# 1 Introduction

The main objective of the pilot is to create sample implementations of REST APIs conformant to the [ISA<sup>2</sup> IPS REST API Profile](#) both to provide a reference for future implementations and to validate the profile's fitness for purpose. As such, the aim was to pilot all three sections of the profile: the API Core Profile, the API Documentation and the Messaging API Specification. The integration between the National Broker and DSD registry uses the Messaging API Specification, while the integration between National Broker and the UI Client uses the API Core Profile. Both APIs are documented using the API Documentation.

## 1.1 Purpose of the document

This document provides an overview of the technical implementation of the pilot. It describes the components that were developed, along with insight into their logical design.

The implementation serves as proof of concept of the use case scenarios and can be used as an example for other projects based on the [ISA<sup>2</sup> IPS REST API Profile](#).

As part of the pilot, a generic framework for using the Messaging API Specification was developed. Before the framework can be used for production purposes, additional quality and reliability assurance work must be carried out.

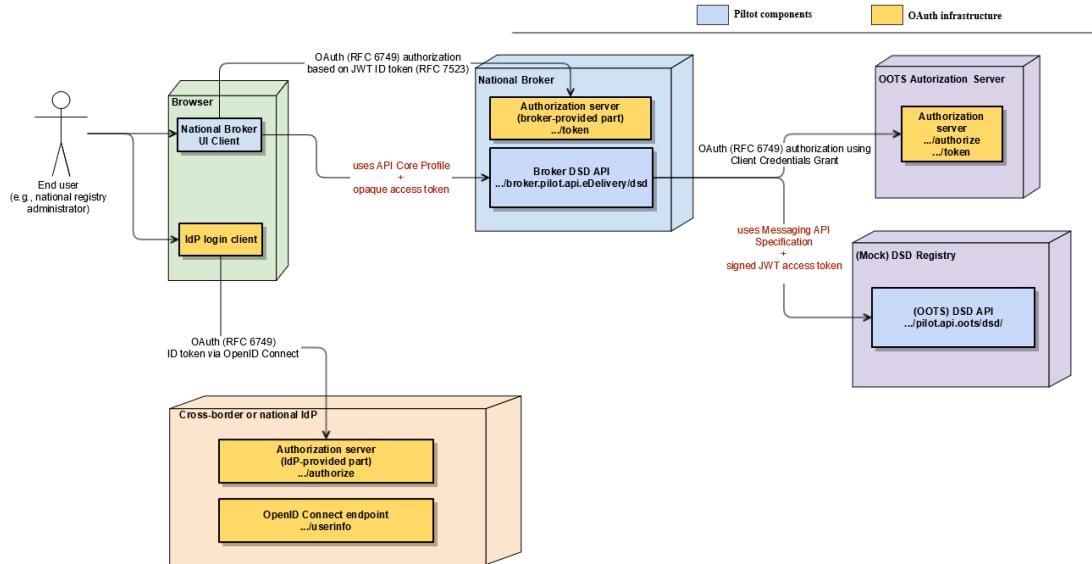

## 1.2 Limitations

As the actual business functionality is only relevant to the extent that it supports the main objective presented above, most such functionality is either mocked or provided in a simplified way. This allowed focusing the effort on the use of as many of the specifics of the [ISA<sup>2</sup> IPS REST API Profile](#) as possible in the REST APIs that were developed.

Because the profile is using the latest version of the OpenAPI specification (version 3.1), one of the challenges was to implement features only introduced in this version because at the time the pilot was implemented there were no [Java frameworks](#) that would support OpenAPI v3.1.

## 2 Use case implementation

The detailed Software Functional Specification for REST API Pilot is provided at [link here](#). The component diagram contained therein is reproduced here for reference:

### 2.1 Implementation of "National registry administrator is authenticated before being authorised to update the DSD registry"

For the first leg of the authentication & authorization process, **between the National Broker UI Client and the National Broker**, the REST API Pilot uses [Auth0](#) as the Identity Provider (IdP). OAuth Authorization Code with PKCE flow is used for authorization.

#### Auth0 details for the pilot

Tenant: **national-broker-poc**

Domain: [national-broker-poc.eu.auth0.com](https://national-broker-poc.eu.auth0.com)

Application: **NationalBroker-UI-Client**

For the second leg of the authentication & authorization process, **between the National Broker and the DSD registry**, the [Okta](#) authorization server is used as an external authorization server.

Okta was chosen over Auth0 to demonstrate a segregated IdP / external authorization server setup and also because Auth0 did not fully allow the implementation of the Client Credentials flow for an external API endpoint.

#### OKTA details for the pilot

Domain: [dev-24443841.okta.com](https://dev-24443841.okta.com)

### OKTA details for the pilot

Applications: [National-Broker](#) (Client ID: 0oat23m60pvuxHNMT5d6)

APIs: [DSD-MOCK-API-Authorization](#) (<https://dev-24443841.okta.com/oauth2/aus1096gcr9r537Ut5d7>)

Metadata URI: <https://dev-24443841.okta.com/oauth2/aus1096gcr9r537Ut5d7/.well-known/oauth-authorization-server>

## 2.1.1 Pre-requisites: Admin configuration in Auth0 and Okta

### 2.1.1.1 Configure Auth0 Tenant

A tenant in [Auth0](#) identifies a group of users connected to a specific instance of an application. In the context of the REST API Pilot, each instance of the National Broker should be identified separately as an Auth0 tenant.

