Methodology

HICPs designed for international comparison

The Harmonised Indices of Consumer Prices (HICPs) are harmonised inflation figures required under the Treaty on the Functioning of the European Union. They are designed for international comparison of consumer price inflation.

The euro area annual inflation rate is used by, among others, the European Central Bank (ECB) as a main indicator for monetary policy management for the euro area.

The Member States' HICPs are supplied by the National Statistical Institutes; the euro area, EU and EEA aggregates are compiled by Eurostat. HICPs are computed as annual chain indices allowing weights to be changed each year. HICP aggregates are calculated as weighted averages of the HICPs using the weights of the countries and sub-indices concerned. The weight of a country is its share of the household final monetary consumption expenditure in the total of the country group. The euro area is treated as a single entity within the EU and EEA starting from 1999.

Euro area, EU and EEA aggregates

The euro area, EU and EEA data refer to the respective country compositions at a specific point in time. New Member States are integrated into the aggregates using a chain index formula.

The euro area was originally comprised of Belgium, Germany, Ireland, Spain, France, Italy, Luxembourg, the Netherlands, Austria, Portugal and Finland. Greece was included from January 2001, Slovenia from January 2007, Cyprus and Malta from January 2008, Slovakia from January 2009, Estonia from January 2011, Latvia from January 2014, and Lithuania from January 2015. New Member States are integrated into the aggregates using a chain index formula.

The EU had 15 Member States until April 2004, 25 Member States until December 2006, 27 Member States until June 2013 and 28 Member states from July 2013. New Member States are integrated into the aggregates using a chain index formula.

EEA inflation is computed by using HICP data for Iceland and Norway in addition to the EU Member States.

Measures of inflation

An *annual rate* measures the change of the index level between the current month and the same month of the previous year. This measure is responsive to recent changes in price levels but can be influenced by one-off effects in either month.

A *12-month average rate* overcomes this volatility by comparing average HICPs in the latest 12 months to the average of the previous 12 months. This measure is less sensitive to transient changes in prices.

Additional information

About 100 MUICP, EICP, EEAICP and HICP sub-indices and over 30 special aggregates with corresponding weights and inflation rates are available in Eurostat's database:
