**UKRAINE**

**COUNTRY OVERVIEW TO AID IMPLEMENTATION OF THE EUTR**

| LAND AREA: | 57.9 million hectares¹ |
| FORESTED AREA: | 9.7 million hectares² 16.7% of total land area² |
| FOREST TYPE: | 0.6% primary 49.1% naturally regenerated² |
| FOREST OWNERSHIP: | 98% public ownership² <1% private ownership² |
| PROTECTED AREAS: | 2.4 million hectares³ 11% of forests found in Protected Areas³ |

**ECONOMIC VALUE OF FOREST SECTOR:**

- USD 1.5 billion in 2011⁵
- 1% of the GDP in 2011⁵
- 25ᵗʰ highest exporter of EUTR products in 2015 by weight (kg)⁶
- 45ᵗʰ highest exporter of EUTR products in 2015 by value (USD)⁶

**TREE COVER LOSS:**

74 400 hectares of tree cover loss in 2018⁷

Average of 72 680 hectares per year 2014-2018⁷

[noting that ‘tree cover’ may be natural forests or plantations and that ‘loss’ can be due to a variety of factors].

**CERTIFIED FORESTS:**

- PEFC certification: 0 hectares (2018)⁹

**CHAIN OF CUSTODY CERTIFICATION:**

- FSC certification: 304 CoC certificates (2019)⁸
- PEFC certification: 1 CoC certificate (2019)⁹

**MAIN TIMBER SPECIES IN TRADE:**

- Silver fir (Abies alba), common alder (Alnus glutinosa), common silver birch (Betula pendula), hornbeam (Carpinus spp.), European beech (Fagus sylvatica), European ash (Fraxinus excelsior), Norway spruce (Picea abies), Scots pine (Pinus sylvestris), English oak (Quercus robur)¹⁰

**CITES-LISTED TIMBER SPECIES:**

None¹¹

**RANKINGS IN GLOBAL FREEDOM AND STABILITY INDICES:**

| Rule of law index¹² | Corruption perceptions index¹³ | Fragile states index¹⁴ | Freedom in the world¹⁵ |
| 3ʳᵈ quarter 77/126 in 2019 | 3ʳᵈ quarter 120/180 in 2018 (score: 32/100) | 2ⁿᵈ quarter 91/178 in 2019 | 2ⁿᵈ quarter 107/195 in 2019 (score: 60/100) |

These EU Timber Regulation country overviews were developed by UNEP-WCMC for the European Commission. However, their content does not necessarily reflect the views or policies of UN Environment, UNEP-WCMC, the European Commission, contributory organisations, editors or publishers, and they cannot be held responsible for any use which may be made of the information contained therein. These documents are updated periodically based on available information and are subject to external review. Please send any specific inputs you may have to timber@unep-wcmc.org; these will then be considered for potential inclusion in the next update.
LEGAL TRADE FLOWS

In 2015, Ukraine’s export of EUTR-regulated products (timber and timber products to which the EUTR applies) totalled 7.63 billion kg, of which 62.4% was exported to the EU-28. Exports of EUTR-regulated products mainly consisted of paper products (HS48*) by value and fuel wood (HS4401) by weight (Figures 1b and 1c); Ukraine imported very little timber and consumed the majority of its roundwood production (Table 1). Sawn wood (4407) also represented a large proportion of exports by both weight and value, indicating the high value of the product. The majority (54%) of EUTR products were exported to countries neighbouring Ukraine, with the Russian Federation the single largest importer in 2015 (Figure 1a). The majority of EUTR products imported into the EU from Ukraine in 2015 were imported by Poland and Romania, followed by Italy and Germany (Figures 2 & 3).

Figure 1: a) Main global markets for EUTR products from Ukraine in 2015 in USD; b) main EUTR products by HS code exported from Ukraine by value in USD in 2015; and c) main EUTR products by HS code exported from Ukraine by weight (kg) in 2015.

*Key to HS codes: 4401 = fuel wood; 4403 = rough wood; 4407 = sawn wood; 4408 = veneer sheets; 4410 = particle board; 4418 = joinery and carpentry wood; 48 = paper and paper products
KEY RISKS FOR ILLLEGALITY

COMPLIANCE WITH LEGISLATION:
The legality of forestry activities is subject to inspection by the State Environmental Inspection\textsuperscript{18,19}. The State Forest Enterprises may be implicated in illegal logging, making investigation and prosecution difficult\textsuperscript{20,21}.

