Growth forecasts for the euro area ⁽¹⁾

Growth assessment

According to the **Euro Growth Indicator**, published by the Euroframe group on 3 March 2020, euro area GDP is forecast to accelerate to quarterly rate of 0.6 per cent in the first and second quarter of 2020 which is slightly higher as compared to the 0.2 per cent growth expected by the indicator for the last quarter of 2019 and the 0.1 per cent estimate released by Eurostat. The euro area's year-over-year GDP growth rate is forecasted to stabilize at 1.0 per cent in the first quarter of 2020 and to accelerate to 1.5 per cent in the second quarter of 2020. The Indicator, however, is based on February sentiment indicators that do not capture yet the negative economic effects induced by the spread of the coronavirus that are currently unfolding.

The **€-coin** indicator slightly rose from 0.25 in January to 0.28 in February 2020, confirming that modest expansion in economic activity in the euro area continues. The indicator benefited from the favourable trend in employment and in share prices which more than offset the persistent weakness in the industrial cycle. Cyclical indicators for the euro area (¹)

Growth assessment

The **Business Climate Indicator (BCI)** (²) for the euro area decreased by 0.04 points in February 2020, following a decrease of 0.19 points in January 2020.

The **Composite leading indicators (CLIs)** (³), published on 10 February 2020 continue to point to stable growth momentum, albeit below long-term trends, in the OECD area as a whole. However, these CLIs have been estimated using data collected before the WHO's recent declaration of a public health emergency following the novel coronavirus outbreak in China. It is not yet possible to incorporate the potential negative impact of the coronavirus outbreak on global activity, particularly on supply chains and tourism linkages. With this important caveat in mind, stable growth momentum remains the assessment for Japan, Canada and the euro area as a whole, including France, Italy, and now also Germany.

In the United States and the United Kingdom, the CLIs are tentatively pointing to growth gaining momentum from below-trend. Prior to the novel coronavirus outbreak, tentative signs of growth gaining momentum were also emerging in the industrial sector of China, but there is a high degree of uncertainty about near-term developments. Amongst other major emerging economies, the assessment anticipated growth gaining momentum in Brazil, remaining stable in Russia, and decreasing in India.

The **IFO Economic Climate** in the euro area has worsened in the fourth quarter of 2019. It decreased to -16.3 points in the fourth quarter of 2019 from -6.7 points in the third quarter of 2019, plummeting to its lowest level since spring 2013. The experts' assessment of the current situation dropped for the seventh quarter in a row. Expectations also

clouded over. The slowdown in the euro area continues. The economic climate in Germany, Spain, Austria, and Finland continued to fall. The WES experts assessed both the current situation and the expectations as worse than in the previous quarter. While there were hardly any changes in France and Belgium, respondents in Italy were increasingly optimistic, albeit starting from a very low level. Experts in the euro area significantly lowered their expectations for exports and imports in particular. Investment expectations also continued to deteriorate. More respondents rated trade barriers and

the lack of demand as problematic. Inflation expectations for this year dropped from 1.5 % to 1.3 %, while medium-term expectations for 2024 dropped from 1.9 % to 1.8 %.

The **DZ BANK's Euro-Indicator**, published on 3 of March 2020, points to almost no change in the economic outlook of the EA in February 2020, slightly increased by 0.1 per cent (month-on-month). The indicator has hardly moved at all since June 2019. The indicator now stands at 98.9 points, 0.3 % lower than in February 2019.

Methodological notes

Indicators of growth and turning points — sources and methods

The **EUROFRAME Euro Growth Indicator**: calculated by the OFCE (Paris) in cooperation with the EUROFRAME group, which consists of: CPB (Den Haag), DIW (Berlin), ESRI (Dublin), ETLA (Helsinki), IFW (Kiel), NIESR (London), PROMETEIA (Bologna), WIFO (Vienna), and CASE (Poland). The purpose of this leading indicator is to anticipate the development of the GDP in the euro area two quarters ahead of official statistics. The indicator considers surveys from industry, construction, and households, ISM survey of US industry, real euro/dollar exchange rate, and European stock index. The indicator is based on ordinary least squares (OLS) estimation of the GDP growth rate, and released on a monthly basis.

€-COIN: a monthly “smoothed” estimate of quarter-on-quarter GDP growth in the euro area, calculated by the Banca d’Italia. It is obtained by collecting a large set of statistics and extracting from it information relevant to forecast future GDP. It tracks GDP growth anticipating official GDP releases by several months, by giving each month an early estimate of euro area growth in terms of quarter- on-quarter changes in GDP. Moreover, it sheds light on the underlying trend by removing short-run fluctuations and measurement errors from the growth rate; in this respect it is not only a forecast, but also an indicator of the true growth momentum in the euro area.

The **OECD Composite Leading Indicator**: designed to predict cyclical turning points (peaks and troughs) in GDP as a proxy of the business growth cycle of the overall economy. It comprises a set of component series from a wide range of economic indicators.

IFO: Economic Climate Indicator, designed to give an accurate picture of the economic situation and forecasts for economies on a quarterly basis. It consists of qualitative information: appraisals and expectations of economic experts. For the euro area the trend of the indicator correlates well with the actual business-cycle trend.

DG ECFIN: Business Climate Indicator (monthly), designed to deliver a clear and early assessment of the cyclical situation of the euro area. The indicator uses, as input, five balances of opinions from DG ECFIN’s Business and Consumer Surveys. The resulting ‘common factor’ may be read as a survey result: the higher the level, the healthier the cyclical situation, and a rise in the indicator points to an upswing in activity and an improvement in business climate

DZ-Euroland-Indicator: calculated by DZ Bank (monthly), aims at predicting recessions and has also proved to reflect movements in GDP growth rate. It is built on concepts

implemented by the US Conference Board for monitoring cyclical indicators. Nine series for euro area or for the main countries are selected for their leading properties, and aggregated to give a composite index which can be compared with the level of GDP in order to anticipate recessions.

Trend-cycle decomposition

The trend and cycle are two components of a time series that represent variations of low frequency and “business cycle” frequency, respectively, the high frequency fluctuations having been filtered out. Identifying and estimating trend and cyclical components of key economic indicators is invaluable when making decisions and informing policy-makers. The distinction between the two components helps the analyst ascertain whether any change to the indicator is temporary or permanent. However, there exist many alternative methods to identify

and estimate trends and (business or deviation) cycles. The estimates for three indicators — GDP, industrial production, and employment — are produced using three different filters:

Hodrick-Prescott (HP): a filter widely used in macroeconomics to fit a smooth curve through a set of points.

Christiano-Fitzgerald (CF): a well-known approximation to an ideal band pass filter, estimated non-parametrically.

Unobserved Components (UC): a parametric approach which involves estimating a statistical model and decomposing the series into components, including the trend and cycle.

Date Period Comparisons

Q/Q-1: the value of the indicator (quarterly) is divided by the value of this indicator for the previous quarter (as a percentage).

Q/Q-4: the value of the indicator (quarterly) is divided by the value of the same indicator for the previous year (as a percentage).

M/M-1: the value of the indicator (monthly) is divided by the value of this indicator for the previous month (as a percentage).

(**) Due to the fact that the Luxembourg Government does not have outstanding long-term debt securities with a residual maturity of close to ten years, the indicator is based on a basket of long-term bonds. This basket has an average residual maturity of close to ten years. The bonds are issued by a private credit institution and the indicator is thus not fully harmonised" (source ECB).
