COMMISSION OF THE EUROPEAN COMMUNITIES

Brussels, 26.10.2007

COMMISSION DECISION

of 26 October 2007

COMMISSION DECISION

of 26 October 2007

(Only the Romanian text is authentic)

THE COMMISSION OF THE EUROPEAN COMMUNITIES,

Having regard to the Treaty establishing the European Community,

Whereas:

(2) The Climate Change Committee\(^2\) considered the national allocation plan and called on the Commission to assess all national allocation plans on a consistent, coherent and robust basis. In this context, the Climate Change Committee underlined the importance of using the 2005 emissions figures as a significant element for the assessment of second period national allocation plans. The Climate Change Committee, inter alia, expressed strong concern about the proposed total quantity of allowances and urged the Commission to take all necessary measures to ensure that

---

Romania’s allocation to the trading sectors will not be more than needed. For that purpose, the Committee urged the Commission to compare Romania’s proposed allocation to projections and measures for the non-trading and trading sectors, including in particular assumptions made (on growth rates and carbon intensity trends) as well as to recent historic and projected emissions, and to examine the justification for deviations from recent historic and projected emissions for the trading sector. In this context, the Committee invited the Commission to examine the justifications for the respective differences between 2005 emissions data, as far as they are available, and the proposed allocations for the year 2007 and use the best available data for its analysis, and the Committee urged the Commission to ensure that the cap is determined as much as possible on the basis of independently verified emissions data in order to avoid serious market distortions and allocations beyond needs as experienced in a number of Member States for the 2005 to 2007 trading period. The Committee called on the Commission to examine projections for certain sectors which are partly not based on data established independently from production companies, as to whether they are realistic and adequately explained. The Committee invited the Commission to scrutinise the compatibility of the early action bonus criteria as used by Romania in order to exclude any undue advantages for operators. The Committee also called on the Commission to examine the compatibility of the proposed rules for allocation in case of temporary and partial closures, as well for known JI projects. Moreover, the Climate Change Committee noted that the Commission should examine the admissibility under criterion 12 of Annex III to the Directive of the intended maximum amount of CERs and ERUs which may be used by operators as a percentage of the allocation of allowances to each installation. The views of the Climate Change Committee have been taken into account.

3 The national allocation plan, including the total annual average quantity of allowances of 83.917000 million tonnes stated therein, has been evaluated against the criteria contained in Annex III to and Article 10 of the Directive, taking into account the Commission's guidance to Member States on the implementation of these criteria. Certain aspects of the national allocation plan have been found incompatible with those criteria, and in particular with criteria 1, 2, 3 and 10 in Annex III to the Directive.

4 The national allocation plan contravenes criteria 1, 2 and 3 of Annex III to the Directive because the total quantity of allowances intended to be allocated is more than would be consistent with assessments of actual and projected progress made pursuant to Decision 280/2004/EC and more than would be consistent with the potential, including the technological potential, of activities covered by the Community scheme to reduce emissions. Criteria 2 and 3 provide for a methodology using the most representative emissions figures, taking into account economic growth and carbon intensity improvements. Pursuant to criterion 1, the total quantity of allowances to be allocated shall not be more than is likely to be needed for the strict application of the criteria of Annex III.

5 With respect to criterion 2, considering that Romania acceded to the European Union only on 1 January 2007 and that therefore the most recent Commission’s assessment
made pursuant to Decision 280/2004/EC does not include Romania in respect of 2005 verified emissions figures, the Commission has critically assessed the 2005 emissions figures for the trading sector as indicated by Romania in the plan, taking into account external expert advice. The Commission has hereby found that the 2005 emissions figures as indicated by Romania in the plan do not deviate significantly from the figures following from its own assessment and external expert advice. For this reason, the Commission accepts the 2005 emissions figures for the trading sector indicated by Romania in its plan as the starting point of analysis for the assessment under criteria 2 and 3.

