electronic products (which form part of the [manufacture of computer, electronic and optical products](#) , Division26), while commercial and industrial equipment (as opposed to household domestic appliances) for cooling, freezing, cooking and so on is also excluded (as this forms part of the [manufacture of machinery and equipment n.e.c.](#) , Division28).

Main statistical findings

Structural profile

The fabricated metal products manufacturing sector (Division25) in the EU-27 comprised 364 thousand enterprises in 2009, the largest population of enterprises among all of the manufacturing (SectionC) NACE divisions. Together they employed 3.6 million persons, equivalent to 2.7% of all persons employed in the non-financial business economy (SectionsB to J and L to N and Division95) and 11.9% of the total manufacturing workforce. They generated EUR136723 million of value added which was 2.5% of the non-financial business economy total and 9.8% of the manufacturing total.

In employment terms, the fabricated metal products sector was the second largest manufacturing NACE division in the EU-27 in 2009 after food products manufacturing (Division10), while the EU-27's fabricated metal products sector had the third highest level of added value, after food products manufacturing and the manufacture of machinery and equipment (Division28).

The apparent labour productivity of the EU-27's fabricated metal products manufacturing sector in 2009 was EUR38 thousand per person employed, below both the non-financial business economy average of EUR41.6 thousand per person employed and the manufacturing average of EUR46 thousand per person employed. Average personnel costs in this sector were EUR30.0 thousand per employee, also below the manufacturing average (EUR34.5 thousand per employee) but exactly the same as the non-financial business economy average. The relatively low level of apparent labour productivity contributed to a low wage-adjusted labour productivity ratio for fabricated metal products manufacturing, 125.3% compared with the non-financial business economy average of 138.8% and the manufacturing average of 132.1%. The fabricated metal products sector's gross operating rate (the relation between the gross operating surplus and turnover) was 9.0%, somewhat above the manufacturing average (7.0%) but below the non-financial business economy average (9.7%).

Sectoral analysis

The manufacture of structural metal products (Group25.1) and the treatment and coating of metals and machining (Group25.6) subsectors were the largest subsectors in the EU-27's fabricated metal products manufacturing sector in 2009: together these two subsectors accounted for just over half of sectoral value added and employment. The next largest subsector was the manufacture of other fabricated metal products (Group25.9) followed by the manufacture of cutlery, tools and general hardware (Group25.7), both with more than 10% of

sectoral value added and employment; these were followed in the ranking by the forging, pressing, stamping and roll-forming of metal and powder metallurgy (Group25.5) with a share of just under 10%. The three remaining subsectors each contributed less than 5% of sectoral value added and employment in the EU-27 in 2009.

The four largest subsectors within the EU-27's fabricated metal products manufacturing sector had relatively low apparent labour productivity in 2009, all recording values below the non-financial business economy average (EUR41.6 thousand of value added per person employed). The lowest apparent labour productivity figure of any subsector was EUR34 thousand per person employed recorded for the treatment and coating of metals and machining subsector while the highest was EUR54 thousand per person employed for the manufacture of weapons and ammunition (Group25.4). The three largest subsectors also recorded average personnel costs below the non-financial business economy average (EUR30.0 thousand per employee): the structural metal products manufacturing subsector and the treatment and coating of metals and machining subsector recorded the lowest average personnel costs, just over EUR28 thousand per employee in both subsectors. As for apparent labour productivity, the weapons and ammunition manufacturing subsector recorded the highest average personnel costs, EUR38.4 thousand per employee.

The three smallest subsectors within the EU-27's fabricated metal products manufacturing sector recorded wage-adjusted labour productivity ratios slightly above the non-financial business economy average in 2009: 141.4% for the manufacture of weapons and ammunition, 140.5% for the manufacture of steam generators, except central heating hot water boilers (Group25.3) and 139.7% for the manufacture of tanks, reservoirs and containers of metal (Group25.2). The manufacture of other fabricated metal products (134.2%) recorded a wage-adjusted labour productivity ratio just above the manufacturing average (132.1%) while the other subsectors recorded ratios below this level. The lowest wage-adjusted labour productivity ratio recorded for any of the subsectors was 115.3% for the manufacture of cutlery, tools and general hardware.

