

Waste Producer

Fill in a form where report data on waste generated and handed over within the reference year to waste operators whether national or abroad

Waste Operator

Fill in a form where report data on waste received and handled within the reference year from waste producers whether national or abroad

The statistical office use, the Statistical Units Register also in use for the main statistical activities on economy, to compare with the administrative data provided by the national

The data used for the statistic is a combination of those 2 data sources. In the process of merging the 2 different reporting sources is done a duplicates verification regarding all the bussinesses (whether national or foreign) are identified by the VAT number.

In processing the integration of the data from those 2 data sources, is also done the matching with the bussinesses sample selected and all data belonging to waste producers with a VAT number not selected or absent (foreign producers essentially) in the national bussinesses register is excluded.

The waste producers report on amounts of waste (t) generated and handed over to waste operators coding the data according the LoW and the R and D codes.
The data reported by waste operators in the perspective of amounts of waste received from producers is basicaly the same. Having the reference of origin (also have VAT number of the producer and the operator) in the integration process the data is described and inverted in the waste producer perspective.

In the integration process data reported by waste producers on waste sended to operators abroad is included.
However the data reported by waste operators on waste received from foreign producers is excluded (VAT number not belonging to the register).

The data on secondary waste received by waste operators from other waste operators is included.
At the end we have a single dataset build up in the waste producer perspective which is afterwards checked for matching with the bussinesses sample selected to do the statistics.