(6) The Commission is aware of the opinion brought forward by some Member States, but not endorsed by the Climate Change Committee, in favour of averaging 2005 emissions figures with Member States' estimates of emissions over other years in order to smooth out singular events in one particular year. However, in each year there are several factors, including weather patterns, influencing aggregate emissions that generally balance each other out over one year in their effects on total annual emissions. The Commission has examined the availability and quality of other data concerning emissions and energy use prior to 2005. The Commission does not have sufficient indications that a clear majority of exceptional circumstances manifestly pointed in one direction in 2005 and that therefore 2005 emissions figures cannot be regarded as representative. Consequently, the Commission considers that there are no sufficient reasons with respect to Romania to adjust emissions figures for 2005.

(7) With respect to criterion 3, the Commission notes that for a national allocation plan to be consistent with the potential, including the technological potential, of activities covered by the scheme to reduce emissions a rigorous assessment of total allocations is required in accordance in particular with projections of economic growth and improvements in carbon intensity. The Commission has assessed the figures at its disposal, including those in the public domain, with a view to calculating Romania's projected emissions. In order to derive the total quantity of allowances that is consistent with the potential, including the technological potential, of activities covered by the Community scheme to reduce emissions, the 2005 aggregate emission figures of installations in the Community scheme have been multiplied with two factors: firstly, the projected gross domestic product (thereafter "GDP") growth rate and, secondly, the rate for carbon intensity improvement, each in the period from 2005 to 2010. The resulting figure is compared with Romania's proposed allocation so as to determine to what extent it is in line with criterion 3. Of all data at its disposal, including those in the public domain, the Commission considers the data indicated in the PRIMES model as the most accurate and reliable estimations of both GDP

---

6 PRIMES is a modelling system that simulates a market equilibrium solution for energy supply and demand in the EU Member States. The model determines the equilibrium by finding the prices of each energy form such that the quantity producers find best to supply match the quantity consumers wish to use. The equilibrium is static (within each time period) but repeated in a time-forward path, under dynamic relationships. The model is behavioural but also represents in an explicit and detailed way the available energy demand and supply technologies and pollution abatement technologies. The system reflects considerations about market economics, industry structure, energy/environmental policies and regulation. These are conceived so as to influence market behaviour of energy system agents. The modular structure of PRIMES reflects a distribution of decision making among agents that decide individually about their supply, demand, combined supply and demand, and prices. Then the market integrating part of PRIMES simulates market clearing. PRIMES is a general purpose model. It is conceived for forecasting, scenario construction and policy impact analysis. It covers a medium to long-
growth7 and carbon intensity improvement rates. The PRIMES model has been used for analysis of energy and climate policy for a long time and the baseline assumptions8 are updated on a regular basis to reflect the most likely future trend. Furthermore, baseline assumptions are validated with the involvement of experts from Member States. There is no other data source at the disposal of the Commission, which offers a comparable degree of consistency and uniform accuracy across all Member States.

(8) The PRIMES model has been concretely applied on the basis of a coherent set of assumptions and methodologies. The baseline used for the analysis of the national allocation plans of the 25 Member States prior to 2007 was based on information established in 2005 and published in the document "European Energy and Transport Trends to 2030" of the Commission's Directorate-General for Transport and Energy9 and in the document of its Environment Directorate-General containing the calculation of baseline scenarios for the revision of the National Emission Ceilings Directive10. However, Romania acceded to the European Union only on 1 January 2007, leading to the need to notify its plan only as of that date. Moreover, the most recent baseline for Romania with a high degree of accuracy was established in 2007 and therefore later than for the 25 other Member States. The baseline for Romania established before accession did not show a comparable degree of quality as for the other Member States. Therefore for Romania the analysis of the national allocation plan is based on an update11 of the document "European Energy and Transport Trends to 2030" of the Commission's Directorate-General for Transport and Energy established in 200712.

Long-term forecasts are taken from European Commission, DG ECFIN “Long Run Labour Productivity and Potential Growth Rate Projections for the EU25 Countries up to 2050 (information note for Members of the EPC’s working group an ageing populations)”, ECFIN/50485/04-EN.

