

Dear Sir, Madam,

Net Neutrality has been a hot topic the last couple of years. Opponents want a way to discriminate between the different sorts of data sent over the network for instance because they want to filter and/or control copyrighted or questionable content. And although there are noble reasons one could consider abandoning net neutrality, a non-neutral network will become an arena of lobby groups, businesses and perhaps even governments fighting over control and leaving the regular user being crushed in the middle.

The openness of the internet has always guaranteed innovation and equality for all users. A multinational has the same opportunities and variety of the internet available to him or her as a regular 'Joe' or 'Jane' trying to start up a business. Both can trust their data, be it email, VoIP, streaming video or P2P traffic can be sent or received equally, regardless of how much control they can assert over the network or it's providers.

And this exemplifies the importance of the internet remaining neutral.

And I hope we can find a way to keep it neutral.

Thank you,

E. Dueren