Despite relatively low productivity indicators, several of the larger subsectors in the EU-27 recorded relatively high operating profitability in 2009, as measured by the gross operating rate. The treatment and coating of metals and machining subsector recorded a gross operating rate of 10.3% in 2009; this was above the non-financial business economy average (9.7%) and the second highest rate among the eight subsectors, lower only than the 10.9% rate that was recorded for weapons and ammunition manufacturing. The only subsector within the EU-27's fabricated metal products manufacturing sector to record a gross operating rate below the manufacturing average (7.0%) in 2009 was the forging, pressing, stamping and roll-forming of metal and powder metallurgy subsector which had a gross operating rate of 4.8%.

Country analysis

Germany had the highest value added of any Member State in the fabricated metal products manufacturing sector in 2009: the German share of EU-27 value added was 25.8% for the whole of the fabricated metal products sector and reached 40.8% for the manufacture of cutlery, tools and general hardware subsector. The next largest shares of value added within the EU-27's fabricated metal products sector were recorded by Italy (17.1%), France (11.9%) and the United Kingdom (9.7%). In six of the eight subsectors Germany had the highest value added, the exceptions being the manufacture of structural metal products where Italy was the largest Member State and the manufacture of weapons and ammunition where the United Kingdom had the highest value added.

The relative importance of the fabricated metal products manufacturing sector was highest in Slovenia where it accounted for 4.2% of non-financial business economy value added in 2009, followed by Italy (3.9%) and the Czech Republic (3.5%). Slovenia was among the top three most specialised Member States in value added terms in five of the subsectors and was the single most specialised Member State in the miscellaneous subsector of the manufacture of other fabricated metal products. In a similar manner Italy and the Czech Republic were among the most specialised Member States in value added terms for several of the subsectors and were the single most specialised Member State for one – see Table 3. In contrast, the specialisation of some Member States was more narrow: Estonia was particularly specialised in the manufacture of structural metal products, without being strongly specialised in any other subsectors; Bulgaria was the most specialised Member State (with data available) in the manufacture of weapons and ammunition, despite being somewhat unspecialised in the fabricated metal products manufacturing sector as a whole.

Generally Member States recorded low wage-adjusted labour productivity ratios for the fabricated metal products manufacturing sector, with Italy the only country to record a ratio for fabricated metal products manufacturing that was above its national non-financial business economy average in 2009. In terms of the gross

operating rate, the situation was more balanced, with a small majority of Member States recording rates for fabricated metal products manufacturing that were above their national non-financial business economy averages, with the largest positive difference recorded in Poland.

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

This article presents an overview of statistics for the fabricated metal products manufacturing sector in the EU, as covered by NACE Rev.2 Division25. This division includes the manufacture of products made solely from metal (such as parts, containers and structures), usually with a static, immovable function; these can be contrasted with combinations or assemblies of such metal products (sometimes with other materials) into more complex units that – unless they are purely electrical, electronic or optical – work with moving parts and are classified to Divisions26 to 30.

Structural metal products include, for example, metal frameworks or parts for construction. Steam generators include, for example, generators for nuclear reactors or for power boilers.

The manufacture of weapons and ammunition includes the manufacture of heavy weapons, small arms, air or gas guns and pistols, war ammunition, hunting, sporting or protective firearms and ammunition, explosive devices such as bombs, mines and torpedoes.

Forging, pressing, stamping and roll-forming of metal and powder metallurgy as well as the treatment and coating of metals and machining are typically carried out on a fee or contract basis. The treatment and coating of metals also includes plating, engraving, boring, turning, milling, sharpening, polishing and welding.

The manufacture of other fabricated metal products includes the production of steel drums, containers, light metal packaging, nails, screws, bolts, nuts, springs, chains, as well as household and industrial fixtures.

