

Annual Net Earnings in Manufacturing 1996 - 2002

Anne Paternoster

This article presents comparative figures on average annual net earnings in Manufacturing (Section D of NACE Rev.1) for Member States (MS), Acceding and Candidate Countries (ACC), EFTA Countries and the United States. In the remaining text "net earnings" stands for "average annual net earnings".

Net earnings represent that part of remuneration that employees can actually spend. Compared with gross earnings, net earnings do not include social security contributions and taxes but include family allowances. Net earnings depend on the family situation. The data presented here focus on four family cases with average salaries: 'a single person without children', 'a two-income married couple without children', 'a two-income married couple with two children' and 'a one-income married couple with two children'.

Detailed methodological information on net earnings and the list of countries included in the analysis are presented in the Methodological Notes.

Average annual net earnings in Manufacturing vary across the countries

Figure 1: Average annual net earnings in Manufacturing for 'a single person without children' for selected countries, euro, 1996-2002

Figure 1 shows differences between countries in the level of net earnings of 'a single person without children' in Manufacturing and their development over time. The figure presents the two, three or four EFTA countries with the lowest and highest net earnings in the MS, the ACC, the EFTA countries, and in the US.

Statistics in focus

POPULATION AND SOCIAL CONDITIONS

THEME 3 – 4/2004

Contents

Average annual net earnings in Manufacturing vary across the countries 1

Gross earnings differ more among countries than net earnings 3

In 2002 net earnings represent between 57% and 93% of gross earnings for 'a single person without children' 4

Considerable differences between countries in employee's and employers' social security contributions ... 5

Among the MS, Portugal followed by Greece and Spain have the lowest levels of net earnings over the whole period. The MS with the highest level of net earnings are Luxembourg and the United Kingdom. Among the ACC, Estonia, Latvia, Lithuania and Bulgaria have the lowest, Malta and Cyprus the highest level of net earnings. All ACC have lower levels of net earnings than the MS except for Malta where the net earnings are above those of Greece and Portugal, and Cyprus where the net earnings are also above those of Spain. Switzerland, Norway and the US generally have higher levels of net earnings expressed in euro than most MS.

The average annual increase in net earnings varies for the MS for the years available from 1.1% in Austria to 8.8% in Ireland and for the ACC from 3.6% in Cyprus to

14.6 % in Lithuania.

Analysing time series in Purchasing Power Standards (PPS) removes the effect of price level differences. Tables 1 and 2 present net earnings for all countries in 1996 and 2002 in euro and PPS. When comparing net earnings over the years they usually increase in euro as well as in PPS. But the annual increase in PPS is generally much lower than the annual increase in euro. Examples include the United Kingdom, with an 8.7% annual increase in euro but only a 3.3% annual increase in PPS, and Lithuania (14% vs. 7%). In the US we see an opposite result, an average annual decrease in euro of 2%, due to the exchange rate effect, and an annual increase in PPS of 4%.

Table 2: Net earnings of employees in Manufacturing, PPS, 1996 and 2002

Gross earnings differ more among countries than net earnings

Compared to net earnings, gross earnings include taxes and social security contributions but no family allowances. All figures in this section relate to the year 2002.

In the MS, gross earnings of 'a single person without children' in Manufacturing ranged from 41 088 euro in Denmark to 8 325 euro in Portugal, corresponding to a ratio of 5 to 1. In terms of net earnings, this ratio is 3.5 to 1 (24 446 euro in Luxembourg, 6 956 euro in Portugal), i.e. clearly smaller. It goes down even further when expressed in PPS, the ratio between the highest and lowest net earnings becoming 2.5 to 1.

In the ACC, gross earnings of 'a single person without children' in Manufacturing ranged from 15 223 euro in Cyprus to 1 474 euro in Bulgaria, a ratio of 12 to 1. In terms of net earnings, this ratio is 10 to 1 (14 150 euro

in Cyprus, 1 176 in Bulgaria), i.e. evidently smaller. It also goes down even further when expressed in PPS, the ratio between the highest and lowest net earnings becoming 5 to 1.

