25

Business services

In this chapter, the term 'business services' is used to refer to the aggregate of two NACE divisions: computer and related activities (NACE Division 72, as covered by Subchapter 25.1) and other business activities (NACE Division 74, the components of which are covered in Subchapters 25.2 to 25.6).

Business services consist of many different activities. These include professional business services such as legal services, consultancy services such as management consultancy, technical services such as engineering consultancy, marketing services such as advertising or market research, and operational services such as cleaning and security services. Business services are mainly supplied to other enterprises and/or the public administration, while households can also make use of some of these services, especially legal, architectural, engineering, and technical testing activities. Many of these services could be provided in-house by enterprises themselves, but by purchasing (outsourcing) them from service providers they can focus on core activities and take advantage of the specialisation offered by service providers. As such, an efficient and successful business services sector can contribute top the overall competitiveness of the business community.

The freedom to provide services and the freedom of establishment are central principles to the internal market for services and are set out in the EC Treaty. They guarantee EU enterprises the freedom to establish themselves in other Member States, and the freedom to provide services on the territory of another EU Member State. The Directive (1) on services in the internal market aims to achieve a genuine internal market in services, removing legal and administrative barriers to the development of services activities between Member States. The

Directive will have to be implemented by Member States by the end of 2009 at the latest. As well as covering most business services (but notably not services of temporary work agencies) the Directive applies to a wide variety of services including industrial and construction activities, as well as distributive trades, hotels and restaurants, travel agents, real estate and renting services.

Structural profile

In 2006, the EU-27's business services (NACE Divisions 72 and 74) sector comprised 4.4 million enterprises, more than one in every five enterprises in the whole of the non-financial business economy (NACE Sections C to I and K). The sector's workforce included 22.2 million persons, making it the largest workforce in the non-financial business economy (based on the sectoral aggregates used for the chapters in this publication), with a 17.1 % share of the non-financial business economy workforce. This workforce generated EUR 1 763.3 billion of turnover in 2006 leading to EUR 892.1 billion of value added. As such, the business services sector accounted for 7.9 % of the turnover in the non-financial business economy, while accounting for twice as much of value added, a 15.8 % share. In turnover terms business services was the third biggest sector within the EU-27's non-financial business economy, smaller only than wholesale trade and retail trade and repair, whereas in value added terms it was the largest sector. In 15 of the 26 Member States with recent value added data available (no Malta) business services was the largest sector, while it was second largest in three more: seven of the eight Member States where business services was not one of the two largest sectors were Member States that joined the EU in 2004 or 2007, the one exception being Greece.

(1) Directive (EC) no 2006/123 of the European Parliament and of the Council.

Among the two NACE divisions that make up the business services sector, computer and related activities (NACE Division 72, see Subchapter 25.1) accounted for about one fifth of sectoral value added in 2006. Other business activities (NACE Division 74, as presented in Subchapters 25.2 to 25.6) accounted for the remainder of the output. Of these activities, the largest was professional business services (NACE Group 74.1) which alone provided 31.3 % of all business services value added - see Subchapter 25.2 - but just 23.1 % of the workforce. The other business services (NACE Groups 74.6 to 74.8), presented in Subchapter 25.6, together contributed 18.8 % of business services value added. However, in employment terms, this subsector was the largest, providing employment for 31.0 % of the business services workforce. Looking at the employment and value added contributions of each subsector, by both of these measures advertising (NACE Group 74.4) was the smallest subsector. Personnel services (NACE Group 74.5) made a considerably greater contribution in employment rather than in value added terms, unsurprising given that one part of this activity involves providing workers through employment agencies.

In value added terms, the United Kingdom was by far the largest contributor to the EU-27's business services sector in 2006, and in fact was the largest contributor to each and every one of the subsectors presented in Subchapters 25.1 to 25.6. With EUR 203.5 billion of value added in the business services sector in 2006 the United Kingdom generated 27.0 % of the EU-27's business services value added, and also 22.5 % of all value added in the non-financial business economy in the United Kingdom, making it also the most specialised Member State in business services. Germany

Map 25.1:: Business services (NACE Divisions 72 and 74)
Persons employed in business services (NACE Divisions 72 and 74) as a proportion of those employed in the non-financial business economy (NACE Sections C to I and K) (%)

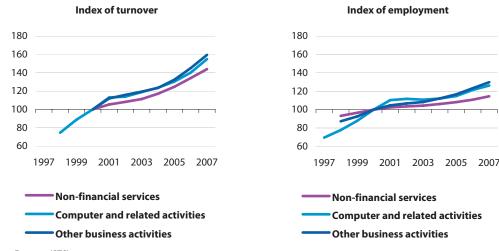

contributed 17.4 % of the EU-27's value added and employment in business services, making it the second largest Member State according to both of these measures. France, Italy and Spain were the only other Member States that recorded more than EUR 50 billion of value added in 2006 in this sector as well as workforces in excess of 2 million persons.

