EventsVienna, Austria5 June 2014 to 6 June 2014

European Conference on Human Centered Design for Intelligent Transport Systems

Innovative ICT functions are being developed, aiming to support cleaner and safer multimodal mobility. However, all these developments raise numerous issues in terms of their acceptability and usability by a diverse population, and their effects and impact on user behaviour and attitudes.

The conference will gather the community of Human Centred Design for Intelligent Transport Systems researchers to offer an overview of the current developments and trends and to create an area for discussion and debate.

During the conference, the following scientific topics will be addressed: Human Factors, HMI & Design, Safety, Ecomobility and HMI Methodologies.