This NACE division is composed of eight groups:

- the manufacture of structural metal products (Group25.1);
- the manufacture of tanks, reservoirs and containers of metal (Group25.2);
- the manufacture of steam generators (Group25.3);
- the manufacture of weapons and ammunition (Group25.4);
- the forging, pressing, stamping and roll-forming of metal and powder metallurgy (Group25.5);
- the treatment and coating of metals and machining (Group25.6);
- the manufacture of cutlery, tools and general hardware (Group25.7);
- the manufacture of other fabricated metal products (Group25.9).

Excluded from this division are the manufacture of tanks and other fighting vehicles (included as part of the [manufacture of other transport equipment](#) , Division30), the manufacture of metal furniture (which is part of [furniture manufacturing](#) , Division31), metal sports goods, games and toys (which are classified to [other manufacturing](#) , Division32) and [specialised repair, maintenance and installation activities](#) , which form part of Division33.

Table 4b: Key indicators, manufacture of food products (NACE Division 10), 2009 - Source: Eurostat (sbs_na_ind_r2)

Main statistical findings

Structural profile

There were 251.2 thousand enterprises operating with food products manufacturing (Division10) as their main activity in the EU-27 in 2009. Together they employed 4.0 million persons, equivalent to 3.0% of all persons employed in the non-financial business economy (Sections B to J and L to N and Division95) and 13.0% of the total number of persons employed in manufacturing (SectionC). They generated EUR 158000 million of value added which was 2.8% of the non-financial business economy total and 11.3% of the manufacturing total. At the NACE divisionlevel, this was the largest sector within manufacturing in 2009, both in terms of employment and value added.

The **apparent labour productivity** of the EU-27's food products manufacturing sector in 2009 was EUR 38 thousand of value added per person employed, below not only the manufacturing average of EUR 46 thousand per person employed but also the non-financial business economy average of EUR 41.6 thousand per person employed. Alongside this low apparent labour productivity, **average personnel costs** within the EU-27's food products manufacturing sector were EUR 25.4 thousand per employee which was also lower than the averages recorded across the whole of manufacturing and the non-financial business economy (EUR 34.5 thousand and EUR 30.0 thousand per employee respectively). Combining these two indicators into the **wage-adjusted labour productivity ratio** shows that value added per person employed in the EU-27's food products manufacturing in 2009 was equivalent to 155.1% of average personnel costs per employee. This ratio was above the manufacturing average of 132.1% and also the non-financial business economy average of 138.8%.

The **gross operating rate** (the relation between the **gross operating surplus** and **turnover**) of the EU-27's food products manufacturing sector in 2009 was 7.9%, slightly above the manufacturing average (7.0%) but below the non-financial business economy average (9.7%).

Sectoral analysis

Close to three in every five (58.1%) enterprises within the EU-27's food products manufacturing sector manufactured bakery and farinaceous products and were thus classified in NACE Group10.7. The second largest enterprise population among the subsectors (14.7% of the sectoral total) concerned the processing and preserving of meat and meat production (Group10.1). These two subsectors were also the largest in terms of employment, followed by the manufacture of other food products (Group10.8) – see Figure 1. In value added terms, these three subsectors were also the largest, although their relative importance changed, as the sectoral share generated by other food products manufacturing (22.9%) was greater than that for the processing and preserving of meat and meat production (18.5%); the largest subsector remained bakery and farinaceous products manufacturing with a 25.0% share.

The low apparent labour productivity figure for the whole of the EU-27's food products manufacturing sector was pulled downwards in 2009 by the two largest subsectors (in terms of the number of enterprises and employment), namely bakery and farinaceous products manufacturing and processing and preserving of meat and meat production – as these two subsectors recorded apparent labour productivity ratios of EUR 27 thousand and EUR 30 thousand per person employed respectively. The only other subsectors with an apparent labour productivity below the manufacturing average were the processing and preserving of fish, crustaceans and molluscs (Group10.2) – which was also below the non-financial business economy average – and the processing and preserving of fruit and vegetables (Group10.3). The five remaining food subsectors all recorded apparent labour productivity ratios that were above the manufacturing average, with prepared animal feeds manufacturing (Group10.9) the highest (EUR 68 thousand per person employed). In contrast, only two subsectors recorded average personnel costs above the manufacturing average, namely prepared animal feeds manufacturing and the manufacture of vegetable and animal oils and fats (Group10.4).

