# What is an ICT Service at Village Level

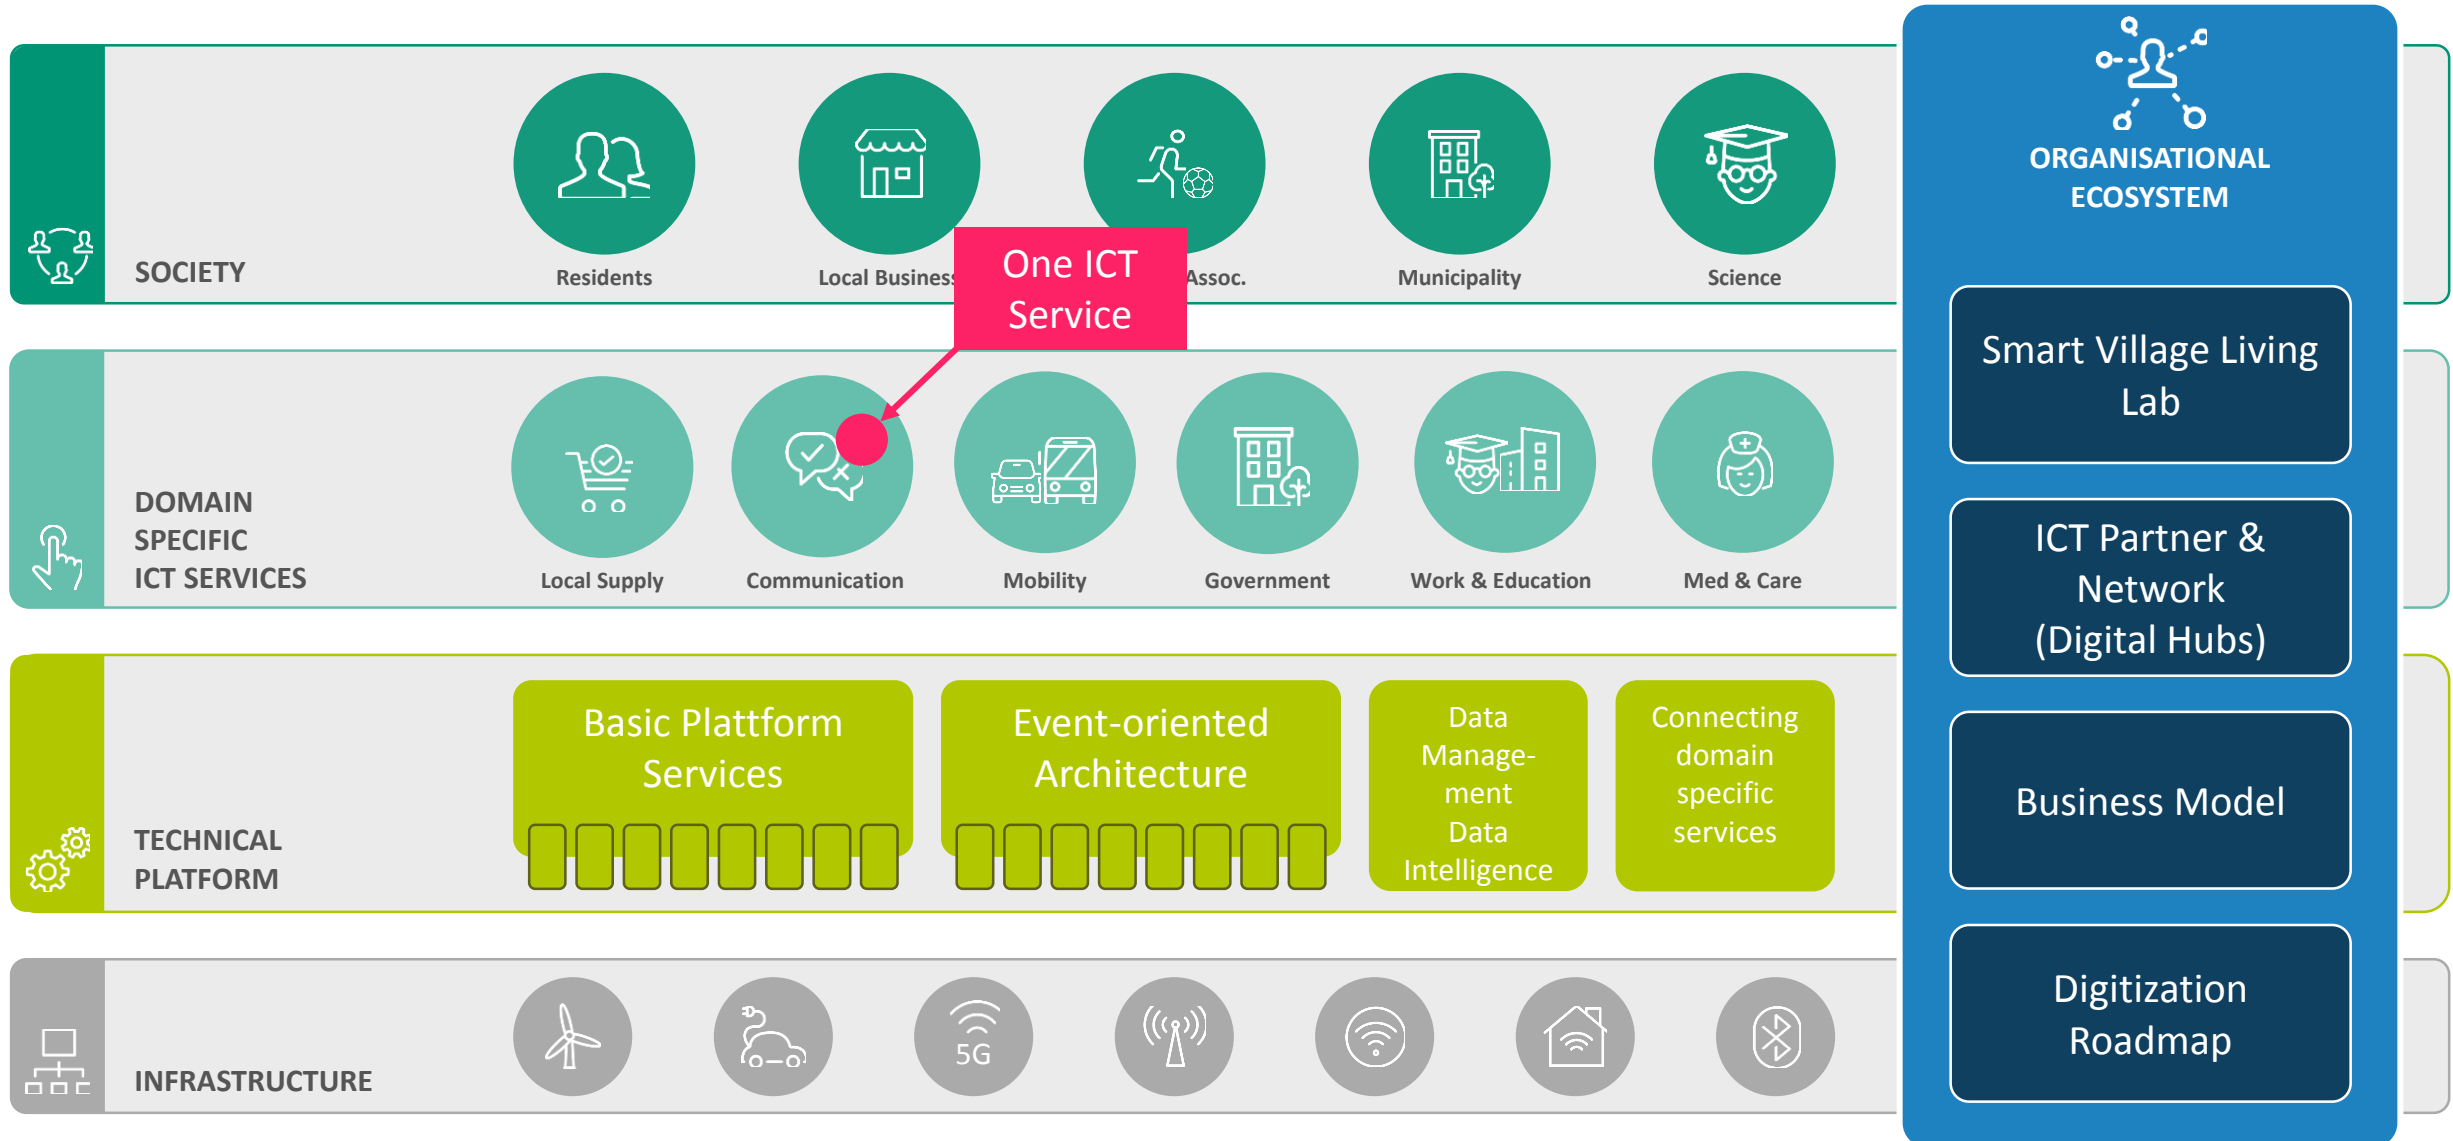

## ■ Smart Villages ...

- ... are villages or regions that master challenges facilitating a **digital transformation** process
- ... use new methodologies of **innovation** and **creativity** and new **sources of information**
- ... use often **cloud-hosted** solutions that connect **devices/things** and **collect/combine/manage data** of different rural domains and services within a **smart ecosystem**

## ■ An **ICT Service** at village level...

- ... is a **single digital service or applications** that runs in such a smart ecosystem
- ... is **one of the tools** and not the only one for achieving social innovation in rural areas

# An ICT Service within the whole Ecosystem

Connectivity is a prerequisite!

# Why?

- ICT Services at rural areas...
  - ... have to potential to solve **major challenges**
  - ... are **connecting** the key players: residents, municipalities, research and industry
  - ... are **enhancing** social innovation approaches
  - ... can be operated in a **sustainable** way
- ICT Services are **fulfilling needs** at cross-cutting topics
- *ICT Services are not solving every existing especially organizational problem!*

Involving local residents are a key success factor in  
designing those services

(Human-Centered-Design)
