Research need from Focus Group: Develop and adopt specific LCA and environmental risk assessment methodologies for agricultural systems as the current methods were designed particularly for industrial processes

This is the problem:

This need for research has been identified in FG 19 on “Nutrient recycling”. If you want to know more about it, check the [final report of the Focus Group](#) [1].

Life Cycle Analysis and risk assessment often use information from theoretical databases which themselves were derived from other fields of (industrial) application for which they are more adapted. However, dedicated data and modelling methodologies are required for agricultural processes. In the pursuit of more dedicated assessment methodologies, great care is required for appropriate standardisation.