Examples for baseline assumptions are future developments in population, fuel prices, etc.

8 Examples for baseline assumptions are future developments in population, fuel prices, etc.

9 Long-term forecasts are taken from European Commission, DG ECFIN “Long Run Labour Productivity and Potential Growth Rate Projections for the EU25 Countries up to 2050 (information note for Members of the EPC’s working group an ageing populations)”, ECFIN/50485/04-EN.

11 The 2007 update to the document "European Energy and Transport Trends to 2030" of the Commission's Directorate-General for Transport and Energy is based on a scenario that corresponds to a "low carbon constraint/no CCS - scenario". This scenario is identical to the one contained in the calculation of baseline scenarios for the revision of the National Emission Ceilings Directive, and assumes that the carbon price in 2010, which is an important determinant of the carbon intensity trend development from 2005 to 2010, will increase as compared to the scenario established in the publication "European Energy and Transport Trends to 2030" published in 2005. The introduction of the Community scheme in 2005 and the strong commitments by the EU and Member States to combat climate change provide a clear and sustained signal to installations covered by the Community scheme that there is an economic cost to emitting greenhouse gases, which will become even more important in
In the light of the above, the following table indicates the data for the developments from 2005 to 2007 of both GDP and carbon intensity in Romania in absolute terms. The corresponding relative development factors and growth rates from 2005 to 2007 are also indicated:

<table>

</tr>
</tbody>
</table>

On the basis of this, the following table shows the calculation of the annual excess allocation for the year 2007, i.e. the difference between the annual average allocation proposed by Romania and the allocation resulting from the strict application of criteria 2 and 3. Concretely, the latter is calculated as the product of the total 2005 emissions figure and the relative development factors of GDP and carbon intensity from 2005 to 2007 as indicated in the above table:

The GDP growth assumptions are based on the Commission's Economic and Financial Affairs Directorate-General's forecasts of April 2007 for the short term (2006-2008) as well as the long term (2005-2030). More specifically, short terms forecasts are taken from European Commission Economic Forecasts, Spring 2007 (EUROPEAN ECONOMY. No. 2/ 2007. Office for Official Publications of the EC. ISBN XXXY), also published on the website: http://www.ec.europa.eu/economy_finance/publications/european_economy/forecasts_en.htm. Long-term forecasts are taken from European Commission, DG ECFIN “Long Run Labour Productivity and Potential Growth Rate Projections for the EU25 Countries up to 2050 (information note for Members of the EPC’s working group an ageing populations)”, ECFIN/50485/04-EN. As stated above, the time horizon for the assessment of national allocation plan of Romania is the first half of 2007 due to its accession to the EU only as of 1 January 2007, which constituted also the deadline for notifying their plans. In order to take into account the most recent figures available to the Commission, the GDP figure that can be calculated from the PRIMES-model update of 2007 has been replaced by the more recent development factors from the "Economic Forecasts Spring 2007" for those years, for which they are available (see p. 95 therein), i.e. the years 2006 (factor of 1.077) and 2007 (factor of 1.067). The overall development factor from 2005 to 2007 is calculated by multiplying the indicated annual development factors, i.e. 1.077*1.067. This figure is expressed in terms of CO₂ Emissions to GDP (tonne of CO₂/million Euro value year 2005).
Calculation of the annual excess allocation for the year 2007

Accordingly, given that in the year 2007 the proposed allocation exceeds emissions taking into account GDP growth and carbon-intensity improvements, the Commission finds that the annual average excess allocation by Romania in the year 2007 amounts to 9.080765 million tonnes, which contravenes criteria 1, 2 and 3.

