

European occupational diseases statistics (EODS) – experimental statistics – Country profile: **Switzerland**

Introduction

European occupational diseases statistics (EODS) are essential elements for the European Commission's strategy to assess the efficiency of Community legislation on health and safety at work. At present, EODS are experimental statistics. Beyond their occurrence, these statistics reflect the way in which the concept of occupational disease is integrated into the national social security or health systems.

This country profile is based on the EODS short list of occupational diseases. It presents information about the occupational diseases at national level (as aggregated data for the signalled period).

Definition

The occupational diseases are diseases that are exclusively or predominantly caused by harmful substances or certain types of work according to a list issued by the Federal Council.

The occupational diseases are also deemed to be other diseases that are proven to have been due exclusively or clearly predominantly to the professional duties of the insured person.
