Remote sensing to support the early detection and management of pests

Deteriorating plant health

Early detection

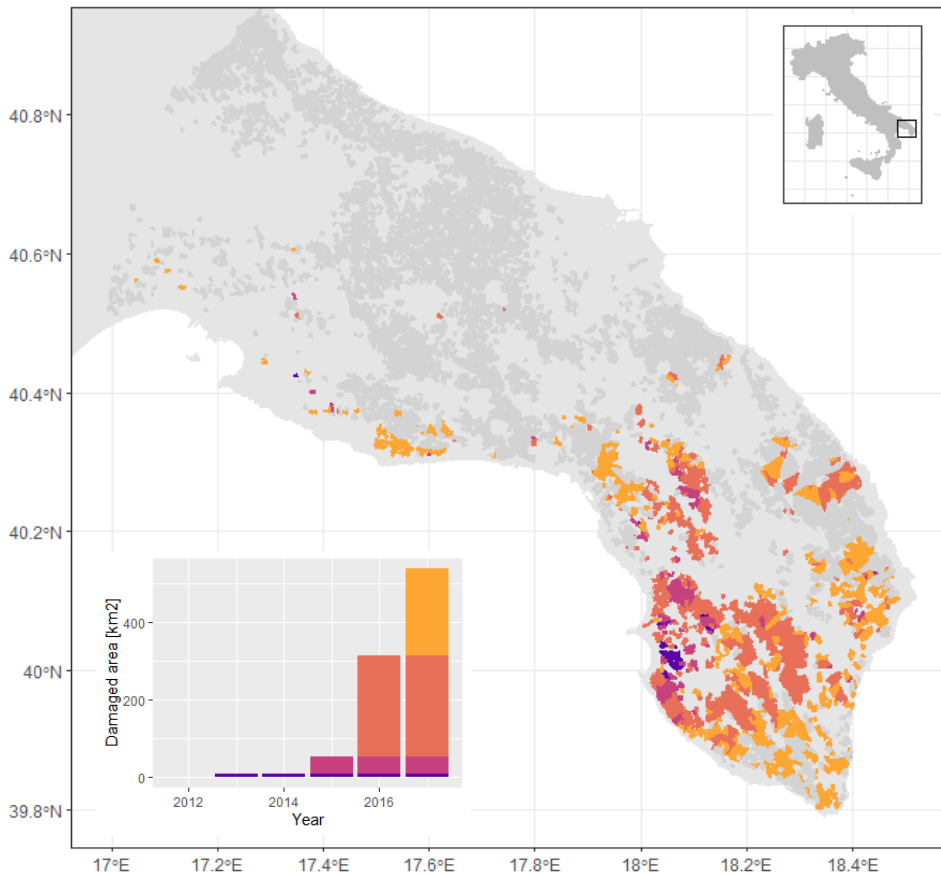

Damage mapping

Early detection

With sensors on aircraft

Damage mapping With satellite sensors

Take home messages

- Remote sensing will not replace traditional surveys or diagnostic tools, but often can make them more efficient or targeted
- There is no one-size-fits-all when using remote sensing. Instead, the technology should be tailored on case by case basis
- Some remote sensing applications can be deployed operationally, others are cutting-edge research
- The remote sensing field is moving forward quickly, thanks to, among others, the Copernicus programme, drones, and machine learning

Abstract

In agreement with Article 6(2) of the Regulation (EU) 2016/2031 on protective measures against pests of plants, the European Commission has been tasked by the Council and European Parliament to establish a list of Union quarantine pests which qualify as priority pests. The prioritisation is based on the severity of the economic, social and environmental impact that these pests can cause in the Union territory. The Commission's Joint Research Centre (JRC) is in charge of developing a methodology based on a multi-criteria decision analysis and composite indicators. In this context, EFSA has provided technical and scientific data related to these pests, in particular: (i) the potential host range and distribution of each of these pests in the Union territory at the level of NUTS2 regions; (ii) parameters quantifying the potential consequences of these pests, e.g. crop losses in terms of yield and quality, rate of spread and time to detection. Expert knowledge elicitation methodology has been applied by EFSA in order to provide those parameters in a consistent and transparent manner.

<i>Tilletia indica</i> (Karnal bunt of wheat)	18	0.1220	6	20	20
<i>Clavibacter michiganensis</i> ssp. <i>Sepedonicus</i> (Bacterial ring rot of potato)	19	0.1126	13	15	19
<i>Synchytrium endobioticum</i> (Wart disease of potato)	20	0.0930	14	17	18

Some figures for the pests in the podium

Xylella fastidiosa

5.5 billion EUR of agricultural production at risk

103 protected habitat and species potentially affected

Popillia japonica (Japanese beetle)

2.4 billion EUR of agricultural production at risk

158 countries we trade with might restrict imports from EU

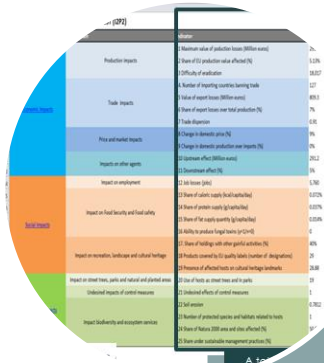

Thaumatotibia leucotreta (Citrus codling moth)

1.2 billion EUR of agricultural production at risk

0.21% of total protein intake at risk