After creating an account in [Auth0](#), create a tenant and choose the relevant option. Subscription and payments related to [Auth0](#) and customised services provided thereof are out of scope of this document.

The screenshot shows the 'New Tenant' configuration dialog in Auth0. It includes fields for 'Tenant Domain' (national-broker.eu.auth0.com), 'Region' (Europe selected), and 'Environment Tag' (Production selected). The dialog has 'Cancel' and 'Create' buttons at the bottom.

In order to authenticate users of the NationalBroker-UI-Client and associate the necessary authorizations, an instance of the NationalBroker-UI-Client needs to be configured as a single page application.

The major configuration settings to be considered are provided below:

Configuration Setting	Configuration Value
<b>Application Type</b>	<b>Single Page Application</b>
<b>Allowed Callback URLs</b>	<the endpoints of the NationalBroker instance that will be used for token exchange. Reverse proxy URLs can also be provided. This URL will be included in the audience field of the token request>
<b>Allowed Logout URLs</b>	<the endpoints to redirect to after user logout from Auth0. Reverse proxy URLs can also be provided>
<b>Allowed Origins (CORS)</b>	<the endpoints of NationalBroker-UI-Client from which redirection will be initiated to the Auth0 authentication page>

Configuration Setting	Configuration Value
<b>Advanced Settings → Grant Type</b>	<b>Authorization Code</b>

The public certificates to be included in the truststore of the NationalBroker can be downloaded from **Advanced Settings → Certificates**. This certificate is needed for the NationalBroker to validate the JWT Access Token issued by [Autho](#).

Here is an example of a working configuration:

## REST API Pilot: Implementation Overview

Use case implementation – 8

The required user roles have to be configured under **User Management → Roles**:

The screenshot shows the Auth0 dashboard navigation on the left and the 'Roles' management screen on the right.

**Left Sidebar (Navigation):**

- Activity
- Applications
- Authentication
- Organizations **NEW**
- User Management **▼**
- Users
- Roles** (highlighted with a blue box)
- Branding
- Security
- Actions
- Auth Pipeline
- Monitoring
- Marketplace

**Right Screen (Roles Management):**

### Roles

Create and manage Roles for your applications. Roles contain collections of Permissions and can be assigned to Users.

Name	Description	...
ROLE_SUPER_USER	ROLE_SUPER_USER	...
ROLE_UPDATE_DSD	ROLE_UPDATE_DSD	...
ROLE_UPDATE_ROA	ROLE_UPDATE_ROA	...

**Create Role**

In order for [Auth0](#) to accept the token exchange endpoint of the NationalBroker as an intended audience, the endpoint should be configured as an API under **Applications → APIs**. Here is an example of a working configuration:

The screenshot shows the Auth0 API Management interface. On the left, there's a sidebar with various navigation items like Activity, Applications, Authentication, Organizations (which is highlighted with a blue background), User Management, Branding, Security, Actions, Auth Pipeline, Monitoring, Marketplace, Extensions, and Settings. Below the sidebar, there are links to 'Get support' and 'Give feedback'.

The main content area has a title 'NationalBroker-Token-Exchange-Endpoint' with a subtitle 'Custom API Identifier http://national-broker-server:8080/national-broker/oauth/token'. Below this, there are tabs for Quick Start, Settings (which is selected and highlighted in blue), Permissions, Machine to Machine Applications, and Test.

The 'Settings' tab is divided into several sections:

- General Settings**: Contains fields for 'Id' (60d061baa3e04a003f58305d) and 'Name' (NationalBroker-Token-Exchange-Endpoint). A note says: 'A friendly name for the API. The following characters are not allowed: < >'.
- Token Settings**: Contains fields for 'Token Expiration (Seconds)' (86400) and 'Token Expiration For Browser Flows (Seconds)' (7200). Notes say: 'Expiration value (in seconds) for access tokens issued for this API from the Token Endpoint.' and 'Expiration value (in seconds) for access tokens issued for this API via Implicit or Hybrid Flows. Cannot be greater than the Token Lifetime value.'
- RBAC Settings**: Contains a 'Enable RBAC' toggle switch (disabled) and a note: 'If this setting is enabled, RBAC authorization policies will be enforced for this API. Role and permission assignments will be evaluated during the login transaction.'
- Access Settings**: Contains a 'Add Permissions in the Access Token' toggle switch (disabled) and a note: 'If this setting is enabled, the Permissions claim will be added to the access token. Only available if RBAC is enabled for this API.'
- Allow Skipping User Consent**: Contains a 'Allow Skipping User Consent' toggle switch (enabled) and a note: 'If this setting is enabled, this API will skip user consent for applications flagged as First Party.'
- Allow Offline Access**: Contains a 'Allow Offline Access' toggle switch (disabled) and a note: 'If this setting is enabled, Auth0 will allow applications to ask for Refresh Tokens for this API.'

A large blue 'Save' button is located at the bottom right of the settings section.