In the EFTA countries gross earnings are around the level of Denmark in Switzerland (43 783 euro) and Norway (38 875 euro); Iceland, with 26 430 euro, is close to the level of Sweden. In the US the gross earnings in 2002 amounted to 30 436 euro, which is around the same level as the Netherlands. As can be seen from Figure 1, net earnings in 2002 in Switzerland (34 389 euro) and Norway (27 684 euro) are the highest in the countries examined. With 20 624 euro net earnings in Iceland are higher than those in Sweden (18 368 euro). Net earnings in the US (23 055 euro) remain comparable with those in the Netherlands (22 052 euro).

In 2002 net earnings represent between 57% and 93% of gross earnings for 'a single person without children'

Salary deductions (taxes and social security contributions) and family allowances vary between the countries. In 2002, among the MS the lowest relative deductions for 'a single person without children' in Manufacturing are in Portugal, Greece and Ireland, the highest in Belgium, Denmark and Germany. As can be seen from Figure 2, the ratio of net to gross earnings (we use 'net/gross' in the remaining text) are about 84% and 57% respectively. In the ACC, the lowest deductions are in Cyprus and the highest in Slovenia. The net/gross ratio is respectively 93% and 67%. In the EFTA countries and the US the net/gross ratio is between 71% and 79%.

'A two-income married couple without children' has the highest net/gross ratio in Ireland (84%) and Portugal (83%) in the MS, and in Cyprus (93%) among the ACC, whereas the lowest net/gross ratio is in Belgium, Denmark and Germany (57%) and in Slovenia (67%). In the EFTA countries and the US the net/gross ratio varies between 71% and 78%.

In the case of 'a two-income married couple with two children', the net/gross ratio was highest in Luxembourg with 91%, followed by Portugal and Ireland with 88%. In the ACC the highest net/gross ratios are found in Cyprus (93%), Slovakia (87%) and Bulgaria (85%).