Pursuant to criterion 5 of Annex III to the Directive, the Commission has also examined compliance of the national allocation plan of Romania with the provisions of the Treaty, and in particular Articles 87 and 88 thereof. The Commission considers that the allocation of allowances free of charge to certain activities confers a selective economic advantage to undertakings which has the potential to distort competition and affect intra Community trade. The allocation of allowances for free appears to be imputable to the Member State and to entail the use of State resources to the extent that more than 95% of allowances are given for free. The Commission therefore at this stage considers that the plan could potentially imply State aid pursuant to Article 87(1) of the Treaty. On the basis of information provided by Romania, the Commission at this stage cannot consider with certainty that any potential aid granted under the national allocation plan is consistent with and is necessary to achieve the overall environmental objective of the Directive. Non-compliance with criteria 1, 2 and 3 fundamentally jeopardises the overall environmental objective of the emission trading scheme. The Commission considers that in such a case the environmental benefit of any aid included in the allowances may not be sufficient to outweigh the distortion of competition referred to above. The Commission notes in particular that an allocation exceeding projected emissions will not require beneficiaries to deliver an environmental counterpart for the benefit they receive. The Commission at this stage therefore cannot exclude that any aid involved would be found incompatible with the common market should it be assessed in accordance with Articles 87 and 88 of the Treaty.

Furthermore, pursuant to criterion 5 of Annex III to the Directive, the Commission has examined the methodology by which Romania intends to allocate allowances at sector and installation level. The Commission notes that individual allocations to installations rely on growth projections for the sector prepared by the government. Such estimates can depend on many subjective assumptions which are difficult to verify in an objective manner and Romania has not demonstrated that the estimates used are sufficiently substantiated. Finally, the Commission has not received appropriate information to assess whether the early action bonus is granted in a consistent manner. For these reasons, due to the lack of sufficient safeguards, the proposed allocation methodology may lead to undue advantages to certain sectors or installations in the

19 83.917000 - 74.836235.
light of criterion 5 of Annex III to the Directive. Therefore, the Commission at this stage and on the basis of the currently available information cannot exclude that State aid involved in the allocations may partially be found incompatible with the common market should it be assessed in accordance with Articles 87 and 88 of the Treaty.

(12) The intention of Romania to adjust the allocation of allowances to installations listed in the national allocation plan and operating in its territory in application of the procedures provided in the plan, as outlined in the below recitals, contravenes criterion 10 in Annex III to the Directive which requires the quantity of allowances to be allocated to each installation to be stated *ex-ante* in the national allocation plan covering the period referred to in Article 11(1) of the Directive and not to adjust the allocation of allowances set out in the national allocation plan after the adoption of the decision referred to in Article 11(1) of the Directive. Following the final allocation decision the number of allowances to be allocated and issued for each installation is fixed and may not be changed, except in the case of full closure and withdrawal of the greenhouse gas permit of that same installation.

(13) In this respect, the Commission has examined the provisions in the proposed plan relating to the envisaged allocation of allowances from the new entrants' reserve for, firstly, installations where changes occur in the installation or technology that lead to an increase of emissions due to an increase in production of at least 20% compared to the previous year of operation and, secondly, installations obtaining an update of their greenhouse gas permit due to an increase in CO₂ emissions because of compliance with legal provisions. The Commission finds that any such production increase subsequent to the notification to the Commission of the national allocation plan cannot be subsumed under the definition of "new entrant" pursuant to Article 3(h) of the Directive according to which a "new entrant" means any "installation carrying out one or more of the activities indicated in Annex I, which has obtained a greenhouse gas emissions permit or an update of its greenhouse gas emissions permit because of a change in the nature of functioning or an extension of the installation, subsequent to the notification to the Commission of the national allocation plan". The Commission interprets this definition in the light of the objective of the Directive "to promote reductions of greenhouse gas emissions in a cost-effective and economically efficient manner" and its rationale. Accordingly, any "extension of the installation" can only relate to extensions of capacities of activities in an installation which have a direct bearing on emissions and which would require a new or an update of the respective greenhouse gas emission permit pursuant to the Directive. As the Directive applies to installations carrying out the various activities set out in Annex I of the Directive, any "change in the nature of functioning or an extension of the installation" needs to occur strictly with regard to the activity by virtue of which the particular installation is falling under the Directive, regardless of any other activities that may be carried out in that installation. Therefore, if an activity is not defined in Annex I to the Directive by referring to its final product (e.g. steel), but rather to the process (e.g. combustion of a fuel) that is taking place in the installation (as is the case for "combustion installation"), the extension of an installation's production capacity that is not accompanied by the extension of the relevant activity indicated in Annex I to the Directive cannot be considered a new entrant. In other words, it is decisive that the emission-relevant activity of the installation covered by the Directive is extended, since for mere extensions of production capacity, in particular productions not covered by the Directive, a new greenhouse gas permit or update of an existing greenhouse gas permit is not mandatory.
Consequently, the Commission finds that the provisions relating to the envisaged allocation of allowances from the new entrants' reserve for, firstly, installations where changes occur in the installation or technology that lead to an increase of emissions due to an increase in production of at least 20% compared to the previous year of operation and, secondly, installations obtaining an update of their greenhouse gas permit due to an increase in CO₂ emissions because of compliance with legal provisions and leading to an increase of allowances allocated after the allocation decision has been taken, constitute an ex-post adjustment that contravenes criterion 10 in Annex III to the Directive.

Such ex-post adjustments contradict the essential concept of a "cap-and-trade" system as conceived by the Directive. Under the Community scheme, each installation is allocated a certain amount of allowances in the decision referred to in Article 11(1) of the Directive, whose value it can freely dispose of with a view to taking optimal economic decisions. Three major alternatives exist, which are equally legitimate: investing in emissions reductions and selling freed allowances, reducing production volume and selling freed allowances, or maintaining/expanding production volume while buying additional allowances needed.

The Commission considers that there is no administrative need or any other justification for ex-post adjustments. Member States are required to use the best data available when deciding on allocations up-front. As a matter of fact, the use of prognoses always requires to a certain degree an ex-ante estimation of emissions the actual volume thereof may eventually deviate in reality. This is an inherent feature of any "cap-and-trade" scheme and can thus certainly not justify a retroactive change to the allocation already decided upon up-front. Moreover, the reasons for such a deviation cannot be reliably identified and may well be the result of emissions reductions due to real investments having been carried out by operators in line with the economic incentives created by the scheme.

The Directive allows only for two adjustments following the decision referred to in its Article 11(1) where such retroactive change does not occur or does not have a detrimental impact on the functioning of the Community scheme: firstly, where an installation is closed during the trading period, that Member States determine that there is no longer an operator to whom allowances will be issued; and, secondly, where allocation takes place to new entrants from the reserve, that Member States determine the exact allocation to each new entrant.

In order to bring the national allocation plan in conformity with the criteria listed in Annex III to Directive 2003/87/EC, the plan should be amended. The Commission should be notified of the amendments made to the plan in accordance with this Decision by Romania as soon as possible, taking into account the time-scale necessary to carry out the national procedures without undue delay. Were Romania to amend its national allocation plan in a non-discriminatory manner in accordance with Article 2 of this Decision and duly taking into account the Commission's observations in recitals 10 and 11, the Commission considers that any potential aid is likely to be compatible with the common market should it be assessed in accordance with Articles 87 and 88 of the Treaty.

Information in the national allocation plan not relevant for the allocation of allowances for the period referred to in Article 11(1) of Directive 2003/87/EC has not been taken into account for the purposes of this Decision.
(20) The reports on the implementation of policies and measures and the use of the Kyoto Protocol’s mechanisms submitted by Member States pursuant to Decision 280/2004/EC are important sources of information for the evaluation of the national allocation plans pursuant to criterion 2 of Annex III to Directive 2003/87/EC.