The required role permissions then need to be configured in the **Permissions** tab:

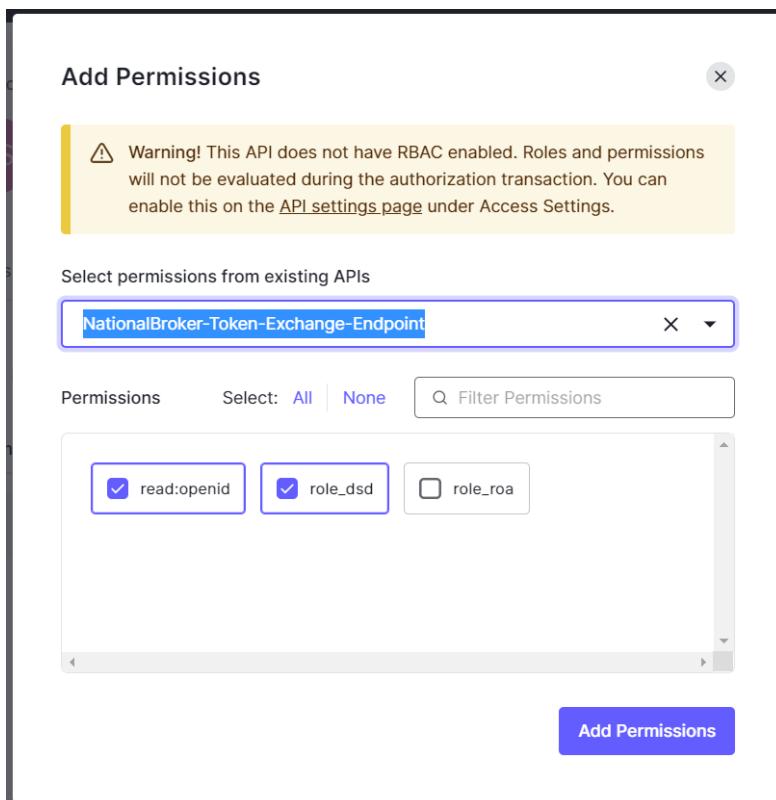

The screenshot shows the Auth0 API Management interface. On the left, there's a sidebar with various navigation options like Activity, Applications, APIs, Authentication, Organizations, User Management, Branding, Security, Actions, Auth Pipeline, Monitoring, Marketplace, Extensions, and Settings. The main area is titled 'NationalBroker-Token-Exchange-Endpoint' and shows a 'Custom API' identifier. Below the title, there are tabs for Quick Start, Settings, Permissions (which is selected), Machine to Machine Applications, and Test. Under the 'Permissions' tab, there's a section for 'Add a Permission (Scope)' where 'read:appointments' is listed with a description 'Read your appointments'. Below this is a 'List of Permissions (Scopes)' table with three rows: 'read:openid' (description: 'Read your id details'), 'role\_dsd' (description: 'permission to read,update,delete all DSD entities'), and 'role\_roa' (description: 'permission to read,update,delete all ROA entities'). At the bottom left, there are links for 'Get support' and 'Give feedback'.

#### 2.1.1.2 Configure user in Auth0 tenant

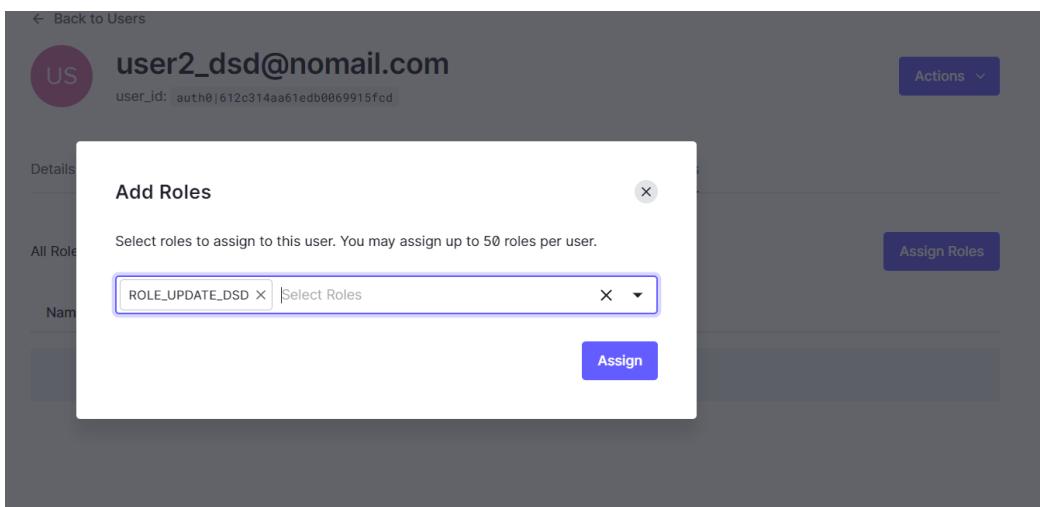

A default user has been configured in [Auth0](#) for use in the Demo installation.

