## Methods and definitions

The **index of the volume of retail trade** measures the evolution of the turnover in retail trade, adjusted for price changes (deflated), i.e. the evolution of the total amount of goods sold, based on data adjusted for calendar and seasonal effects.

**Seasonal adjustment** is a statistical method for removing the effects of recurring seasonal influences, which have been observed in the past from an economic time series, thus showing non-seasonal trends more clearly. **Calendar adjustment** is a statistical method for removing the variation caused by the changing number of particular weekdays or holidays in different months or other time periods (quarters, years). The annual comparisons are based on data adjusted for calendar effects only.

**Seasonally adjusted** euro area and EU series are calculated by aggregating the seasonally adjusted national data.

Missing observations from Member States for recent months are estimated for the calculation of the euro area and the EU aggregates.

## Revisions and timetable

Data of previous months have been revised compared to those issued in the News Release [65/2021](#) of 4 June 2021. The monthly percentage change for April 2021 has been revised from -3.1% to -3.9% in the euro area and from -3.1% to -3.6% in the EU.