In seven of the eight food products manufacturing NACE groups for which data are available in 2009 the EU-27 wage-adjusted labour productivity ratio exceeded the manufacturing average (132.1%), the one exception being processing and preserving of meat and meat production (131.8%). Most of these subsectors recorded ratios that were also above the non-financial business economy average (138.8%), with the highest wage-adjusted labour productivity recorded for the manufacture of grain mill products, starches and starch products (Group10.6; 187.2%), prepared animal feeds manufacturing (185.8%) and the manufacture of vegetable and animal oils and fats (181.9%).

In contrast, EU-27 gross operating rates for the food products manufacturing subsectors in 2009 were more evenly distributed around the manufacturing average, with one matching the manufacturing average of 7.0% and four each above and below this rate. The lowest gross operating rate was recorded for the processing and preserving of meat and meat production (4.9%), whereas the highest was recorded for bakery and farinaceous products manufacturing (12.2%).

Country analysis

The largest food products manufacturing sector was in Germany, where 17.7% of the EU-27's value added was recorded in 2009. The next largest Member States, by this measure, were France, the United Kingdom and Italy, each with more than 10% of the EU-27 total. Germany, France and Poland were the only Member States to account for 10% or more of the EU-27's food products manufacturing workforce in 2009, with Italy just under this level. The four largest Member States in the food products manufacturing sector accounted for a smaller share of EU-27 value added and employment than was typical for manufacturing as a whole, underlining the relatively widespread nature of this sector compared with manufacturing as a whole: in other words, food products manufacturing displayed less geographical concentration and specialisation than manufacturing as a whole. Among the nine food products manufacturing subsectors, Germany and the United Kingdom were the largest producers (based on value added) for three activities, Spain for two, and France for one.

Based on shares of non-financial business economy value added, Lithuania was the most specialised Member State in food products manufacturing, as it generated 5.7% of its non-financial business economy value added in this sector. The next most specialised Member States in 2009 were Ireland (5.3% of non-financial business economy value added was in food products manufacturing), Hungary (4.6%) and Poland (4.5%). The least specialised Member State was Sweden, the only country where this sector's contribution to non-financial business economy value added was less than 2.0%. Table 3 shows the Member State most specialised in each of the subsectors.

By far the highest wage-adjusted labour productivity ratio in the food products manufacturing sector in 2009 was recorded in Ireland, with apparent labour productivity equivalent to 324.4% of average personnel costs. The next highest ratio was recorded in Poland (202.9%), followed by Romania (199.7%) and the United Kingdom (190.0%). These four Member States with the highest wage-adjusted labour productivity ratios in 2009 all recorded gross operating rates of 10.0% or more in this sector, as did Greece and Cyprus.

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

This article presents an overview of statistics for the food products manufacturing sector in the EU, as covered by NACE Rev.2 Division10. This division includes the processing of the products of agriculture, forestry and fishing into food for humans or animals, and includes the production of various intermediate products that are not directly food products. The activity often generates associated products of greater or lesser value (for example, hides from slaughtering, or oilcake from oil production). Production can be carried out for own account, as well as for third parties, as in custom slaughtering.

Some activities are considered manufacturing (for example, those performed in bakeries, pastry shops, and prepared meat shops and so on which sell their own production) even though there is retail sale of the products in the producers' own shop. However, where the processing is minimal and does not lead to a real transformation, the unit is classified to [wholesale and retail trade](#) (SectionG).