ILLEGAL LOGGING OF SPECIFIC TREE SPECIES:
Beech and oak have been reported as higher risk species\textsuperscript{22}.

PREVALENCE OF ILLEGAL LOGGING OF TIMBER:
Average annual volume of illegal logging has been estimated between 20 000 m\textsuperscript{3} (in 2008 by the State Forest Agency) and 1.25 million m\textsuperscript{3} (by a Swiss-Ukrainian Forest Development Project in 2010)\textsuperscript{23}. Official statistics of illegal timber performed without permitting documents for 2016, 2017 and 2018 were 27 700 m\textsuperscript{3}, 26 100 m\textsuperscript{3} and 17 700 m\textsuperscript{3} respectively\textsuperscript{24-25}. Volumes of illegally-harvested timber in a 2018 survey of the Carpathians were extrapolated to estimate “1.2 million m\textsuperscript{3} of illegal timber harvested annually in this region”\textsuperscript{26}. The Forest Guard project in 2017-2018 detected 4.7 thousand m\textsuperscript{3} of illegally harvested wood in the Carpathians, with “80% of the information confirmed by law enforcement agencies”\textsuperscript{27}. Sanitary logging was considered the principal means of illegal logging since the late 1990s\textsuperscript{28}. In 2017, the share of sanitary logging on total harvest was estimated at around 30–40%\textsuperscript{18}.

RESTRICTIONS ON TIMBER TRADE
EU ban on import of goods from Crimea and Sevastopol\textsuperscript{29,30}. Exports of unprocessed timber/raw logs (code HS 4403) were banned for 10 years from 1\textsuperscript{st} November 2015, with pine trees included in this ban from 1\textsuperscript{st} January 2017\textsuperscript{31}. Exports of sawn wood (HS 4407) from the following valuable tree species have been prohibited since 2005: acacia \textit{(Robinia spp.)}, checker tree \textit{(Sorbus torminalis)}, cherry tree \textit{(Cerasus spp.)}, pear tree \textit{(Pyrus spp.)}, walnut tree \textit{(Juglans spp.)}, chestnut tree \textit{(Castanea spp.)}, common yew \textit{(Taxus baccata)}, black cherry \textit{(Cerasus avium)}, sycamore \textit{(Acer pseudoplatanus)} and juniper \textit{(Juniperus spp.)}\textsuperscript{32}. The harvest of species listed in the Red Book of Ukraine is also prohibited\textsuperscript{33}.

COMPLEXITY OF THE SUPPLY CHAIN
73% of Ukrainian forests are given to permanent use of State Forest Enterprises (SFEs), a sphere of responsibility of the State Forest Resources Agency (SFRAU)\textsuperscript{18,33}. 310 SFEs are in charge of managing these forests\textsuperscript{18}. Logging operations are managed by SFEs either directly, through private contractors, or private companies performing services under contracts\textsuperscript{18}. The remaining 27% of forests are in permanent use by other central government bodies and municipalities\textsuperscript{18}. Regional Forest and Hunting Departments of SFRAU monitor the activities of SFEs, and are in charge of issuing logging permits for final felling\textsuperscript{18}. SFEs have the authority to issue logging permits for sanitary felling and thinnings\textsuperscript{18}.

Illegal trade
Illegal logging in Ukraine is the harvesting of wood without a special permit for the use of forest resources or in violation of felling permits\textsuperscript{25}. Common forms of large scale illegal logging identified in Ukraine involve the extensive use of sanitary logging and use of legitimate papers to launder illegal timber\textsuperscript{21,22,33,18}, particularly in the Carpathian region of Ukraine\textsuperscript{20,28}.

Sanitary logging was reported to have become a stable source of timber procurement from protected and commercial forests\textsuperscript{23}, with a 2011 study showing a 6 to 7-fold increase of selective sanitary cutting (unrelated to natural disasters) over the previous 15-20 years\textsuperscript{34}. Non-profit organisation Earthsight reported that, based on official SFRAU figures, the amount of timber harvested under sanitary logging in the Ukrainian Carpathians in 2016 was greater than the amount cut under the pre-planned Annual Allowable Cut (AAC)\textsuperscript{21}. Figures provided by the State Forest Resources Agency (SFRAU) show that, in 2017, the volume of timber harvested in Ukraine was 21.9 million m\textsuperscript{3}, of which 9.4 million m\textsuperscript{3} (43%) was cut as part of the final fellings and 12.4 million m\textsuperscript{3} (57%) originated from cuttings connected to forest management activities’ (3.1 million m\textsuperscript{3} of which came from clear sanitary cutting, the remainder from thinnings and other activities connected to formation and improving the sanitary state of forests)\textsuperscript{35}. Undocumented logging in areas not designated for harvest in the Ukrainian Carpathians was reported to have been widespread 1988-2007\textsuperscript{28}. Localised “unauthorised harvesting” of timber for wood fuel and minor home repairs was also reported to occur\textsuperscript{20}.

