Digital intersection agriculture / administration
GERMANY – Schleswig-Holstein
Budget allocated for execution: €800.000

Starting date - expected end date | 01.10.2018 - 30.09.2021

digitalisierung.schleswig-holstein.de (under construction)

The contacts between farmers and agricultural administration always include data traffic (e.g. 'electronic applications', control of measurement data, etc.). The 'digital intersection' has to be structured and defined.

The administration needs better connections to databases on farms (e.g. animal identification, pharmaceuticals, fertiliser, crop protection, etc.). The new file formats need to be developed in collaboration with farmers and consultants.

Questions of data protection and data exploitation in companies as well as existing reservations about data interfaces with the agricultural administration (e.g. fear of 'additional' controls, etc.) are essential.

At the federal level, there is cooperation with the projects 'Geobox' and the 'i-green project'. It is checked which software solutions from other countries can be adopted or adapted.

Main promotor: Ministry of Agriculture & Environment