The regional specialisation in business services is shown in the map which is based on the non-financial business economy employment share of this sector. The region with the highest specialisation in business services in 2006 was Inner London where more than two fifths (43.2 %) of non-financial business economy employment was within this sector. As well as parts of the United Kingdom, several other countries had many regions specialised in these services, notably in the Netherlands and Germany. In a number of countries one region was particularly specialised in

these services, typically around the capital city. The regions least specialised in business services (in employment terms) were mainly in Slovakia, Romania and Greece, along with Åland (Finland) and Ciudad Autónoma de Ceuta (Spain).

Data availability for the development of business services based on annual short-term statistics starts in 1998 for computer and related activities and 2000 for other business activities, with the turnover index recording uninterrupted year on year growth (in current prices) for both of these activities. Combined, their growth rate exceeded the average for non-financial services (NACE Sections G to I and Divisions 72 and 74) every year except for 2004. Both of these activities recorded double digit annual growth in 2001, and also in the latest year available, 2007. Between 2000 and 2007, other business activities averaged growth of 6.9 % per annum, and computer and related activities averaged 6.5 % per annum: for

^{(1) 1} to 9 persons employed and 50 to 249 persons employed, 2005.

comparison the non-financial services average was 5.3 %. The employment index also followed an upward development. Business services as a whole averaged growth of 4.6 % per annum between 1998 and 2007, double the non-financial services average. Employment growth for computer and related activities averaged 5.5 % per annum, despite a fall of 0.8 % in 2003. This one negative rate of change and the relatively low growth of 1.1 % in 2004 were the only years where the rate of change in the employment index for computer and related activities was below the average rate for non-financial services. In contrast, the growth in the employment index for other business activities outstripped the non-financial services average each and every year from 1999 to 2007.

In 2006, a size class breakdown of the EU-27's business services value added showed that large enterprises (with more than 250 persons employed) generated about one third (33.4 %) of the total, a somewhat lower share than the non-financial business economy average (42.1 %). However, micro enterprises (with less than 10 persons employed) brought some 29.1 % of value added to the sector in 2006, around 8 percentage points above the non-financial business economy average in 2005. A more detailed analysis, comparing computer and related activities with other business activities, shows that these activities had quite different size structures. Large enterprises played a greater role in computer and related activities, providing 44.6 % of value added in 2006, slightly above the non-financial business economy average. In contrast, in other business activities, large enterprises generated just three tenths (30.5 %) of value added, while micro enterprises dominated in this activity with a 32.1 % share of value added in 2006, far higher than the equivalent 21.0 % (in 2005) for the non-financial business economy. However, an analysis based on employment gives a different picture. Large enterprises classified to the business services sector employed over one third of the sector's workforce, slightly above the non-financial business economy average. In total 7.9 million persons worked for large enterprises in the EU-27's business services sector in 2006, nearly one in five (18.6 %) of all persons working for large enterprises in the non-financial business economy. This high incidence of employment in large enterprises was due in large part to the importance of labour intensive activities among several of the other business activities, for example industrial cleaning and personnel services.

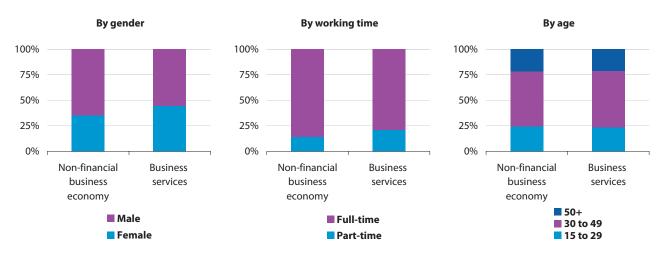

Employment characteristics

According to Labour Force Survey data, male employment represented 55.3 % of the total number of persons employed in the EU-27's business services sector in 2007; a share that was 9.6 percentage points lower than that for the non-financial business economy as a whole, but in line with the non-financial services (NACE Sections C to I and K) average. However, among the two NACE divisions that compose the business services sector, male employment was considerably higher (77.3 %) for computer and related activities, but much lower (51.0 %) for other business activities. The share of the workforce that was male was as low as 39.8 % for other business activities in Cyprus, and was below 50 % in around half of the Member States. In contrast, in computer and related activities, the lowest share of male employment was 67.8 % in Luxembourg, and this share reached as high as 84.8 % in the Netherlands.

