## Requirements for Verifying Usability of Chain Lubricants (Version 2017)

### Appendix 1: Cold temperature flow characteristics

#### Laboratory test

**Test equipment**
- Cold chamber, adjustable to -30°C (243 K)
- 3 Pourpoint vessels with marked as indicated (sketch)
- Thermometer
- Stopwatch

**Method**

The cleaned Pourpoint vessels are filled with the test liquid to mark 1 and placed without a lid in a cold chamber set to -15°C for 100 hours. After this period the flow time is measured immediately after removal. In the case of water based products the minimal requirements can be reduced to -10°C, if every container provides information specifically describing the lower cold stability of the product.

**Measurement/requirement**

Immediately following the cold phase, the Pourpoint vessels are tipped from the vertical to the horizontal and the time recorded for the liquid to reach mark 2. The flow time at -15°C \([-10°C]\) must not exceed 15 s over the initial flow time \(T_D\) \((t < 15 \text{ sec} + T_D)\).

![Diagram](image)

- \(D = 32 \pm 2 \text{ mm}\)
- \(A = 50 - 55 \text{ mm}\)
- \(H = 115 - 125 \text{ mm}\)
- "1" = fill mark
- "2" = measuring mark
Appendix 2: Ageing resistance

Laboratory test

Test equipment

- Heat chamber: Temperature range 50°C – 120°C (323 – 373 K)
- 3 Petri dishes Ø 90 ± 3 mm, with marked as indicated (sketch)
- Rack inclined at 25°
- Stopwatch
- Laboratory scales with readability $d = 0.1$ g

Methods

The curvature of the bases of three Petri dishes are measured and marked permanently according to sketch 2. The acceptable curvature may not exceed 0.5 mm (see sketch 1).

Petri dishes must be cleaned thoroughly before filling. Fill dishes with 6 ± 0.2 g of the test liquid.

Place filled petri dishes without lid into a heat chamber set to 80°C without air circulation.

Sketch 1

Measurement / requirements

The petri dishes are removed after a time interval of 200 hours and left to cool to room temperature (20°C +/- 2°C). Now the flow time is measured by placing the dishes onto a rack inclined at 25° (see sketch 3).

The time is measured for the test liquid to reach the measuring point on the lateral surface of the petri dish. Flow time after 1000 hours warm storage must not exceed initial flow time ($T_o$) by more than 15 s ($t < 15$ sec + $T_o$).
This test method is applicable for all liquids where temperature related evaporation losses during the ageing period do not result in a separation of the active components. In this case, a comparable test method must be used to simulate the ageing process more realistically. A useful test in this case would be to compare chain braking times.
### Appendix 3: Phase separation

#### Laboratory test

**Equipment**
- Test tube Ø 12 ± 2 mm
- Rack

**Method**

The test tube is filled to mark 1 with the test liquid and stored in the dark at room temperature without a lid. The visual inspection follows after an interval of 500 and 1000 hours.

**Measurement/requirements**

The following criteria are examined during visual inspection:
- phase formation
- irreversible phases (two or more phases that cannot be mixed again)
- flake formation
- streak formation
- thin film on surface
- colour changes

Following a test period of 1000 hours, the liquid should not show any visible signs of change.
Cold test

The test liquid is also checked for signs of phase separation during the low temperature flow characteristics test (appendix 1). The same criteria are assessed as in the laboratory test (see above). The liquid should not show any visible signs of change.
**Field test**

Two forestry operations centres are supplied with 20 l of the test liquid for field-testing. The liquid is examined visually for signs of phase separation during tank filling. The field test assesses the same criteria as the laboratory test (see above). The liquid should not show any visible signs of change.
# Appendix 4: Contact materials

## Field test

### Methods

Two forest operations centres receive 20 l test liquid for field-testing. During the test period the chainsaws are cleaned and maintained according to manufacturer's instructions at the prescribed intervals.

