Instant Mobility video - Multimodality for people and goods in urban areas

Watch how Sophie gets her bike and how Alan gets to his job interview ... in time.

 In the Instant Mobility vision, every journey and every transport movement is part of a fully connected and self-optimising ecosystem. Whatever the traveller's situation (office, home, on-trip...) Instant Mobility will deliver useful Future Internet enabled information and services.

The traveller will receive personalised and real-time solutions to support him reaching his destination according to current personal preferences and constraints, real-time traffic status and public transport availability along his journey. These real time-solutions will be proactively updated during the traveller journey based on his effective progression.
