Construction is changing rapidly, with new business models, concepts and technologies emerging in the construction markets in Germany, Romania, Spain, and the UK. The reports provide an overarching policy overview for a quick summary of news and upcoming events.

The European Construction Sector Observatory (ECSO) offers a range of-(insert missing word) environmental, social, and governance (ESG) tools to assess the performance of the construction sector. These tools include an Environmental Performance in Construction (EPC) framework, which helps stakeholders to identify and address environmental issues in the construction process. The EPC framework is based on a comprehensive assessment of environmental performance indicators, including energy consumption, water use, and waste generation. It also considers the social and economic impacts of construction projects and provides guidelines for improving environmental sustainability. The ECSO also offers a set of policy fact sheets that provide detailed information on specific initiatives and programmes aimed at reducing the environmental impact of construction. These fact sheets cover a wide range of topics, including energy efficiency, sustainable materials, and waste management. They provide valuable insights into the latest trends and initiatives in the construction sector and can be used to inform policy decisions and support the development of sustainable construction practices.