### Measurement / requirements

The contact materials are visually inspected during cleaning and maintenance of the chainsaw. The following criteria are examined:

- Signs of changes of colour and material on:
  - coated surfaces
  - plastic parts
  - rubber parts
  - metal components

- corrosion of metal components
- gumming of contact materials

There should be no signs of visible changes.
# Requirements for Verifying Usability of Chain Lubricants

## (Version 2017)

### Appendix 5: Effect on clothes

## Laboratory test

### Test equipment

- Standard cut protection sample

### Methods

The outer layer of the standard cut protection sample is removed to expose the cut protection material (DIN EN 381-1 : 1993). 5 ml of the test liquid are applied to the upper cut protection material layer. The treated sample is stored openly at room temperature (20°C ± 2°C).

### Measurement / requirements

The treated cut protection material must not show any signs of gumming.

## Field test

### Equipment

- Washing machine
- All-purpose laundry detergent

### Method

Two forestry operations centres are supplied with 20 litres of the test liquid for the field test. After a test period of two weeks, the soiled clothing is washed at a maximum temperature of 60°C in a household washing machine using an all-purpose laundry detergent. If possible, avoid spinning the laundry.

### Measurements / requirements

Work garments should be clean after washing without visible permanent stains.
### Requirements for Verifying Usability of Chain Lubricants (Version 2017)

#### Appendix 6: Chainsaw soiling

<table>
<thead>
<tr>
<th>Laboratory test</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Test equipment</strong></td>
</tr>
<tr>
<td>- Test stand for evaluating the lubricating characteristics of saw chain lubricants</td>
</tr>
<tr>
<td>- Ultrasonic bath</td>
</tr>
</tbody>
</table>

**Methods**

The soiling of the cutting equipment is tested using a test stand for evaluating the lubricating characteristics of saw chain lubricants. The requirements for this test method are described in detail under test criterion 2.5 Lubricating characteristics in the norm ISO/TS 19858.

**Measurement / requirements**

At the end of each test run, the cutting equipment is examined and photographed to ascertain the degree of soiling. The high temperatures achieved during the test runs may cause scorching of the cutting equipment coating and insoluble lubricant stains. This soiling is especially prevalent near the chain guide and the tip of the bar. To evaluate this test criterion it is necessary to cleanse the cutting equipment in an ultrasonic bath to remove loose residues after each test run.

<table>
<thead>
<tr>
<th>Practical test</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Equipment</strong></td>
</tr>
<tr>
<td>- Household detergent</td>
</tr>
<tr>
<td>- Warm water (50-60°C)</td>
</tr>
<tr>
<td>- Scrubbing brush/paintbrush</td>
</tr>
</tbody>
</table>

**Method**

The chain lubricant is tested under field conditions. The soiled chainsaw is then stored for three days. Following this period, the cutting equipment and the chainwheel cover are removed. The soiled parts of the engine unit, chainwheel cover and cutting equipment are cleaned with a scrubbing brush or paintbrush and a mixture of household detergent and water.
### Measurements / requirements

After three days of non-use and subsequent thorough cleaning, there should not be any signs of permanent staining on engine unit, chainwheel cover and cutting equipment.

---

*Chain Lubricant Requirements – Version 2017*

**Appendix 6: Chainsaw soiling**
### Appendix 7: Odour development

#### Laboratory test

**Test equipment**
- Test stand for evaluating the lubricating characteristics of saw chain lubricants

**Methods**

Odour development of the lubricant during operation is assessed using a test stand for evaluating the lubricating characteristics of saw chain lubricants. The requirements for this test method are described in detail under Test criterion 2.5 Lubricating characteristics in the ISO-method.

**Measurement / requirements**

Odour development of the chain lubricant is assessed during the test runs. There should be no indication of objectionable (pungent, irritating, obnoxious) odours emanating from the fresh oil and oil aerosols.

#### Field test

**Method**

Two forestry operation centres are supplied with 20 litres of the test liquid for field-testing. Odour development is assessed during the filling of the tanks as well as during operation.

**Measurements / requirements**

There should be no indication of objectionable (pungent, irritating, obnoxious) odours during filling and chainsaw operation.
**Appendix 8: Labelling**

### Laboratory test

The labelling of the product is assessed by visual inspection. The following criteria must be fulfilled:

- Product must be labelled as chainsaw lubricant
- The product shelf life must be visibly indicated on the label (production or expiry date)
- Instructions for use

### Field test

An additional assessment of readability and durability of the label is carried out under working conditions in the forest. The label must retain readability and remain fixed to the container even during wet weather conditions.