Close to four fifths (78.8 %) of those employed in the EU-27's business services sector worked on a full-time basis, again very similar to the non-financial services average. Once more this average disguised very different characteristics between the two NACE divisions that compose the sector: nine tenths (90.5 %) of the computer and related activities' workforce worked full-time, compared with three quarters (76.4 %) for other business activities.

The age structure of the EU-27's business services workforce was quite similar to that of the non-financial business economy as a whole in 2007, although the proportions of young persons (aged less than 30) and older persons (aged 50 or more) were both somewhat lower in business services, balanced by a slightly higher proportion of those aged between 30 and 49. In the computer and related activities' workforce this age class was significantly more represented, 61.4 % compared with 53.7 % on average in the non-financial business economy, while the proportion of older persons (12.8 %) was considerably below the non-financial business economy (21.9 %) average.

Figure 25.3: Business services (NACE Divisions 72 and 74) Employment characteristics, 2007

Expenditure, productivity and profitability

Gross tangible investment by the EU-27's business services sector was valued at EUR 66.6 billion in 2006, around 6.4 % of all investment in the non-financial business economy. Professional business services accounted for two fifths (40.9 %) of this total, and computer and related activities a further one fifth (20.1 %). Overall the business services sector recorded an investment rate (investment as a percentage of value added) of 7.5 % in the EU-27, less than half the non-financial business economy

average. The EU-27 recorded investment rates for most of the subsectors within a narrow range, from 6.8 % for advertising to 9.7 % for professional business services: the one exception was personnel services that had a very low investment rate, just 1.2 %, that was in fact the lowest investment rate of all NACE groups within the EU-27's non-financial business economy in 2005 or 2006. A very low investment rate was recorded for business services in Luxembourg (1.5 %), while none of the Member States (2) recorded an investment rate higher in business services than in the non-financial business economy as a whole.

Figure 25.5: Business services (NACE Divisions 72 and 74) Labour output and costs, EU-27, 2006 (EUR thousand per capita)

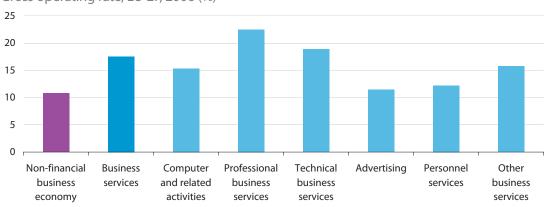

An analysis of operating expenditure for the EU-27's business services sector shows that close to two fifths (39.5 %) was dedicated to personnel costs in 2006, around two and a half times the average share within the non-financial business economy. This share was particularly high for the personnel services subsector, where the share reached 72.6 %, while the lowest share was 17.1 % for advertising. Average personnel costs were EUR 31.1 thousand per employee for business services in the EU-27 in 2006, but this average varied greatly between the subsectors. The lowest average was EUR 19.3 thousand per employee for other business services, while for personnel services the average was only slightly higher,

EUR 21.6 thousand per employee. All other subsectors recorded average personnel costs above the non-financial business economy average, reaching their highest level at EUR 51.1 thousand per employee for computer and related activities. A similar pattern could be seen for apparent labour productivity with the same two subsectors recording the lowest averages and all other subsectors above the non-financial business economy average with computer and related activities at the top of the ranking. However, the overall average for the business services sector was EUR 40.2 thousand of value added per person employed, below the non-financial business economy average of EUR 43.5 thousand per person employed.

The combination of below average apparent labour productivity and above average personnel costs per employee led to a wage adjusted labour productivity ratio of 129.4 % for the EU-27's business services sector in 2006, some 21.8 percentage points below the non-financial business economy average. In fact none of the subsectors recorded a wage adjusted labour productivity ratio above the non-financial business economy in 2006, the highest being 141.5 % for advertising, and the lowest being 117.5 % for personnel services and

118.2 % for technical services. Despite these low ratios, the business services sector recorded a relatively high gross operating rate (ratio of gross operating surplus to turnover) of 17.6 % in 2006, significantly higher than the non-financial business economy average of 10.8 %. Furthermore, all of the subsectors recorded a rate above the non-financial business economy average, ranging from 11.5 % for advertising and 12.2 % for personnel services, up to 22.5 % for professional business services.

