	Annex D.1 - Share of estimates per transaction/sector.....	202
	Annex D.2 - List of abbreviations used.....	205

## Section A. General overview

### 1. Organisational aspects

#### 1.1. Description of the organisation and responsibilities for the compilation of non-financial ASA and related datasets

In Italy, responsibilities for annual and quarterly accounts, financial accounts and Balance of payments are shared between the National Statistical Institute (Istat) and the National Central Bank (the Bank of Italy), according to the table below.

	Istat	Bank of Italy
ANA	X	
QNA	X	
QSA for S11,S12,S14,S2	X	
ASA for S11,S12,S14,S2	X	
QSA for S.13	X	
ASA for S.13	X	
QFA		X
AFA		X
BoP		X

The relationship with the Bank of Italy is mainly managed through a “Memorandum of Understanding” that was signed in 2011 by Istat and the central bank for the cooperation in the field of research and the exchange of statistical information. It is a formal memorandum, signed by both parties. It has been recently renewed until 2020.

Through the Memorandum Istat and the Bank of Italy aim at enforcing the collaboration in the research on topics of common interest and the exchange of statistical information initiated with an old agreement signed in 1996. A Coordinating Committee, composed of three members (and three deputy members) and a secretary for each of the two Institutions, has been established to oversee the activities covered by the memorandum. Both parties are interested in ensuring that the exchange of statistical data is realized by means of advanced ICT technologies that guarantee high standards of efficiency, security and simplicity of use.

The Coordinating Committee has promoted the discussion of methodological issues of common interest or otherwise relating to the spheres of national and international statistical collaboration. It has also facilitated the activities of exchange of statistical data between the parties, promoting the synergic use of the existing sources, defining and regulating the timetable and the contents of data exchanges in specific statistical domains, including ASA.

The Coordinating Committee may set up specialized sub-committees, to which delegate specific functions and where outside experts may participate, and task forces to which outsiders may also contribute.

In Istat NA Directorate, non-financial annual sector accounts for S.11, S.12, S.14, S.15 and S.2 are compiled in in the Division “Supply side estimate of GDP- National Accounts by Institutional Sector - Regional Accounts” (DCCN/CNA)<sup>1</sup>. Annual accounts for S.13 are compiled in the Division "Compilation of government finance accounts". The synthesis of ASA and the compilation of Table 800 is performed by CNA.

---

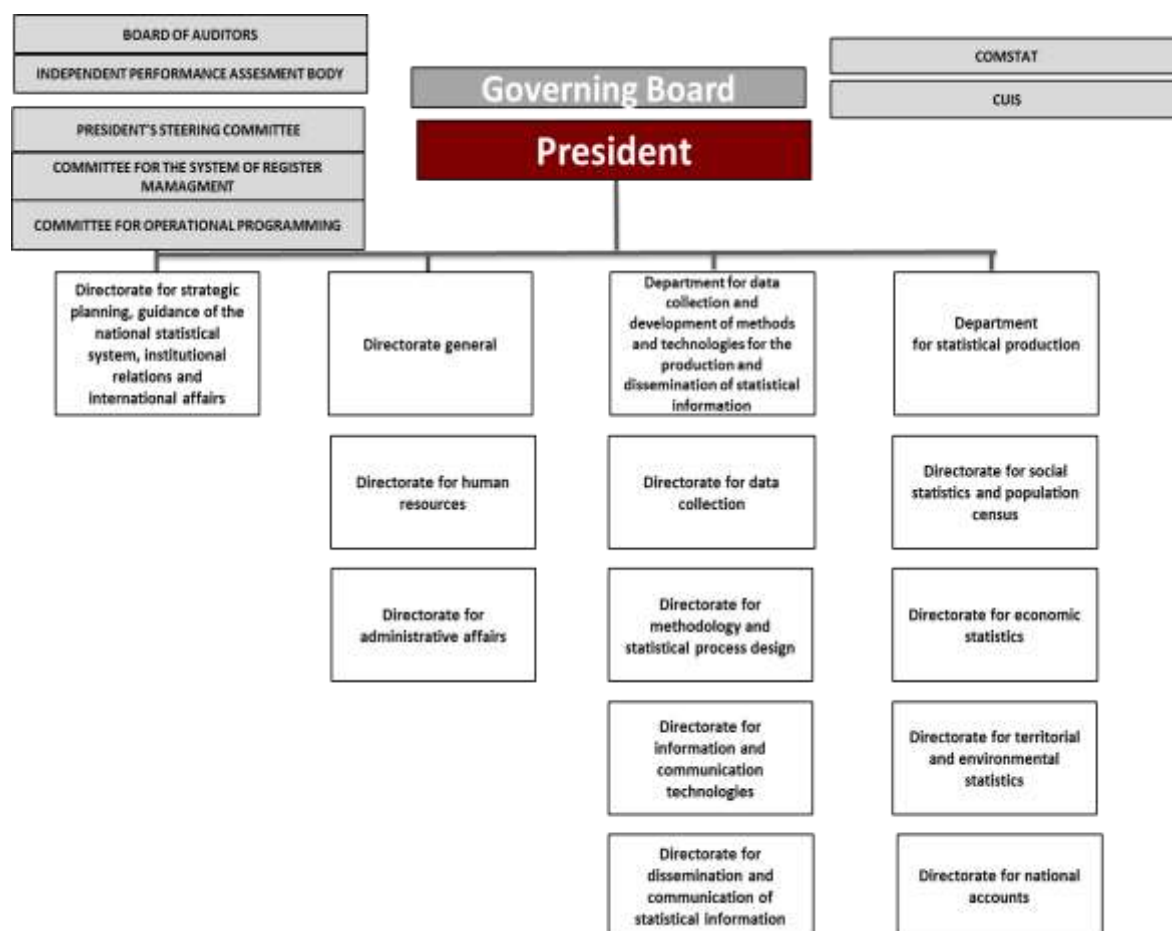

<sup>1</sup> An organisation chart of NA Directorate is provided in par.1.2.

Quarterly sector accounts (QSA) are compiled in NA Directorate, too, under the responsibility of the Unit "Quarterly National Accounts".

In the routine Istat revision process (see par. 4 below for details), annual national accounts (ANA) data are released twice a year, on March 1st and on September 23rd. The cycle of production and dissemination of ASA proceeds in parallel with ANA: in the first release they are compiled by the end of March and published in April; in September they are disseminated together with ANA<sup>2</sup>. The above timetable has been arranged to seek full consistency across the different statistical domains.

## 1.2. Organisation chart

### Major Istat Organisation chart

The tasks assigned to the Directorate of National Accounts, defined in the organizational documents of the Institute<sup>3</sup>, are the following:

- design and implementation of the system of national and territorial economic accounts, at annual and quarterly frequency, aligned to international standards and to criteria set by the European System of Accounts (ESA), which aims at providing a systematic and detailed description of the functioning of the economic system and its

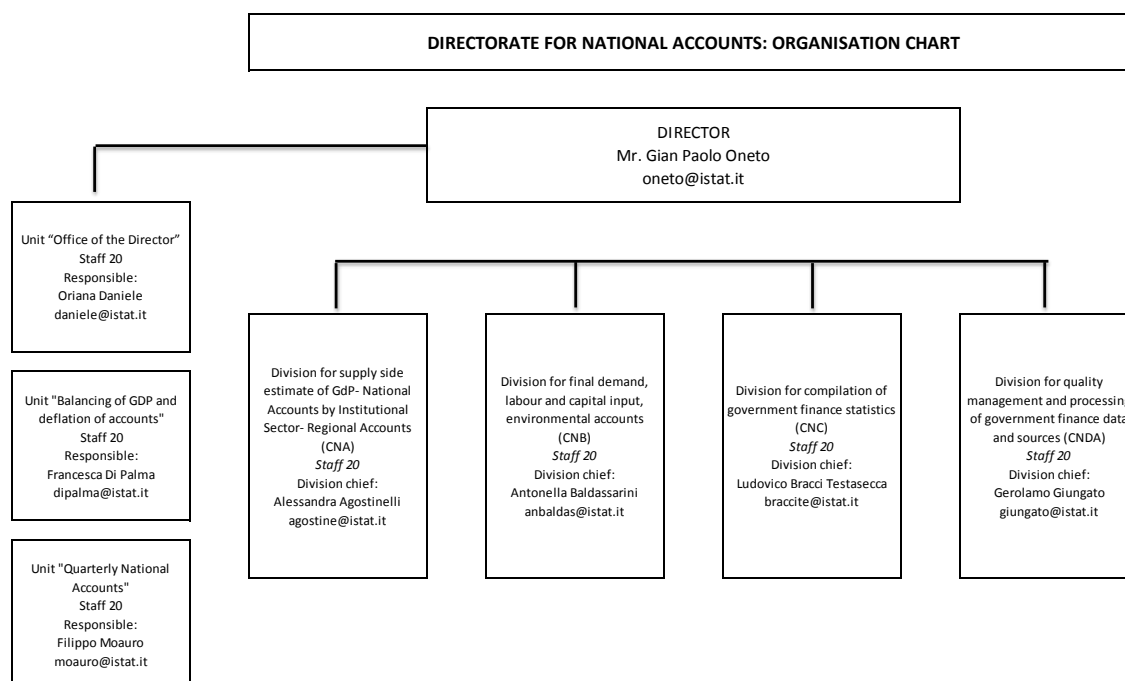

<sup>2</sup> A specific press release for ASA is scheduled every year in April (see <http://www.istat.it/it/archivio/198858> for the Italian publication and <http://www.istat.it/en/archive/198860> for the short version in English); it also includes a methodological note and a glossary. In September ANA and ASA are included in a same press release. The data are available in I.stat, the warehouse of statistics currently produced by the Italian National Institute of Statistics.

<sup>3</sup> Official Act of General Organisation (AOG1/2016).

interrelations with the rest of the world, as well as the behaviour of the economic agents;

- development of the general government accounts as defined by the ESA and of the aggregates that fall under the excessive deficit procedure (EDP);
- definition and statistical analysis of the list of units included in the General Government institutional sector (to be maintained in collaboration with the Directorate for economic statistics);
- design and implementation of environmental accounting and development of satellite accounts.

The total staff of the National Accounts Directorate includes about 140 people organised in 4 Divisions and 3 staff units reporting directly to the Director:

The current organizational structure of the Directorate defines the integration of different phases of the compilation process of National Accounts within two separate Divisions; at the same time, it defines the activities concerning Government Finance Statistics by separating two functions: the compilation of annual and quarterly accounts of the General Government, as well as of EDP aggregates; the collection, processing, verification and quality management of source data and procedures to be utilised in the compilation of GFS and EDP statistics. The design is completed by two activities managed in a staff position: the coordination of quarterly accounts (with the exception of General Government quarterly accounts); the finalisation of annual estimates via the SUT balancing procedure and the coordination of the deflation system.

The Division "Supply of goods and services and institutional sector accounts - Regional accounts" manages the estimation of supply variables of industry and services sectors, as well as the agricultural sector accounts. It manages the activities concerning accounts of financial companies, of NPISH institutions, and of the rest of the world, compiling institutional sector accounts. It develops the measures of the distribution of household income and compiles the estimates of compensation of employees. It handles the estimate of regional accounts and the development of local economic indicators coherent with the national accounts framework.

The Division "Final demand, labour and capital inputs, environmental accounts" manages the activities concerning the annual estimate of the aggregates of the domestic demand and the construction sector, the estimate of non-financial assets and the estimate of foreign trade of goods and services. It compiles the estimates of capital stock, capital consumption, the labour input variables, and productivity indicators. It manages the production of environmental accounts of material flows, atmospheric emissions and environmental taxes as well as the implementation on new environmental account modules.

The Division "Compilation of government finance accounts" is in charge of the compilation of annual and quarterly accounts of General Government and its sub-sectors, it manages the procedures concerning the EDP notification and oversees the application of the relevant methodologies. It manages the compilation of the accounts of social protection (ESSPROS) and Health accounts (SHA). It compiles estimates of aggregates related to General Government included in the national accounts.

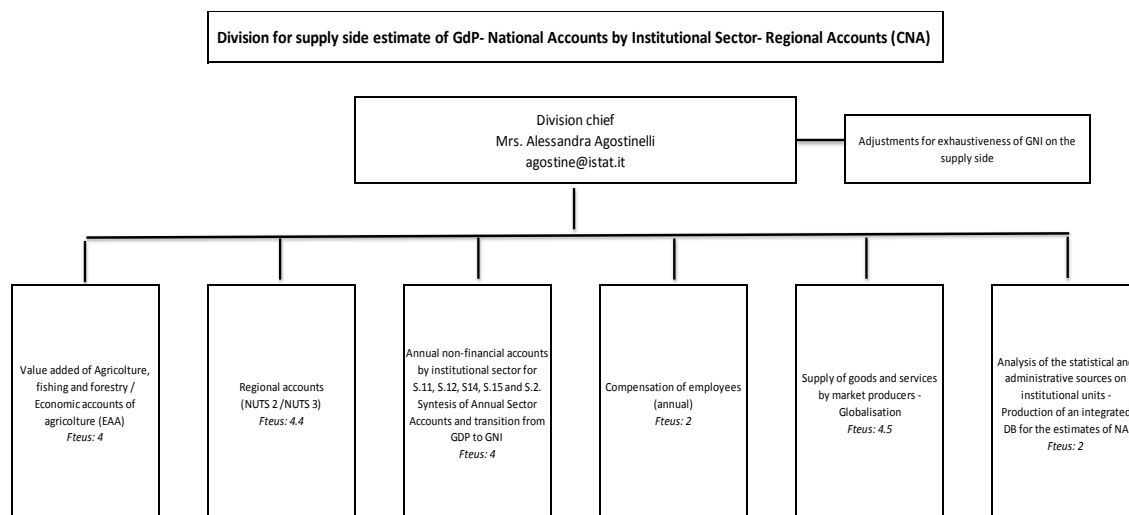

The Division "Treatment and verification of the quality of public finance data" provides analysis for the verification of the perimeter of General Government (S.13) and manages its ongoing updating. It defines and develops the procedures of processing and verification of the quality of basic data for the compilation of government finance statistics. It manages the activities for developing quality management procedures and robust accounting methods in the administrations that provide the sources of public finance.

The Office of the Director acts as the secretariat of direction, taking care of institutional relationships. Manages the planning procedures in the framework of the Institute strategic and operational planning and monitors the interaction affecting the annual budget; takes care of the documentation regarding data confidentiality and handling rules. It handles relationships with Eurostat and international bodies.

The Unit "Balance and deflation of the accounts" is in charge of the synthesis of the different components of the central accounts, managing the balancing of supply and use tables at current prices, from preliminary estimates of supply and demand produced by other units of the Directorate. The unit is responsible for the estimate at current prices of the intermediate inputs table (domestic production), and manages the deflation of the aggregates of the supply of goods and services and GDP, developing a balancing system at constant prices.

The Unit "Quarterly National Accounts" coordinates the compilation and dissemination of quarterly economic accounts, including flash estimates of GDP; it carries out quarterly estimation of market value added, gross fixed investment, labour input and compensation of employees, prices and volumes measures. The unit is in charge of managing the compilation and dissemination of quarterly institutional sector accounts, excluding the General Government accounts.

In particular, the Division CNA is organised as follows:

The compilation of sector accounts involves about 4,5 FTEs.

## 2. ASA compilation overview

### 2.1. Data Sources

The description of the data sources provided below refers to the final and semi-final version of the accounts, it is to say to year t-3 for ASA published in April of year t and to year t-2 and t-3 for ASA published in September of the same year.

The information provided in the present Inventory, most extensively refer to S.11, S.12, S14 and S.15.

S.13 and S.2: in fact, present peculiar features. The estimates for General Government are processed in compliance with ESA 2010 and the specific provisions for the sector contained in the Eurostat (MGDD) “Manual on Government Deficit and Debt.” The sources and methods, are subjected to a careful control and validation process within the context of the “Excessive Deficit Procedure” (EDP), and, as established by Council Regulation 479/2009 and subsequent modifications, are described in detail in the EDP Inventory<sup>4</sup> (<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

<sup>4</sup> Within the context of the European procedures for controlling and validating the quality and consistency of public finance statistics, it is established that the individual Member States are to compile an Inventory

To compile S.2 accounts, data stemming from the Balance of Payments (BoP) are mainly used: in fact the compilation of the BoP complies with the standards of BPM6, that, in turn, comply with ESA2010. The only correction needed to ensure consistency with the rules defined by the ESA 2010 is related to interbank FISIM between resident and non-resident operators.

S.13 and S.2 accounts are, in turn, the main source for most of the entries of the secondary distribution of income account for S.11, S.12, S.14 and S.15: in fact, the procedures they are compiled upon allow to provide a breakdown of each entry detailed enough to ensure a correct individuation of the counterpart institutional sector. Of course, this makes it necessary to go beyond the synthetic figures registered in the template of Table 800. As for S.13 non-financial accounts, they are compiled inside the same Istat Directorate, so that any operational issue has been agreed upon; at the same time, institutional agreements exist with BoP compilers (see par.1.1) that secure the closest cooperation.

Given the above, going beyond the rationale “account/item” used for the other sectors, for the sake of completeness, an overall description of the main data sources for S.13 and S.2 are reported in special sections (2.1.8, 2.1.9).

Of course, the compilation of ASA grounds for the most part of the integrated DB produced as a basis for all the NAs by the dedicated unit inside CNA Division, that is already adjusted to meet ESA2010 definitions: the compliance is assessed during the GNI control cycle.

Specific assessments to bridge data to ESA2010 concepts have been carried out for Financial intermediaries and Insurance corporations and pension funds, in close coordination with the supervisory authorities, it is the Bank of Italy, IVASS and COVIP.

### **2.1.1. Production account**

The estimate of production, value added and compensation of employees (PAY) in Italia National Accounts develops at the same time by institutional sector and by KAUs (Kind-of-Activity Units). KAUs that make up the institutional units are classified in 98 industries (branches), which derive from the aggregation of NACE Rev.2 groups that also constitute the breakdown at which the SUT tables are compiled. As a consequence, annual values are available at the same time by institutional sector and by industry.

Of course the statistical and administrative data sources only provide information on observed activities. To account for non observed economy (NOE) specific adjustment must be introduced. All the exhaustiveness adjustments are registered by institutional sector and by industry. An overview of the procedures to account for NOE is reported in 2.2.1.1

Thus the description of the data sources provided below only refers to observed/regular activities.

---

of the sources and methods of the estimates underlying the national accounts of public administrations. In particular, art. 9 of Council Regulation no. 479/2009 states: *"Member States shall provide the Commission (Eurostat) with a detailed inventory of the methods, procedures and sources used to compile actual deficit and debt data and the underlying government accounts. The inventories shall be prepared in accordance with guidelines adopted by the Commission (Eurostat) after consultation of CMFB. The inventories shall be updated following revisions in the methods, procedures and sources adopted by Member States to compile their statistical data"*.