The following are the steps to configure a new user as part of a tenant:

1. Switch to the national broker tenant in [Auth0](#) and go to link **User Management** → **Users**. Create new user and provide mail (as login – username) and password.
2. Open the user details and go to **Permissions** tab. Click assign permission and select API for National Broker Token Exchange endpoint with permissions: **openid** and **role\_dsd**:

3. In user details go to the **Roles** tab, click **Assign Roles** and select **ROLE\_UPDATE\_DSD**:

4. In National Broker database table – **NB\_USER**, add the user details with the unique user id from the IdP and add linked entry in **NB\_USER\_ROLE** table.

Name	Email	Signed Up
user2_dsd@nomail.com	user2_dsd@nomail.com (pending)	August 30th 2021, 4:03:31 AM
<a href="#">Edit</a>		
Primary Identity Provider	Latest Login	Accounts Associated
Database	Never	None
Browser		
Other 0.0.0 / Other 0.0.0		

5. The ID Token from [Auth0](#) can be exchanged to an access token issued from the National Broker using the token exchange endpoint – <http://national-broker-server:8080/national-broker/oauth/token>. The token obtained from this token exchange endpoint is used further in the National Broker API as Bearer token authorization.

#### 2.1.1.3 Configure Okta Tenant

For DSD mock endpoints to be accepted as an intended audience in the access token issued by [Okta](#), the DSD mock first needs to be registered in [Okta](#) as a recognized API.

Inside **Applications** → **Create App Integration**, select **API Services**. Typically only one instance of DSD is required:

The screenshot shows the Okta Applications page with the DSD-MOCK-API application selected. The left sidebar has 'Applications' expanded. The main area shows the 'General' tab for the DSD-MOCK-API application. It displays the Client ID (Ooa1092j9CYicpsh5d7) and Client secret (redacted). Below that is the General Settings section with the Okta domain set to dev-24443841.okta.com and the App integration name set to DSD-MOCK-API.

To use custom OAuth scopes along with the client credentials authorization flow, a custom authorization server needs to be created. Under **Security → API**, click on **Add Authorization Server**. Provide the messaging endpoint of DSD as the **Audience**:

The screenshot shows the Okta Security → API → Authorization Servers page. The 'API' tab is selected in the left sidebar. A new authorization server named 'DSD-MOCK-API-Authorization' is being configured. The 'Settings' tab is selected. The configuration includes:

- Name:** DSD-MOCK-API-Authorization
- Audience:** http://dsd-mock-server:13003/dsd-mock/v1/messaging
- Description:** DSD-MOCK-API-Authorization server port 1
- Issuer:** https://dev-24443841.okta.com/oauth2/aus1096gcr9r537Ut5d7
- Metadata URI:** https://dev-24443841.okta.com/oauth2/aus1096gcr9r537Ut5d7/.well-known/oauth-authorization-server
- Signing Key Rotation:** Automatic
- Last Rotation:** 13 Sep 2021

In the **Scopes** tab, add the ROLE\_DSD scope as shown below:

[← Back to Authorization Servers](#)

## DSD-MOCK-API-Authorization

[Help](#)

Active ▾

Name	Display Name	Description	User Consent	Block Services	Default Scope	Metadata Publish
ROLE_DSD	ROLE_DSD	ROLE_DSD	No	No	No	Yes
openid	openid	Signals that a request is an OpenID request.	No	No	No	Yes
profile	View your profile information.	The exact data varies based on what profile information you have provided, such as:	No	No	No	Yes

The supported OAuth flows and the token lifetime can be configured using **Access Policies**:

Settings Scopes Claims Access Policies Token Preview

Add New Access Policy															
1	Assign ROLE_DSD	Assign ROLE_DSD	Active ▾	Edit	Delete										
		Description	Assign ROLE_DSD												
		Assigned to clients	 DSD-MOCK-API  National-Broker												
		Add Rule	<table border="1"> <thead> <tr> <th>Priority</th> <th>Rule Name</th> <th>Scopes</th> <th>Status</th> <th>Actions</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>Assign ROLE_DSD using DSD-MOCK-API</td> <td>1</td> <td>Active ▾</td> <td>Info Edit Delete</td> </tr> </tbody> </table>			Priority	Rule Name	Scopes	Status	Actions	1	Assign ROLE_DSD using DSD-MOCK-API	1	Active ▾	Info Edit Delete
Priority	Rule Name	Scopes	Status	Actions											
1	Assign ROLE_DSD using DSD-MOCK-API	1	Active ▾	Info Edit Delete											

The demo application does not implement a token refresh function, so it is recommended to set the token lifetime to a sufficiently long duration:

The screenshot shows the 'Edit Rule' page in the Okta UI. The rule name is 'Assign ROLE\_DSD using DSD-MOCK-API'. The configuration includes:

- IF Grant type is:** Client acting on behalf of itself (Client Credentials is checked)
- AND User is:** Any user assigned the app
- AND Scopes requested:** The following scopes: ROLE\_DSD
- THEN Use this inline hook:** None (disabled)
- AND Access token lifetime is:** 1 Days
- AND Refresh token lifetime is:** Unlimited

Every new instance of a National Broker should be configured separately as an application in the [Okta](#) authorization server for client credentials authorization. Under **Applications** → **Create App Integration**, select **Sign-in method : OIDC - OpenID Connect** and **Application type : Web Application**:

**okta**

Search...

