Methods and definitions
The House Price Index (HPI) measures the price changes of all residential properties purchased by households (flats, detached houses, terraced houses, etc.), both newly built and existing, independently of their final use and independently of their previous owners. The Member States’ HPIs are compiled by the National Statistical Institutes. The euro area and the EU aggregate HPIs are compiled by Eurostat. HPIs are computed as annually chained indices with weights being updated each year. The European HPI aggregates are currently calculated as weighted averages of the national HPIs using as weights the GDP at market prices (expressed in millions Purchasing Power Standards - PPS) of the countries concerned.

The figures are not seasonally adjusted.

Missing country data is estimated by Eurostat using data from non-harmonised sources. These estimates are not published but are used to calculate euro area and EU aggregates.

**Country notes:**
Germany: The HPI has been revised mostly to reflect improvements in capturing the locations of property transactions.

Slovenia: The HPI has been revised after corrections in the calculation process.