For institutional units classified in the sector of Non-financial corporations (S.11) and of Households as producers<sup>5</sup>(S.14P), operating in sectors other than Agriculture, the estimate of value added and its components totally relies on micro-data: the data source is Frame-SBS<sup>6</sup>, a statistical register that contains individual information on financial statements for the whole population of enterprises active in a given year included in the ASIA-Enterprises Business register (about 4.4 million units); this data base is compiled in order to produce structural business statistics (SBS) according to Regulation 295/2008 of the European Parliament and of the Council. The compilation of the register is based on the massive use of administrative and fiscal data as primary source of information, complemented by statistical survey data. The register also includes the “Cooperative sociali” (Social cooperatives) that are classified as Non-profit institutions (NPIs) in S.11. Economic data reported in the Frame-SBS result from a complex harmonization and integration process and are consistent with the definitions of the economic account of the statutory financial statements according the 4th EU Directive. Along with the standardisation and the harmonization of the definitions, the integration process includes an analysis of the outlier and imputation procedures for a limited number of units (about 5%) for which no consistent economic information has been recorded. Quality analysis of the harmonization and of the integration process is carried out through comparison between administrative data and survey data.

In the majority of cases, the accounting information available in Frame-SBS allows a correct transition from business accounting to national accounts, through a proper aggregation of the entries of the P&L/Balance sheet account. Nonetheless, some specific actions are needed to comply with ESA2010 definitions: this is the case of borderline cases of inclusion/exclusion in transactions or that need specific adjustments, expressly listed in ESA2010, that require specific procedures (Durable goods of small value, major repairs and renovations, valuation of inventories, software and entertainment, literary and artistic originals, research and development, insurance service charges, production and allocation of FISIM, leasing): such procedures are extensively described in the GNI Inventory.

Production and value added for institutional units classified in Nace Rev. 2 section A (Agriculture, fishing and forestry), out of the scope of SBS regulation, are estimated through a quantity and price approach. The main sources are the 6th General Census of Agriculture in 2010, that served as a benchmark, the Farm Structure Survey (FSS) used for the inter-censal years, the survey on Economic outcomes of agricultural holdings (RICA-REA), together with a wide number of sectorial statistical surveys run by Istat (on crops, livestock, intermediate consumption such as fertilizers, feeding stuffs, plant production products, etc.) and (over 100) specialised surveys designed to provide very detailed area and output data, such as the annual survey on the Economic performance of agricultural holdings. ISTAT surveys are supplemented by specific administrative data (e.g. Agricultural subsidies agency (Agenzia per le erogazioni in agricoltura – AGEA) for information on EAGGF subsidies).

For Financial corporations (S.12) (other than Financial auxiliaries) the estimates of production, intermediate consumption and value added are based on the financial

---

<sup>5</sup> In Italy separate accounts are compiled for the producers and the consumers units classified in S.14. Total S.14 accounts result from the consolidation of the two sectors. The assumptions underlying this partition and the relevant methodologies are illustrated in par.6.

<sup>6</sup> A detailed description of Frame-SBS is reported in section C.

statement data of the operators, surveyed by the supervisory authorities and made available in aggregate form to Istat, according to institutional agreements. The financial statement data are provided by Bank of Italy for the institutional units included in the following sub-sectors: Central bank (S.121), Deposit institutions excluding the central banking authorities (S.122), Money market funds (S.123), Non-MMF investment funds (S.124), Other financial intermediaries, excluding insurance corporations and pension funds (S.125) and Captive financial institutions and money lenders (S.127); as for Holding corporations (included in S.127) information on the financial statements is gathered from the InfoCamere archive. The data for Insurance corporations (S.128) are provided by IVASS (Istituto per la vigilanza sulle assicurazioni - the Italian insurance supervisory authority), and for Pension funds (S.129) by COVIP (Commissione di vigilanza sui fondi pensione – Supervisory commission on pension funds).

Data for Holding corporations are gathered from the Archive of companies' financial statements (InfoCamere archive), an information system on the profit and loss accounts and the balance sheets of corporations and the related documentation (Notes, statutes...), provided by the Association of the Italian Chambers of Commerce.

For institutional units with up to 99 persons employed classified in division 66 of section K (Auxiliary activities of financial service and of insurance activities), data are gathered from Frame-SBS<sup>7</sup>. For the larger units of this division information are gathered from administrative data (Financial statements /Balance sheets available in a DB made available for consultation by the Chambers of Commerce).

There are several different statistical sources used in the General Government (S.13)<sup>8</sup> accounts. The system is mainly based on administrative sources, that provide information for almost each single unit included in the sector, but it also includes ad hoc surveys conducted by Istat, financial statements and accounting documents of each unit.

As for the administrative sources, data flows are regulated by formal agreements, mainly with the State General Accounting Department (RGS in Italian), the Ministry of Economy and Finance, the Ministry of Interior and the Ministry of Health that have defined with Istat specific Memoranda of Understanding or other formal agreements detailing the content and the characteristics of the data flows, their formats, dissemination procedures and timing.

RGS is the main data source of the State and other Central Government, but it also supplies data and information about the whole General Government sector. The main data about local bodies are collected and supplied by the Ministry of Interior; data on Local health care units are provided by the Ministry of Health.

As for the data on the remaining institutional units not covered by the above sources, Istat conducts ad hoc surveys within the National Statistical Programme (PSN in Italian), and in residual cases proceeds to collect the accounting information directly from the single institutional units. For each type of institutional unit included in the S.13 list, all sources are detailed in the Inventory of methods, procedures and sources used to produce statistics on deficit and debt and on public finance accounts according to the ESA 2010 rules.

---

<sup>7</sup> Division 66 is out of the scope of SBS, but an agreement exists with the Directorate responsible of SBS to extend the collection of financial statements of these units for the sake of the compilation of NA.

<sup>8</sup> According to art.1 par.3 of Law 196/2009 (Legge di contabilità e finanza pubblica) Istat is required to publish every year on the Italian Official Journal the list of the institutional units classified in S.13.

S.13 data are gathered in a detail wide enough to provide information on the counterpart sectors for the main distributive transaction activated by S.13 units (taxes, subsidies, social contributions and social benefits, current and capital transfers).

Households as consumers (S.14C) are the private producers of goods and services for own final use. Their production includes:

- a) *Production of services of owner-occupied dwellings (imputed rents)*. The estimate follows the approach indicated by Commission Regulation (EC) No. 1722/2005 of 20 October 2005: the stock of owner-occupied dwellings is appropriately stratified and valued on the basis of the average market rental prices as derived from the Household Budget Survey.
- b) *Production of agricultural products for own final use*. The value of this component is included in that of the total output of the farm sector (Sect. A NACE Rev.2), which is exhaustive by construction, as it is estimated through a procedure that calls for evaluating the entire quantity of product generated (whether or not offered on the market).
- c) *Construction activities of households for own final use*. Production by households for own gross fixed capital formation, includes dwellings built or enlarged by the households themselves, and own-account construction, including communal construction undertaken by groups of household (ESA 2010, §3.22). Since this is not market-oriented production, in compiling national accounts this activity is assessed with an indirect estimation procedure and is included as an adjustment for exhaustiveness in category N3 (producer is not required to register because it has no market output);
- d) *Production of services by paid domestic staff*, made equal to the compensation of employees paid, both declared and undeclared. The main sources upon which the estimate relies are:
  - National Social Security Institute (INPS) Archive of domestic work relationships;
  - INPS-Uniemens archive, for doormen;
  - Labour Force survey, for the estimate of compensation of undeclared employees.

The main source used to estimate the aggregates of NPIs other than social cooperatives, both market (included in S.11 and S.12) and non-market (S.15) is the Census of Non-profit Institutions (CISINP), carried out by Istat in 2012 within the 9<sup>th</sup> Census of Industry, Services and non-profit institutions with reference to the year 2011. CISINP did not cover the activity of religious organizations in their worship practice. Therefore, for this set of units, the census source was integrated with information taken from report, established by art. 44 of Law no. 222 of 20 May 1985, regarding the use of amounts received in 2011 by the Central Institute for the Sustenance of the Clergy and the Italian Episcopal Conference, under Articles 46 and 47 of the same law. Such statements are transmitted annually by the Italian Episcopal Conference to the State Authority and published in the "Bulletin of the Italian Episcopal Conference", official department of the Conference, and provide information on the total amount intended for the support of the clergy, and on the number of priests to whom these sums are allocated.

For units not covered by CISINP and for which no admin data are available, a labour-based model is applied: the average hourly values of each aggregate, calculated by industry and by enterprise's size class for NPISHs surveyed by

CISINP, are grossed up to non-surveyed institutions.

All in all, in 2011, the benchmark year for the transition to ESA2010, 86% of production and 66% of the value added generated by NPISHs has been estimated using the census data; 3.4% of production and 12% of value added has been estimated from administrative sources and refer to religious organizations in the practice of their worship; 10.5% of production and 21.9% of the value added is estimated via extrapolation and/or models.

Data for the years following 2011 are extrapolated through a labor-based method that will be illustrated in paragraph 4 of Section D.

### **2.1.2. Generation of income account**

The estimate of Compensation of employees is carried out by industry, separately for each individual component (wages and salaries, and social contributions, actual and imputed).

In general, the data sources for Compensation of employees paid are the same as for value added.

For S.11 and S.14P the estimates of the declared component are carried out at the micro level (for each employer): the data source is Frame-SBS.

For S.12 (excluding financial auxiliaries), the data used are drawn predominantly from reports to the supervisory bodies that are also used to estimate output and intermediate consumption. Information, where required, are supplemented by the data from financial statements of financial corporations. Data for Cassa Depositi e Prestiti S.p.A. (not included in the data of the banks) and for the Bank of Italy are estimated through direct information gathered from their financial statements. For insurance corporations (S.128) supervisory data provided by IVASS are integrated with information on persons employed and labour costs provided by ANIA (National Association of Private Insurance Corporations).

As for sector S.13, the data base for the estimate of compensation of employees is the same used for all the other production components, i.e. financial statements and census type surveys, as well as extra-balance sheet information or additional sources. Wages and salaries are derived, for each unit, directly from the sources with adjustments introduced only to ensure consistency with the ESA definitions and compliance with the accrual principle.

Total Employers' actual social contributions are estimated from the side of the receiving sectors, it is S.13 and S.129 (Pension funds). In addition to actual contributions collected by social security funds and pension funds, actual contributions also include the sum that remain within the employers' accounts, it is the provision for severance fund (TFR), also called settlement or severance pay, which in Italy constitutes a portion of wages and salaries that the employer pays directly to the employee upon termination of the work relationship. Employers must set aside yearly the amounts that form the fund needed to pay the severance indemnity<sup>9</sup>. This part of contributions is estimated using information from enterprises (the same sources used to estimate wages and salaries, according to the economic sector).

Flows to/from the Rest of the World (S.2) are drawn from the Balance of Payments.

Information on Taxes (D21, D29) and on Subsidies (D31, D39) are provided by

---

<sup>9</sup> As defined by the Legislative decree 252/2005.

S.13 accounts compilers and by BoP. Data on D29 and D39 rec/paid by S.13 are supplied in a detailed breakdown by kind of tax/subsidy, which allows to distribute them to the institutional sectors as much correctly as possible.

### **2.1.3. Allocation of primary income account**

#### *D.41 Interest*

Annual gross interest flows are estimated through a quite detailed procedure: as a general rule whom-to-whom matrices for financial assets and liabilities in a very detailed breakdown (instrument/sector) are derived from Financial Accounts (FA), compiled by the Bank of Italy, and appropriate interest rates are applied.

Total interest paid and received by S.2 and S.13 are a constraint; the same is true for S.121+ S.122 (Central bank + banks), whose data are provided by the Bank of Italy (Supervisory data), and for Insurance corporations (Supervisory data).

Interest matrices are balanced through a Stone-based method. Interest are then adjusted for FISIM.

#### Main sources:

- Financial accounts: source Bank of Italy
- Actual interest rates on deposits, loans and bonds, by institutional sector: source Bank of Italy
- Supervisory data on the balance sheets of financial intermediaries: source Bank of Italy
- Balance of Payments: source Bank of Italy
- Balance sheet of the Bank of Italy
- Balance sheet of the Cassa Depositi e Prestiti S.p.a.
- S.13 accounts
- Supervisory data on Insurance corporations: source IVASS

#### *D.421 Dividends*

#### Main sources:

- Frame-SBS
- IRAP tax return form (a Regional Tax on Productive Activities that applies at the regional level)
- Supervisory reporting by the banks and other financial intermediaries to the Bank of Italy
- Financial Statements of Insurance Corporations
- S.13 accounts
- Balance of Payments

#### *D.422 Withdrawals from income of quasi-corporations*

In Italy, sector S.11 includes corporations employing self-employed workers (see Section A, par. 6 “*The level of the profit share in Italy*”). In order to represent the remuneration of self-employed workers in corporations, the same methodology applied for quasi-corporations is used (see Section D, par. 32 and 33). In the national publication, this income is disseminate as “Other income distributed by corporations” with the code D.423.

#### Main sources:

- Frame-SBS
- Statistical archive of active enterprises (ASIA-Enterprises)

- Information system on Employment (ASIA-Employment)

*It is an integrated system of administrative archives on employment LEED-type (Linked Employer Employees Database), that allows every individual worker to be linked to the company he/she works for via their working relationship, classified according to the type of occupation in compliance with international standards. ASIA-Employment includes individual data on employees and self-employed (employers, outworkers, partners, etc.), and highlights their relationships with the Legal Units. For instance, an individual can be associated with the enterprise he/she is employed by, or with the one he/she owns and in which he/she also works (as a working partner or family member). Such an integrated structure includes the features of the working relationship itself, as well as some demographic features of the worker, associated with a specific period of time (week, month, year). The total labour force of an enterprise is divided into an internal component, represented by all the persons employed, whether employees or self-employed, and an external component, represented by those persons participating in the production process as outworkers and temporary workers. Outworkers have working arrangements based on contracts of collaboration, continuous in time (co.co.co) or based on a more occasional nature, bounded to a project (co.co.pro) or not; moreover they can carry out working activities with or without the existence of a VAT number. Other types of contracts exist, such as voucher contracts, administrators/managers, temporary agency work (temp contract workers). The use of such an archive allows the whole labour input “used” by a single economic unit to be measured and analyzed.*

#### *D.43 Reinvested earnings on F.D.I.*

Main source: Balance of Payments. FDI stock and flows data is collected on a sample basis for non-financial and insurance companies and on a census basis for financial intermediaries.

#### *D.441 Investment income attributable to insurance policy holders*

Main source: Financial Statements of Insurance Corporations: source IVASS

#### *D.442 Investment income payable on pension entitlements*

Main source: Supervisory data on Pension funds: source COVIP

#### *D.443 Investment income attributable to collective investment fund shareholders*

Main source: Balance of payments and Supervisory data of Bank of Italy

#### *D.45 Rents*

Main sources: S13 accounts for rents paid and received by General Government; Frame-SBS for rents paid and received by enterprises; Council for Agricultural Research and Economics (CREA) data for rent of agricultural land.

### **2.1.4. Secondary distribution of income account**

#### *D.5 Current taxes on income, wealth, etc.*

In general, for all kind of taxes levied by General Government extremely detailed information is available in the accounting records of the units included in the sector. As for Central Government, (State) detailed tax revenues are collected by the Department of Finance (MEF) and transmitted to ISTAT; the report contains data detailed by type of tax and by collection method (direct or roll procedure). As for Local Governments, both information from Department of Finance (MEF) and budget reporting are used. The information is comprehensive enough to allow a one-to-one matching between the kind of tax and the paying sector.

#### *D.61 Social contributions and D.62 Social benefits*

##### Main sources:

- Inps (National institute of social insurance) budget reporting ;
- Annual reports of other public social security funds ;
- Statistical survey on final budgets of Social security funds named “Rilevazione dei bilanci consuntivi degli enti previdenziali”, codified as IST-00233 in the PSN (National Statistics Programme)
- Supervisory data on pension funds (source: COVIP)
- Frame –SBS and supervisory data on banks and other financial intermediaries for provision for severance fund (TFR), also called settlement or severance pay, which in Italy constitutes a portion of wages and salaries that the employer pays directly to the employee upon termination of the work relationship

#### *D.71 Net non-life insurance premiums and D.72 Non-life insurance claims*

##### Main sources:

- Financial Statements of Insurance Corporations: source IVASS.
- Frame-SBS
- Households Budget Survey (HBS)
- S.13 accounts
- Balance of Payments

#### *D.74 Current international cooperation and D.76 VAT- and GNI-based EU own resources*

##### Main sources:

- Italian Ministry of the Economy and Finance (MEF):
- State General Accounting Department
- General Inspectorate for Public Accounting and Public Finance (IGECOFIP)
- General Inspectorate for Financial Relations with the European Union (IGRUE)

#### *D.75 Miscellaneous current transfers*

##### Main sources:

- S.13 accounts
- Balance of Payments
- 2011 Census of non-profit institutions (CISINP)
- Financial Statements of Insurance Corporations
- Financial Statements of Bank of Italy
- Supervisory reporting by the FIs to the Bank of Italy
- Statistics on income e living conditions (Eu Silc)
- 15th General Population and Housing Census

### **2.1.5. Use of income account**

#### *P.3 Final consumption expenditure*

##### Households final consumption

##### Main sources:

- Household Expenditure Survey (HBS)
- Census of Population and Housing
- Survey on aspects of daily life

- Other Istat surveys
- Commodity-flow method
- Administrative and other sources.

The 2011 Census of Population and Housing has collected updated information on the Italian resident population as well as the population currently present. The following units were measured: households, cohabitants, persons temporarily present, dwellings and buildings. The survey has been organized in a questionnaire dedicated to collect a set of information on buildings, while another questionnaire was mainly devoted to collect information on population and dwellings.

The definition of a new housing stock and the detailed information on the characteristics of buildings and dwellings collected in the Census (among which occupied, not-occupied, owned or rented dwellings, surface classes in square meters, year of construction, type of heating, etc.), together with the use of other sources, allowed a new benchmark estimate both of household spending for actual and imputed rentals, and of unauthorized dwellings for the estimate of gross fixed capital formation in residential construction.

Istat has implemented a methodology for back-calculating inter-census population using the results of the Post Enumeration Survey (PES), a compulsory survey that provides information on over-estimation or under-estimation effects in population results (Regulation n. 1151/2010). The new population quarterly estimates for 2010-2011 have affected the households final consumption through the sampling coefficients of the corresponding main sources of information (respectively the Labour Force Survey and the Household Budget Survey).

#### NPISHs final consumption

##### Main sources:

- 2011 Census of Non-profit Institutions (CISINP)
- National Institute for Social Security (INPS) data
- Frame-SBS

#### S.13 collective consumption

The estimation is based on an exhaustive micro-data base (i.e. information for each single institutional unit) which ensures that all goods and services provided by S.13 sector can be correctly classified and allows to identify current revenues separately from capital revenues (see 2.1.7)

The final consumption expenditure is estimated from direct sources (census or administrative) for 94.1% of the amount, and only the remaining 5.9% is estimated using extrapolation models.