Figure 25.6: Business services (NACE Divisions 72 and 74) Gross operating rate, EU-27, 2006 (%)

Source: Eurostat (SBS)

25.1: Computer and information services

Computer and related activities (NACE Division 72) include consultancy activities for hardware or software, data processing activities, database activities and the maintenance and repair of office and information technology machinery. Note that although this subchapter includes the repair of computers it does not cover their actual manufacture (NACE Class 30.02), nor their wholesaling, retailing, or renting (NACE Classes 51.84, 52.48 and 71.33).

Computer and related activities are at the forefront of the information society along with telecommunications – see Subchapter 22.4. Computer and related activities have one of the highest levels of expenditure on research and development among services. An average from the 22 Member States for which data are available ⁽³⁾ shows a 5.5 % share for computer and related activities, a substantial share bearing in mind that manufacturing activities account for 78.5 % of the total.

It is quite common for enterprises to outsource their requirements for hardware, software and data processing services to specialist providers. The ability of such services to be traded across borders has been assisted by improved telecommunications.

Structural profile

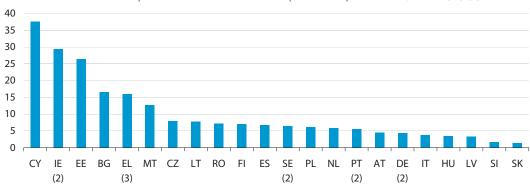

The EU-27's computer and related activities (NACE Division 72) sector generated EUR 180.4 billion of value added from EUR 369.8 billion of turnover in 2006, therefore contributing around one fifth of business services (NACE Divisions 72 and 74) output. The computer and related activities workforce comprised 2.8 million persons, one eighth (12.6 %) of the business services total, working in just over half a million enterprises.

An analysis of the breakdown of turnover in computer and related activities is available for a subset of Member States (4), based on the data from a development project compiled on a voluntary basis. The results show that software consultancy

Source: Eurostat (Statistics on research and development)

and supply (NACE Group 72.2) generated the largest share (68 %) of the sector's turnover, followed by data processing services (NACE Group 72.3, 13 %).

The United Kingdom had by far the largest computer and related activities sector within the EU-27 in 2006, providing about three tenths of the EU-27's value added and one fifth of the employment total. By the same two measures Germany had the next largest computer and related activities workforce, significantly smaller than in the United Kingdom. Given its extremely high share of EU-27 value added in 2006, the United Kingdom was the most specialised Member State (5) within computer and related activities, as this sector contributed 4.9 % of non-financial business economy (NACE Sections C to I and K) value added in the United Kingdom. The next most specialised Member States included Ireland and the three Nordic Member States, which all generated at least 3.5 % of their non-financial business economy value added in this sector. By the same measure the least specialised Member States in computer and related activities were Cyprus and Bulgaria (both 2005), Greece and the Baltic Member States that all generated 1.5 % or less of their non-financial business economy value added in this sector.

Expenditure and productivity

Apparent labour productivity in the EU-27's computer and related activities sector was EUR 64.7 thousand per person employed in 2006 and average personnel costs were EUR 51.1 thousand per employee, the highest levels for both of these indicators among the business services subsectors presented in Subchapters 25.1 to 25.6. In several other respects the EU-27's computer and related activities sector was typical of business services, with a wage adjusted labour productivity ratio

(126.5 %) and share of personnel costs in operating expenditure (39.0 %) both just below the business services averages.

Computer and related activities accounted for one fifth of gross tangible investment in EU-27 business services in 2006, valued at EUR 13.4 billion. The resulting investment rate was 7.4 %, typical for a business services activity, and as such around two fifths of the non-financial business economy average.

25.2: Professional business services

This subchapter extends across a variety of professional activities that include legal services, accounting, book-keeping, auditing, tax consultancy, market research, public opinion polling, business and management consultancy services, as well as management activities relating to holding companies. These are all classified within NACE Group 74.1, and in this publication are referred to as professional business services.

Legal services cover the activities of advocates, barristers, solicitors, notaries, registered lawyers and legal consultants. Enterprises in this sector are generally small, and a common legal form is that of partnerships. Another characteristic of these activities is that they are used by households, for instance when they need an accountant, a lawyer, a notary or a tax adviser.

