

Eurostat – Unit F.5: Education, health, social protection

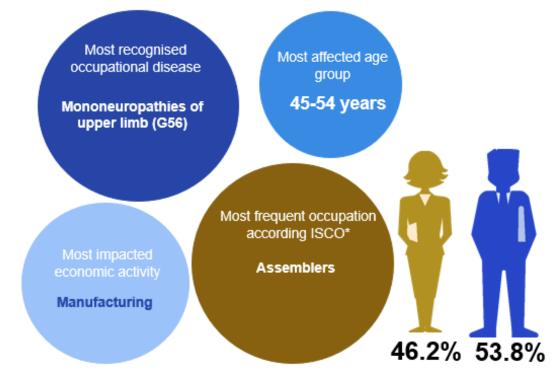

European occupational diseases statistics (EODS) – experimental statistics – Country profile: **Czechia**

Introduction

European occupational diseases statistics (EODS) are essential elements for the European Commission's strategy to assess the efficiency of Community legislation on health and safety at work. At present, EODS are experimental statistics. Beyond their occurrence, these statistics reflect the way in which the concept of occupational disease is integrated into the national social security or health systems.

This country profile is based on the EODS short list of occupational diseases. It presents information about the occupational diseases at national level (as aggregated data for the signalled period).

Definition

An occupational disease is a disease due to the adverse effects of chemical, physical, biological or other harmful factors if it occurred under conditions described in the List of Occupational Diseases. Occupational diseases also include acute poisonings caused by the adverse effects of chemical substances.

Notes

The reported share of recognized occupational diseases in the Czech Republic is based on the total number of commonly agreed range of diagnoses selected for comparison of occupational disease statistics in EU countries. For this reason, the total number of cases of occupational diseases and the corresponding share can be significantly different from the ones reported at the national level.