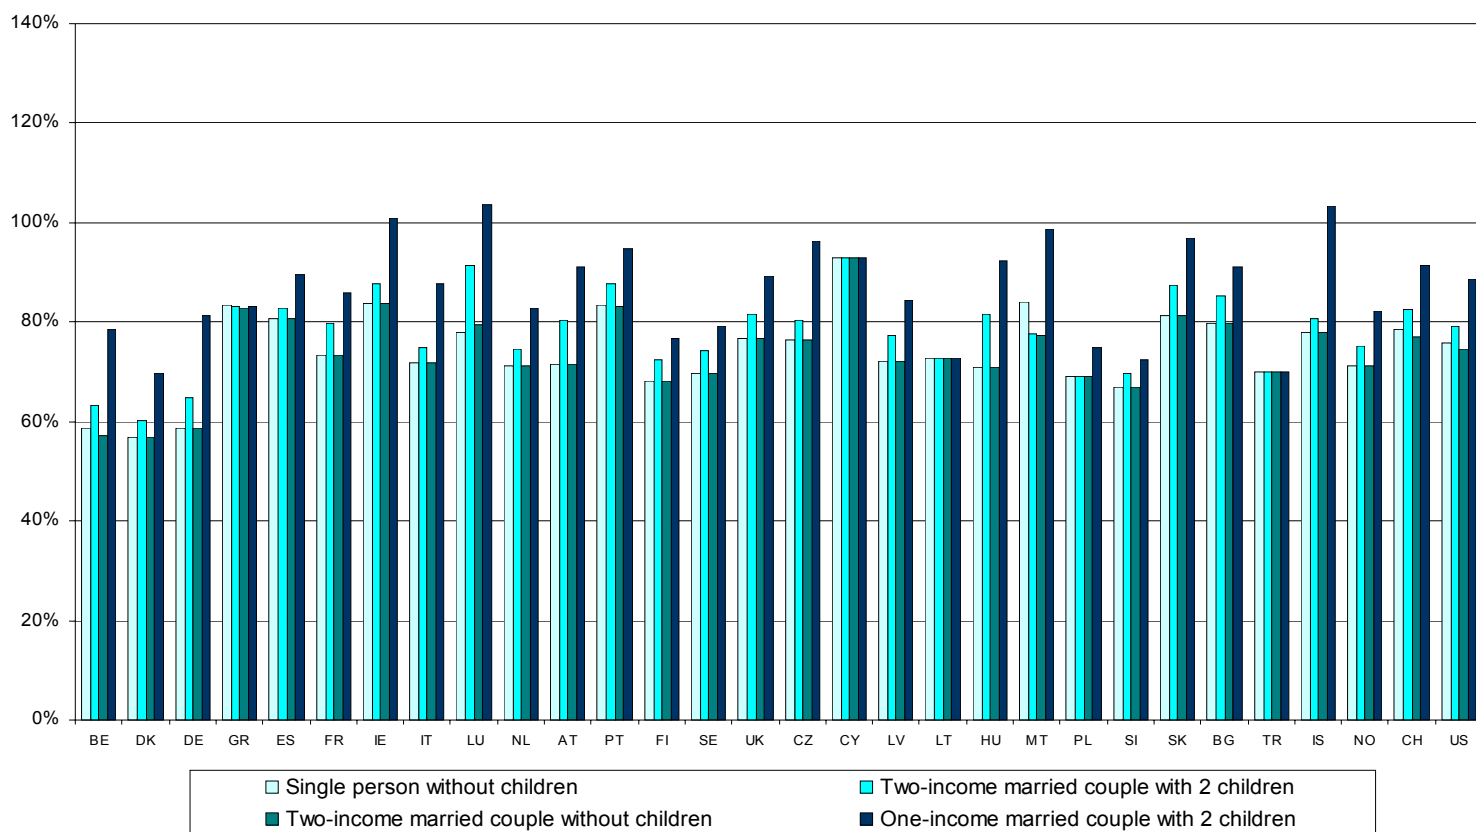

Figure 2: Net earnings as a percentage of gross earnings in Manufacturing, 2002

The smallest gap between gross and net earnings among the family cases considered is for 'a one-income married couple with two children'. Among the MS the net earnings for this type of family exceed the gross earnings in Luxembourg (104%) and Ireland (101%) as family allowances and/or tax relief more than compensate salary deductions. Among the ACC the net earnings are almost equal to the gross earnings in some countries with the highest ratio of 99% in Malta and Slovakia.

Family allowances can make up an important part of net earnings, the highest proportions being found in Austria (20%) and Luxembourg (17%) in the MS, Czech Republic (15%) and Slovakia (14%) in ACC. In the EFTA countries family allowances vary from 12% in Iceland to 10% in Norway and 9% in Switzerland. There are no family allowances in the US but tax relief is given related to marital status and dependant children.

In most countries the net/gross ratio is lower for 'a single person without children' and 'a two-income married couple without children' than for 'a two-income' or 'one-income married couple with two children'. There are some exceptions however: Cyprus, Lithuania, and Turkey where the ratio is equal for all four family cases,

Malta where the ratio for 'a single employee' is higher than for 'a two-income married couple with two children' and Poland where the ratio is the same for 'a single person without children' and 'a two-income married couple with two children'.

Considerable differences between countries in employee's and employers' social security contributions

The levels of income tax and social security contributions on an average salary are equal irrespective of the family cases examined here.

Figure 3 shows the proportion of taxes and social security contributions paid by a single employee.

The proportion of social security contributions paid by employees varies considerably between the countries. Ireland, Finland and Spain are the countries where in 2002 employees pay the lowest social security contributions of 5 to 6%. The highest social security contributions are paid in the Netherlands and Germany, where they amount to 21% of the gross salary, followed by Austria with 18%.

Figure 3: Distribution of gross earnings by components in Manufacturing, for 'a single person without children', 2002

Between 1996 and 2002 the proportion of social security contributions remained almost the same in most countries. However the following countries have changes of more than 5 %-points: France – a reduction from 19% to 13% between 1996 and 1998; Luxembourg

– a reduction from 33% to 21% between 1996 and 2002; Latvia – an increase from 3% to 9% between 1996 and 1997; Bulgaria and Turkey – an increase from 8% to 15 % between 1999 and 2000.