### UC 02.03 National registry administrator searches and selects a DSD dataset that is linked to any of the organisations (s)he is entitled to edit

- ✓ By selecting the organisation and clicking the "DSD Datasets" button as shown in the image below:

Organization ID	Organization name	Description
100001	Federal Ministry of Education and Research	Federal Ministry of Education will provide information regarding German university diplomas issued by any German university
110001	Bavarian State Ministry for Education, Culture, Science and Arts	State Ministry of Education will provide information regarding diplomas issued by universities located in Bavaria
111001	Technische Universität München	Technische Universität München will provide information regarding diplomas issued by this university
111002	Munich University of Applied Sciences	Munich University of Applied Sciences will provide information regarding diplomas issued by this university

a DSD Dataset page is shown with a pre-set organisation identifier filled in in the search filter. The page shows only the datasets linked to the selected organisation (*publisher*):

**D  
o  
n  
e**

## Implementation comment

- Double clicking on a dataset (or selecting it and clicking the "Edit" button) opens the "DataSet Edit" dialog where the dataset details are shown:

### UC 02.04 National registry administrator creates a request to update a dataset record in the DSD registry

- In the "DataSet Edit" dialog shown in UC 02.03 most details about a dataset can be edited. Editing the identifier(s) of a dataset is disabled. Upon completion, the user can submit the update request.

**D  
o  
n  
e****Implementation comment**

The update request status can be consulted on the page "DSD request status":

The screenshot shows a table titled 'DSD request status list' with the following columns: Entity type, Service, Action, Request Id, Request On, Response Id, Update Confirmed On, Username, and Status. There are six rows of data, each representing an update request for an Organization entity.

Entity type	Service	Action	Request Id	Request On	Response Id	Update Confirmed On	Username	Status

**UC 02.05 National registry administrator creates a request to create a dataset record in the DSD registry**

- ✓ A new dataset can be created from the "DSD Datasets" page by clicking the "New" button. The dataset identifier cannot be set in the dialog; a UUID will be assigned by the DSD registry when it creates the record.

The screenshot shows the 'DataSet Edit' dialog with the following fields:

- DSD Dataset data:**
  - Type id: 4827002f-5b96-464a-a9e4-d02ec45f5134
  - Identifiers: 0cc42b87-1f73-451b-82...
  - Titles: Dataset title
  - Descriptions: Dataset description
  - Qualified Relationships: urn:oasis:names:tc:ebcore:partyid-type:iso6523:9999.0000000005 (https://toop.eu/dataset/supportedIdScheme)
  - Conforms to: https://semantic-repository.toop.eu/ontology
- Publisher data:**
  - Publisher Identifier: 111002
  - Organization level: level5
  - Organization names: Munich University of Applied Sciences
  - Descriptions: München university of Applied Sciences will provide information regarding diplomas issued by this university

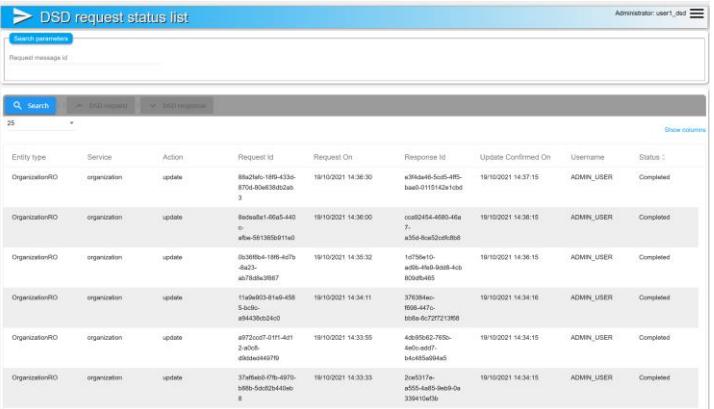

Buttons at the bottom: OK and Cancel.

The updated dataset is shown in the UI after it is successfully created in the DSD component. The "DSD Datasets" page must be refreshed to see the updated dataset.

**UC 02.06 National registry administrator consults the results of the requests (s)he created to manage the data in the DSD registry**

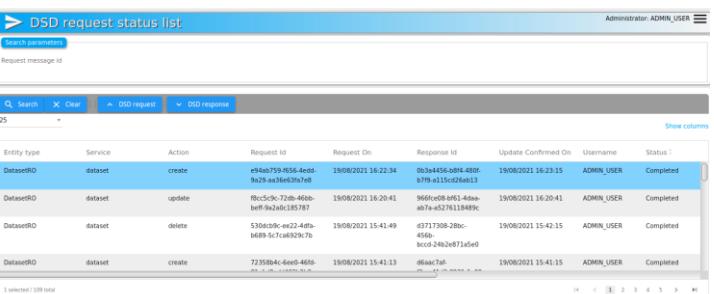

- ✓ The update request status can be consulted on the page "DSD request status":

**Implementation comment**

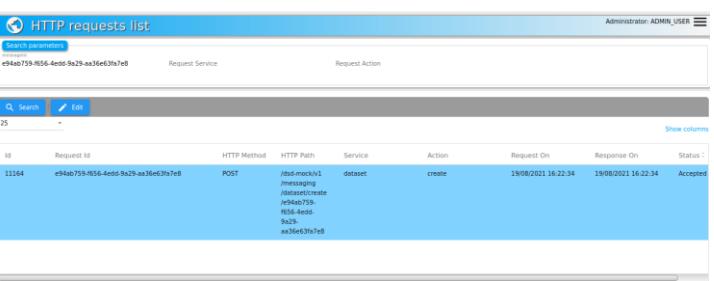

The DSD request statuses are Pending, Completed and Rejected.