In a 2010 survey, forest experts in Ukraine reported a large number of unregistered sawmills, and a system for purchasing stolen timber in the Ivano-Frankivsk area\textsuperscript{20}. Incidents of corruption in the same area were also reported, including bribing forestry officials, land fraud and issuing illegal harvesting permits\textsuperscript{25}. Two thirds of local residents surveyed in the Carpathian region (800 of 1200 respondents) believed that there was overcutting of the forest in their locality, with more than half reporting an increase in volume over the previous five years\textsuperscript{20}. By 2017, there were estimated to be 12 000 unlicensed sawmills operating in Ukraine, compared with 9200 legal ones\textsuperscript{36,21}. Non-profit organisation Earthsight
estimated that exports of sawn timber in 2016 were 50 per cent more than that recorded as having been legally produced in the country’s sawmills, with nearly one million cubic metres of wood exported which could not be accounted for. In a 2017 national risk assessment, FSC identified a range of specified risks, including: that according to evidence provided by some nature conservation NGOs, some sanitary cuttings are planned in violation of legislation and/or silvicultural requirements; there is a shortage of documentary evidence of land-use rights for communal, private and state enterprises that are beyond SFRAU jurisdiction; underestimating the amount of rent specified in harvesting tickets, through incorrect assessment of volumes, species composition and size-quality characteristics of the wood; understatement of taxes due to illegal sale of wood or sale with misstating of wood category, grade and volume; violations related to timber transportation by road without any logistics documents; and violations by enterprises subordinated to SFRAU concerning non-compliance with requirements on selling all wood through auctions. There were noted to be substantial discrepancies between official statistics of illegal and unauthorised logging and figures reported from unofficial sources.

The official figures on illegal logging (without permits) in forest under the sphere of activity of SFRAU for 2016, 2017 and 2018 were 27,700 m³, 26,100 m³ and 17,700 m³ respectively. However, as noted in the 2018 EU TAIEX mission report on Ukraine, the State Forest Guard is in charge of detecting illegal logging (wood theft) committed by private individuals or criminal groups. The State Ecological Inspection of Ukraine (SEIU), National Police and the State Fiscal Service of Ukraine (SFSU) acknowledge that a far larger problem is illegal logging ‘with papers’ (violation of felling permits) that involves corruption of public sector employees and forgery, together with ‘illegal’ forest management. Figures provided annually by SEIU to the State Statistics Service of Ukraine indicate that during 2016 there were 7,506 cases of illegal felling registered, resulting in the destruction and damage of 43.8 thousand m³ of wood or 0.2% of the total timber harvest.

In 2018, WWF presented results of their two year study in the Carpathians, where 4.7 thousand m³ of illegally-harvested timber was found in the 2,902 ha of forests surveyed. Extrapolating from these figures, WWF calculated that there is potentially 1 million m³ of illegal timber harvested in the Carpathian forests annually.

In their 2018 report, Earthsight considered timber corruption in the Ukraine to be pervasive, with illegality permeating the supply chain from harvest to export. Their analysis of court records 2017-2018 revealed numerous investigations filed in Ukrainian courts against SFEs for forging documents, receiving bribes from timber companies and causing losses to state revenues by illegally undervaluing timber at auctions. Each year the State Forest Resources Agency brings to responsibility and dismisses a number of employees of State Forest Enterprises for improper performance of their duties; in 2018 477 employees of the State Forest Guard were brought to disciplinary responsibility, with 62 people dismissed from their positions.

Following the allegations made by Earthsight about corruption and illegal logging in Ukraine’s forest industry, Assurance Services International (ASI – an international accreditation service owned by FSC) conducted in-depth compliance assessments for key targets in the Ukraine, with a focus on regions highlighted in the 2018 Earthsight report. Although ASI stated that the allegations against the Ukrainian Government, private companies and the FSC system were “not unfounded”, they found that the previous findings of the FSC auditors in Ukraine were in line with accreditation and certification requirements and so could not verify Earthsight’s findings. They noted that corruption was a difficult issue for voluntary standards systems to detect and address.