Structural profile

The 1.6 million enterprises active in the EU-27's professional business services sector (NACE Group 74.1) employed 5.1 million persons in 2006. As such this sector accounted for more than one third (36.7 %) of all enterprises in the business services (NACE Divisions 72 and 74) population in 2006, and provided employment for just under one quarter (23.1 %) of the business services workforce. Paid employees accounted for a relatively low proportion (75.7 %) of the EU-27's professional services workforce, indicating a large proportion of working proprietors and unpaid family workers: the average proportion of paid employees for all business services was 84.5 %.

This sector's contribution to business services was greater when measured in output rather than employment terms: professional business services generated EUR 525.2 billion of turnover and EUR 279.2 billion of value added in 2006, accounting for 29.8 % of the business services turnover and 31.3 % of its value added. Professional business services had therefore the largest turnover and value added among the business services activities covered in Subchapters 25.1 to 25.6.

Source: Eurostat (SBS)

The United Kingdom generated more than one quarter (27.0 %) of the EU-27's value added in this sector in 2006, the largest contribution among the Member States, followed by France and Germany that each contributed between 17 % and 18 %. Along with Italy, the only other Member State with a double digit share of EU-27 value added, the four largest Member States dominated this sector, collectively accounting for 72.1 % of EU-27 value added; for comparison, their share within business services was 70.6 % and within the non-financial business economy (NACE Sections C to I and K) as a whole it was 64.6 %. These four Member States were also the largest employers in the sector. This activity was also particularly important in Belgium and Luxembourg: indeed, the professional business services sector accounted for 9.2 % of non-financial business economy value added in Luxembourg, some way ahead of the 7.0 % share in the United Kingdom and the 6.6 % share in Belgium.

A product analysis

Data are available for a limited set of countries to allow a product analysis for three of the five NACE classes covered by the professional business services sector. Legal advisory and representation services accounted for the highest proportion of turnover in all of the countries concerning the legal activities subsector, except in Latvia, Lithuania and Malta. For enterprises in accounting, book-keeping, auditing and tax consultancy activities, four fifths of turnover was derived from the main products associated with these activities, with a further 13 % derived from business and management consultancy. The turnover derived by those enterprises operating within business and management consultancy activities was spread across a wide range of products, with just over three fifths of turnover derived from the main business and management consultancy services.

Expenditure and productivity

The EU-27's professional business services sector invested around EUR 27.2 billion in 2006, approximately two fifths (40.9 %) of the business services total, a greater share than this sector contributed in value added terms. Consequently this sector recorded an above average investment rate, 9.7 % compared with the business services average of 7.5 %. As for computer and related activities, professional business services also reported above average apparent labour productivity (EUR 54.5 thousand per person employed)

and average personnel costs (EUR 41.5 thousand per employee), in both cases the second highest among the business services activities presented in Subchapters 25.1 to 25.6. The wage adjusted labour productivity ratio that resulted from the combination of these two indicators was 131.4 %, marginally above the business services average. Among the Member States ⁽⁶⁾ only the Hungarian professional business services sector had a wage adjusted labour productivity ratio below 100 % in 2006, meaning that apparent labour productivity was lower than average personnel costs.

25.3: Technical business services

Architectural and engineering activities covered by NACE Group 74.2 include architectural consulting activities (such as building design and drafting, supervision of construction, town and city planning, and landscape architecture) and various engineering and technical activities related to construction, as well as geological and prospecting activities, weather forecasting activities and geodetic surveying. Technical testing and analysis activities (NACE Group 74.3) include environmental measuring, testing of food hygiene, buildings and equipment, as well as the periodic testing of vehicles for roadworthiness. In this publication these activities are referred to as technical business services

The ten largest architectural enterprises (groups) in the EU are presented, based on information compiled by the Swedish Federation of Consulting Engineers and Architects (STD). As can be seen, the United Kingdom dominated this activity in 2007, as the six largest groups were British. However, even the largest groups were relatively small, with only the two largest having 1 000 or more employees.

Structural profile

Some EUR 129.6 billion of added value was generated in 2006 by the EU-27's technical business services sector (NACE Groups 74.2 and 74.3), from a turnover of EUR 269.6 billion. This

corresponded to 15.3 % of the total turnover for business services (NACE Divisions 72 and 74) and 14.5 % of the value added. There were 2.7 million persons employed across the 926.3 thousand enterprises that were active in this sector, equivalent to 12.4 % of the EU-27's business services' workforce and more than one fifth (21.2 %) of the business services' enterprise population. Among the persons employed in this sector, 71.8 % were paid employees, the lowest level of this share among the business services sectors presented in Subchapters 25.1 to 25.6, indicating a high incidence of working proprietors and unpaid family workers.

