

# Workshop on areas facing natural and other specific constraints (ANCs)

18 October 2016

**Fine-tuning**

## Standard Outputs (SO)

This is one of the indicators MS can use.

At the same time MS can propose their own methodology and thresholds, if they are supported by evidence. It should be demonstrated that the methodology used is adequate, correct and complete.

In the MS concerned, there is the perception that the SO alone cannot take into account all those variables which depend on the situation on the ground and which could lead to a differentiated local result.

### **Question:**

How do you think this issue can be fixed?

Is there any methodology you may propose?

## Discussion on a possible solution:

The issue hasn't been fixed yet.

Nevertheless, there is a proposal on the table that could fit in the framework of the fine-tuning exercise.

Using the National Census and the RICA database, it could be possible to obtain all the necessary data to design a derived indicator which integrates the SO with the intermediate consumption and the labour cost.

**Thank you for your attention**