This NACE division is organised by activities dealing with different kinds of products:

- the processing and preserving of meat and production of meat products, including the production of hides and skins originating from slaughterhouses and the production of feathers and down (Group10.1);
- the processing and preserving of fish, crustaceans and molluscs (Group10.2), including the production of fishmeal for human consumption or animal feed;

- the processing and preserving of fruit and vegetables (Group10.3), including the production of fruit or vegetable juices as well as nuts;
- the manufacture of vegetable and animal oils and fats (Group10.4), including the manufacture of crude and refined oils and fats from vegetable or animal materials, except rendering or refining of lard and other edible animal fats;
- the manufacture of dairy products(Group10.5), including the operation of dairies and cheese making, the production of ice cream; the production of raw milk (for example, from cattle or sheep) is excluded as is the manufacture of non-dairy milk and cheese substitutes;
- the manufacture of grain mill products, starches and starch products (Group10.6), including the milling of flour or meal from grains or vegetables, the milling, cleaning and polishing of rice, as well as the manufacture of flour mixes or doughs from these products;
- the manufacture of bakery and farinaceous products (Group10.7), including the production of bread, fresh and preserved pastry goods and cakes, rusks and biscuits, macaroni, noodles, couscous and similar farinaceous products;
- the manufacture of other food products, including sugar, cocoa, chocolate and sugar confectionery, coffee, tea, spices, sauces and condiments, prepared meals and dishes (in other words, prepared, seasoned and cooked), perishable foods (such as sandwiches) and specialty food products such as infant formulae, baby foods, dietary foods for special medical purposes (Group10.8);
- the manufacture of prepared feeds for farm animals or pets, including the concentrated animal feed and feed supplements (Group10.9).

This division does not include the preparation of meals for immediate consumption, such as in restaurants. The production of animal feeds from slaughter waste or by-products is classified in food manufacturing; however, processing food waste into secondary raw material is classified to [waste collection, treatment and disposal activities and materials recovery](#) (Division38). The packaging of meat is excluded (as it forms part of [office administrative, office support and other business support activities](#) , Division82) as is the processing and preserving of fish on vessels engaged in fishing (which forms part of fishing aquaculture, Division03 – which is outside the activities covered by structural business statistics).

Main statistical findings

Structural profile

The EU-27's furniture manufacturing (Division31) sector included 124 thousand enterprises in 2009 that employed 1.08 million persons. This sector represented 0.6% of the total enterprise population in the **non-financial business economy** (Sections B to J and L to N and Division95) and 0.8% of the non-financial business economy's workforce. The furniture manufacturing sector generated EUR29000 million of value added which was 0.5% of the non-financial business economy total, lower than the sector's shares of employment and the enterprise population indicating relatively low **apparent labour productivity** and a relatively small average size. The furniture manufacturing sector accounted for 3.5% of the **manufacturing** (Section C) workforce and 2.1% of manufacturing value added.

The apparent labour productivity of the EU-27's furniture manufacturing sector in 2009 was EUR27 thousand per person employed, about one third lower than the non-financial business economy average of EUR41.6 thousand per person employed and even further below the manufacturing average of EUR46 thousand per person employed. This low apparent labour productivity was accompanied by low **average personnel costs** which were EUR22.0 thousand per employee within the EU-27's furniture manufacturing sector in 2009, around one quarter below the EUR30.0 thousand per employee average for the non-financial business economy and more than one third below the EUR34.5 thousand per employee average for manufacturing as a whole.

The **wage-adjusted labour productivity ratio** combines the two previous indicators and shows that apparent labour productivity in the furniture manufacturing sector was 119.6% of average personnel costs per employee, a lower ratio than the average for the non-financial business economy (138.8%) and manufacturing (132.1%). Despite the relatively low wage-adjusted labour productivity ratio, the EU-27's furniture manufacturing sector recorded relatively high operating profitability as measured by the **gross operating rate**, in other words, the ratio between the **gross operating surplus** and **turnover**. This rate was 7.7% for the EU-27's furniture manufacturing sector in 2009, higher than the manufacturing average (7.0%) but just below the non-financial business economy average (9.7%).