#### *D.8 Adjustment for the change in pension entitlements*

##### Main sources:

- Supervisory data on Pension funds: source COVIP
- Frame-SBS (for entitlements on provisions to severance fund (TFR) made by enterprises for their employees)
- Supervisory reporting by the banks and other financial intermediaries to the Bank of Italy
- Financial Statements of Insurance Corporations

#### **2.1.6. Change in net worth due to saving and capital transfers account**

*D.91 Capital taxes, D.92 Investment grants and D.99 Other capital transfers*

Main sources: S.13 and S.2 accounts

### **2.1.7. Acquisition of non-financial assets account**

#### *P.51G Gross Fixed Capital Formation*

Main sources:

- Frame-SBS
- Data on real estate transaction provided by Tax and Revenue Agency (Agenzia delle Entrate)
- Survey on building permits
- Households budget survey
- Census of Population and Housing, 2001 and 2011
- Survey run by Istat and CREA (ex INEA) on the economic performance of agricultural enterprises (RICA-REA survey) ( for land improvements)
- Data from the public motor vehicle register (Pubblico Registro Automobilistico – PRA) provided by UNRAE (Unione Nazionale Rappresentanti Autoveicoli Esteri, Association of foreign car makers) for cars and other motor vehicles
- notes to the financial statements of the corporations operating in the railway transport and land transport of passengers

#### *P.52 Changes in Inventories*

Main sources:

- Frame-SBS
- S13 accounts

#### *P.53 Acquisitions less disposals of valuables*

The estimate of the capital formation in valuables is obtained through the commodity-flow approach

#### *NP Acquisitions less disposals of non-produced assets*

Main sources:

- S.13 accounts
- S.2 accounts
- Data on real estate transaction provided by Tax and Revenue Agency (Agenzia delle Entrate)

### **2.1.8. Main sources for S.13**

In general, the database used for the estimation of S.13 accounts is strictly analytical and thorough. Different data items are gathered for each institutional unit included in sector S.13 by means of specific surveys or by processing the institutions' final financial statements. In case of lack of information, additional data from sources other than the balance sheet is used, for instance the Athena database for the independently managed school institutions; or individual payment orders for the analysis of specific expense categories of the State Budget, etc. In this way the exhaustiveness of the estimations in terms of units is assured, and it is possible to detail each transaction concerning the production activity and the sector's non-financial account.

The estimate is carried out at institutional unit level or at homogeneous institutional group level. The General Government sub-sectors are composed as follows:

- Central government:
  - The State (Ministries, Prime Minister's Office), Fiscal Agencies, Constitutional Bodies and Other Bodies of constitutional status (Court of Auditors, Prime Minister Office, Regional Administrative Court; State Council)
  - National Economic Entities (EEN), such as economic activities regulatory bodies, economic service producers, independent administrative authorities, associative-type bodies
  - Research bodies (EDR)
  - Institutions providing cultural assistance services (ENA)
- Local government:
  - Regions and Autonomous Provinces
  - Provinces
  - Municipalities (including Municipalities' Unions)
  - Local economic entities (EEL) including Mountains Development Bodies, Chambers of Commerce, Port Authorities, Tourism bodies, Regional Development bodies, Employments Services Agencies, Other bodies at local level, Water Services Regulatory Authorities, and Other bodies
  - Local Assistance entities (EAL), including Regional Health Agencies, Institutions Providing Education, Cultural Services and Assistance at a local level, Universities, University studies aiding bodies, Concert institutions, and similar bodies, Consortiums for university research, Nature park bodies, and Regional bodies for research and environment
  - Producers of Health services at local level (ESL), including Local Health Agencies, Hospital Agencies, Public Research Hospital, University Hospitals
- Social Security Funds (EDP)

In the table below the main statistical data sources used for different public bodies are listed.

**Table A - Main statistical sources used for the estimates of S.13 sector**

Entity/Entity group	Main statistical sources
State	State budget (Rendiconto generale dello Stato), reports on the budget results of minor units included in the State definition
Other central units	Financial statements of entities and Istat surveys
Regions and autonomous Provinces	Census survey on the financial statements of regions and autonomous provinces
Provinces and municipalities	Certificates of final balance from Istat-Ministry of Interior survey
Local Healthcare units	Survey of local health care units profit and loss accounts/balance sheets (CE form)
Other local units	Units' financial statements and Istat survey on the units' financial statements
Social Security units	Istat Surveys and units' financial statements

For the Central government, the statistical sources are the final or pre-final financial statements of the units.

For the State, the main source is the State budget (“Rendiconto generale dello Stato”) recorded on a cash and legal commitments basis, provided by the State General Accounting Department (RGS in Italian) of the Ministry of Economy and Finance. This document is ruled by the accounting and financial Law n.196, dated 31st December 2009, and it reports the results of the financial statements of the State in the previous financial year. The “Rendiconto generale dello Stato” is submitted to the Parliament to be approved as law by the 30th June of every year. Before the submission, the document must be officially assessed by the Court of

Audit, by the end of May (“giudizio di parificazione”), comparing the State’s outcomes with what reported by the Court of Audit when monitoring State accounts.

For fiscal Agencies and for the other constitutional bodies included in the State definition, direct sources are used, i.e. the financial statement reported by the authorities themselves. For constitutional bodies estimates are based on a statistical survey carried out by Istat on units of S.13 sector not included in other data sources (PSN IST-02.538 Survey of Information, Data and Documents necessary for the Classification of Economic Units - RIDDCUE).

The State budget is also integrated through additional information to ensure a correct and complete recording of transactions that in the public accounts are not consistent with ESA definition.

For the main units of the EEN group (ANAS, Equitalia, Italia Lavoro, Gestore dei Servizi Energetici – GSE, and others), the basic data sources are the budget reporting documents (profits and losses accounts, balance sheets and explanatory notes detailing important transactions). Such documents are on accrual basis according to the private accounting rules and are available after the internal approval (typically, 120 days from the end of the financial year).

For EEN, ENA and EDR the main data source is the RIDDCUE survey that covers a wide range of units belonging to the sub-sectors of central and local government. However, for units not covered, alternative sources are used. Moreover, a standard procedure of total or partial imputation of missing values is applied if alternative sources are not available.

For the local government, sub-sector estimates are based on surveys of the final statements of the entities. In particular, Regions are covered by the census survey carried out by Istat. The survey aims at collecting directly by Regions the budget reports containing all revenue and expenditure items of each Region, codified for each category of transaction according to the economic and functional (for expenditure) classification scheme (SIR) agreed among Regions and detailed for legal accrual (assessments/commitments) and cash data. The collection of Regions data through the survey mentioned above is exhaustive.

For Provinces, Municipalities and Municipalities’ Unions, the final\_account certificates are collected by the Ministry of Interior and then transmitted to Istat. The certificates contain all revenue and expenditure items of each unit, codified for each category of transaction according to the economic and functional (for expenditure) classification on legal accrual (assessments/commitments) and cash data.

For the Chambers of Commerce estimation are based on a specific Istat census survey on final profit and loss accounts/balance sheet. For universities, the source called “Omogenea redazione dei conti delle Università Statali e non” is used. This survey is regulated by the Inter-Ministries Decree dated 1st March 2007, approved by the Ministry of University and Research and the Ministry of Economy and Finance. The survey run by MIUR is administered through CINECA, a MIUR support organization; it covers all Italian Universities on annual basis and records all financial statement items.

For the Entities for Rights to University Education (DSU in Italian) a Istat census survey is carried out (PSN IST-00235).

Since 2001, for Local Healthcare Units, the Ministry of Health collects LHUs’ profit and loss accounts in a standardized model (“modello CE”) in order to assure homogeneous and comparable data. The units involved in the survey as Local Health Units are: Local Health Agencies (ASLs) Hospital Units (AOs), Scientific Institutes for Research, Hospitalization and Health Care (IRCCSs) and University

Polyclinics (POLs). Standard classification of data according to accounting rules and the description of their content are set by law as the schedule of data transmission. These data, consolidated at regional level, are transmitted by every LHU to the NSIS System (Nuovo Sistema Informativo Sanitario) of the Ministry of Health, at quarterly and annual frequency and then to Istat, as defined in the institutional agreement between Istat and the Ministry of Health.

Other Local Government units include a wide range of bodies with different accounting systems (public accounting or profit and loss accounts). Hence, according to the type of body both budget reporting and financial statements are used as sources, collected through a dedicated Istat surveys, referred to year T-2 through a standard form. Data are on legal commitments/ cash basis, or profits and losses accounts and balance sheets. Data are detailed by units and by category of transaction, according to economic and (for expenditure) functional classification.

As for Social Security units, the main data source is a census survey carried out yearly by Istat on financial statements. Data are checked and integrated with information based on accounting documents (final statements and correspondent statistical attachments and/or explanatory notes). Moreover, for INPS and INAIL, which represent the largest institutional units among the social security entities, further additional information are provided by the units themselves.

### **2.1.9. Main sources for S.2**

In general the flows registered in RoW accounts are taken over from the BoP (current and capital account) that, in turn, includes data on Imports and Exports of goods collected by Istat (Directorate for Economic Statistics, DCSE). Import and exports of services are compiled by the Bank of Italy. All additional breakdowns necessary to properly compile S2 accounts are provided by BoP compilers.

BoP data are provided to NA by the Bank of Italy according to a scheduled timetable, which satisfies the requirements both for ANA/QNA and ASA/QSA domains. Data transmission is regulated by the “Memorandum of Understanding”, signed by the National Institute for Statistics (Istat) and the Bank of Italy (see par.1.1).

The main sources for the compilation of the BoP may be summarized as follows :

- Direct reporting sample survey on enterprises, (<https://www.bancaditalia.it/statistiche/raccolta-dati/direct-reporting/index.html>)
- Sample surveys on tourism and transport
- Supervisory reports of banks
- Data on import and export of goods provided by Istat
- Payments made by the Bank of Italy on behalf of General Government
- Internal accounting of the Bank of Italy for its transactions with the RoW
- Survey on money transfer operators (MTOs)
- Data on pension funds by COVIP
- Administrative data provided by Tax and revenue agency (Agenzia delle entrate) and National institute for social security (INPS).

### **2.1.10. Main sources for the year t-1 (provisional year)**

As for ANA, the estimates of ASA for the provisional year t-1 mostly rely on quarterly information provided by QNA and QSA.

Direct information only exist for:

- BoP;
- the transactions included in S.13 accounts;
- S.121, S.122 and S.129.

A first estimate of FISIM and Interest is also compiled, grounded on data provided by the Bank of Italy.

## 2.2. Methods

The procedural path along which annual national accounts are compiled starts with the estimation of GDP and GNI, mainly accomplished through the production approach, and continues with the compilation of institutional sector accounts: the two estimations are strictly interconnected.

*Annual data are released twice a year: the first time Annual National Accounts (ANA) are released on the 1<sup>st</sup> of March together with S.13 accounts, and Annual Sector Accounts (ASA) are published by mid-April; at the end of September ANA and ASA are published altogether. The September release takes into account the statistical sources that become available after February.*

*If no significant adjustment to the year  $t-4$  is deemed necessary, in the release of February/April of year  $t$  a final estimate is published for the year  $t-3$ , while a provisional estimate for the year  $t-2$  and a first estimate for the year  $t-1$  are compiled, both through a simplified approach based on quarterly estimates (QNA/QSA). Then, in the September (of year  $t$ ) release data are revised for the year  $t-2$ , drawing upon the statistical sources that have become available and again for the year  $t-1$ , updating the QNA/QSA-based simplified approach.*

For the final version of each year the same data sources are processed at the meantime by industry and by institutional sector, which guarantees the maximum consistency between GDP and its components as registered in ASA and ANA. As for the provisional estimates based on quarterly estimates, similarly, the same consistency that is ensured by construction between QNA and QSA, is transferred to ANA/ASA.

In both annual releases, a most updated version of S.13 accounts is incorporated in ASA.

### 2.2.1. Compilation procedures: the methodological approach to compile ASA

S.13 accounts are compiled in the division « Compilation of Public finance statistics » and are incorporated in the system of institutional sector accounts connecting each transaction/operation to the counterpart sector(s). The accounts for S.11, S.12, S.14, S.15 and S.2 are compiled inside the division « Supply side estimate of GDP - National Accounts by Institutional Sector - Regional Accounts», that also collates the accounts and draws up ESA2010 Table 800.

No subsectors are compiled, except for S.14, which is subdivided into Consumer Households (S.14C) and Producer Households (S.14P).

All the components of GDP are compiled **at the same time by industry and by institutional sector**, except for GFCF that is estimated by product in the SUT system and is attributed to the owner sectors in a second phase. In fact, institutional units are classified at the same time in the institutional sectors and are subdivided into KAUs (Kind-of-Activity Units), according to a specific level of NACE Rev.2/ATECO 2007. KAUs that make up the institutional units are grouped in 98

industries (branches)<sup>10</sup>, which derive from the aggregation of NACE Rev.2 groups and represent the level of aggregation of economic activities used in estimates of the supply of goods and services. All the necessary conceptual adjustments to business accounting necessary to comply with ESA2010 requirements and all the data validation treatments are implemented at this stage, at the same time by industry and by institutional sector. For the final and quasi-final years, in general, the estimates for producers of market goods and services follow an additive procedure: the observed activities that are directly measured in the data sources are complemented with the main components of Non-observed Economy (NOE). The adjustments made to ensure exhaustiveness of GDP are briefly reported in par.2.2.1.1 below.

The compilation of *production account and of generation of income account* for all sectors stems from the compilation of GDP/GNI components.

Where the estimates for S.11 and for market units included in S.14 are based on the economic results available for each unit at the micro-level, and data from the financial statements provided by the supervisory authorities are used for S.12, the estimates for S.15 (NPISHs) and some market NPIs included in S.11 are rather based on modelling, since to date direct information is only available for the census year 2011. A survey on non-profit sector has been run for 2015 and a specific Register is being compiled: the results will be included in the estimates by 2019.

The output of NPISHs is measured by summing the costs of production, whereas the value added is defined as the sum of compensation of employees, taxes on production less subsidies and consumption of fixed capital. Compensation of employees paid by NPISHs surveyed in CISINP is based on census survey data, while for active NPISHs not included in CISINP it is estimated from information provided by administrative sources or indirect estimation models. Since the census survey does not provide any information for a direct estimation of taxes and subsidies on production, an indirect estimation model is used. Consumption of fixed capital is obtained by applying the PIM to the capital stock and it is distributed by industry using the breakdown of GFCF

In the years different from the benchmark year, extrapolation methods based on the labor input method are used to compile the flows of NPIs, both market and non-market (NPISHs), excluding Social cooperatives, that are included in the scope of Frame-SBS. As a matter of fact, not any annual survey exists for these units and an indirect approach is performed, through a labour-input based model.

Every year labor input in terms of jobs and hours worked is estimated for NPI, separately for market and non-market units.

As for market NPIs output and intermediate consumption in year t are estimated as follows:

- average values per hour worked for market NPIs are calculated for the year t-1, by industry;
- they are then updated through the annual dynamic of SMEs in the relevant industries, as derived from Frame-SBS data;
- the updated average values per hour worked for the year t are then grossed up through labour input.

As for NPISHs, a similar approach is adopted to update the components of output, it

---

<sup>10</sup> The list of the 98 branches and their relationship with the NACE classification is reported in Annex 1 to this section..

is compensation of employees and intermediate consumption. In particular:

- average wages and salaries are updated by means of Social Security Institute data (Uniemens archive) and grossed up through labour input;
- the same contribution rate (employers' social contributions to wages) of enterprises in the same domains is applied;
- average values per hour worked of intermediate consumption are calculated for the year t-1, by industry;
- they are updated through the ratio Intermediate consumption/compensation of employees calculated for market NPIs in the same domains.

All the procedures and IT applications used within the system of national accounts are developed according to the standards set by the Directorate for information and communication technologies. In particular ASA compilation relies on the use of the applications SAS and Modeeasy, that run under the OS UNIX; Windows Microsoft Excel is also widely used. All the releases of ASA are stored in an ORACLE data base.

The procedures for the compilation of sector accounts are based on adequate standards to allow identification of the sources of information, the treatment of the sources, the process of compilation of single variables and aggregates, the definition of the final output. Stages of control are defined so as to avoid identified risks, and to ensure the completeness and coherence of the estimates.

A system of checks on horizontal and vertical consistency is integrated in the compilation procedure. It verifies:

- the coherence of ASA and ANA;
- the coherence of ASA and GG accounts;
- the coherence of ASA and BoP.

An analysis of the revisions and the year to year changes is performed through the compilation of a set of tables and graphs; a number of key indicators are monitored. This also allows the economic interpretation of the results, and is the main tool to draft the press release.

Since most part of data sources are available every year, in the compilation of ASA extrapolation procedures grounding on indicators are only used for NPIs.

### **2.2.1.1. The main approaches taken with respect to exhaustiveness**

According to Commission Decision 94/168 on exhaustiveness, to ensure the exhaustiveness of the GDP/GNI estimates, a number of adjustments to value added are improved in national accounts, to account for underground (presence of areas of under-coverage of production units; tax and contribution evasion phenomena; avoidance linked to the payments non-required to the relevant institutions), illegal activities, production for own use and income in kind.

Such an integration is needed for private producers of market goods and services or for own final use ; no NOE activities are deemed to exist in General Government , both for the nature itself of the sector and for the very exhaustive data sources used.

A summary presentation of the main methods used in the production approach is provided below according to the categories N1-N7, generally used to represent NOE.

*N1 (producer fails to register in order to avoid tax and social security obligations).*

This category includes:

- the value added generated through the undeclared labour input, both employees

and self-employed. As a general rule, the average value of the output/value added per working hour, re-evaluated to include the under-reporting of production and value added, is applied to the number of hours worked by unregistered workers. More details are provided in Annex 2.

**Institutional sectors affected:** S.14, S.11, S.126

- the rents paid by undeclared entrepreneurs who carry out their activities in an irregular manner, i.e., evading the administrative, fiscal and social security obligations for the buildings where they exercise their productive activity. It is plausible to assume that, while for those who exercise a regular activity there is no advantage in concealing the rents paid, this does not apply to entrepreneurs who exercise undeclared activities. More details are provided in Annex 2.

**Institutional sectors affected:** S.14

*(N2) (Illegal producer):* total value added includes the estimate of those activities that, although illegal from the juridical standpoint, contribute to determine the income of a country (drug trafficking, prostitution, smuggling). The estimate of the value added and the other aggregates is based on methodological approaches agreed at the European level, and are based on demand indicators, where data sources allow. In this case the estimates mainly consider information regarding the final users of the illegal goods or services and their consumption behaviour. In other cases indicators of supply are used, that allow to estimate the value of the production starting from information on the goods seized or on the production units involved. As suggested by Eurostat, Istat has identified the illegal economic aggregates to be estimated, according to their actual significance in terms of domestic production, trading and international trade; for instance, the smuggling of alcohol and the international prostitution is not considered significant in Italy.