If a row is selected in the DSD request status list, the "DSD request" and "DSD response" buttons are enabled:

When the aforementioned buttons are clicked, the application navigates to the "HTTP requests" page with pre-set messageid filter for the HTTP request:

## Implementation comment

## **UC 02.07 The National Broker forwards the request to the DSD registry**

- For simplicity, in the pilot project the National Broker immediately proxies the request to the DSD registry when it receives the request from the UI client. The type of request is identified via the service invoked by the UI Client, but the forwarded request is transformed to comply with the DSD registry API specification.

The request itself and the statuses are logged to the file system and the database.

## 3 Component implementation overview

This section presents the technical implementation details of the DSD mock and National Broker components.

### 3.1 DSD mock

The component DSD mock implements two DSD specific interfaces for managing:

- DSD Organization entities: <https://github.com/isa2-api4ips/rest-api-oop-pilot/blob/main/dsd-mock/src/main/java/eu/europa/ec/isa2/oop/restapi/docsapi/DSDOrganizationApi.java>
- DSD Dataset entities: <https://github.com/isa2-api4ips/rest-api-oop-pilot/blob/main/dsd-mock/src/main/java/eu/europa/ec/isa2/oop/restapi/docsapi/DSDDatasetApi.java>

Both interfaces are using the Messaging API pilot annotations defined in the module **isa2-messaging-profile-impl**: <https://github.com/isa2-api4ips/rest-api-oop-pilot/tree/main/isa2-messaging-profile-impl/src/main/java/eu/europa/ec/isa2/restapi/profile/annotation>

The annotations and the implementation in the module **isa2-messaging-profile-impl** take care of all Messaging API-related objects (parameters, headers, mime responses, etc.) and the security aspects. They are also defining the OpenAPI document that conforms to the API Documentation specifications. The OpenAPI documents are generated and deployed at build time into the "national broker" project. The national broker project uses the swagger generator to generate a "client" for invoking the DSD mock services and RESTful web server for Webhook operations.

An example of the generated DSDOrganizationApi.json OpenAPI document is here:

<https://github.com/isa2-api4ips/rest-api-oop-pilot/blob/main/national-broker/src/main/openapi/DSDOrganizationApi.json>

#### 3.1.1 Generating the Messaging API OpenAPI document

Parsing and building the OpenAPI document from the annotations is handled by the class [MessagingReader.java](#). The purpose of the class [OpenApiWriter.java](#) is to serialize OpenAPI documents at build time. Below is an example of the project's maven ant plugin configuration that invokes this process.

**Example of dsd-mock/pom.xml plugin for OpenAPI generation from the DSD annotated REST API endpoints:**

```

<plugin>
    <artifactId>maven-antrun-plugin</artifactId>
    <executions>
        <!-- "ant/run" to generate open api document for the
national broker -->
        <execution>
            <id>generate-open-api</id>
            <phase>process-classes</phase>
            <goals>
                <goal>run</goal>
            </goals>
            <configuration>
                <target>
                    <!--ANT Task definition
                    Class generates OpenApi document. The
OpenApi documents are used by the national-broker
for generating "Client" code for national-
broker -> DSD mock integration
                    1. Parameter: comma separated
hibernate database dialects
                    2. script version
                    3. export scripts.
                    4. reference type. One of the values
INLINE, DOCUMENT_COMPONENTS, MESSAGING_API_COMPONENTS,
MESSAGING_API_OBJECT;
                    5. The Url of published Messaging API
parameter and schema definitions for the reference type: MESSAGING_API,
MESSAGING_API_OBJECT;
-->
                <java
classname="eu.europa.ec.isa2.restapi.profile.generator.OpenApiWriter"
fork="true" failonerror="true">
                    <arg
value="eu.europa.ec.isa2.oop.restapi.docsapi.DSDDatasetApi,
eu.europa.ec.isa2.oop.restapi.docsapi.DSDOrganizationApi" />
                    <arg
value="${project.basedir}/../national-broker/src/main/openapi/" />
                    <!-- Because in subproject national-
broker -> io.swaggercodegen.v3:swagger-codegen-maven-plugin:3.0.26
does not work with version 3.1.0
change version to 3.0.99 for the client generation -->
                    <arg value="3.0.99" />
                    <!-- During the pilot implementation
io.swaggercodegen.v3:swagger-codegen-maven-plugin:3.0.26
did not parse OK the mode
MESSAGING_API_COMPONENTS
-->
                    <arg value="MESSAGING_API_OBJECT" />
                    <arg
value="https://raw.githubusercontent.com/jrihtarsic/OpenApiTest/main/profile/specifications/core-api" />
                    <!-- document version API -->
                    <arg value="v1" />
                    <!-- properties file -->
                    <arg
value="${project.basedir}/src/main/resources/dsd.properties" />
                    <!-- reference to the passed-in
classpath reference -->
                    <classpath
refid="maven.compile.classpath" />
                    </java>
                </target>
            </configuration>
        </execution>
    </executions>

```

```
</plugin>
```

#### Code Block 2 Messaging OpenAPI document generation

The Messaging API OpenAPI document generator can be parametrized to produce the OpenAPI document that refers to common, pre-defined objects in one of the following ways:

- INLINE - definitions are generated inline where they are used.
- DOCUMENT\_COMPONENTS - definitions are generated in the document components #/components/(schema|parameters|headers).
- MESSAGING\_API\_COMPONENTS - definitions are referenced to the published Messaging API document.
- MESSAGING\_API\_OBJECT - definitions are referenced to the published JSON file for each object.