Sectoral analysis

The furniture manufacturing sector is composed of four NACE classes, three of which concern a particular type of furniture manufacturing, while the fourth covers all remaining furniture manufacturing. Within the EU-27

the largest of the four subsectors in 2009 was the manufacture of other furniture (Class31.09), with close to three fifths (56.8%) of sectoral value added and nearly two thirds (65.6%) of the sectoral workforce. Among the three more specific subsectors, the largest activity was the manufacture of office and shop furniture (Class31.01) with close to one fifth (19.0%) of sectoral employment and nearly one quarter (23.8%) of sectoral value added, followed by the manufacture of kitchen furniture (Class31.02) which was about half the size of office and shop furniture manufacturing. The smallest subsector was mattresses manufacturing (Class31.03).

The low apparent labour productivity figure for the whole of the EU-27's furniture manufacturing sector was pulled downwards by the largest subsector, namely the manufacture of other furniture, where apparent labour productivity in 2009 was EUR23 thousand per person employed, approximately half the manufacturing average. The value added per person employed in the remaining subsectors was EUR33 thousand for kitchen furniture manufacturing and EUR34 thousand for office and shop furniture manufacturing: an incomplete aggregate based on data available for 21 Member States⁷⁸ shows that the apparent labour productivity for mattresses manufacturing was also around this level.

For the three subsectors manufacturing a particular type of furniture, average personnel costs per employee within the EU-27 ranged in 2009 from EUR25.0 thousand for mattresses manufacturing to EUR29.1 thousand for office and shop furniture manufacturing; average personnel costs for the manufacture of other furniture were well below this range, at EUR19.1 thousand per employee.

The relatively low wage-adjusted labour productivity ratio recorded for the EU-27's furniture manufacturing sector as a whole was common across all subsectors, ranging from 115.1% for office and shop furniture manufacturing to 121.8% for other furniture manufacturing; again based on an incomplete aggregate for 21 Member States, mattresses manufacturing recorded a wage-adjusted labour productivity ratio of 129.3% in 2009.

For the gross operating rate, the kitchen furniture manufacturing subsector and the other furniture manufacturing subsector recorded rates above the manufacturing average (7.0%) but below the non-financial business economy average (9.6%) in 2009, while the rate for office and shop furniture manufacturing was below the manufacturing average. For mattresses manufacturing the gross operating rate was 6.9% in 2009, once more based on an aggregate of the available data for 21 Member States.

Country analysis

In value added terms, Germany and Italy were the largest Member States in the furniture manufacturing sector in 2009 with shares in the EU-27 total of 20.6% and 19.8% respectively. The United Kingdom (9.4% of the EU-27 total), Spain (8.6%) and France (8.4%) were the next largest contributors to value added in the EU-27's furniture manufacturing sector. The 0.6% share of EU-27 value added recorded by Lithuania in the furniture manufacturing sector was the highest share for Lithuania in any of the non-financial business economy NACE divisions (with data available) in 2009. At a more detailed level, Italy had the highest value added for other furniture manufacturing, while Germany was largest producer in the remaining subsectors. Based on employment, the largest Member States in the furniture manufacturing sector were Italy (16.2% of employment in the EU-27), Poland (15.3%) and Germany (12.5%).

Given its relatively large share of EU-27 value added in this sector it is unsurprising that the relative importance of the furniture manufacturing sector was highest in Lithuania where it contributed 2.0% of value added in the non-financial business economy in 2009. The next most specialised Member States, in value added terms, were Poland (1.3% of non-financial business economy value added was generated in furniture manufacturing), Estonia (1.2%), Slovenia and Italy (both 1.0%). The Member States that were least specialised in furniture manufacturing (in value added terms) were the United Kingdom, France and Luxembourg where this sector contributed 0.3% or less of non-financial business economy value added in 2009.

