

Life Cycle Climate Performance [LCCP] in Mobile Air Conditioning

Matti Vainio, European Commission

with contributions from

Stephen Andersen, Ward Atkinson, Denis Clodic,
Rob Farrington, Jochen Harnisch, William Hill,
Stella Papasavva and Winfried Schwarz

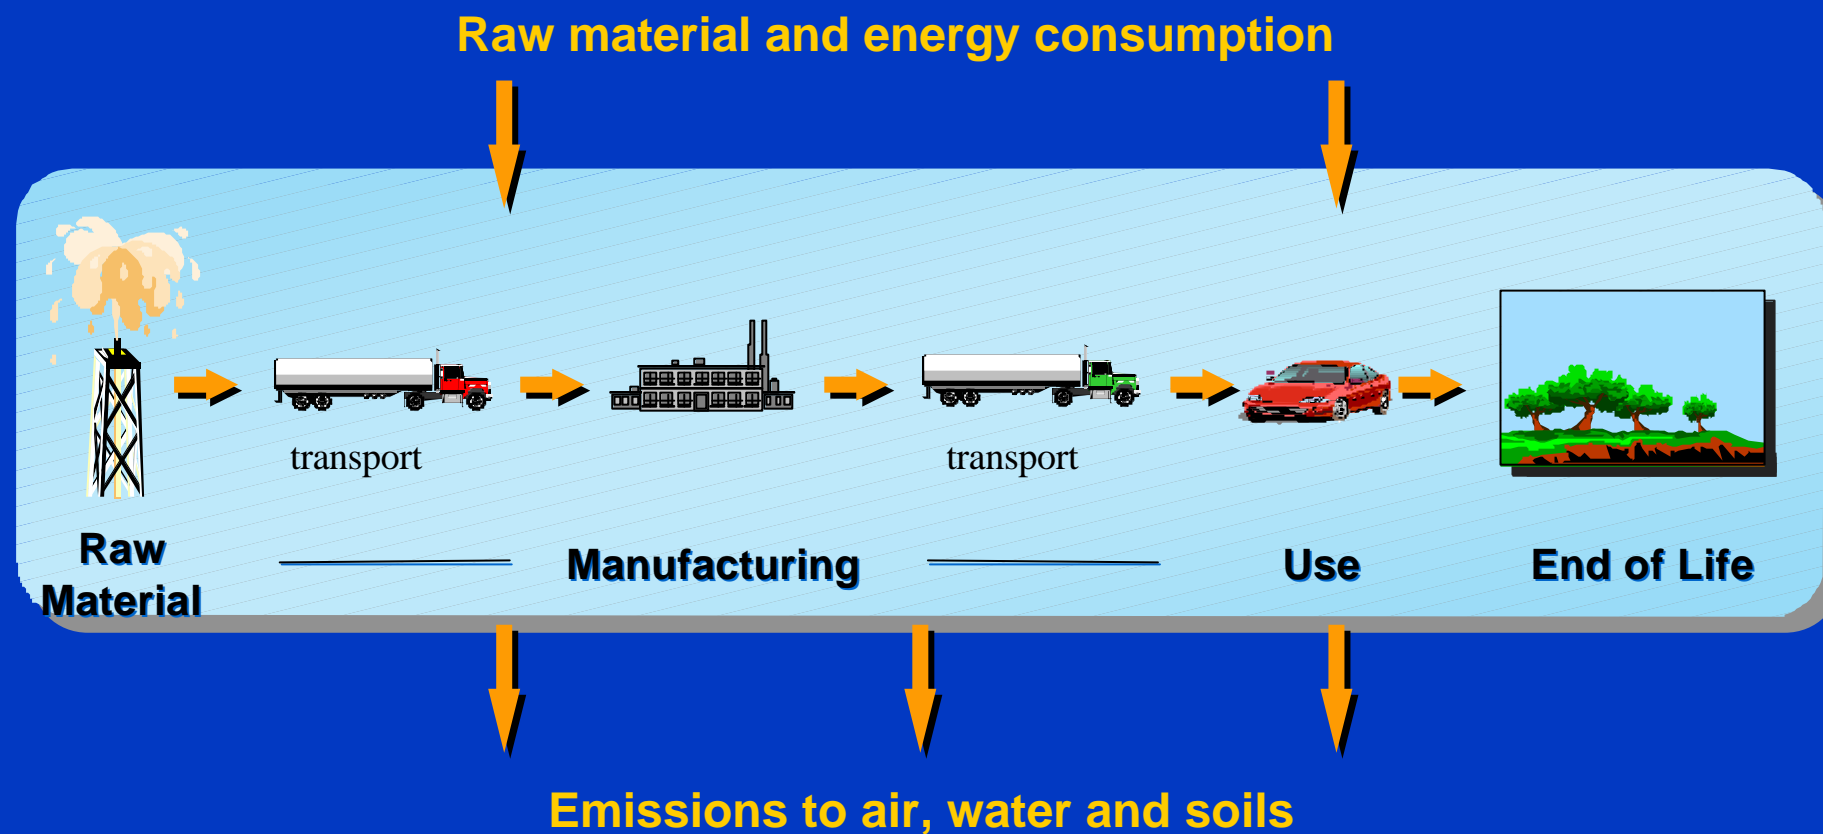

Purpose

- ❖ Based on the contributions of two presentations on greenhouse gas emissions from refrigerant (HFC-134a) and fuel consumption (CO₂) complete the picture:
 - identify the life cycle climate performance of today's MACs in EU-15

What is Life Cycle Climate Performance (LCCP)?