The United Kingdom contributed the greatest share (23.4 %) of value added in the EU-27's technical business services sector, the second largest contribution being recorded by Germany (17.4 %). However, Germany had a larger workforce in this sector than the United Kingdom. In value added terms, the United Kingdom, Sweden and France were the most specialised Member States in these activities in 2006, as this sector contributed between 2.7 % and 2.8 % to national non-financial business economy (NACE Sections C to I and K) value added. Bulgaria (2005) was the least specialised in this activity, generating just 1.0 % of its non-financial business economy value added in technical business services, with Poland, Cyprus (both 2005), Slovakia, Portugal and Latvia also recording shares below 1.5 %.

Expenditure and productivity

The share of personnel costs in operating expenditure was 35.0 % for the EU-27's technical services sector in 2006, 4.5 percentage points below the business services average, but nevertheless far above the non-financial business economy average (16.1 %). Average personnel costs were relatively high, EUR 40.0 thousand per employee, while apparent labour productivity was EUR 47.2 thousand of value added per person employed, also above the business services average. The resulting wage adjusted labour productivity ratio

was low, 118.2 %, reflecting the high average personnel costs. This was the second lowest ratio among the business services activities presented in Subchapters 25.1 to 25.6. Italy and Belgium both recorded ratios below parity (100 %) indicating that average personnel costs were higher than apparent labour productivity (7). Only in Greece was the wage adjusted labour productivity ratio for the technical business services sector above the national average for the non-financial business economy.

(7) Cyprus and Poland, 2005; Ireland, Malta and the Netherlands, not available.

25.4: Advertising

Advertising is covered by NACE Group 74.4 which includes the creation and placing of outdoor advertising, the sale of advertisement time and space, and the distribution or delivery of advertising material, as well as direct marketing, sponsorship and sales promotion services. Note that advertising enterprises buying and reselling sales time or space tend to have a relatively high level of turnover (and therefore a relatively low gross operating rate), while purchases of goods and services tend to be high relative to personnel costs, reflecting the distributive nature of this part of their activity.

Advertising and direct marketing are among the activities for which expenditures tend to rapidly decrease when the economic climate is not favourable. Nonetheless, when an upturn is foreseen, expenditure on these services tends to increase faster than the economy in general. This

sector was affected by the slowdown observed in the EU's economy in 2001 and 2002, and again by the recession that started in the second half of 2008.

Advertising and direct marketing enterprises engage in services aimed at promoting goods, services and information, be it to the general public, specific target groups, or other enterprises. Advertising maintains or raises awareness about an issue, event, person, product or brand, and so can support choice and competition.

Structural profile

The 210.1 thousand enterprises that were classified to advertising activities (NACE Group 74.4) in the EU-27 in 2006 employed an estimated 882.0 thousand persons and generated EUR 38.6 billion of value added. By all of these measures the contribution of advertising to the business services (NACE Divisions 72 and 74) total was between 4.0 % and 4.8 %. In turnover terms, however,

⁽²⁾ Malta and the Netherlands, not available; Bulgaria, Cyprus, Poland and Romania, 2005.

Source: Eurostat (SBS)

advertising made a greater contribution to business services: its EUR 144.4 billion of turnover in 2006 was equivalent to 8.2 % of the business services total. This high turnover reflected the fact that some parts of advertising involve buying and reselling advertising space, effectively a distributive trade activity, which therefore involves high turnover with relatively low margins.

The United Kingdom and Germany were the two largest contributors to the EU-27's value added in advertising activities in 2006, both contributing just under one fifth of the total. The contribution of France (18.2 %) was only slightly lower, but was itself nearly twice as high as the next highest share, from Spain. Nevertheless, in employment terms, Germany, France and Spain all had larger workforces in the advertising sector than were recorded in the United Kingdom. Few Member States (8) were strongly specialised in this sector, with Sweden, France and Latvia recording the highest shares (0.9 %) of advertising activities in non-financial business economy value added. Using this measure, the least specialised Member State was Luxembourg, with advertising generating 0.3 % of non-financial business economy value added.