#### 3.1.2 Runtime Messaging API framework

At runtime the messaging interfaces are handled by [MessageServiceHandlerController.java](#). The class takes care of all Messaging API headers, parameters and JAdES signatures, mime/multipart wrapping of requests and responses, etc. The purpose of [MessageServiceHandlerController.java](#) is to implement all generic Messaging API methods in one place and enable developers to focus mainly to the business aspects of the code when using the Messaging API specification. The security, message payload wrapping, signal generation is handled by framework.

#### 3.1.3 Message JAdES signature

For generating and validating the JAdES signature, the Digital Signature Service (DSS) library version 5.8 offered by the CEF eSignature building block is used. The Messaging API writer is implemented in the package [/europa/ec/isa2/restapi/jws](#).

To allow the verification and inspection of message signatures, the UI Client and National Broker have built-in functionality to store all the request/responses between National Broker and DSD mock. With tools available in the "HTTP requests" page of the demo, signatures can be exported and validated.

The example keystore, with the "curve secp256k1" key (for ECDSA signatures) used by the pilot project are located here:

<https://github.com/isa2-api4ips/rest-api-oop-pilot/tree/main/national-broker/src/main/setup/config/national-broker/keystores>

### 3.2 National Broker

### 3.2.1 DSD mock integration

Please note that for the DSD mock REST API interface [DSDDatasetApi.java](#) two OpenAPI documents are generated:

- **DSDDatasetApi.json**: OpenAPI document for the client generation. The client is used by the National Broker for invoking DSD mock services.
  - **DSDDatasetApi-server.json**: OpenAPI document for the server code generation. The server is the implementation of the Webhook services.

The National Broker uses the maven plugin io.swagger.codegen.v3:swagger-codegen-maven-plugin to generate the Java client and Java server interface code. Below is an example of national-broker/pom.xml plugin for Java code generation from the OpenAPI documents:

```

<plugin>
    <groupId>io.swagger.codegen.v3</groupId>
    <artifactId>swagger-codegen-maven-plugin</artifactId>
    <executions>
        <execution>
            <id>DSDDatasetApi</id>
            <goals>
                <goal>generate</goal>
            </goals>
            <configuration>
                <inputSpec>${project.basedir}/src/main/openapi/
DSDDatasetApi.json</inputSpec>
                <language>java</language>
                <modelPackage>eu.europa.eu.dsd.messaging.gen.da-
taset.model</modelPackage>
                <apiPackage>eu.europa.eu.dsd.messaging.gen.data-
set.api</apiPackage>
                <invokerPackage>eu.europa.eu.dsd.messaging.gen.
dataset.invoker</invokerPackage>
                <generateApiTests>false</generateApiTests>
                <generateApiDocumentation>false</generateApiDoc-
umentation>
                <output>${project.build.directory}/generated-
sources</output>
                <configOptions>
                    <groupId>${project.groupId}</groupId>
                    <artifactId>${project.artifactId}</artifactId>
                    <artifactVersion>${project.version}</artifactVer-
sion>
                    <library>resttemplate</library>
                    <java8>true</java8>
                    <dateLibrary>java8</dateLibrary>
                    <licenseName>Apache 2.0</licenseName>
                    <licenseUrl>https://www.apache.org/licenses/

</plugin>
```

**Code Block 3 Messaging OpenAPI server and client Java code generation**

### 3.2.2 Messaging Multipart

The Messaging API Specification of the ISA<sup>2</sup> IPS REST API Profile defines that all message payloads must be wrapped in S/MIME multipart. To read and verify the JSON Web Signature of the payload for incoming messages and to package and sign outgoing messages the [MultipartMimeDsDConverter.java](#) is registered to the REST API template [DSDRestTemplate.java](#).

### 3.2.3 UI Client integration

For the UI Client integration, the National Broker uses the following REST API interfaces:

- [DatasetLCMController.java](#): The DSD proxy services for managing DSD dataset entities.
- [OrganizationLCMController.java](#): The DSD proxy services for managing DSD organization entities.
- [OrganizationController.java](#): The local National Broker services.

The National Broker OpenAPI uses regular Swagger annotations. For handling digest calculation and JSON Web Signatures the objects javax.servlet.http.HttpServletResponse and javax.servlet.http.HttpServletRequest are used.