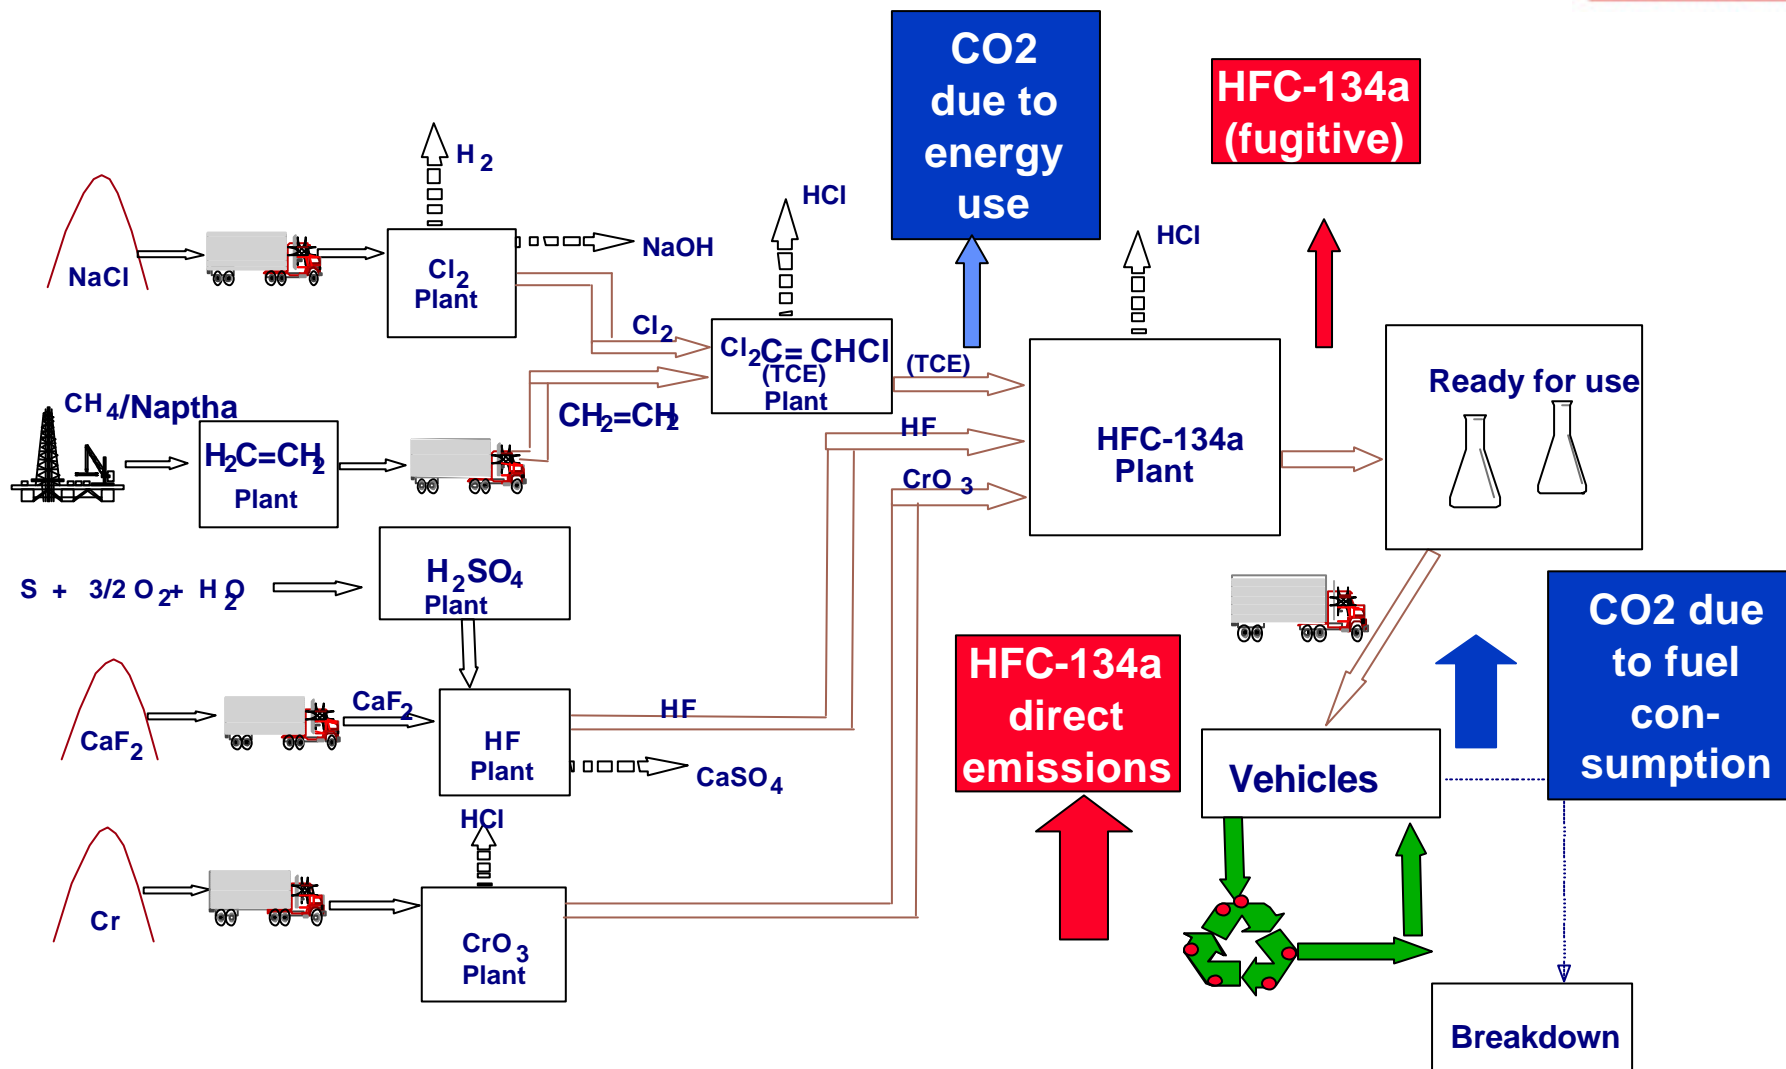

LCCP for MACs

- ❖ Includes AC operation only
 - Heater operation excluded (little data)
- ❖ Includes refrigerant components only
 - No plastic case parts or duct parts included
- ❖ Includes all energy emissions related to blower and cooling fan and an estimated energy conversion factor
- ❖ System components to be sized for equivalent performance
- ❖ Does not include engine/transmission efficiency variations
 - Should assume some nominal performance for reference
- ❖ Should be done according to ISO 14040-14044 standards for life cycle assessment