(21) Pursuant to Article 9(3), second sentence, of the Directive, the Member State shall only take a decision under Article 11(1) of the Directive if proposed amendments are accepted by the Commission. The Commission accepts all modifications of the allocation of allowances to individual installations within the total quantity to be allocated to installations listed therein resulting from technical improvements to data quality. No further prior assessment and acceptance by the Commission is necessary because the allocation methodology and the total quantity of allowances remain unchanged. As the modification is limited to mechanically adjusting the result from the use of data of higher quality having become available more recently to the intended allocation, any such modification cannot be conceived to be incompatible with the criteria of Annex III to or Article 10 of the Directive. Similarly, changing the share of allocation of allowances free of charge within the limits set in Article 10 of the Directive is accepted, since it requires no prior assessment by the Commission. The Commission considers that such a change cannot per se be conceived to discriminate between companies or sectors in such a way as to unduly favour certain undertakings or activities in the light of criterion 5 or contravene any other criteria of Annex III to the Directive.

(22) The whole procedure comprising the notification to, assessment and possible rejection by the Commission of the national allocation plans and the final allocation decisions to be taken by Member States is foreseen by the Directive in a short schedule and implemented by the decisions taken pursuant to its Article 9(3) so as to ensure that the system operates effectively with a minimum of uncertainty for market participants,

HAS ADOPTED THIS DECISION:

Article 1

The following aspects of the national allocation plan of Romania for the year 2007 are incompatible respectively with:

1. criteria 1, 2 and 3 of Annex III to the Directive: the part of the intended total quantity of allowances, amounting to 9.080765 million tonnes CO₂eq per year, that is not consistent with assessments made pursuant to Decision 280/2004/EC and not consistent with the potential, including the technological potential, of activities to reduce emissions;

2. criterion 10 of Annex III to the Directive: the provisions of the national allocation plan contained in:

   − Annex D, Section D1.3., relating to the envisaged allocation of allowances from the new entrants' reserve for installations where changes occur in the installation or technology that lead to an increase of emissions due to an increase in production of at least 20% compared to the previous year of operation;
   − Annex D, Section D1.3., relating to the envisaged allocation of allowances from the new entrants' reserve for installations obtaining an update of their greenhouse
gas permit due to an increase in CO₂ emissions because of compliance with legal provisions;
to adjust the allocation of allowances to an installation listed in the national allocation plan and operating in its territory after the decision pursuant to Article 11(1) of the Directive has been taken.

Article 2

No objections shall be raised to the national allocation plan, provided that the following amendments to the national allocation plan are made in a non-discriminatory manner and notified to the Commission as soon as possible, taking into account the time-scale necessary to carry out the national procedures without undue delay:

1. the total quantity to be allocated for the Community scheme is reduced by 9.080765 million tonnes CO₂eq of allowances per year;
2. the allocation of allowances to an installation listed in the national allocation plan and operating in its territory, contrary to what is provided by the plan in:
   – Annex D, Section D1.3, relating to the envisaged allocation of allowances from the new entrants' reserve for installations where changes occur in the installation or technology that lead to an increase of emissions due to an increase in production of at least 20% compared to the previous year of operation;
   – Annex D, Section D1.3, relating to the envisaged allocation of allowances from the new entrants' reserve for installations obtaining an update of their greenhouse gas permit due to an increase in CO₂ emissions because of compliance with legal provisions;

is not adjusted after the decision pursuant to Article 11(1) of the Directive has been taken.

Article 3

1. The total annual average quantity of allowances of 74.836235 million tonnes to be allocated by Romania according to its national allocation plan to installations listed therein and to new entrants shall not be exceeded.
2. The national allocation plan may be amended without prior acceptance by the Commission if the amendment consists in modifications of the allocation of allowances to individual installations within the total quantity to be allocated to installations listed therein resulting from improvements to data quality or to reduce the share of the allocation of allowances free of charge within the limits set in Article 10 of the Directive.
3. Any amendments of the national allocation plan made to correct the incompatibilities indicated in Article 1 of this Decision but deviating from those referred to in Article 2 must be notified as soon as possible, taking into account the time-scale necessary to carry out the national procedures without undue delay, and require prior acceptance by the Commission pursuant to Article 9(3) of the Directive. Any other amendments of the national allocation plan, apart from those made to comply with Article 2 of this Decision, are inadmissible.
Article 4

This Decision is addressed to the Republic of Romania.

Done at Brussels, 26 October 2007

For the Commission