**Institutional sectors affected:** S.14

*N3 (producer is not obliged to register because it has no market output):* this category includes the production of Households for own GFCF, i.e. dwellings, or extensions to dwellings produced by households and own-account construction, including communal construction undertaken by groups of households (ESA 2010, §3.22). In this case the estimate is based on the use of indirect indicators on the hours worked as recorded in the Use of Time survey, as well as of direct information on some aggregates of the output of small enterprises (1–5 persons employed) operating in the sector, provided by Frame-SBS.

**Institutional sectors affected:** S.14

*N4 (registered legal person not included in statistics).* This category includes:

- Units not included in the SBS scope of observation, but included in the ASIA-Enterprises Business register, it is: the units active for less than six months in the year and Financial auxiliaries (Division 66) with 100 persons employed and more. Information on the economic aggregates has been taken from any available administrative data (mainly from the InfoCamere archive). For units active for less than six months, since direct data are not always available, the value added has been estimated through an indirect method, based on the average output and value added resulting in admin data for the cluster they belong to (stratifying according to economic activity and size class), applied to the relevant labour input.

**Institutional sectors affected:** S.11, S.14, S.126

- SPEs (Special Purpose Entities).

**Institutional sectors affected:** S.11, S.12

N5 (Registered entrepreneur not included in the statistics). This category includes two types of integrations:

- some marginal, non-structured micro-enterprises, that can be identified with the entrepreneur himself and that are out of the scope of the BR. They operate in economic activities where the incidence of non-observed economy is quite substantial (Construction, and in some services activities, such as Trade, Support services and Health care). As for these units, the Labour force sample survey provides information on the hours worked, both for primary and secondary job; no information is available on their economic aggregates. The value added generated by them is estimated by applying to the total amount of hours worked the average value per hour worked as detected for very small enterprises operating in the same economic activity sectors.
- production generated by the activity of para-subordinate workers, that are not included in the BR. These para-subordinate workers are not considered as employees of the enterprise for whom they work/provide a service, and their remuneration is included in the intermediate consumption.

**Institutional sectors affected:** S.14P

N6 (mis-reporting) This category includes two types of integrations:

- the adjustment to value added for income deliberately concealed by enterprises to tax authorities, either by overstating costs or understating revenues: in these cases a similar behaviour has been detected in official statistical surveys. The availability of a micro-founded database such as Frame-SBS enables to improve the consistency between estimation models and features of the different types of enterprises and to widen the number of units analyzed. The population includes all active enterprises with less than 100 persons employed, with the exclusion of those units that cannot be processed by the models. For such production units a stratification scheme has been set up, based on economic/organizational criteria, which allowed the definition of different estimation models for each cluster. The estimation procedure enables to separate the phase concerning the identification of the under-reporting enterprises from that of the correction of value added. Since the analysis is performed at a micro level, the resulting estimates have a high level of reliability and accuracy, also at a sectorial and territorial breakdown. The estimation methodology is more extensively described in Annex 3.
- a further integration of value added that occurs when comparing estimates on the supply and on the demand side, before the SUT enter the balancing procedure. This integration includes non-quantifiable purely statistical effects as well as a share of non-observed economy, not detected through the other adjustments performed. Since the estimate of output is influenced by the behaviour of the economic units that conceal part of their profits, in some cases the estimates on the demand side prove to be more reliable than those on the supply side; an adjustment is thus needed, in particular for Freight transport by road, for which the information on the supply side is not exhaustive enough.

**Institutional sectors affected:** S.11, S.14P, S126

N7 (statistical deficiencies in the data): This category includes:

- tips: for some economic activities (mainly hotels and restaurants, hairdressing, taxi operation, removal services and condominium concierges; sections H, I, S and T) the output (and the compensation of employees) is adjusted to include in the employer's output tips paid to his employees by customers, that will then be

distributed as compensation of employees.

**Institutional sectors affected:** S.11, S.14

- meals and drinks provided free of charge to employees in food and beverage service activities are added to output and to compensation of employees.

**Institutional sectors affected:** S.11, S.14P

- food and accommodation of domestic staff serving households.

**Institutional sectors affected:** S.14C

- own account production of Research and Development, software and original works of art and literature made by enterprises

**Institutional sectors affected:** S.11, S.14P, S.126

### **2.3. Estimation of backward data (if relevant)**

Backward calculation of time series are generally necessary only in the occasion of benchmarking revision.

## **3. ASA consistency with related data sets**

### **3.1. ASA consistency between financial and non-financial annual accounts**

A working group has been set up between Istat and the Bank of Italy, to study and try to solve the inconsistencies between financial and non-financial sector accounts. To start with, the inconsistencies between BoP and Financial accounts are being analysed, and some step forward have already been made, that, in a whom to whom perspective, help the consistency of the flows among S.2 and the other sectors. At the same time sector S.12 is being examined: some evidences arose concerning a possible non adequate treatment in the manuals of Provisions and Holding Gains, whose relevance is increasing in the banking industry.

The working group produces a documentation and refers its progress to the Coordinating Committee quoted in par.1.1.

### **3.2. ASA consistency with non-financial QSA data**

QSA is benchmarked on ASA

### **3.3. ASA consistency with other data sets**

Please refer to 2.2.1

## **4. Release policy**

ASA are released twice a year :

- at the beginning of April (t+65 days after the reference year): year t-3 final; t-2 and t-1 provisional;
- on 22/23 September (t+9 months) year t-3 final; t-2 semi-final and t-1 provisional.

All table 800 is published, together with some key indicators.

Time series start from 1995 and are available in the data warehouse I.stat.

A paper publication is released, too: in April it is totally devoted to ASA<sup>11</sup>, while at end September the results for sector accounts are included in the press release on national accounts<sup>12</sup>.

## 5. Revision policy

In the routine Istat revision process, annual national accounts (ANA) data are released twice a year, on March 1<sup>st</sup> and on September 23<sup>rd</sup>. The cycle of production and dissemination of ASA proceeds in parallel with ANA: in the first release they are compiled by the end of March and published in April; in September they are disseminated together with ANA<sup>13</sup>. The above timetable has been arranged to seek full consistency across the different statistical domains.

In standard conditions, in year t:

- in the first release (March 1<sup>st</sup> for ANA and April for ASA) - if no significant adjustment to the year t-4 is deemed necessary- a final estimate is published for the year t-3, while a provisional estimate for the year t-2 and a first estimate for the year t-1 are compiled, both through a simplified approach based on quarterly estimates (QNA).
- in September data are revised for the year t-2, drawing upon the statistical and administrative sources that have become available; the year t-1 is again updated through a QNA/QSA-based simplified approach.

The September release for the year t-2 incorporates all the statistical sources that become available after February. In particular, by June a final version of the Statistical Business Register and of Structural Business Statistics for year t-2 are made available.

## 6. Some specific features of institutional sector accounts in Italy

Two specific features of institutional sector accounts in Italy are worth mentioning:

### 1. *Separate accounts for Households as consumers and as producers.*

In general, S.14 includes:

- a) Individuals or groups of individuals whose principal function is consumption and that produce goods and non-financial services for exclusively own final use;
- b) Private non profit non market units with no economic relevance, i.e. with no employees;
- c) Own account workers and sole proprietorships (“imprese individuali”, “società semplici” and “società di fatto” with up to 5 employees;
- d) Financial auxiliaries with no employees.

Given the large number of very small productive units to be classified, according to their features, in the Households sector, separate accounts are compiled in Italy for HH as consumers, corresponding to point a) and b), and HH as producers, corresponding to point c) and d). This allows, among other things, to:

---

<sup>11</sup> See: <http://www.istat.it/it/files/2017/04/Conti-per-settore-istituzionale-2016.pdf?title=Conti+economici+per+settore+istituzionale++11%2Fapr%2F2017+-+Testo+integrale+e+nota+metodologica.pdf>

<sup>12</sup> See: <http://www.istat.it/it/archivio/203741>

<sup>13</sup> A specific press release for ASA is scheduled every year in April (see <http://www.istat.it/it/archivio/198858> for the Italian publication and <http://www.istat.it/en/archive/198860> for the short version in English); it also includes a methodological note and a glossary. In September ANA and ASA are included in a same press release. The data are available in I.stat, the warehouse of statistics currently produced by the Italian National Institute of Statistics.

- highlight the contribution of very small enterprises to the generation of income;
- better analyse the role of General Government in the secondary distribution of income, and, more in general, the efficacy of the welfare policies;
- more closely define the saving ratio.

As to consumer HH (S.14C), the sector is indirectly defined by the activity attributed to it. In particular production consists of compensation of employees paid to domestics and porters; own account agricultural production, directly estimated ; imputed rentals for own occupied dwellings; ordinary and extraordinary maintenance of owned dwellings made on one's own.

Producer HH are market oriented units, whose income derive essentially from production (mixed income), but they also receive property income and other transfers. On the other hand, consumer households receive compensation of employees, but also the part of mixed income that the entrepreneur decide to devote to final consumption of his family (defined under specific assumptions on the behaviour of the entrepreneurs), together with property income, all pensions and other transfer incomes.

While imputed rents are included in own account production of S.14C, actual rents are a market production included in the output of S.14P.

The two set of accounts are compiled and published at the national level both on an annual and quarterly basis.

## *2. The level of the profit share in Italy proves to be much higher than in the other countries.*

In Italy the institutional sector S.11 includes all incorporated enterprises (“Società per azioni”, “Società in accomandita per azioni”, “Società a responsabilità limitata”, “Consorzi”) and cooperatives, together with all partnerships (“Società in nome collettivo”, “Società in accomandita semplice”) and sole proprietorships with more than 5 employees, whose economic behaviour has been considered consistent with the definition of a quasi-corporation. The sector also includes NPIs serving non-financial corporations (for instance, trade associations like “Confindustria” and “Confcommercio”), and market NPIs. Given such classification rules, a peculiar feature of Non-financial corporations sector is the presence of a number of self-employed persons, who typically consist of partners of the corporation/quasi-corporation who contribute with their own work to the productive activity of the unit: as a consequence, the remuneration they receive cannot be interpreted as a “pure” property income, since it also includes the payment for the work supplied. The presence of self-employed persons is relevant also in corporations *strictu sensu*, in particular in the legal form of “Società a responsabilità limitata”, which are to all intents and purposes incorporated units, but whose main partners usually do work on a full time basis in the enterprise. To cope with this peculiarity in the national version of annual sector accounts a supplementary item has been introduced in the Secondary distribution of income accounts, termed “Other distributed income of corporations”, where the remuneration of self-employed in corporations is registered.

## **7. Future plans**

ASA have been aligned to ESA2010 in 2014, at the time of the benchmarking revision of national accounts.

A new « light » benchmark is planned in 2019 (reference year 2016), to introduce in NA any improvement that will become available in the sources and to incorporate the action points defined by Eurostat in the recent GNI verification round.

In particular, improvements are expected in the accounts of S.15, since a specific Survey has been run in 2017 for the reference year 2015.

Some improvements are expected in the representation of the activity of Multi National Enterprises (MNEs), to which much attention is currently given at the international level, mainly by Eurostat.

By September 2019 the scope of the data transmitted on a voluntary basis will be enlarged, to include:

- separate accounts for the following sub-sectors of S.12: Monetary financial institutions (S.12K), Other financial institutions (S.12P), Insurance corporations and pension funds (S.12Q);
- the detail of GFCF by type of asset for all resident sectors.

We are currently investigating the possibility to compile separate accounts for public and private corporations (S.11).

## ANNEX A.1 - Correspondence between 98 industries and NACE Rev.2 codes

A98	NACE Rev.2 Code	Description
1	<b>Crop production and related service activities</b>	
	01.1	Growing of non-perennial crops
	01.2	Growing of perennial crops
	01.3	Plant propagation
2	01.6	Support activities to agriculture and post-harvest crop activities
	<b>Animal production, hunting and related service activities</b>	
	01.4	Animal production
	01.5	Mixed farming
	01.7	Hunting, trapping and related service activities
3	02	Forestry and logging
4	03	Fishing and aquaculture
5	05	Mining of coal and lignite
6	06	Extraction of crude petroleum and natural gas
7	07	Mining of metal ores
8	08	Other mining and quarrying
9	09	Mining support service activities
10	10	Manufacture of food products
11	11	Manufacture of beverages
12	12	Manufacture of tobacco products
13	13	Manufacture of textiles
14	14	Manufacture of wearing apparel
15	15	Manufacture of leather and related products
16	16	Manufacture of wood and of products of wood and cork, except furniture
17	17	Manufacture of paper and paper products
18	18	Printing and reproduction of recorded media
19	19	Manufacture of coke and refined petroleum products
20	20	Manufacture of chemicals and chemical products
21	21	Manufacture of basic pharmaceutical products and pharmaceutical preparations
22	22	Manufacture of rubber and plastic products
23	23	Manufacture of other non-metallic mineral products
24	24	Manufacture of basic metals
25	25	Manufacture of fabricated metal products, except machinery and equipment
26	26	Manufacture of computer, electronic and optical products
27	27	Manufacture of electrical equipment
28	28	Manufacture of machinery and equipment n.e.c.
29	29	Manufacture of motor vehicles, trailers and semi-trailers
30	30	Manufacture of other transport equipment
31	31	Manufacture of furniture
32	32	Other manufacturing
33	33	Repair and installation of machinery and equipment
34	<b>Electricity, steam and air conditioning supply</b>	
	35.1	Electric power generation, transmission and distribution
	35.3	Steam and air conditioning supply
35	<b>Manufacture of gas</b>	
	35.2	Manufacture of gas
36	36	Water collection, treatment and supply
37	37	Sewerage

<b>A98</b>	<b>NACE Rev.2 Code</b>	<b>Description</b>

## **ANNEX A.2 -The estimate of value added generated by undeclared labour input**

Estimates of employment are produced in the national accounts framework complying with definitions and coverage set by ESA 2010 and consistently with the concept of domestic employment.

Estimates are mainly obtained elaborating microdata of statistical and administrative sources. Microdata are integrated, validated and adjusted using statistical methodologies based on checks of consistency among information related to the same statistical unit (person or production unit) in the different sources available.

The methodology allows estimating all the measures of labour input (persons employed, jobs, hours worked, FTEUs) both for declared and for undeclared workers.

A synthetic description of the procedure is provided in Section D- EMP.

Undeclared labour input generates part of the non-observed value added in the economic system, that is classified in category N1.

As for employees, they are not registered by employers at the social security authorities and therefore their social security contributions are not paid; such a situation exists both in regular enterprises and in those that are completely undeclared. The undeclared entrepreneurs are those who avoid the obligations to register with the tax and social security authorities.

To measure non-observed value added generated through undeclared labour input (which falls under the category N1 “Producer fails to register in order to avoid tax and social security obligations”), a labour-based approach is adopted, grounded on the hours worked by undeclared workers. A complex model based on a wide information data base that matches Labour Force Survey and a number of administrative sources allows a detailed estimate of the number of hours worked by undeclared workers, both employees and self-employed.

In defining the new estimation procedure of non-observed value added, potential overlaps between the component generated by undeclared work and the component of revaluation of the declared entrepreneur’s profit are in principle avoided. For this purpose, methods of quantification of the value added produced by the undeclared labour input have been designed according to the domain segmentation identified in the correction phases of the under-reporting.

For minimum size units and for micro units (units with less than 10 employees in the industrial sector and less than 6 in services), value added generated by undeclared labour input is evaluated on the basis of its distribution to production factors. In this reference domain the average profit revalued by the correction process of under-reporting is attributed to the undeclared self-employed; as for undeclared employees, the average hourly wage paid to undeclared workers is applied to the relevant number of hours worked. To represent the gain deriving from the use of undeclared employees, the entrepreneur’s operating surplus (declared or not) is increased by the difference, in the reference domain, between the average hourly wage of a declared employee and that of an undeclared one. Therefore, in the distribution of value added, once the declared and undeclared labour input is appropriately remunerated, the gross operating surplus comes to include also the component hidden through under-reporting plus a margin generated by using undeclared employees.

In small and medium enterprises with a more complex organization (units with 10 employees or more in industry and 6 or more in services), the evaluation of the value added generated by undeclared labour input closely follows the criteria applied for the correction of under-reporting in registered units. The revaluation method of enterprises belonging to this domain is multiplicative, based on the identification, through the use of a profitability model, of an average value added per labour unit in each domain: this average value is applied to the undeclared labour input, employees and self-employed, in the same domain.

N1 also includes rents paid by undeclared entrepreneurs who evade any administrative, fiscal and social security obligations for the buildings where they exercise their productive activity,

fall under the category N1 of adjustments for exhaustiveness. In general, the output related to the lease of non-residential buildings is estimated as the sum of related costs declared by the registered production units: it is assumed, in fact, that for those who exercise declared productive activities, there is no advantage in concealing the rents paid, because they are deductible from the tax base. The opposite must be assumed in the case of entrepreneurs who exercise a totally undeclared production activity. The amount of rent paid by undeclared entrepreneurs was obtained by an indirect method (labour input method), applying to the undeclared self-employed the average value of the rent paid by “declared” entrepreneurs active in the same cluster (stratified according to economic activity and size class).

### **ANNEX A.3 - Under-reporting of value added (N6)**

On the occasion of the benchmark revision for the adoption of ESA2010, a new methodology was developed for adjusting value added for under-reporting (which is classified in category N6), defined as the deliberate concealment by companies of a portion of the income, through misstatements of turnover and/or costs to the statistical authorities (generally arising from similar behaviour towards the tax authorities).

The method used in the Italian National Accounts for the detection and correction of the under-reported value added before the benchmark revision considered an approach originally proposed by A. Franz in 1985<sup>14</sup>. The selection model of under-reporting units underlying the so-called ‘Franz method’ assumes that if the business income is less than the amount the entrepreneur could obtain by changing his/her own status from self-employed to subordinate employee, the unit must be considered under-reporting. The correction of the value added of the production unit brings the aggregate to a level (the so-called “shadow income”) whereby the entrepreneur obtains by his/her company at least the same amount as an employee would obtain from a job.

The improvement and strengthening of data sources, census-oriented on small and medium enterprises, associated with progress in the use of administrative and tax data led to the development of a new methodology.

The new procedure for the correction of the under-reporting of value added in small and medium enterprises is divided into three phases<sup>15</sup>:

- 1) analysis of available information sources;
- 2) identification of the population of enterprises to be submitted to analysis of under-reporting of business income and partition of the this population into sufficiently homogeneous groups from the point of view of economic and tax behaviour to which different correction methods are applied;
- 3) definition, for each group, of a method of identifying the under-reporting subjects and correction of the relative economic results.

In the following the main aspects of the estimation procedure are presented.

---

<sup>14</sup> Basic Model for Estimates of the hidden economy in Austria on the basis of official statistics, Austrian Central Statistical Office, 1985.

<sup>15</sup> To support the study and analysis for the revision of the estimation method of NOE, Istat set up a commission of experts to redefine the system of production of non-observed economy estimates, including chaired by Monducci R., with scholars and experts from the administrations and institutions having greater involvement (Tax Authority, INPS-National Institute of social insurance, the Ministry of Labour, INAIL-National Institute for Insurance against Accidents at Work, Customs Agency, Bank of Italy, Universities). The results of the studies are summarised in the internal report “Rapporto finale alla Commissione incaricata di ridefinire il sistema di produzione delle stime dell’economia non osservata” for the issues addressed and the operational solutions proposed and accepted by the Commission.