Expenditure and productivity

A large share of operating expenditure within EU-27 advertising activities was accounted for by purchases of goods and services, as the share of personnel costs was just 17.1 %, the lowest of all of the business services sectors presented in Subchapters 25.1 to 25.6. Nevertheless the share of personnel costs was slightly higher than the average for the non-financial business economy (16.1 %). Tangible investment by the advertising sector was low, EUR 2.6 billion in 2006, resulting in an investment rate of 6.8 %.

Average personnel costs for the advertising sector were EUR 30.9 thousand per employee, almost exactly the same as the business services average, while the apparent labour productivity was EUR 43.7 thousand per person employed, some EUR 3.6 thousand per person above the business services average. As a result the advertising sector had the highest wage adjusted labour productivity ratio of all business services sectors, at 141.5 %, although this was still 9.6 percentage points below the non-financial business economy average.

 $^{(2) \} Malta\ and\ the\ Netherlands,\ not\ available;\ Bulgaria,\ Cyprus,\ Poland\ and\ Romania,\ 2005.$

⁽⁸⁾ Bulgaria, Cyprus, Poland and Romania, 2005; Malta and the Netherlands, not available.

25.5: Personnel services

The activities covered in this subchapter include personnel search, selection referral, head-hunting and job placement services; these activities are included in NACE Group 74.5. Personnel services may be supplied to persons looking for work or to an enterprise trying to hire. The data presented also cover labour-contracting activities (for example, temporary work agencies); however, they do not comprise farm labouring or the performing arts.

Personnel services have grown mainly as a consequence of the outsourcing trend, using the flexibility and expertise provided by enterprises in this sector (for example, knowledge of the employment market and selection procedures) instead of trying to employ personnel directly.

On 27 June 2007, the European Commission proposed in a Communication the establishment of eight common principles of flexicurity (9), a policy approach that gains growing importance as an instrument that combines labour market flexibility with employment security and the need to respect workers rights and working conditions. This policy is a response to the challenges posed by globalisation, with the aim of making EU labour markets more flexible while providing employment security at the same time. In this framework, enterprises acting in personnel services are directly concerned.

Structural profile

The EU-27's personnel services sector (NACE Group 74.5) generated EUR 96.2 billion of value added in 2006 from EUR 127.9 billion of turnover.

equivalent to 10.8 % of the wealth that was created in the business services (NACE Divisions 72 and 74) sector and 7.3 % of the turnover. In turnover terms this was the smallest of the business services activities presented in Subchapters 25.1 to 25.6, and it was the second smallest in value added terms. However it was with respect to employment that the 71.1 thousand enterprises in the personnel services sector made their greatest contribution: the personnel services workforce consisted of 3.8 million persons, equivalent to 17.1 % of the business services total, making it the third largest workforce within business services. The significant differences in the contribution of personnel services to the business services total depending on the indicator studied can be largely explained by the nature of a much of this sector, namely, to employ people to undertake work for clients in other sectors.

Among the Member States, close to one third of the EU-27's value added came from the United Kingdom (32.1 %), the largest market for personnel services, as well as the largest employer. France and Germany were respectively the second and third largest contributors, both in terms of value added or employment. These three Member States dominated this sector, collectively accounting for 69.7 % of EU-27 value added; for comparison, their share within business services was 61.2 % and within the non-financial business economy as a whole it was 53.5 %. The Netherlands was the fourth largest Member State in personnel services, ahead of both Italy and Spain. In particular, the size of the Dutch workforce was remarkable, with over half a million persons employed in personnel services. In value added terms the United Kingdom and France were the

most specialised ⁽¹⁰⁾ in this sector, both registering 2.9 % of their non-financial business economy (NACE Sections C to I and K) value added in this sector. Cyprus, Bulgaria (both 2005), Greece, Latvia and Lithuania were the least specialised in this sector, all generating 0.2 % or less of their non-financial business economy value added in personnel services.

Product analysis and type of personnel

A breakdown of turnover by product for the personnel services sector shows that in 2005 supply services of personnel generated the largest share of turnover in most of the Member States for which data are available, as compared with placement services. Only in Latvia and Lithuania did the placement services of personnel (such as executive search services) generate more than half of the total sales. It should be borne in mind that turnover for placement services tends to correspond to a fee for the placement, whereas the turnover for the supply of personnel involves both a fee for arranging the supply as well as the payments made to the personnel supplied.