LCCP-Overview

Source: S. Papasavva, Ph.D Thesis, 1997, Tufts University "Reducing the Risk of Global Warming from CFC Alternatives: A Scientific Basis for Policy Options"

LCCP - Issues to address

- ❖ Decide why to carry out the LCCP
 - to get an order of magnitude (policy makers) or
 - to calculate differences between car makes (vehicle manufacturers)?
- ❖ Laboratory test data should be used based on difficulty of getting precise data from vehicle tests
- ❖ Different vehicle classes as well as regional driving cycles and ambient profiles should be used
- ❖ Conventional air pollutant emissions and their effect on AC operation are excluded
- ❖ CO2 emissions vary due to fuel mix differences

LCCP vs. Total Equivalent Warming Impact (TEWI)

	LCCP Cradle-to-Grave Emissions	TEWI In-Use Emissions
❖ Production energy - all materials	■	□
❖ Refrigerant emissions		
➤ Refrigerant manufacturing losses	■	
➤ Vehicle system leakage	■	
➤ Vehicle service & scrap losses	■	■
❖ Energy to carry MAC mass	■	■
❖ Energy to operate MAC	■	■
❖ Energy to reclaim and recycle refrigerant	■	□
❖ Energy to Recycle Components	■	

Components to be included in LCCP

Emissions before MAC use

- ❖ CO2 emissions due to energy needed to produce MACs
 - Raw materials used for producing MAC
 - Assembly energy
- ❖ Fugitive emissions and energy for manufacturing of refrigerant
 - Refrigerant emissions
 - CO2 emissions
 - Initial charge plus lifetime re-charges

Emissions during MAC use

- ❖ CO2 emissions
 - Mechanical and electrical energy
 - Affect of weight of MAC
- ❖ Direct emissions of refrigerant
 - “Controlled” leakage
 - “Uncontrolled” leakage
 - Emissions during service/repair

End-of-life of MAC

- Refrigerant losses during recycling
- CO2 emissions due recycling and destruction of refrigerant (energy)

CO2 emissions due to energy needed to produce MACs

Energy Consumed and CO2-Equivalents Emitted from the Manufacture of A/C Components

R134a/Baseline	Energy of Production (MJ/kg)	(kg)	(MJ)
Compressor	103	5.4	603.0
Aluminum Castings	22.5	2.6	321.3
Aluminum Forgings	55	1.3	177.9
Elastomers	17	0.3	33.0
Steel Forging	80	1.0	21.6
Copper Alloys		0.5	28.2
Steel Castings		0.6	10.9
Plastics		0.1	10.2

LCCP - CO2 emission “during use” depend on ambient driving conditions

Example: “Optimistic” case in EU15

Note: Assuming NO technological change...

Emissions before MAC use

- ❖ CO₂ emissions due to energy needed to produce MACs
 - 1675 MJ
 - EU fuel mix 51,3 t kg CO₂/MJ
- ❖ Fugitive emissions and energy for manufacturing of refrigerant
 - Refrigerant emissions (about 1%) (including “heels”)
 - CO₂ emissions (77 kg CO₂/1 kg of HFC-134a)

Emissions during MAC use

- ❖ CO₂ emissions
 - 4% additional
- ❖ Direct emissions of refrigerant
 - “Controlled” leakage 57 g/ year
 - “Uncontrolled” leakage 1.9%/year
 - Emissions during service/repair
 - 6% of charge or 45 grams per service

End-of-life of MAC

- Refrigerant losses during recycling (15%)
- CO₂ emissions due recycling and destruction of refrigerant (energy) (n.a.)

Lifecycle emissions of a MAC in the EU car (today's technology), kg CO₂ eq

LCCP of R-134a in the EU: “Optimistic” case (kg CO₂ eq).

