Swine vesicular disease

- 5 outbreaks have been confirmed so far in Campobasso Province (Molise region)
- The source of infection has been traced in one holding, which moved animals to the other four.
- SVD free status of Campobasso province has been withdrawn (decision 2005/779).

Swine vesicular disease

Holding	Pigs in the holding*
021CB002	0
057CB348	3
030CB140	9
057CB141	10
030CB054	9

*At moment of suspicion and confirmation

All animals have been slaughtered

Swine vesicular disease

- No further movements (except to slaughterhouse) occurred from the 4 receiving holdings (fattening farms).
- All lots moved from the holding 021CB002 (the origin of infection) have been traced and further testings are ongoing. The involved holdings are located in the following provinces: Campobasso and Isernia (Molise), Chieti (Abruzzo), Foggia (Puglia), Benevento (Campania).
- 021CB002 introduced animals only from accredited holdings. However, testings are ongoing in these holdings. To date, a possible hypothesis for the introduction of infection in 021CB002 includes the contamination of truck during animal trade.
- Further information will be available when testings will be completed.