As can be seen from Figure 4, the social security contributions paid by the employer in 2002 represented 29% of total staff cost in France and 25% in Italy and Sweden, but only 1% in Denmark, 8% in the United Kingdom and 10% in Ireland and the Netherlands

Between 1996 and 2002 the proportion of social security contributions paid by the employer remained almost the same in most countries.

Figure 4: Gross earnings and employers' social security contributions as a percentage of their total in Manufacturing, for 'a single person without children', 2002

However the following countries have changes of more than 5 %-points: Italy – a reduction from 32% to 25% between 1997 and 1998; Latvia and Hungary – a reduction between 1996 and 2002 respectively from 26% to 21% and from 32% to 24%; Poland – a

reduction from 33% to 17% between 1998 and 1999; Turkey – an increase from 10% to 18% between 1999 and 2001; Netherlands - an increase from 7% to 14% between 1997 and 1998, and a reduction from 14% to 10% between 2001 and 2002.

➤ ESSENTIAL INFORMATION – METHODOLOGICAL NOTES

Data were provided on a Gentlemen's Agreement basis.

The data source is the OECD for all countries except for eight countries from which Eurostat collects data individually: Bulgaria, Cyprus, Estonia, Latvia, Lithuania, Malta, Romania and Slovenia. At the time of publication data for Romania were not available.

More details on tax levels and tax structures can be found in the OECD publication "Taxing Wages".

Net earnings are defined as follows:

Net earnings are calculated from gross earnings by deducting the employee's social security contributions and income taxes - and by adding family allowances if there are children in the family.

The average annual net earnings to be used is that for a full-time employee in Manufacturing (OECD refer to this as 'APW'). The 'APW' relates to the average for males and females combined.

A production employee is a manual employee - which corresponds to classes 7 to 9 of the occupational classification ISCO-88 (COM).

Annual gross earnings are defined as follows:

Total gross earnings paid during the reference year include overtime and regular cash supplements as well as vacation payments typically paid to employees. Apart from regularly paid bonuses, all bonuses and payments which are not paid regularly should be included (13th or 14th month payments, holiday bonuses, profit sharing, allowances for leave not taken, etc). The following should not be included: payments in kind, severance payments and profit-sharing schemes that take the form of dividend distributions.

Data are available at the national level for the following cases:

Single person without children (6 cases): 50%, 67%, 80%, 100%, 125% & 167% of the APW.

Single person with two children (1 case): 67% of the APW.

Married couple with two children (4 cases): 100%:0%; 100%:33%; 100%:67%; 100%:100% of the APW

Married couple without children (2 cases): 100%:33%; 100%:100% of the APW

In the case of married couples the first APW % refers to the male and the second APW % refers to the female. So, for example, for a married couple with two earners the « 100%: 33% » case refers to a husband who is earning 100% of the APW and a wife who is earning 33% of the APW.

Where there are children, both children are taken to be between five and twelve years of age.

Tax & social security parameters to be used:

The income tax parameters and social security contributions that apply from the beginning of the fiscal year should be used. All changes that occur after the beginning of the fiscal year are ignored.

Family allowances:

Family allowances are family cash transfers universally paid in respect of dependent children between five and twelve years of age who are attending school. If cash transfers vary within this age range, the most generous provisions are taken. The case of twins is explicitly disregarded.

Purchasing Power Parities (PPPs) and Purchasing Power Standard (PPS):

To remove the effect of differences in price levels between the countries special conversion rates called Purchasing Power Parities (PPPs) have been used. In particular, PPPs for household final consumption expenditure in each country were used to convert the net earnings expressed in national currencies to an artificial common currency called Purchasing Power Standard (PPS). The resulting net earnings effectively show the purchasing power of the average annual net earnings.

Exchange rates:

For euro-zone countries, the fixed euro exchange rates have been used for the analysis of the time series of individual countries. For cross-country comparisons and for aggregations, series expressed in euro have been used.