### ***Segmentation of the population***

The overall population of interest (enterprises with up to 99 employees)<sup>16</sup> was broken down into five groups, one of which includes all units that are not deemed to be subjected to re-evaluation of economic results, since they have particular conditions of intractability:

- Group 1: Minimum size units;
- Group 2: Micro units;
- Group 3: Organized units;
- Group 4: Units belonging to groups of domestic enterprises;
- Group 5: Untreatable units.

Group 1 of the minimum size units includes the so-called ‘small entrepreneurs’, defined as those units in which the entrepreneur’s work is fully interchangeable with that of an employee, with specialization being equal. The enterprise actually coincides with its owner, and the equipment to pursue the activities is absent or minimal. In this sense, there are no specific obstacles for a change in the occupational status from self-employed to employee. More particularly, Group 1 contains all units which are not corporations, nor controlled by them, and only have working shareholders (i.e., who do work for the enterprise) and which also meet at least one of two conditions: (1) they adhere to the tax regime of minimum taxpayers; (2) they present a turnover of less than 30,000 euro; (3) they have only one self-employed worker, and no employees.

This group was further divided into three sub-groups, with features that make it possible to identify differentiated treatments.

Subgroup 1A includes the units presumably under conditions of ‘economic marginality’: entrepreneurs that are holders of other forms of earned income, such as pension income or employment at other companies, or aged over 70, for which the existence of retirement income is assumed. Subgroup 1B includes the units that, by their nature, have low capacity to produce income: units operating in economic activities that do not require highly specialized skills and training, do not employ external staff, whose owners are aged between 40 and 70 years; units whose owners have an age between 30 and 40 years regardless of the economic activity and the presence or absence of external staff. Subgroup 1C includes units that have a greater capacity to produce income: units operating in economic activities that require highly specialized skills and training, regardless of whether or not they employ external staff; units that operate in economic activities not requiring skills and highly specialized training but employ external personnel; in both cases, the owners are aged between 40 and 70 years.

Group 2 includes the so-called ‘micro-enterprises’, i.e. units that have a reduced business organization and production structure. These have been identified as units, not included in Group 1 and having less than 10 employees, if they operate in the industrial sectors, and less than 6 workers when operating in market services.

Group 3, the ‘organized’ units, including small and medium enterprises with a more complex organizational and production structure, defined as units with 10 or more employees, active in the industrial sectors, and 6 or more employees, active in the market services sectors.

---

<sup>16</sup> The exclusion of large companies (100 employees or more) is based on the following elements: (1) evidence of analysis of tax assessments indicates that generally the larger companies adopt complex strategies, that are not limited to the recording of items in the profit and loss account; (2) theoretical and empirical studies in the literature; (3) applying statistical models as those identified for smaller companies would lead to operational difficulties, mainly related to the very low number of observations (in particular by excluding companies belonging to groups - see next point). For these companies it is therefore necessary to design different approaches, but to do so requires tools, information and more time and resources.

Group 4 includes the units that are part of groups of companies resident in the national territory, with a staff of fewer than 100 workers, and that do not have links with foreign firms. For the identification of the units belonging to this segment, the Business Register of Enterprise Groups is used, which completes the Business register ASIA with information related to the control and connections between companies belonging to groups of enterprises. The different conditions of intractability and exclusion concern enterprise for which there is no definition for the phenomenon of *under-reporting* (enterprises controlled by institutional units that are part of the General Government, or operating in regulated markets), enterprises for which the availability of information sources is inadequate, enterprises where the new method is not applicable (due to specific events, business start-up, etc.), and enterprises associated with particular conditions (e.g. co-operative enterprises, or enterprises whose main business is the sale and purchase of own property, in which the treatment of properties as current assets distorts the definition of value added).

### ***Methods of selecting and correcting under-reporting***

For each of the different groups of enterprises identified, specific methods were adopted for selecting the under-reporting enterprises and performing the correction of the value added.

#### ***Minimum size units (Group1)***

Enterprises of Group 1A are excluded a priori from the selection and correction process because under-reporting, although possible, cannot be detected by the method.

For units belonging to Group 1B under-reporting enterprises are identified by comparing the business income with the so-called 'shadow income' (defined as a normalized measure of labour costs), then re-evaluating the value added by an amount equal to the difference between the two quantities. The estimation of this 'shadow income' uses a very rich information basis on the compensation of employees (INPS-EMENS data<sup>17</sup>) and a statistical methodology to define an 'optimal' stratification for labour costs compared to the economic, territorial and size characteristics of the companies. The statistical tool used is the regression trees (CART Algorithm-Classification and Regression Trees), which makes it possible to stratify units into sub-sets that are homogeneous with respect to the value of the target variable (in this case, the labour cost) and differentiated as much as possible.<sup>18</sup> This procedure, applied on EMENS archive data, resulted in the identification of nodes corresponding to a set of companies in the EMENS archive with a specific combination of modes of the stratification variables. In particular, the 'shadow income' is calculated, for each node, by aggregating the data of these enterprises relative to the totals of labour costs (normalized<sup>19</sup> and not) and the employees distinguished by profession (managers and clerks, employees) with a full-time contract.

---

<sup>17</sup> The EMENS archive is a exhaustive set of data providing the monthly statements of companies with employees (about 1.6 million enterprises with employees) transmitted to social security institutions by computer (directly or through those in charge), with data on wages/salaries and information useful to the calculation of contributions to the management of individual insurance positions and the payment of benefits. For each enterprise, data is available on compensation and employees distinguished by individual qualification (managers, office workers and executives, low skill workers, apprentices) and by type of contract (full-time, part-time).

<sup>18</sup> This algorithm generates a graphic representation in the shape of a tree in which, starting from the root node (the set which has not been divided, that is to say the whole population), branches out into a series of nodes and branches. The nodes that do not undergo further ramifications (splits) are called tree terminals. Each node represents a particular subset, characterized by a particular combination of modes of stratification variables (division of economic activity, the volume of business class, region and aggregate legal form).

<sup>19</sup> The normalization of labour costs occurs through a coefficient – by qualification and branch of economic activity - based on Labour Force Survey data and calculated as the ratio between the average number of hours worked by entrepreneurs and the average number of hours worked by employees of each

For the units included in Group 1C an approach similar to the one presented for units of Group 1B is used. However, due to the nature of the companies considered here, at the border between this segment and that of the micro-enterprises (Group 2), the ‘shadow income’ is corrected on the basis of a profit function in which the following variables appear: the reference threshold of the strata, the value of intermediate consumption and some factors controlling for the economic context.

#### *Micro units (Group 2)*

The approach to the under-reporting estimation of the micro units is based on the separation between the selection and correction procedures.

The selection of the under-reporting companies is conducted at micro level using a set of economic indicators that are summarized using a factor analysis (where the population stratification variables are both sectorial and territorial), then aggregated into a composite indicator. A logistic model and its ROC (Receiving operating characteristics) analysis make it possible to define a cut-off point that separates units into under-reporting and not.

The re-evaluation of the value added is based on an econometric estimation (at the micro level) of a profitability model, which considers the relationship between the production value, fixed costs and variable costs. The behavioural hypothesis is based on the assumption that the entrepreneur guarantees a margin on variable costs for him/herself (*mark-up* model). A theoretical profit is estimated on the non-underreporting units that is added to the labour cost and is compared with the income declared by the entrepreneur: the correction is equal to the difference between the two levels (observed and estimated). The possibility of working on a very detailed stratification allows a satisfactory matching between the models and the economic features while the use of profitability functions makes the estimation of the threshold (and therefore, the correction mechanism) sensitive to the economic situation.

#### *Organized units (Group 3)*

For organized units, the selection procedure is similar to that defined for micro-enterprises but, the correction procedure uses the results and models developed in the selection phase. Based on the difference between the value obtained for the single unit and the threshold value of the composite indicator (which determines the inclusion in the under-reporters group), an extrapolation is made of the level of value added per employee that the unit should declare in order to attain the minimum value of the composite indicator, so that it can be considered not under-reporting. In this way, the correction of the unit value added will depend on two factors: the difference between the composite indicator value of the unit itself and the *cut-off* level; the relative importance (compared to the structure of indicators) of the value added per employee.

#### *Units belonging to groups of national enterprises (Group 4)*

The companies belonging to the national groups are treated the same way as Group 3 of the organized units, taking the enterprise group as a whole as unit of analysis. In order to select the under-reporting groups, the items of the income statement and balance sheet needed for the calculation of the selection indicators and the calculation of the value added are consolidated at the group level and the possible correction of the group results is calculated. It is then redistributed between the enterprises in the group based on the weight of the turnover of each unit on the total.

## SECTION B - Sector delineation

### 1. List of the (sub)sectors

The table below shows the (sub)sectors, marked with 'X', that are distinguished in the sector accounts compilation process.

Sector code	List of subsectors		Additional breakdowns / comments
S.11	Non-financial corporations	X	
S.11001	- Public non-financial corporations		
S.11002	- National private non-financial corporations		
S.11003	- Foreign controlled non-financial corporations		
S.12	Financial corporations	X	
S.121	- The central bank	X	
S.122	- Deposit-taking corporations except the central bank	X	The compilation procedures do not distinguish the two sub-sectors: we estimate the economic flows for S122+S123.
S.123	- Money market funds		
S.124	- Non-MMF investment funds	X	
S.125	- Other financial intermediaries, except insurance corporations and pension funds	X	
S.126	- Financial auxiliaries	X	
S.127	- Captive financial institutions and money lenders		
S.128	- Insurance corporations	X	
S.129	- Pension funds	X	
S.13	General government	X	
S.1311	- Central government	X	
S.1312	- State government	X	
S.1313	- Local government	X	
S.1314	- Social security funds	X	
S.14+S.15	Households and Non-profit institutions serving households		
S.14	Households	X	
S.141 + S.142	- Employers and own-account workers		

S.143 + S.144 + S.145	- Others than employers and own-account workers		
S.15	Non-profit institutions serving households	X	
S.2	Rest of the world	x	

## 2. Importance of institutional sectors in domestic economy

Reference year: 2015

<b>Sector</b>	<b>Employment</b> <i>(full-time equivalence thousands of unit)</i>	<b>Share in total economy (%)</b>
<b>S11</b>	11,214.7	47.8%
<b>S12</b>	467.5	2.0%
<b>S13</b>	3,335.6	14.2%
<b>S14</b>	8,338.2	35.6%
<b>S15</b>	93.6	0.4%

## 3. Sector allocation of institutional units

The table below shows the criteria used to allocate units to institutional sectors.

	Corporations	Limited Companies (join-stock company, limited-liability company, cooperative) Market non-profit institutions
<b>S11</b>	Quasi-corporations	Unlimited partnerships Sole proprietorships and simple partnerships with more than five persons employed, if active in sections other than K Branches and other notional resident units
	Corporations	Limited Companies (join-stock company, limited-liability company, cooperative) Market non-profit institutions
<b>S12</b>	Quasi-corporations	Unlimited partnerships Sole proprietorship and simple partnership with more than one person employed, if active in sections K Branches and other notional resident units
<b>S13</b>		Public non-market producers
	Consumer Households	Own final use producers
	Producer Households	Sole proprietorships and simple partnerships with up to five persons employed, if active in sections other than K Sole proprietorships and simple partnerships with one person employed, if active in sections K Non-structured microenterprise that can be identified with the entrepreneur himself Outworkers
<b>S14</b>		
<b>S15</b>		Private non-market producers (non-market NPIs)

A specific feature of sector accounts that deserves attention is **the classification of institutional units as quasi corporations**.

In Italy, the classification by institutional sector of unincorporated enterprises follows the following criteria:

- a) Partnerships, *branches* and other notional resident units, sole proprietorships and simple partnership with more than one person employed, if they are active in Section K of NACE Rev.2, or with more than 5 persons employed, if active in sections other than K, are classified in S.11 or S.12 as quasi-corporations, since they are deemed to have autonomy of decision in respect of their principal function;
- b) the remaining units are classified as Producer households (S.14P) in the Households sector: sole proprietorships and simple partnership with one person employed and active in Section K of NACE Rev.2, and with up to 5 persons employed in sections other than K; microenterprises with a non-formalized organizational structure; and outworkers.

The data sources available to identify unincorporated enterprises are:

- Statistical register of active enterprises (ASIA-Enterprises) for sole proprietorships, partnerships and branches in sections B-N and P-S of NACE Rev.2.
- ASIA LeU register for some non-structured microenterprises that may be identified with the entrepreneur himself.
- Archive of INPS separate management for outworkers not included in the Asia-enterprises register.
- 6th Census of Agriculture (reference year 2010) for unincorporated enterprises in the agricultural sector (Section A of NACE Rev.2).

A second issue that is worth addressing is **the coverage of S.15**. Non-profit institutions include social cooperatives (that by law cannot share profits with their partners), recognized and non-recognized associations, charities, committees, ecclesiastical institutions, and mutual-aid societies.

The CISINP supplies information on the organizational model and the composition of the revenues and expenses of the financial statements of NPIs in 2011; the detail of the entries for revenues and expenditures provided allows to apply the criteria defined by ESA 2010 to

identify their public or private nature, as well as whether they are producing for the market or not. Relying on the information available on the organizational model and the composition of the revenues and expenses of the financial statements of NPIs, the non-market units are identified and classified in the S.15 sector, while market NPIs are classified in the sectors of non-financial and financial corporations according to their economic activity.

The data sources available to define NPIs are:

- 2011 Census of non-profit institutions (CISINP)
- Statistical register of active enterprises (ASIA-Enterprises)
- Asia LeU register
- Administrative archives (Uniemens archive, Tax register).

The table below gives a sense of the distribution of NPISHs by economic function.

**Final consumption expenditure of NPISHs by function - Year 2011 (million EUR)**

COPNI	Values
Health	373
Recreation and culture	2.209
Education	612
Social protection	867
Religion	1.624
Political parties, labour and professional organisation	1.128
Environmental protection	23
Services n.e.c.	1.982
<b>Total</b>	<b>8.819</b>

The final issue concerns the identification and classification of the **Special purpose entities (SPE)**. These units are corporations that are part of groups and:

- are directly (first level of control) and totally (100%) foreign controlled;
- exercise no control over other legal units;
- are not included in ASIA-Enterprises register;
- have no employees, nor outworkers.

These entities with little or no physical presence are identified since 2011 through the integration of the statistical register on enterprise groups (ASIA-Groups), ASIA-LeU and the InfoCamere archive of financial statements

#### 4. Matrix 'Industries – (sub)sectors'

Reference year: 2015

Industries A98	Sectors (in GVA)					
	Total	S11	S12	S13	S14	S15
01 Crop and animal production, hunting and related service activities	2.09%	0.31%	0.00%	0.00%	1.78%	0.00%

DS12	<p><b>Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS)</b></p>	<p><b>Type of source</b> Statistical</p> <p><b>Type of collection method</b> Census data</p> <p><b>Population and reporting units</b> Enterprises included in the Business Register (ASIA-Enterprises)</p> <p><b>Contents</b> SBS variables and the details of revenue and costs Eurostat Regulation No. 58/97 and SBS Regulation No. 295/2008 The SBS Frame derives the economic information for each unit with less than 100 employees from a large set of sources. Information are drawn from: - Business accounts: BS and P&amp;L of corporate enterprises; - Business Sector Studies - Studi di settore (SDS) - Tax returns: Ordinary income tax return (UNI), Regional Tax on Productive Activities (IRAP). The choice of the source follows a hierarchical criterion: first of all, the information derived from Business accounts (for medium enterprises) and SDS (for small enterprises) are considered; when these sources are not available, IRAP or UNI source are considered. Details of revenue or costs not directly available from administrative data are estimated by the “projection estimator” using survey data from the “Survey on small and medium-sized enterprises” (SME, Italian acronym PMI), including professional and artistic activities. For units with 100 employees or more, SBS aggregates are derived from the “Survey on the financial statements of large enterprises” (SCI).</p> <p><b>Valuation principle</b> Accrual</p> <p><b>Organisation collecting data</b> Istat</p> <p><b>Periodicity</b> Annual</p> <p><b>Timeliness</b> t+18 months</p>	<p>Main source for S.11, S.14, S.126</p>

## SECTION D. Description by transaction

### 1. P1 - Output

Table D.1 - Output - Year 2015 (million EUR)

Institutional sectors		Resources	Uses
S.1	Total economy	3,129,282	0
S.11	Non-financial corporations	2,107,366	0
S.12	Financial corporations	129,668	0
S.13	General government	306,140	0
S.14	Households	574,747	0
	<i>S.14/C Consumer Households</i>	<i>169,660</i>	<i>0</i>
	<i>S.14/P Producer Households</i>	<i>405,087</i>	<i>0</i>
S.15	NPISH	11,360	0
S.2	Rest of the world	0	0

Output is estimated by institutional sector and industry. Institutional units are classified, according to their economic activity, in 98 industries which derive from the aggregation of NACE Rev.2 groups (see Annex A.1). Furthermore, institutional units are distinguished and classified into institutional sectors according to the type of activity they perform:

*Producers of market goods and services*

- Financial and non-financial corporations, including non-profit institutions serving (financial and non-financial) corporations, and other market NPIs (S.11, S.12)
- Producer households (S.14P)

*Private producers of goods and services for own final use*

- Consumer households (S.14C)

*Producers of non-market goods and services*

- General Government (S.13)
- Non-profit institutions serving households (NPISHs) (S.15)

The criteria used to allocate units to institutional sectors are described in Section B, paragraph 3.

The table D.2 shows the output by institutional sectors and divisions Nace Rev.2 in the year 2015.

Table D.2 - Output by institutional sectors and divisions Nace Rev.2 – Year 2015

## 2. P.11 – Market output

Table D.3 - Market output - Year 2015 (million EUR)

Institutional sectors		Resources	Uses
S.1	Total economy	2,628,313	0
S.11	Non-financial corporations	2,081,869	0
S.12	Financial corporations	128,553	0
S.13	General government	14,905	0
S.14	Households	402,985	0
	<i>S.14/C Consumer Households</i>	0	0
	<i>S.14/P Producer Households</i>	402,985	0
S.15	NPISH	0	0
S.2	Rest of the world	0	0

Market output is the result of the economic activity carried out by units that belong to the institutional sectors S.11, S.12 (Financial and Non-financial corporations), S.14 (Households) and S.13 (General Government).

As regard to sector S.14, when compiling sector accounts, Producer households (S.14P) are treated separately from Consumer households (S.14C). The estimation procedure of the latter will be described in the relevant paragraph.

The estimation procedure of market output by institutional sector and industry (98 industries according to NACE Rev.2) follows the one used within the framework of annual accounts.

Production of institutional units derives from observed and non-observed activities. Observed activities are directly measured in the basic data from which the national accounts are compiled while non-observed activities are either illegal or deliberately concealed by enterprises to tax authorities in order to avoid tax and social security obligations and are therefore measured with indirect methods.