## 4 Messaging API Message Exchange Patterns

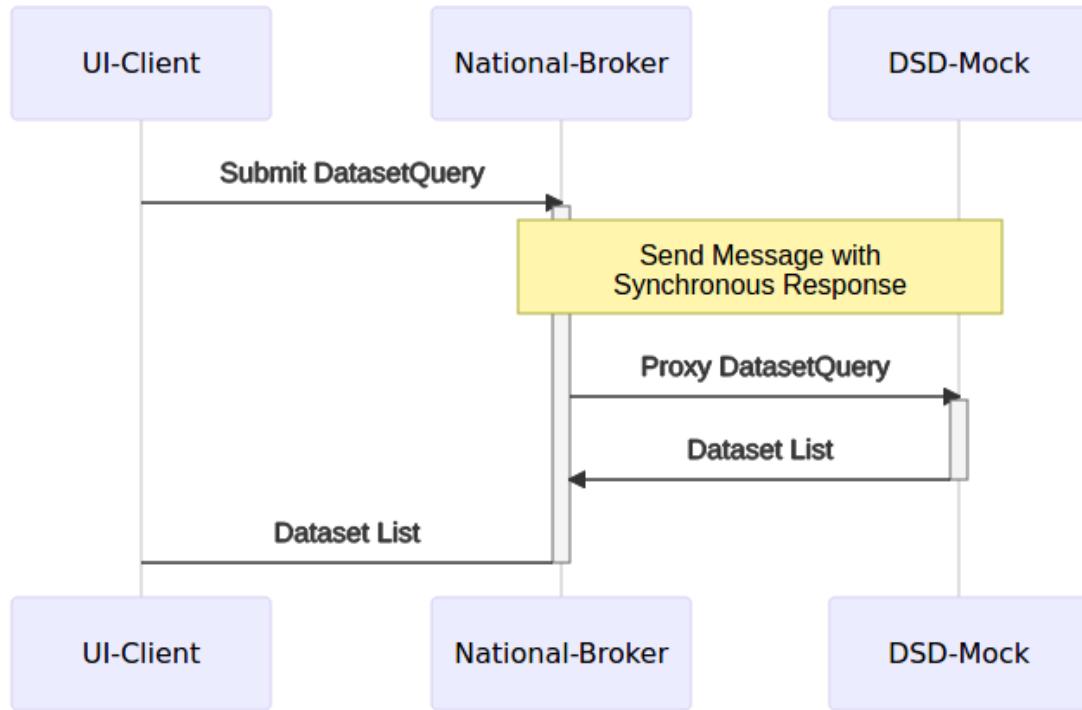

The Messaging API Specification of the ISA<sup>2</sup> IPS REST API Profile specifies seven types of the Message Exchange Patterns (for details, please consult the ISA<sup>2</sup> IPS REST API Profile):

- Send Message with No Response – Push
- Send Message with No Response – Pull
- Send Message with Synchronous Response
- Send Message with Asynchronous Response – Push and Pull
- Send Message with Asynchronous Response – Push and Webhook Pull
- Send Message with Asynchronous Response – Push and Webhook Push
- Send Message with Asynchronous Response – Pull and Push

For the integration between the National Broker and the DSD mock, five of the seven message exchange patterns were implemented. The Send Message with No Response – Push, Send Message with No Response – Pull were implemented as part of the "Send Message with Asynchronous Response – Push and Webhook Pull implementation".

### 4.1 Send Message with Synchronous Response

This pattern is implemented in support of the query to list/filter Datasets in the "DSD Datasets" page. The implementation follows the sequence diagram depicted below:

The National Broker submits a request such as:

```
(Request-Target): post /dsd-mock/v1/messaging/dataset/query/a3951d4f-3d0f-4ea7-92a3-c6268c10c9bd-sync
Accept: application/problem+json

#### Code Block 5 DSD query response

## 4.2 Send Message with Asynchronous Response – Push and Pull

This message exchange pattern combines the "Send Message With No Response – Push" and "Send Message With No Response – Pull" patterns. The pattern supports the implementation of the following features:

- Updating the Organization data
- Adding a new Dataset
- Removing an existing Dataset

The implementation follows the sequence diagram depicted below:

The National Broker submits an update Organization request such as:

```
(Request-Target): post /dsd-
mock/v1/messaging/organization/update/8bb10f70-4b4e-49b0-b518-5e55be99fb30

**Code Block 11 Get Message Response response**

### 4.3 Send Message with Asynchronous Response – Push and Webhook Pull

The pattern supports the implementation of the update Dataset functionality. The implementation follows the sequence diagram depicted below:

The National Broker submits an update Dataset request such as:

```
(Request-Target): post /dsd-mock/v1/messaging/dataset/update/3995bf3d-978f-4150-9dae-c95562f30c3e
Accept: application/json
Content-Length: 3537

}

```

### Code Block 15 Webhook Signal response

Following the receipt of the Signal, the National Broker can send the request to obtain the message response:

```

(Request-Target): get /dsd-mock/v1/messaging/dataset/status/632c8d81-da89-
41a9-9c8a-869fa21f9326
Accept: application/problem+json
Content-Length: 0
Content-Type: application/json
Host: localhost:8080
Request-Target-PRIVATE: get /dsd-
mock/v1/messaging/dataset/status/632c8d81-da89-41a9-9c8a-869fa21f9326
User-Agent: Java-SDK

```

### Code Block 16 Get Message Response request

And receives it:

```

Connection: keep-alive