The Prime Minister of Ukraine announced on 18 July 2018 a crackdown on illegal logging and timber smuggling, initiating in 2018 large-scale inspections of forestry enterprises and signing an appeal to the Prosecutor General to verify the facts of violations. Up to 01.04.2019 the results of inspections have not been published.

Various social and economic factors have been identified as contributing to the occurrence of illegal logging, such as unemployment and poverty in rural areas, low salaries of state forestry officials and employees and the higher profit margins of sanitary cutting relative to final felling. The legal status and definition of Forest Guards’ roles in forest control was also reported to be unclear in Ukrainian legislation, which can hamper forest law-enforcement. An ineffective system of law enforcement and weaknesses in the institutional structures of forest governance were considered to present challenges to tackling illegal logging, with inter-agency cooperation is also low. State Forest Guards have been implicated in illegal logging and there were also reported to be cases where State Forest Guards were themselves threatened or attacked as a result of their work of fighting against forest crime. A 2010 World Bank analysis of corruption risk in Ukrainian legislation found 12 areas of potential risk, including lack of transparency in the activities of the State Forestry Commission, policies of issuing on the spot fines without the need for receipts, emphasis on punishment...
rather than reducing violations and lack of clarity on when infractions constitute crimes rather than offences. The ability of State Forest Guards to collect administrative fines on the spot was revoked in 2012. SFRAU attribute the main reasons for increased volumes of illegal logging to: the activities of technically equipped criminal groups; socio-economic factors within rural populations, which are forced to meet their needs illegally; as well as number of uncontrolled small private sawmills who procure illegally-harvested wood. The increasing of illegal logging in the southern and eastern regions of Ukraine is attributed, to a large extent, to the lack of budget support for the maintenance of state forest protection, resulting in large areas of forest remaining unguarded.

Whilst in 2015 the Ukraine put in place a temporary ban (for a period of 10 years), on the export of unprocessed timber/rough wood (HS 4403), export of logs to the EU was reported to have continued, often mis-classified as ‘fuelwood’. For example, Earthsight reported that in the first half of 2018, Ukrainian customs agents on the border with Romania detected illegal log exports worth >US$ 1 million. The SFSU, responsible for tax and border checks, noted that this relates to a problem with the Ukrainian ‘GOST’ measurement standards, where descriptions of ‘fuel wood’ and ‘wood in the rough’ are similar and not linked to the destined use of the wood, as required by the international standards applicable to both the Ukraine and the EU. Since 12 January 2017, SFEs have been required to limit the length of any wood exported as fuelwood to two meters. However, this measure does not address the issue that only wood destined to be used as fuel may be declared as ‘fuel wood’. This deficiency is being exploited by some for illegal export of ‘wood in the rough’ as ‘fuel wood’. Another risk group in timber exports since the log export ban was reported to be sawn wood, when logs (or ‘wood in the rough’) has been very minimally modified to be exported as ‘sawn wood’.

Official government figures for 2016 reported that fuelwood made up 57.6% or 11.294 million m³ of the total volume of timber produced in 2016 (19.605 million m³), the rest consisted of round timber. The bulk of timber produced was harvested from sanitary cutting and thinnings (47%) and final felling (43%). Figures produced by SFRAU for 2017 reported a 2.5% drop in timber harvested, compared with 2016 (totalling 15.95 million m³).

One of the reasons for the difference in customs data between Ukraine and the EU prior to 2019 was the difference in standards for timber between the EU and Ukraine. Since 01 January 2019, Ukraine has implemented the transition to European standards for the classification and measurement of timber and timber products.

Forestry management and legislation

The forests of Ukraine occur in three natural zones, the forest (Polissya), forest steppe and steppe, as well as in the mountainous Carpathians, with 37.9% of Ukraine’s forests categorised as merchantable/exploitation forest. The sanitary condition of Ukraine’s forests was reported to be deteriorating due to climate change and anthropogenic factors, with >600 thousand ha of forest plantations damaged annually by pests and disease. In recent years, the spread of pests and disease was reported to have become a problem, not just in plantations, but throughout the territory of Ukraine.