LCCP of R-134a in the EU: **“Optimistic” case (kg CO2 eq) 17** **g/km**

	kg CO2 eq	Share
Lifecycle emissions of an HFC-134a MAC		
HFC emissions when filling MAC	7	0%
Regular HFC emissions (57g per annum)	889	34%
Irregular HFC emissions (14g per annum)	218	8%
HFC emissions during servicing (45g per service)	117	4%
HFC emissions at End Of Life (15% of remaining charge)	119	5%
HFC emissions due to HFC production (inc. "heels")	23	1%
CO2 emissions of HFC production 77 kg	119	5%
CO2 emissions of MAC production (1675 MJ)	86	3%
CO2 emissions due to HFC destruction (n.a.)	0	0%
CO2 emissions of MAC destruction (1675 MJ/2)	43	2%
CO2 emission due to fuel use (4% additional)	998	38%
Total	2620	100%

Example: “Realistic” case in EU15

Emissions before MAC use

- ❖ same as before

Emissions during MAC use

- ❖ CO2 emissions
 - twice as high (8%)
- ❖ Direct emissions of refrigerant
 - “Controlled” leakage same
 - “Uncontrolled” leakage twice as high (3.8%/year)
 - Emissions during service/repair
 - over twice as high (100 grams per service)

End-of-life of MAC

- same as before

LCCP of R-134a in the EU: “Realistic” case (kg CO₂ eq).

Lifecycle emissions of a MAC in the EU car (today's technology), kg CO₂ eq

Realistic case

- CO₂ emission due to fuel use (8% additional)
- CO₂ emissions of MAC destruction (1675 MJ/2)
- CO₂ emissions due to HFC destruction (n.a.)
- CO₂ emissions of MAC production (1675 MJ)
- CO₂ emissions of HFC production (77 kg)
- HFC emissions due to HFC production (inc. "heels")
- HFC emissions at End Of Life (15% of remaining charge)
- HFC emissions during servicing (100g per service)
- Irregular HFC emissions (28g per annum)
- Regular HFC emissions (57g per annum)
- HFC emissions when filling MAC
- In system at the end of the year

LCCP of R-134a in the EU: “Realistic” case (kg CO₂ eq) 25 g/km

	kg CO ₂ eq	Share
Lifecycle emissions of an HFC-134a MAC		
HFC emissions when filling MAC	7	0%
Regular HFC emissions (57g per annum)	889	22%
Irregular HFC emissions (28g per annum)	437	11%
HFC emissions during servicing (100g per service)	260	7%
HFC emissions at End Of Life (15% of remaining charge)	80	2%
HFC emissions due to HFC production (inc. "heels")	25	1%
CO ₂ emissions of HFC production (77 kg)	132	3%
CO ₂ emissions of MAC production (1675 MJ)	86	2%
CO ₂ emissions due to HFC destruction (n.a.)	0	0%
CO ₂ emissions of MAC destruction (1675 MJ/2)	43	1%
CO₂ emission due to fuel use (8% additional)	1997	50%
Total	3955	100%

Policy relevance

- ❖ “Optimistic” case, LCCP of a MAC of 2.6 kg CO₂ eq
 - if no technological progress
 - equal to about 17 g/km of CO₂ eq
 - 32 Mt CO₂ eq in 2010
 - assuming 70% of EU15 vehicles have a MAC
 - over 40 Mt CO₂ eq in 2020
 - with 95% share

- ❖ “Realistic” case, LCCP of a MAC of 4.0 kg CO₂ eq
 - if no technological progress
 - equal to about 25 g/km of CO₂ eq
 - 48 Mt CO₂ eq in 2010
 - assuming 70% of EU15 vehicles have a MAC
 - over 60 Mt CO₂ eq in 2020
 - with 95% share

There is also a “pessimistic” case where emissions in 2010 would be over 50 Mt and in 2020 almost 90 Mt

Conclusion

- ❖ It is possible to get a good order of magnitude of the greenhouse gas emissions of today's MACs
 - In the EU, the good progress made to reduce CO₂ emissions from cars by 25% up to 2008/9 is eroded by the increase of greenhouse gas emissions from MACs
 - It seems that about half of the projected gains would be lost due to MACs
- ❖ It is possible (but more difficult) to get the order of magnitude estimated for "tomorrow's" MACs
- ❖ It might be a good idea to standardize the definitions and terminology when LCCP is carried out
 - Issue to agree upon during VDA Winter Meeting?
