

Eurostat – Unit F.5: Education, health, social protection

European occupational diseases statistics (EODS) – experimental statistics – Country profile: **Slovenia**

Introduction

European occupational diseases statistics (EODS) are essential elements for the European Commission's strategy to assess the efficiency of Community legislation on health and safety at work. At present, EODS are experimental statistics. Beyond their occurrence, these statistics reflect the way in which the concept of occupational disease is integrated into the national social security or health systems.

This country profile is based on the EODS short list of occupational diseases. It presents information about the occupational diseases at national level (as aggregated data for the signalled period).

Definition

Occupational diseases are diseases caused by a prolonged direct impact of the work process and by working conditions that falls within the direct scope of the activity on the basis of which the patient is insured. List of occupational diseases, circumstances and recognition process are defined by rules issued by health minister.

Notes

Indicators for Slovenia are based on low numbers of reported occupational diseases, therefore data have some reliability issues.