Output is obtained by an additive procedure and consistency by industry is obtained separately for each component that sums up to total output. The latter is estimated at a micro-level with direct or indirect methods; when the information is not available at such a level of detail, the components are subdivided over sectors with the use of indicators such as labour input or output obtained at previous stages of the estimation process.

For some economic activities, output is directly attributed to an institutional sector as for Financial and insurance activities (NACE Rev.2, Section K) and Public administration and defence; compulsory social security (NACE Rev.2, Section O).

Table D.4 shows the share of each component of output referred to private market producers within each institutional sector.

Table D.4 - Share on total output of each component of market output by private institutional sector – Year 2015 (share in %)

## 2.1. Description of compilation procedures

### USES

Not applicable

### RESOURCES

#### *Sector S.1*

Data for S.1 are obtained as sum of all relevant resident sectors.

#### *Sectors S.11, S.14P*

##### A. Sources

Survey on the financial statements of large enterprises (SCI) (DS6)

Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)

Survey on Economic outcomes of agricultural holdings (RICA-REA) (DS17)

6th General Census of Agriculture in 2010 (DS16)

Farm Structure Survey (FSS) (DS19)

Statistical register of active enterprises (ASIA-Enterprises) (DS20)

Archive of INPS separate management (DS25)

Tax register – revenue agency (DS23)

Census of non-profit institutions (CISINP) (DS22)

##### B. Methods

The estimation procedure of market output is the same for sectors S.11 and S.14P.

The main source used to estimate market output of sectors S.11 and S.14P is the Frame-SBS register. The Frame-SBS component accounts for approximately 81% of total market output (87% of total observed market output) as from Table D.4.

The Frame-SBS register is a statistical register on financial statements of enterprises based on administrative and fiscal data and on survey data. It is partitioned into:

- Frame-SME, for enterprises with 0 to 99 persons employed
- Frame-SCI, for enterprises with 100 or more persons employed

Frame-SBS register includes all units of Asia-enterprises register with the exclusion of units of divisions 65 (insurance corporations and pension funds), 64 (banks, other financial intermediaries and holding corporations) and 66 (financial auxiliaries) with more than 99 persons employed.

Business accounts data provides, for each enterprise, detailed information on revenues and costs items that allow a correct transition from business accounting to national accounts and therefore enables to calculate output (at factor costs). To comply with ESA2010 definition some conceptual adjustments are carried out, in particular:

- exclusion of holding gains/losses from changes in inventories;
- inclusion of the valuation of additions to work in progress;
- exclusion of insurance claims;
- exclusion of capital gains from revenues.

Therefore for units included in the scope of SBS regulation, output is calculated at a micro-level for each institutional unit. As a consequence output by institutional sector and by industry is directly measured from micro-data: information on the unit's economic activity, size class of employment and legal status allows to allocate each enterprise to an institutional sector (S.11, S.14P) according to the criteria previously described in Section B, paragraph 3.

For units out of scope of observation of Frame-SBS, that is units that perform their economic activity in Section A (Agriculture) or in Section L (Real estate activity), and for market non-profit institutions, estimates are obtained with the use of different data sources and methodologies.

For institutional units operating in agriculture (section A of NACE Rev.2), out of scope of SBS regulation, a quantity per price approach is adopted to estimate goods and services produced. This methodology guarantees exhaustiveness of output estimates.

According to this method the quantity of each product (about 170) is multiplied by its average annual price per unit. Quantities and prices are provided by specific Istat surveys. The average prices, at producer prices, are then appropriately adjusted to obtain basic prices. The main sources are:

- Survey on Economic outcomes of agricultural holdings (RICA-REA)
- 6th General Census of Agriculture in 2010 (benchmark year)
- Farm Structure Survey (FSS) (infra-censal years)

For this section, output by industry is disaggregated by institutional sector (sectors S.11, S.14P) by means of an indirect methodology. The indicator used is based on the section's labour input by industry.

For units of section L (Real estate activities), the outcomes of Frame-SBS are integrated with the amount of actual rentals collected by natural persons and declared to tax authorities (Tax and Revenue Agency), that are considered production of Producer households and assigned entirely to sector S.14P.

Output of market NPIs, identified according to the criteria described in paragraph 3 of section B2 are estimated for the benchmark year 2011 with the accounting information available from the Census of Non-profit Institutions and are extrapolated to the following years with appropriate indicators based on Frame-SBS and on employment data.

Social cooperatives are already included in Asia-enterprises and economic data are available in the Frame-SBS system.

Output of market NPIs are assigned to Non-financial corporations (sector S.11) except for Bank Foundations that are classified in the Financial sector (S.12).

Since output is evaluated at factor costs, transition to basic prices is carried out (the estimation of other taxes and other subsidies on production will be described in the relevant paragraphs).

Other adjustments are carried out in order to obtain exhaustive estimates. These components may be referred either to observed or non-observed economy and are included in the *Exhaustiveness* categories N1-N7 of the Process Table.

The exhaustiveness components referred to observed activities are:

1. Non-structured micro-enterprises, that can be identified with the entrepreneur himself (category N5 of the Process Table - *Registered entrepreneur is not included in statistics*), included in the ASIA-LeU register but not in ASIA-Enterprises, are identified by micro-linkage between the Labour force survey and administrative registers.

For these units, the Labour force survey provides information on the hours worked. Output is estimated, for each economic activity, by applying to the total amount of hours worked the hourly value added as detected from Frame-SME for very small enterprises.

These operators are assimilated to Producer households and their output is assigned to sector S.14P.

2. Para-subordinate workers (category N5 of the Process Table - *Registered entrepreneur is not included in statistics*) that are not included in ASIA-Enterprises are identified in the “Archive of National social security Agency separate management”. This data source provides information on their remuneration, that corresponds to their output.

This component is allocated to the Producer households sector (S.14P).

3. Producers included in ASIA-Enterprises but outside SBS scope of observation (category N4 of the Process Table - *Registered legal person is not included in statistics*), that is producers active for less than six months in the year: output is estimated by domain (economic activity, size class and institutional sector) through an indirect method, based on economic information from administrative data and labour input.

Output is disaggregated by sector with the use of output by industry obtained at previous stages (sectors S.11, S.14P).

4. Special Purpose Entities (SPE) (category N4 of the Process Table - *Registered legal person is not included in statistics*). They are not included in ASIA-Enterprises. Their production is estimated on the basis of the financial statements data derived from the InfoCamere archive. For those enterprises with no revenues from sales (about 88% of the identified units) the production at basic prices has been approximated by the sum of production costs. No compensation of employees exists and taxes on production and consumption of fixed capital prove to be negligible; therefore output is the sum of costs for purchase of raw materials and services and for leases and rentals.

Output related to these units is allocated to sectors S.11 and S.12.

Output is then adjusted to include the following non-observed components:

1. Income deliberately concealed by enterprises to tax authorities, either by overstating costs or understating revenues. The availability of a micro-founded database such as Frame-SBS enabled to set up a stratification scheme, based on economic/organizational criteria, which allowed the definition of different estimation models for each cluster. The estimation procedure separates the phase concerning the identification of the under-reporting enterprises from that of the correction of value added (category N6 according to the Process Table - Mis-reporting by the producer). Therefore for this component an indirect estimation procedure was set up at a micro-level; units are allocated to institutional sectors according to their economic activity, size class and legal status according to criteria described in paragraph 3 of section B.
2. Output generated through the undeclared labour input (employees and self-employed) (category N1 of the Process Table - *Producer should have registered*). As a general rule, the average value of output per working hour, re-evaluated to include the under-reporting of output, is applied to the number of hours worked by unregistered workers at a level of institutional sector, economic activity (98 industries: an aggregation of NACE Rev.2 groups) and size class (6 classes:1-5, 6-9, 10-19, 20-99, 100-249, 250 and more)
3. Rents paid by undeclared entrepreneurs, that is, who evade any administrative, fiscal and social security obligation (category N1 of the Process Table - *Producer should have registered*). The estimate is obtained by comparing information from the supply side (Frame-SBS and Tax and Revenue Agency) with information from the demand side (dwelling stratification method for residential rentals and information on expenses for non residential rentals from Frame-SBS). This component is assigned to the Producer households sector (S.14P).
4. Output deriving from illegal activities as drug trafficking, prostitution, smuggling (category N2 according to the Process Table - *Illegal producer that fails to register*). The estimate of output is based on methodological approaches agreed at the European level, which are based mainly on demand indicators. Output mainly affects to the Producer households sector (S.14P).

## Sector S.12

### A. Sources

Financial Statements of Insurance Corporations (DS2)

COVIP Annual Report (DS3)

Supervisory reporting by the FIs to the Bank of Italy (DS8)

Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)

Statistical register of active enterprises (ASIA-Enterprises) (DS20)

InfoCamere archive of financial statements (DS24)

Financial statement of the Bank of Italy (DS38)

### B. Methods

Market output of sector S.12 is estimated separately for the following sub-sectors:

- Central Bank (sector S.121)
- Other monetary financial institutions (MFI) (sectors S.122 and S.123)
- Holding companies (sector S.127)
- Other financial intermediaries, excluding insurance companies and pension funds (OFI) (sector S.125)

- Insurance corporations (sector S.128)
- Pension funds (sector S.129)
- Financial auxiliaries (sector S.126)

Output of the central bank (sector S.121) is defined as the sum of its costs, i.e. intermediate consumption, compensation of employees, other taxes on production and consumption of fixed capital. No FISIM are calculated for central banking authorities. The information source is the financial statement of the Bank of Italy published in the Annual report five months after the end of reference year.

Intermediate consumption includes commission expenses, administrative expenses, expenditure for other personnel (administrators, statutory auditors) and the costs for banknotes production services. Other taxes on production are IRAP (the Italian regional tax on productive activity) and municipal taxes on real estate (ICI until 2011, and IMU from 2012). Since a separate estimate of the capital stock of the Central Bank is not available, consumption of fixed capital cannot be calculated via PIM; hence, Central Bank consumption of fixed capital is approximated with the figures registered in the financial statement.

The revenues of the Central Bank for services provided for direct payment are:

- Rents of buildings;
- Commissions, including: charges payable by participants in TARGET2; charges for the management of securities used as collateral for monetary policy operations; fees on financial services on behalf of General Government - fees for substitute protest declarations; fees for Correspondent Central Banking Model services; fees for the retail clearing system services; fees for the use of Central credit register (Centrale dei Rischi) information;
- The fees for studies and projects include the reimbursements of the Eurosystem NCBs in connection with the development of platforms, applications and IT infrastructures by the Bank of Italy in collaboration with other central bank Providers.

The non-directly allocated part of the output of the Bank of Italy is registered as an intermediate cost of MFIs and OFIs (sub-sectors S.122 and S.125); a counterpart transfer from the central bank to MFIs and OFIs is introduced in the secondary distribution of income account. The final uses of directly allocated output are identified with regard to the user (General Government, households, enterprises, non-resident units).

Output of MFIs and OFIs is made up of explicit charges for financial services provided for direct payments (Non-FISIM output) and FISIM. The FISIM estimation methods are detailed in the relevant paragraph.

The estimate of the non-FISIM output of MFIs is compiled using financial statement data gathered by the Bank of Italy. The source covers the domestic banks, excluding Cassa Depositi e Prestiti (CDP), and the branches of EU banks in Italy included in the List required by Art. 13 of the “Testo Unico delle leggi in materia bancaria e creditizia (TUB)” (Legislative Decree n. 385/93).

The supervisory reporting schemes require the MFIs to separate the Profit and loss data concerning the activity carried out on the national territory from the ones concerning activities carried out abroad through a stable organization. Such detailed information allows to include in the estimates of output and value added the activity of domestic branches of foreign banks, and to exclude the activity of foreign branches of Italian banks. This ensures that only the operations carried out by MFIs in the national territory contribute to the gross domestic product.

Table D.5 shows the procedure for calculating output of financial services provided for direct payment (Non-FISIM output).

Table D.5 - MFI: Output of financial services provided for direct payment (Non-FISIM output)

---

Non-FISIM output (=)
(+) Commission earned
▪ on guaranteed loans;
▪ on credit derivatives;
▪ on management, intermediation and consultancy services;
▪ on sales of products/services of third parties;
▪ on cashing and payment services;
▪ on securitization transactions services;
▪ on factoring services;
▪ on management/operation of multilateral trade/trading system activities;
▪ on current accounts management activities;
▪ on other services;
(+) Other net receipts from services:
▪ Rents from real estate
▪ Receipts from IT services supplied
▪ Recoveries for compensations of employees on temporary transfer, on deposits and current accounts, ...

---

The other financial intermediaries excluding insurance corporations and pension funds (OFIs, sector S.125) include:

- the securities investment firms (SIM);
- the financial intermediaries listed in the Special register of financial companies held by the Bank of Italy as per Art. 107 of the Legislative Decree 385 /93, the payment institutions and the electronic money institutions (EMIs). These operators mainly perform the following activities: financial leasing, consumer credit granting, factoring, merchant banking, securities services.

Output of OFIs is estimated from supervisory data provided by the Bank of Italy. OFIs are subject to supervision by the Bank of Italy, for the reduction of risk exposure and asset and liability stability, and by Consob for transparency and correctness, as established in the “Testo unico delle disposizioni in materia di intermediazione finanziaria (Legislative Decree n.58/98)”. As for MFIs, the reporting schemes allow to measure the activities carried out by the resident OFIs in domestic territory, as to properly reflect the economic flows which contribute to the gross domestic product.

Table D.6 and Table D.7 show the calculation of Non-FISIM output for SIMs and OFIs, respectively.

Table D.6 - SIM: Output of financial services provided for direct payment (Non-FISIM output)

---

NON-FISIM output (=)
(+) Commission earned:
▪ on financial instruments trading
▪ on investment activity;
▪ on consultancy and wealth management
▪ on order collection
▪ on door-to-door of financial products
▪ on management/operation of multilateral trade/trading system
▪ on other services.
(+) Other receipts

---

The supervisory reporting schemes require the SIMs to split the item 50 of the P&L account into commissions, which refer only to the revenue from securities intermediary services, and other receipts.

Table D.7 - Non-FISIM Output of financial intermediaries listed in the special register ex Art.107

---

NON-FISIM Output (=)
(+) Commission earned:
▪ on factoring
▪ on servicing
▪ on cashing and payment services
▪ on financial leasing
▪ due to other funding
▪ on consumer credit services
▪ on credit card issuing and operations
▪ on consultancy services
▪ on the activity of intermediaries in transferable securities and trustees firms
▪ on guaranteed loans
▪ on other services
(+) Other net receipts from services:

---

Insurance output is measured indirectly since insurance corporations do not charge explicit commissions to the insured parties. The output is calculated as the sum of actual premiums earned and implicit premium supplements (i.e.- the income from the investments of technical reserves) net of claims due, and the changes in technical provisions.

The estimates of output of life and non-life insurance are based on a proper reclassification of the financial statements of insurance corporations gathered by IVASS for supervisory purposes. IVASS collects very detailed information (BS, P&L account and its annexes) that cover all insurance corporations authorized to run their insurance and reinsurance activity in Italy. The calculation of output of insurance is reported in Table D.8.

The estimate of the insurance service is consistent with the ESA 2010 criteria and with the guidelines of GNP Committee Task Force on Insurance Measurement. In particular, the estimation methods comply with the most relevant recommendations:

- to exclude realised and unrealised holding gains from insurance output, i.e. supplementary premiums and change in life insurances reserves;
- to exclude income generated by investment of companies own funds from supplementary premiums, on the basis of the ratio: (own funds) / (own funds + technical reserves);
- to exclude claims settlements costs from the calculations of claims due to policy holders.

Table D.8 - Output and intermediate consumption of direct insurance

<p>Output at basic prices =</p> <ul style="list-style-type: none"> <li>+Actual premiums accruing = <ul style="list-style-type: none"> <li>+Premiums written during the period</li> <li>- Change in the reserve for unearned premiums</li> <li>+Balance of other technical items</li> </ul> </li> <li>+Supplementary premiums = <ul style="list-style-type: none"> <li>+Interest received – Interest paid</li> <li>+Dividends received</li> <li>+Real-estate operating surplus</li> <li>- Income from insurer own funds</li> </ul> </li> <li>- Adjusted claims due = <ul style="list-style-type: none"> <li>+Claims paid during the period</li> <li>+Change in reserve for claims outstanding</li> </ul> </li> <li>- Changes in technical reserves = <ul style="list-style-type: none"> <li>+Changes in equalisation reserve</li> <li>+Changes in other technical reserves</li> <li>- Balance of holding gains and losses realised and unrealised</li> <li>- Balance of portfolio account</li> </ul> </li> </ul>	<p>Output at basic prices =</p> <ul style="list-style-type: none"> <li>+Actual premiums accruing = <ul style="list-style-type: none"> <li>+Premiums written during the period</li> <li>- Change in the reserve for unearned premiums</li> <li>+Balance of other technical items</li> </ul> </li> <li>Supplementary premiums = <ul style="list-style-type: none"> <li>+Interest received – Interest paid</li> <li>+Dividends received</li> <li>+Real-estate operating surplus</li> <li>- Income from insurer own funds</li> <li>+Balance between income and charges related to investment for policy holders who bear the investment risk</li> </ul> </li> <li>- Benefits due = <ul style="list-style-type: none"> <li>+Claims paid during the period</li> <li>+Change in reserve for claims outstanding</li> </ul> </li> <li>- Changes in technical reserves = <ul style="list-style-type: none"> <li>+Changes in life insurance reserve</li> <li>+Changes in other technical reserves</li> <li>- Balance of holding gains and losses realised and unrealised</li> <li>- Balance of portfolio account</li> </ul> </li> </ul>
<p>Intermediate Consumption =</p> <ul style="list-style-type: none"> <li>+Operating costs net of personnel costs</li> <li>+Claims settlements costs</li> <li>+Investment management fees</li> <li>+Reinsured services</li> </ul>	<p>Intermediate Consumption =</p> <ul style="list-style-type: none"> <li>+Operating costs net of personnel costs</li> <li>+Claims settlements costs</li> <li>+Investment management fees</li> <li>+Reinsured services</li> </ul>

As to holding gains and losses, they are only present in those insurance policies whose benefits are linked to investment funds or market indexes (linked policies). For such insurance contracts, both the assets in which premiums paid by policy holders are invested and the provisions are valued in the profit and loss account at fair value; they thus implicitly contain changes in financial assets due to financial markets trends. To deduct realised gains (losses) on investment and unrealised capital gains (losses) relating to investment of linked policies, the annexes to the profit and loss account provided by IVASS are used: they provide quite a granular information and, in particular, figures on “profit/losses on the realisation on investments” and “unrealised capital gains/losses on unit-linked policies”, that have been subtracted from supplementary premiums. Only the “balance between income and charges relating to investment for policy holders who bear the investment risk” is to be considered a component of supplementary premiums, since it does not contain capital gains or losses.