The vast majority of forests (~87%) are state-owned, with 1.3 million hectares (~13%) attributed to communal property. In terms of forest management, state forests are consolidated under numerous permanent forest users under responsibility of different state authorities, the largest area (about 73%) is in the use of forest enterprises in the sphere of responsibility of the State Forest Resources Agency. SFRAU is a central executive body that implements and monitors state policy in the forest sector. SFRAU and subordinated organisations play a key role in issuing of Felling Licences and development of Forest Management Plans (FMPs). The functions of monitoring and guarding the forest also lie with the SFRAU. Forest patrol is carried out by SFRAU through the State Forest Guards, with the aim of preventing illegal logging by individuals and criminal groups. The variety of roles carried out by SFRAU, its subordinate institutions and enterprises is noted to contain inherent conflicts of interest, making it prone to corruption. Aiming to prevent corruption, the State Forest Resources Agency has approved the Anti-Corruption Program for 2018–2020. SFRAU reported that in 2017 the State Forest Guards conducted 37 thousand raids with 6500 forest perpetrators brought to administrative responsibility. In addition, 2,552 cases of illegal logging were handed over to law enforcement agencies and courts, 792 officials of the State Forest Protection Department were brought to disciplinary responsibility, 104 were dismissed and 4 criminal cases were instituted.

The control function for forests of all forms of ownership in Ukraine, including compliance with environmental and forest law, is performed by the State Ecological Inspection of Ukraine (SEIU), which is subordinated to the Ministry of Ecology and Natural Resources of Ukraine. The SEIU is in charge of inspections in forests, although in 2018 it was reported to have only 188 inspectors conducting forest-related checks, along with other environmental inspections. In 2017, the
SEIU conducted 900 inspections of forest enterprises and detected 3,400 violations, the majority of which were committed by forest enterprises. However, Ukrainian law was reported to only allow for sanctions against state officials and individuals, hence forest enterprises cannot be fined. In addition, there were reported to be no mechanisms in place for sanctioning forest management that is not in line with the forest law\textsuperscript{18}. The separation of forest inspection from forest patrol was noted to create coordination problems, with the system of State Forest Guards in need of reform\textsuperscript{18}.

Sanitary cutting/logging is controlled by SEIU, as established in a resolution regarding rules on sanitary cutting in Ukraine (Resolution No. 555, 27 July 1995)\textsuperscript{45}. The resolution also establishes where sanitary felling is prohibited (including within protected areas of biosphere reserves, natural reserves and around nesting areas for birds listed in the Red Book of Ukraine)\textsuperscript{45}. According to the resolution, which was amended in 2016, administrative procedures for obtaining a logging permit for sanitary felling vary depending on whether a felling is selective or clear\textsuperscript{18}. In both cases, SFEs have the authority to issue logging permits along with a number of supporting documents\textsuperscript{18}. For selective sanitary felling, an inspection of the State Enterprise for Forest Pathology and the State Forest Management Planning Enterprise are needed\textsuperscript{18}. For sanitary clear felling, the above is required as well as approval of a Special Commission consisting of representatives of municipalities and the civil society\textsuperscript{18}. This has been linked to a delay in removal of trees infested with bark beetle\textsuperscript{18}. In cases where sanitary felling is conducted in protected areas, the Ministry of Environment inspects the felling site and has to approve the potential sanitary felling\textsuperscript{18}.

The issue of sanitary felling is also linked to wood auctioning procedures\textsuperscript{18}. SFEs are required to organise auctions for sales of wood harvested from final felling\textsuperscript{18,33}, but there are no regulations on selling wood harvested from sanitary felling\textsuperscript{18}. SFEs can therefore choose to sell such wood in auctions or through direct contracts (with civil society organisations noting that direct contracting involves higher risk of illegal timber sales)\textsuperscript{18}.

Since 2004, Ukraine has launched a number of actions including working to amend legislation to make forestry operations more environmentally sustainable, and working to establish a transparent timber market and to certify forests used by state run forest companies\textsuperscript{20}. In 2015, Ukraine introduced further amendments to existing legislation, including temporary bans on the export of rough wood\textsuperscript{31}, and discussed the development of new provisions for timber trade\textsuperscript{45}. Since 2014, options for reforming the forestry institutional structure of Ukraine have been under discussion and are high on the political agenda\textsuperscript{46,24}. Priorities for reform, as identified by the Deputy/Acting Minister of Agrarian Policy and Food of Ukraine, include separating the functions of economic activity and monitoring/control, redistribution of financial resources across regions, conducting a national forest inventory and assistance with tackling the issue of illegal logging\textsuperscript{47}. 
**RELEVANT LEGISLATION AND POLICY**

For further details on Ukrainian legislation relevant to EUTR, see: FSC (2017) ‘FSC National Risk Assessment of Controlled Wood for Ukraine’, the Ukraine country page on FAOLEX and the national website Legislation of Ukraine.