Slovenia and Greece recorded wage-adjusted labour productivity ratios below 100% for furniture manufacturing in 2009, as average personnel costs per employee exceeded apparent labour productivity per person employed. Wage-adjusted labour productivity ratios were generally low across the Member States, as this ratio for furniture manufacturing was below the non-financial business economy average in every Member State (for which data are available). The highest wage-adjusted labour productivity ratio for furniture manufacturing was 179.8% in Bulgaria, which was 2 percentage points above the Bulgarian average for manufacturing but 8 percentage points below the Bulgarian non-financial business economy average. In terms of the gross operating rate, the

⁷⁸Excluding the Czech Republic, Denmark, Ireland, Luxembourg, Malta and the Netherlands.

situation was slightly different: out of 22 Member States with data available Bulgaria, Lithuania, Poland and Romania recorded gross operating rates for furniture manufacturing that were above their average rates for their non-financial business economies.

Data sources and availability

The analysis presented in this article is based on the main dataset for [structural business statistics \(SBS\)](#) which are disseminated annually. The series provides information for each Member State as well as a number of non-member countries at a detailed level according to the activity classification NACE. Data are available for a wide range of variables.

Context

This article presents an overview of statistics for the furniture manufacturing sector in the EU, as covered by NACE Rev.2 Division31. This division includes the manufacture of furniture and related products of any material except stone, concrete and ceramic. Some of the processes used in furniture manufacturing are similar to processes that are used in other manufacturing activities. However, the multiple processes that are common in furniture manufacturing distinguish it from manufacturing of more simple products manufactured from similar materials (such as wood and metal).

The manufacture of office and shop furniture includes the manufacture of chairs and seats for offices, work-rooms, hotels, restaurants, public premises, theatres, cinemas and the like; special furniture for shops such as counters, display cases, shelves; furniture for offices, laboratories, churches, schools and restaurants.

The manufacture of other furniture includes the manufacture of furniture for gardens and houses (such as for bedrooms and living rooms) as well as finishing work such as upholstery, spraying, painting or French polishing.

This NACE division is composed of four classes organised into one group:

- the manufacture of office and shop furniture (Class31.01);
- the manufacture of kitchen furniture (Class31.02);
- the manufacture of mattresses (Class31.03);
- the manufacture of other furniture (Class31.09).

The information presented in this article excludes the manufacture of soft furnishings such as pillows, cushions and quilts (these are covered within [textile manufacturing](#) , Division13), the manufacture of seats for transport equipment (included as part of the [manufacture of motor vehicles, trailers and semi-trailers](#) and the [manufacture of other transport equipment](#) , Divisions29 and 30) and furniture installation (which forms part of [specialised construction activities](#) , Division43).

Notes

Manufacture of leather and related products statistics - NACE Rev. 2

Data from April 2012. Most recent data: Further Eurostat information, Main tables and Database .

This article presents an overview of statistics for leather and related products manufacturing in the [European Union \(EU\)](#) , as covered by [NACE Rev.2 Division15](#).

	Value
Main indicators	
Number of enterprises (1 000)	37
Number of persons employed (1 000)	422
Turnover (EUR million)	38 765
Purchases of goods and services (EUR million)	28 294
Personnel costs (EUR million)	7 089
Value added (EUR million)	9 786
Gross operating surplus (EUR million)	2 698
Share in non-financial business economy total (%)	
Number of enterprises	0.2
Number of persons employed (1)	0.3
Value added (1)	0.2
Derived indicators	
Apparent labour productivity (EUR 1 000 per head)	23.0
Average personnel costs (EUR 1 000 per head)	18.2
Wage adjusted labour productivity (%)	127.1
Gross operating rate (%)	7.0

Main statistical findings

Structural profile

There were 37 thousand enterprises operating with leather and related products manufacturing (Division 15) as their main activity in the EU-27 in 2009. Together they employed 422 thousand persons, equivalent to 0.3% of the total number of persons employed in the non-financial business economy (Sections B to J and L to N and Division 95) and 1.4% of the manufacturing (Section C) workforce. They generated EUR 9786 million of value added which was 0.2% of the non-financial business economy total and 0.7% of the manufacturing total.