The valuation at market prices of the provisions of linked policies implies that also the change of provisions implicitly includes capital gains and losses. Therefore the change in provisions has been adjusted by the balance of realised and unrealised holding gains and losses: if the balance is positive (indicating capital gains), it is deducted from change of reserves, if it is negative (indicating capital losses), it is added to change of provisions.

Income earned on own funds is excluded from supplementary premiums according to the task force recommendations, separately for life and non-life insurance.

Claim settlement costs were excluded from the calculation of claims to be paid to policy holders and classified as intermediate consumptions of insurance corporations.

The non-life insurance - adjusted claims are derived ex-post as actual claims incurred plus the changes in equalisation provisions.

No claims arising from catastrophic losses have been defined: at the moment there is no specific evidence of insurance companies covering the risks of national disasters in Italy.

Although there has been an increase in the supply of this kind of service in the last few years, according to the information available this was not associated with an increase in the demand by the economic operators. The demand for such an insurance service mainly comes from enterprises, since the existing legislation does not provide for the obligatory subscription of such insurance policies by households.

Reinsurance services are defined as the transfer of part of the risks taken from insurance companies to other specialized insurance or reinsurance companies. ESA 2010 introduced a gross recording of the flows between direct insurers and reinsurers. The production of reinsurance companies has been estimated with reference to the indirect portfolio of authorized insurance enterprises, according to the calculation scheme of nonlife insurance. As a matter of fact, in Italy there are no longer specialized enterprises that supply either life or non-life reinsurance services. The methodology, defined in a working group with experts of the National Association of Insurance Companies (ANIA), uses all the available information and implicitly considers all the elements included in the evaluation of the reinsurance service.

Pension funds in Italy have been regulated by Legislative Decree n. 124 of 21st April 1993, which defines the modalities and requirements to set up pension funds. They are supervised by COVIP (the Italian Supervisory Commission on pension funds), that, in turn, reports to the Ministry of Labor and Social Policies.

Pension funds may be classified in the following categories:

- Contractual (*negoziali* in Italian) pension funds (CPF) represent the technical form chosen by the legislator to set up collective complementary social security in Italy; they are the main category introduced by Legislative Decree 124/1993. They are set up on the basis of collective agreements (for employees), or agreements between workers (for self-employed or professional workers), and are possible exclusively for a category of workers under contract or to which the profession of promoters refer (article 3 of Legislative Decree 124/1993). CPF are legally independent from their promoters (article 4 Legislative Decree 124/1993) and have their own statutory bodies to ensure the performance of fund activity and the pursuing of its aims. The fund rules are provided for in a statute and regulation defined by COVIP. The activity of a pension fund must be authorized by COVIP;
- Open (*aperti* in Italian) pension funds (OPF) are established by Article 9 of Legislative Decree 124/1993, and they may be approached by any possible beneficiary, without any constraint due to contract or professional framework. They are directly set up by the same economic subjects that the law entitled to operate pension funds (asset management companies (SGR) and insurance corporations), and are directly proposed to potential beneficiaries by these subjects. The features of the open fund are set up in a regulation drafted according to the scheme established by COVIP. This type of fund is regulated by the rule on “sollecitazione del pubblico risparmio”.
- Pre-existing Funds (*preesistenti* in Italian) (PPF): all the various types of social security existing before the Legislative Decree 124/1993 entered into force could be included into the new regulation framework on complementary social securities, with a defined number of exceptions. PPF could therefore keep operating without requiring any specific authorization but merely informing COVIP.

Output of the pension funds is measured as sum their costs.

Output of holding corporations included in ASIA-Enterprises is estimated through information from the InfoCamere archive. A cost-based approach is followed for units without revenues from the sale of goods and services.

Output of financial auxiliaries (S.126) is calculated on the basis of Frame-SBS for SMEs, following the procedures described for sector S.11 and S.14P. For large enterprises, information on the economic aggregates has been taken from any available administrative source (mainly from the InfoCamere archive).

*Sector S.13*

The estimation method is described in Italy EDP Inventory (<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

*Sector S.2*

Not applicable.

## 2.2. Balancing adjustments across all sectors

The effect due to balancing of supply and use tables within the National Accounts framework is treated as a separate component that must be added to total output. The subdivision over institutional sectors follows an indirect procedure based on output by industry and sector estimated at previous stages. General government and NPISH are not affected by balancing adjustments.

### 3. P.12 – Output for own final use

Table D.9 - Output for own final use - Year 2015 (million EUR)

Institutional sectors		Resources	Uses
S.1	Total economy	207,606	0
S.11	Non-financial corporations	25,497	0
S.12	Financial corporations	1,115	0

### 3.1. Description of compilation procedures

#### USES

Not applicable

#### RESOURCES

*Sector S.1*

- Data for S.1 are obtained as sum of private market producers (S.11, S.12, S.14P), consumer households (S.14C), NPISHs (S.15) and GG (S.13)

*Sectors S.11, S.12, S.14P*

A. Sources

Survey on the financial statements of large enterprises (SCI) (DS6)  
Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)  
Survey on Economic outcomes of agricultural holdings (RICA-REA) (DS17)  
6th General Census of Agriculture in 2010 (DS16)  
Farm Structure Survey (FSS) (DS19)  
Statistical register of active enterprises (ASIA-Enterprises) (DS20)  
Statistical survey on research and development (DS33)

B. Methods

The estimation procedure used for P.12 for S.11, S12 and S.14P is the same.

Output for own final use is included in the *Exhaustiveness* category N7 of the Process Table, and it refers to:

- Integration of output of food and beverage service activities (division 56) in order to consider meals and drinks provided free of charge to employees (compensations in kind); the average cost per meal is applied to the number of employees
- Tips that the employees receive from customers in some economic activities (hotels and restaurants, taxis operation and removal services; section H and I).
- Production of Research and Development, software and original works of art and literature made by private producers on own account.
- Major maintenance performed by the companies on their own buildings

These components are assigned to Financial and non-financial corporations and Producer households (S.11, S.12, S.14P) according to the distribution by institutional sector of the relevant labour input by industry.

*Sectors S.14C*

A. Sources

Household Expenditure Survey (from 2014) (DS5)  
Household Budget Survey (until 2013) (DS27)  
Survey on Economic outcomes of agricultural holdings (RICA-REA) (DS17)  
6th General Census of Agriculture in 2010 (DS16)  
Farm Structure Survey (FSS) (DS19)  
Multipurpose survey on households time use (DS21)  
Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)  
Archive of domestic work relationships (DS29)  
Uniemens archive (DS28)  
General Census of Population and Housing (DS44).

B. Methods

Private producers of goods and services for own final use are Households (S.14C) in their function as consumers. Their production includes:

- a) Production of services of owner-occupied dwellings (imputed rents). In compliance with the Commission Regulation (EC) No. 1722/2005 of 20 October 2005, the estimate of imputed rentals is carried out using a stratification method based on the

stock of owner-occupied dwellings, that are stratified on the basis of different features of dwellings in order to differentiate the average rents used to give a rental value to the dwellings.

An essential element of the stratification method is the information on the stock of dwellings provided for the benchmark year by the 2011 General Census of Population and Housing.

The average rent used in the calculation of output of imputed dwelling services is the same used for the assessment of actual dwelling services output, therefore it excludes charge for insurance, heating, water, electricity, etc. Information on average actual rentals per stratum are obtained from the Household budget survey: respondents to the survey are asked to indicate the monthly rent paid for their main residence net of all other expenses (managing fees, charges for water, heating, electricity etc.). Variables needed to stratify the housing stock are defined on the basis of detailed information collected by the survey and taking into account the sample robustness. Different rent categories are also identified, distinguishing in particular between social housing rents and market rents. A part of the housing stock is represented by government agencies dwellings built to facilitate specific population groups. These rentals, even if economically significant, are lower than market prices and therefore to estimate imputed rentals only the private market rentals are considered. To ensure the consistency of time series and to correct outliers, HBS data on rent are treated with moving averages before they are used for estimates.

- b) Production of agricultural products for own final use. The value of this component is deducted from the total output of the farm sector (Sect. A NACE Rev.2), which is exhaustive by construction, as it is estimated through a quantity per price procedure.
- c) Construction activities of households for own final use: production by households for own gross fixed capital formation, includes dwellings built or enlarged by the households themselves, and own-account construction, including communal construction undertaken by groups of household (ESA 2010, §3.22). Since this is not market-oriented production, in compiling national accounts this activity is assessed with an indirect estimation procedure based on the use of indirect indicators on the hours worked as recorded in the Use of Time survey, as well as of direct information on some aggregates of the output of small enterprises (1–5 persons employed) operating in the sector, provided by Frame-SBS.
- d) Production of services by paid domestic staff: the value of domestic services obtained by employing paid staff by households is valued by the compensation of employees paid, both declared and undeclared. The estimate is therefore based on the components of compensation of employees: wages in cash and in kind and, where present, social contributions (actual and imputed).

The main sources used for own-account production of services generated by employing paid domestic staff by Households as Consumers (S.14C) are:

- National Social Security Institute (INPS) Archive of domestic work relationships: it includes all the information that employers of domestic staff have to provide when compiling the form for the payment of social contributions. In particular, for each domestic employee, the number of hours worked, hourly pay and paid social contribution are available.
- INPS-Uniemens archive: it provides comparable information on doormen, as to the number of hours worked, wages and paid social contribution.

### Sector S.13

The estimation method is described in Italy EDP Inventory (<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

### Sector S.15

#### A. Sources

Statistical survey on research and development (DS33)

#### B. Methods

Survey on research and development activities provides information to estimate R&D for market and non-market non-profit institutions. The survey is conducted using the methods suggested by the OECD Manual on the statistical measurement of R&D activities (Frascati Manual).

### Sector S.2

Not applicable.

## 4. P.13 – Non-market output

### *Sector S.13*

The estimation method is described in Italy EDP Inventory

(<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

### *Sectors S.15*

#### A. Sources

2011 Census of non-profit institutions (CISINP) (DS22)

Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)

Uniemens archive (DS28)

#### B. Methods

Output of non-market NPIs is calculated as the sum of the production costs incurred: compensation of employees, intermediate consumption, consumption of fixed capital, other taxes on production (D29) net of subsidies on production (D39).

For the benchmark year 2011, the estimates of intermediate consumption and compensation of employees were mainly based on census information and administrative data.

For units not covered by CISINP and for which administrative data are not available, a labour-based model is applied: the average hourly values of each aggregate, calculated by industry and by enterprise's size class for NPISHs surveyed by CISINP are grossed up to cover also non-surveyed institutions.

In 2011, 86% of NPISHs output has been estimated using census data; 3.4% using administrative sources and 10.5% via extrapolation models.

Data for the years following 2011 are extrapolated through a labour-based method. The components of output are estimated as follows:

- average wages and salaries are updated by means of Social Security Institute data (Uniemens archive) and grossed up through labour input;
- the same contribution rate (employers' social contributions to wages) of enterprises in the same domains is applied;
- average values per hour worked of intermediate consumption are calculated for the year t-1, by industry;
- they are updated through the ratio Intermediate consumption/compensation of employees calculated for market NPIs in the same domains.

### 5.1. Description of compilation procedures

#### USES

##### Sector S.1

Data for S.1 are obtained as sum of all relevant resident sectors

##### Sector S.11

#### A. Sources

The intermediate consumption of FISIM is calculated on the basis of information on stocks of deposits and loans of S.11 and on the relevant market interest rates applied by MFIs on deposits and loans of S.11. The data used are collected from the intermediaries included in the subsectors S122 and S125 and published by the Bank of Italy in the publications of the series "Statistics of the Bank of Italy" (DS9, DS13).

#### B. Methods

*Domestic FISIM:* the intermediate consumption of FISIM on deposits of S.11 is calculated by applying to the quarterly average stocks of deposits collected by MFIs (S.122) from S.11 units, the spread between the internal reference rate (see below) and the average market interest rate applied by MFIs on deposits.

The intermediate consumption of FISIM on loans of S.11 is calculated by applying to the quarterly average stocks of loans granted by intermediaries included in S.122 and S.125 to units included in S.11, the spread between the average market interest rate applied by MFIs on loans and the internal reference rate.

The applied market interest rates and the corresponding stocks by maturity are available for loans granted to sector S.11. For this sector the average market interest rate is calculated as the average of the interest rates by maturity weighted on the underlying stocks.

The stock of loans is considered net of securitized loans.

*Imports of FISIM:* please refer to par. 5.2 below.

##### Sector S.12

Intermediate consumption of FISIM is only calculated for FIs other than MFIs and OFIs, namely financial auxiliaries(S.126), insurance corporations(S.128), pensions funds(S.129) and holding corporations(S.127).

*Domestic FISIM*: the intermediate consumption of FISIM on deposits of FIs is calculated by applying to the quarterly average stocks of deposits collected by MFIs (S.122) from these units, the spread between the internal reference rate (see below) and the average market interest rate applied by MFIs on deposits.

The intermediate consumptions of FISIM on loans of FIs is calculated by applying to the quarterly average stocks of loans granted by intermediaries included in S.122 and S.125 to FIs indicated above, the spread between the average market interest rate applied by MFIs on loans and the internal reference rate.

The stock of loans is considered net of securitized loans.

*Imports of FISIM*: please refer to par. 5.2 below

### *Sector S.13*

#### A. Sources

The intermediate consumption of FISIM is calculated on the basis of information on stocks of deposits and loans of S.13 and on the relevant market interest rates applied by MFIs on deposits and loans of S.13. The data used are collected from the intermediaries included in the subsectors S122 and S125 (DS9, DS11, DS13).

#### B. Methods

*Domestic FISIM*: the intermediate consumption of FISIM on deposits of S.13 is calculated by applying to the quarterly average stocks of deposits collected by MFIs (S.122) from S.13 units, the spread between the internal reference rate (see below) and the average market interest rate applied by MFIs on deposits.

The intermediate consumption of FISIM on loans are calculated by applying to the quarterly average stocks of loans granted by intermediaries included in the S.122 and S125 subsectors to units included in S.13 sector, the spread between the average market interest rate applied by MFIs on loans and the internal reference rate.

The stock of loans is considered net of securitized loans.

*Imports of FISIM*: please refer to par. 5.2 below

### *Sector S.14*

#### A. Sources

The intermediate and final consumption of FISIM are calculated on the basis of information on stocks of deposits and loans of S.14 and on the relevant market interest rates applied by MFIs on deposits and loans of S.14. The data used are collected from the intermediaries included in the subsectors S.122 and S.125 and published by the Bank of Italy in the publications of the series "Statistics of the Bank of Italy" (DS9, DS13).

#### B. Methods

*Domestic FISIM*: the intermediate and final consumptions of FISIM on deposits are calculated by applying to the quarterly average stocks of deposits collected by MFIs (S.122) from producer and consumer households, the spread between the internal reference rate (see below) and the average market interest rate applied by MFIs on deposits.

The average market interest rate is obtained as the average of the rates by maturity (with a maturity of less than 2 years) weighted by the underlying stock.

An ad hoc estimate is made for the sub-sectors of households as producers (S.14P) and as consumers (S.14C), for which separate stocks are published by the Bank of Italy.

Intermediate consumptions and final consumptions of FISIM on loans are calculated by applying to the average stocks (average of the quarters) of loans granted to consumer and producer households by intermediaries included in the S.122 and S.125 sub-sectors, the spread between the average market interest rate applied by MFIs on loans and the internal reference rate.

An ad hoc estimate is made for mortgages contracted by households for the purchase of dwellings and is totally allocated to Intermediate consumption, both whether the mortgage is got by S.14C or S.14P.

The relative average market interest rates are obtained as the average of the weighted rate-based interest rates for the underlying stock.

The stock of loans is considered net of securitized loans.

*Imports of FISIM:* please refer to par. 5.2 below

### *Sector S.15*

#### A. Sources

The intermediate consumption of FISIM is calculated on the basis of information on stocks of deposits and loans to S.15. The data used are collected from the intermediaries included in the subsectors S.122 and S.125 and published by the Bank of Italy in the publications of the series "Statistics of the Bank of Italy" (DS9, DS13).

#### B. Methods

The intermediate consumption of FISIM on deposits of S.15 is calculated by applying to the quarterly average of stocks of deposits collected by MFIs from S.15 units, the differential between the internal reference rate (see below) and the average market interest rate applied from MFIs on deposits.

The intermediate consumption of FISIM on loans is calculated by applying to the average stocks (average of the quarters) of loans granted by intermediaries included in the S.122 and S.125 subsectors to units included in S.15 sector, the spread between the average market interest rate applied by MFIs on loans and the internal reference rate.

No interest rate data exist for deposits and loans of S.15 from 2004 to 2017: hence the interest rates available for 2004 have been updated by applying the trend of the interest rates applied by S.122 to S.14. From 2018 on, the Bank of Italy will provide a specific interest rate for loans of S.15.

The stock of loans is considered net of securitized loans.

### *Sector S.2*

See paragraph 16 of Section D.

## **RESOURCES**

### *Sector S.1*

Data for S.1 corresponds to resources of S.12.

### *Sector S.11*

Not applicable

## *Sector S.12*

### A. Sources

The output of FISIM is calculated on the basis of information on stocks of deposits and loans and on the market interest rates applied by banks on deposits and loans. The data used are collected from the intermediaries included in the subsectors S122 and S125 and published by the Bank of Italy in the publications of the series "Statistics of the Bank of Italy" (DS9, DS11, DS13).

### B. Methods

Output of FISIM is calculated through a bottom-up methodology. The production is the sum of the FISIM on deposits of financial intermediaries of sub-sector S.122 and the FISIM on loans granted by intermediaries included in sectors S.122 and S.125 "consumed" by each institutional sector different from S.121, S.122 and S.125.

$$\text{DOMESTIC OUTPUT OF FISIM} = \sum_i \text{FISIM ON DEPOSITS}_i + \sum_i \text{FISIM ON LOANS}_i$$

Where  $i$  represents a generic institutional sector different from FISIM producers.

## *Sector S.13, S.14, S.15*

Not applicable

## *Sector S.2*

See paragraph 19 of section D.

### **5.2. Allocation of imported FISIM by institutional sector**

FISIM imported by each institutional sector, excluding the resident producer sectors, are calculated as the sum of FISIM imported on loans and FISIM imported on deposits. FISIM imported on loans and deposits of each resident institutional sector are estimated through a top-down approach: the total value of imported FISIM on loans and deposits estimated by the Bank of Italy (DS10) is allocated to user institutional sectors according to the underlying stocks (DS13), in order to properly allocate imported FISIM between final and intermediate consumption.

### **5.3. Additional details: internal and external reference rates**

To calculate FISIM produced and consumed internally an internal reference rate is used. The *internal reference rate* is calculated as the ratio of the interest receivable on loans within and between subsectors S.122 and S.125 to the stock of loans within and between subsectors S.122 and S.125. The calculation does not include some operators of the sub-sector S.125, such as Confidi, consumer credit operators and credit card providers. The data on such categories of operators are not included because their implicit interest rate is particularly unstable, and their inclusion in the internal reference rate calculation would have negative repercussions on the total estimate, and would cause an increase in the volatility of the results. The data not included in the calculation represent a small amount of the loans between intermediaries in the sectors S.122 and S.125.