Expenditure and productivity

In several respects concerning expenditure and productivity the EU-27's personnel services sector is atypical for business services. This sector recorded by far the lowest investment rate, just 1.2 % in 2006, from investments valued at EUR 1.2 billion. This was not only the lowest rate within business services, but it was also the

lowest investment rate of all NACE groups within the non-financial business economy in 2005 or 2006. In contrast, expenditure on personnel costs was high, as these costs accounted for 72.6 % of all operating expenditure in this sector; this was 1.8 times as high as the average share in business services and 4.5 times as high as the average share for the non-financial business economy, and unsurprisingly was the highest share for all NACE groups within the non-financial business economy in 2005 or 2006.

Apparent labour productivity and average personnel costs were both lower in the EU-27's personnel services sector than respective averages for business services in 2006. Indeed, apparent labour productivity was EUR 25.4 thousand per person employed for personnel services (EUR 40.2 thousand for the business services) and average personnel costs were EUR 21.6 thousand per employee (EUR 31.1 thousand for business services), and in both cases these were the second lowest levels among the business services sectors. It should be noted that these ratios are to some extent influenced by the high incidence of part-time and temporary work in the personnel services sector, as both of these measures are based on simple head counts of persons employed or employees. These characteristics of the personnel services' workforce do not affect the wage adjusted labour productivity ratio as much, but nevertheless this ratio was just 117.5 % for personnel services in 2006, the lowest ratio among all of the business services sectors.

25.6: Other business services

The business services covered here include security services, such as the transport of valuables and security guard/watchman activities (NACE Group 74.6), industrial cleaning, including interior and exterior cleaning of buildings of all types as well as cleaning of public means of transport (NACE Group 74.7), and miscellaneous business activities (NACE Group 74.8) which includes professional business services such as photographic, secretarial and translation activities, and operational business services such as packaging services.

Structural profile

The other business services sector (NACE Groups 74.6 to 74.8) created EUR 168.1 billion of value added in the EU-27 in 2006 from total turnover of EUR 326.4 billion. These values represented 18.8 % of the business services (NACE Divisions 72 and 74) value added and 18.5 % of its turnover. This output was generated by just over 1.0 million enterprises employing 6.9 million persons, approximately one quarter (23.1 %) and three

tenths (31.0 %) of the business services totals respectively. Among the three subsectors (NACE groups) covered by the other business services sector, miscellaneous business activities (NACE Group 74.8) was the largest in turnover and value added terms accounting for more than half or the sectoral total. However, industrial cleaning (NACE Group 74.7) had the largest workforce of the three subsectors covered, employing 3.1 million persons.

More than one quarter of the EU-27's value added in the other business services sector came from the United Kingdom (25.9 %), which was also the second most specialised Member State in terms of this sector's share of non-financial business economy (NACE Sections C to I and K) value added after Luxembourg. Germany had the largest workforce in other business services. At a more detailed level, the United Kingdom was the largest Member State (in value added terms) in two of the subsectors, but was only fourth largest in industrial cleaning, where Germany, France and Italy were larger.

Table 25.15: Other business services (NACE Groups 74.6, 74.7 and 74.8) Structural profile, EU-27, 2006

Expenditure and productivity

An analysis of expenditure and productivity within the EU-27's other business services sector shows very different situations between the investigation and security activities and industrial cleaning subsectors on one hand, and the miscellaneous business activities subsector on the other hand. Investment by the EU-27's miscellaneous business activities subsector was valued at EUR 9.1 billion in 2006, leading to an investment rate of 9.6 %, far above the 3.5 % rate for investigation and security activities and 3.7 % rate for industrial cleaning.

An analysis of operating expenditure showed an equally remarkable difference, with personnel costs accounting for 67.0 % of operating expenditure for the investigation and security activities subsector and the industrial cleaning subsector, while these costs represented less than half this share, just 29.7 %, for the miscellaneous business activities subsector.

The EU-27's miscellaneous business activities subsector recorded the highest apparent labour productivity and average personnel costs of the three subsectors in 2006, as well as the highest wage adjusted labour productivity ratio (132.4 %). The apparent labour productivity ratio and the average personnel costs for the industrial cleaning subsector were particularly low, respectively the second and fourth lowest levels of these two ratios among all NACE groups within the nonfinancial business economy in 2005 or 2006, reflecting the high incidence of part-time work in this subsector. The wage adjusted labour productivity ratio is less influenced by the incidence of part-time work, and this ratio was 112.4 % for industrial cleaning and 113.0 % for investigation and security activities, both among the five lowest ratios within the non-financial business economy NACE groups in 2005 or 2006.