The information used to calculate the internal reference rate is the supervisory reports carried out by monetary financial institutions and other financial intermediaries authorized by the Bank of Italy (DS8).

The calculation of the imported and exported FISIM requires the use of an *external reference rate*. The external reference rate is calculated as the ratio between interest accrued on loans and deposits and the stock of loans and deposits between resident financial intermediaries (S.122 and S.125) and non-resident financial intermediaries (S.122 and S.125).

## 6. P.2 – Intermediate Consumption

Table D.12 - Intermediate Consumption - Year 2015 (million EUR)

Institutional sectors		Resources	Uses
S.1	Total economy	0	1,644,030
S.11	Non-financial corporations	0	1,369,866
S.12	Financial corporations	0	53,986
S.13	General government	0	89,940
S.14	Households	0	122,471
	<i>S.14/C Consumer Households</i>	<i>0</i>	<i>9,584</i>
	<i>S.14/P Producer Households</i>	<i>0</i>	<i>112,887</i>
S.15	NPISH	0	7,768
S.2	Rest of the world	0	0

Intermediate consumption by institutional sectors is estimated by industry (see Table D.14). In general, the data sources and the methodological scheme used to estimate P.2 are similar to the ones used for P.1.

### 6.1. Description of compilation procedures

#### USES

##### *Sector S.1*

Data for S.1 are obtained as sum of all relevant resident sectors.

##### *Sectors S.11 and S.14P*

#### A. Sources

Survey on the financial statements of large enterprises (SCI) (DS6)

Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)

Survey on Economic outcomes of agricultural holdings (RICA-REA) (DS17)

6th General Census of Agriculture in 2010 (DS16)

Farm Structure Survey (FSS) (DS19)

Statistical register of active enterprises (ASIA-Enterprises) (DS20)

2011 Census of non-profit institutions (CISINP) (DS22)

#### B. Methods

The estimation procedure of intermediate consumption is the same for sectors S.11 and S.14P.

The main source used to estimate intermediate consumption of S.11 and S.14P is the Frame-SBS register. The Frame-SBS component accounts for approximately 91% of total intermediate consumption (Table D.13).

In order to comply with ESA2010 definitions, the following conceptual adjustments are carried out on basic data:

- exclusion of holding gains/losses from changes in inventories;
- exclusion of rents of lands from intermediate consumption;
- adjustment of non-life insurance premiums in order to include in intermediate consumption the insurance service only;
- exclusion of capital losses from expenditures.

Table D.13 - Share on total intermediate consumption of each component of intermediate consumption for market producers (share in %)

	Non-financial corporations	Finanacial Corporations	Producer Households	Market producers
SBS	96.7	14.3	60.9	91.1
Other sources (agriculture, dwelling services, financial services)	0.3	82.6	17.8	4.5
Registered legal persons not included in SBS	0.2	0.0	0.0	0.1
Registered entrepreneur not included in the statistical registers	0.0	0.0	16.3	1.2
Other conceptual adjustments	0.0	0.0	0.0	0.0
NPI	1.0	0.3	0.0	0.9
FISIM	1.7	2.6	3.1	1.8
Other exhaustiveness adjustments	0.2	0.3	0.2	0.2
<b>Total observed output</b>	<b>100.0</b>	<b>100.0</b>	<b>98.3</b>	<b>99.9</b>
Mis-reporting	0.0	0.0	0.0	0.0
Illegal	0.0	0.0	1.7	0.1
<b>Total non-observed output</b>	<b>0.0</b>	<b>0.0</b>	<b>1.7</b>	<b>0.1</b>

Therefore for units included in the scope of SBS regulation, intermediate consumption is calculated at a micro-level for each institutional unit. As a consequence output by institutional sector and by industry is directly measured from micro-data: information on the unit's economic activity, size class of employment and legal status allows to allocate each enterprise to an institutional sector (S.11, S.14P) according to the criteria previously described in paragraph 3 of Section B.

For units out of scope of observation of Frame-SBS, that is units that perform their economic activity in Section A (Agriculture) or in Section L (Real estate activity), and for market non-profit institutions, estimates are obtained with the use of different data sources and methodologies.

Table D.14 - Intermediate consumption by sectors and divisions Nace Rev.2 – Year 2015

Divisions	S.11	S.12	S.13	S.14/P	S.14/C	S.14	S.15	Total

For institutional units operating in agriculture (section A of NACE Rev.2), out of scope of SBS regulation, a quantity per price approach is adopted to estimate intermediate consumption.

The quantities are taken from statistical surveys that collect detailed data for each item. The prices used are those collected through the survey on prices of products purchased by farmers. The other expenses, such as agricultural services and other goods and services, are estimated through specific elaborations on RICA REA survey data.

For this section, intermediate consumption by industry is disaggregated by institutional sector (sectors S.11, S.14P) by means of an indirect methodology. The indicator used is based on the section's labour input by industry.

For units of section L (Real estate activities), intermediate consumption of Frame-SBS is integrated with expenses for maintenance carried out by natural persons for non-residential buildings they own and rent out, which are measured using the costs/output ratio of dwellings. This amount is entirely allocated to the sector of Producer Households (S.14P).

Intermediate consumptions of market NPIs are estimated for the benchmark year 2011 with the accounting information available from the Census of Non-profit Institutions and are extrapolated to the following years with appropriate indicators based on Frame-SBS and on employment data.

Social cooperatives are already included in Asia-enterprises and economic data are available in the Frame-SBS system.

Intermediate consumptions of market NPIs are assigned to Non-financial corporations (sector S.11) except for Bank Foundations that are classified in the Financial sector (S.12).

Other conceptual adjustments are necessary to account for:

1. inclusion of FISIM. FISIM are calculated separately for each institutional sector. This component of intermediate consumption is indirectly subdivided for each sectors across industry on the basis of the structure of output.
2. exclusion from the intermediate consumption of expenses relating to research and development purchases, as well as those incurred for mineral exploration. The first component is allocated by sector with an indicator based on intermediate consumption obtained at previous stages of the estimation procedure; as for mineral exploration the component is attributed to Non-financial corporations (sector S.11).

For the exhaustiveness adjustments that refer to the activities listed below, the sources used, the estimation method and the allocation to institutional sectors is as for P.1:

1. Non-structured micro-enterprises, that can be identified with the entrepreneur himself (category N5 of the Process Table - *Registered entrepreneur is not included in statistics*)
2. Producers included in ASIA-Enterprises but outside SBS scope of observation (category N4 of the Process Table - *Registered legal person is not included in statistics*)
3. Special Purpose Entities (SPE) (category N4 of the Process Table - *Registered legal person is not included in statistics*)

4. Rents paid by undeclared entrepreneurs, that is those evade any administrative, fiscal and social security obligation (category N1 of the Process Table - *Producer should have registered*)
5. Income deriving from illegal activities

### *Sector S.12*

#### A. Sources

Financial Statements of Insurance Corporations (DS2)

COVIP Annual Report (DS3)

Supervisory reporting by the FIs to the Bank of Italy (DS8)

Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)

Statistical register of active enterprises (ASIA-Enterprises) (DS20)

InfoCamere archive of financial statements (DS24)

Financial statement of the Bank of Italy (DS38)

#### B. Methods

The intermediate consumption of the financial corporations is estimated separately by sub-sectors as for output.

The approach used for the Central Bank is treated when describing P.11 (paragraph 2, sector S.12).

The estimates of the intermediate consumption of MFIs is compiled using financial statement data gathered by the Bank of Italy. Table D.15 shows the procedure for calculating intermediate consumption of MFIs.

Table D.15 - MFI: Intermediate consumption

Intermediate consumption (=)
(+ Commission paid:
<ul style="list-style-type: none"> <li>▪ on guaranteed loans;</li> <li>▪ on credit derivatives;</li> <li>▪ on management and intermediation services;</li> <li>▪ on cashing and payment services</li> <li>▪ other services</li> </ul>
(+ Other operating costs
<ul style="list-style-type: none"> <li>▪ IT expenses;</li> <li>▪ Paid rents;</li> <li>▪ expenses on goods and services;</li> <li>▪ non-life insurance service charges;</li> <li>▪ advertising expenses;</li> <li>▪ expenses for other personnel, administrators, statutory auditors</li> </ul>

---

“Commission paid” are defined by the item 50 of the P&L account; the “Other operating costs” are defined by the item 150 sub b) of the P&L account. Intermediate consumption is adjusted to include the expenses for administrators, statutory auditors and other personnel which are registered in compensation of employees in the financial statement (item 150 sub a) of the P&L account.

Intermediate consumption of OFIs is estimated from supervisory data provided by the Bank of Italy. Table D.16 and Table D.17 show the calculation of intermediate consumption for SIMs and OFIs, respectively.

Table D.16 - SIM: Intermediate consumption

---

The estimate of intermediate consumption for insurance corporations is based on a proper reclassification of the financial statements of insurance corporations gathered by IVASS for supervisory purposes. The calculation of intermediate consumption is reported in Table D.9 of paragraph 2.

The intermediate costs of reinsurance companies have been estimated with reference to the indirect portfolio of authorized insurance enterprises, according to the calculation scheme of non-life insurance. The reinsurance service associated with the transfer and retrocession of premiums has been included in the estimate of the intermediate consumption of non-life and life insurance companies.

Intermediate consumption of holding corporations included in ASIA-Enterprises is estimated through information from the InfoCamere archive.

Intermediate consumption of financial auxiliaries (S.126) is calculated on the basis of Frame-SBS for SMEs, following the procedures described for sector S.11 and S.14P. For large enterprises, information on the economic aggregates has been taken from any available administrative source (mainly from the InfoCamere archive).

### *Sector S.13*

The estimation method is described in Italy EDP Inventory

(<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

### *Sector S.14C*

#### A. Sources

Household Expenditure Survey (from 2014) (DS5)

Household Budget Survey (until 2013) (DS27)

General Census of Population and Housing (DS44).

#### B. Methods

This transaction for consumer households (S.14C) includes:

- a) intermediate consumption related to services of owner-occupied dwellings (imputed rents) includes FISIM and the ordinary maintenance not typically carried out by tenants. Expenditure for decoration, maintenance and repair of dwellings not typically carried out by tenants has been estimated using two main sources of information: the Household budget survey (HBS) and the Housing Census. In the benchmark year, data on the stock of dwellings are provided at a high level of detail by the Housing Census (HC) available every ten years. The HBS is a sample survey that provides data on actual rents and includes a specific section on minor maintenance of dwellings. The same general approach is used to estimate the output and the intermediate consumption of maintenance and repairs needed to keep the dwellings in good working order. The method adopted is based on the 'actual average expenditure' per square meter (for tenants and owners) and it has been calculated with the aim to standardize expenditures with respect to surface of dwellings. In order to obtain the total value of intermediate consumption, the average expenditure has been grossed up to the whole stock of dwellings measured by the HC, detailed for typologies of dwellings and expressed in terms of square meters. Costs for insurance, heating, water, electricity etc., are excluded from the calculation of output, and as a consequence they are excluded from intermediate consumption.
- b) Intermediate consumption related to construction activities of households for own final use; costs related to production by households for own gross fixed capital formation. It includes dwellings built or enlarged by the households themselves, and own-account construction, including communal construction undertaken by groups of household (ESA 2010, §3.22). Since this is not market-oriented production, in compiling national accounts this activity is assessed with an indirect estimation procedure.

### *Sector S.15*

#### A. Sources

2011 Census of non-profit institutions (CISINP) (DS22)

Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)

## B. Methods

Intermediate consumption of non-market NPIS is mainly based on census information and administrative data. For units not covered by CISNP and for which administrative data are not available, a labour-based model is applied.

### *Sector S.2*

Not applicable.

## **RESOURCES**

Not applicable

### **6.2. Balancing adjustments across all sectors**

The effect due to balancing of supply and use tables within the National Accounts framework is treated as a separate component that must be added to total intermediate consumption. The subdivision over institutional sectors follows an indirect procedure based on intermediate consumption by industry and sector estimated at previous stages. General government and NPISHs are not affected by balancing adjustments.

## **7. P31 - Individual final consumption expenditure**

The estimation method is described in Italy EDP Inventory

(<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

Sector S.14

*Household final consumption expenditure (HFCE)* is estimated according to the functional classifications (COICOP), that groups expenditure on goods and services in homogenous categories according to the purpose. To include HFCE the SUT system, it must be classified by product, according to CPA: hence, a bridge table is applied to switch from a functional classification to a product classification. The bridge table is a rectangular matrix of 256 groups of products and 62 functions.

The main sources used for estimating HFCE are:

- Household Expenditure Survey (HBS)
- Census of Population and Housing
- Survey on aspects of daily life
- Other Istat surveys
- Commodity-flow method
- Stratification of the housing stock (to estimate expenditure on actual and imputed rents)
- Administrative and other sources.

The use of surveys on the demand side and their integration with other sources of information ensures a good coverage, since no source, by itself, is appropriate for estimating the overall consumption by COICOP item. To give an example, the reliability of HBS data is high for non-durable goods (e.g. food) and much lower for semi-durable and durable goods, whereas the reliability of the commodity flow method is high for durable and semi-durable goods, and low for non-durable goods. The comparison of independent sources allows to capture a part of non-observed economy and to integrate phenomena that can hardly be measured on the basis of information collected from households.

HFCE is adjusted to include FISIM.

Consumption of goods and services stemming from illegal activities (drugs, smuggled tobacco and prostitution) are also added, while some goods purchased and used in the production process by illegal operators are reclassified into intermediate consumption.

*A demand side approach is applied for the trafficking of illicit drugs, based on a quantity per price model: the consumption expenditure is equal to the number of users (consumers) multiplied by the average consumed quantity and by street prices. A supply side approach is adopted to estimate prostitution services, that takes into account the number of different types of prostitution (i.e., street, apartment, night club) and the relevant variables (average costs, daily average performances per year, intermediate consumption). Smuggling of cigarettes is estimated through a supply-side approach, too, based on information on the amount of goods seized, on import and retail prices of goods*

*smuggled as well as on some assumptions (specifically, on the seizure rate<sup>20</sup> and on the share of illicit import of cigarettes that will be used in the domestic market).*

#### *Sector S.15*

*Final consumption expenditure of NPISHs* is all individual. The estimate is derived from output calculation. Referring to non-market production units, output is evaluated as the sum of costs incurred for its implementation (intermediate consumption, compensation of employees, depreciation and other production taxes, net of subsidies for production). Final consumption expenditure is obtained from output subtracting expenses incurred in the production of goods used as investments for own use (own-account production of software and research and development) and as payments for sales of goods and services to households (payments for non-market output). For the benchmark year 2011, Non-Profit Institutions (NPIs) expenditure estimation was based on information provided by the 2011 **Non-profit Institutions Census** (CISINP). This source allowed a direct estimation method of the economic flows for the detected non-market NPIs (NPISHs); then an extrapolation model was applied for active NPISHs not covered by the census. The availability of census data made it possible to prepare a generalized estimation approach for the different categories of non-profit institutions, with the only exception of operators exclusively dedicated to the activity of religious organizations in worship practice, which are not covered by the census. In the years different from the benchmark year, extrapolation methods are used to compile the flows of NPIs, both market and non-market (NPISHs), excluding Social cooperatives, that are included in the scope of Frame-SBS. As a matter of fact, not any annual survey exists for these units and an indirect approach is performed, through a labour-input based model.

Every year labor input in terms of jobs and hours worked is estimated for NPI, separately for market and non-market units.

As for NPISHs the components of output, it is compensation of employees and intermediate consumption, are updated as follows:

- average wages and salaries are updated by means of Social Security Institute data (Uniemens archive) and grossed up through labour input;
- the same contribution rate (employers' social contributions to wages) of enterprises in the same domains is applied.

S.15	NPISH	0	0
S.2	Rest of the world	0	0

### 8.1. Description of compilation procedures

Final consumption expenditure (P.3) by government includes two categories of expenditures:

- the value of the goods and services produced by general government itself (P.1) other than own-account capital formation (corresponding to P.12), market output (P.11) and payments for non-market output (P.131);
- purchases by general government of goods and services produced by market producers that are supplied to households, without any transformation, as social transfers in kind (D.632). General government pays for these goods and services that the sellers provide to households.

While (b) are classified as individual consumption expenditure (P.31), services in (a) can be both individual (for example, education and health services directly provided by S.13), and collective (defence, public order and safety).

The proper evaluation of final consumption expenditure for General Government and its subsectors, is achieved through the following steps:

- the analysis of produced and consumed good and services (output);
- the distinction between market and non-market services;
- the analysis of revenues from sale of output and, of expenditure for social services in kind.

The correct allocation of individual and collective services is obtained through the functional classification *COFOG*

### 9.1. Description of compilation procedures

#### USES

##### Sector S.1

A number of different methods are used to compile gross fixed capital formation (GFCF), namely:

- commodity-flow approach;
- expenditure approach;
- quantity per price approach;
- other indirect approaches.

Through the *commodity-flow approach*, the value of goods intended for capital formation is calculated by subtracting from the total amount of resources of capital goods the amount intended for other uses. The estimate is made at 6 digits of the CPA classification detail. It is used to calculate most part of capital formation in machinery and equipment, in intellectual property products (purchased software and artistic originals), in agricultural assets (livestock) and in dwellings (services of purchases and sales of residential and non-residential real estate on own assets);

Another method widely used in estimating gross fixed capital formation is the *expenditure approach*, using the accounting documentation that reports the expense incurred by enterprises for the purchase of capital goods.

The *quantity per price approach* is mainly used in the estimate of the new private non-residential and residential buildings, of legal expenses.

Finally, for certain types of capital formation, calculation methods are used that cannot be directly ascribed to the three approaches described above, and that do not have common characteristics. *Indirect approaches* contribute significantly to the estimation of artistic originals, software produced for own final use, research and development.

Some adjustments for exhaustiveness are made, in particular an estimate of unauthorized buildings is included.

In 2015 capital formation in construction represents 48% of total gross fixed capital formation (GFCF) (26% of which AN.111 residential buildings and 22% AN.112 other structures and AN.113 land improvements), capital formation in AN.113 machinery and equipment 35%, capital formation in AN.115 cultivated biological resources 0.2% and capital formation in AN.117 intellectual property products 17% (of which AN.1171 research and Development 8%).

## *Sector S.11*

### A. Sources

Survey on financial statements of large enterprises (SCI) (DS6)

Survey on small and medium-sized enterprises and on the exercise of arts and professions (PMI) (DS7)

Economic outcomes of agricultural holdings (RICA-REA) (DS17)

Residential and non-residential real estate sales (DS30)

UNRAE vehicle register (DS31)

### B. Methods

P.51G by institutional sector is estimated at a high level of detail, by industry (98) and with the following asset breakdown:

- dwellings (part of AN.111),
- costs of ownership transfer for residential buildings (part of AN.111),
- buildings other than dwellings (AN.1121),
- costs of ownership transfer for other buildings (part of AN.1121),
- other structures (AN.1122),
- land improvements (AN.1123),
- road transport equipment (new one) (part of AN.1131),
- road transport equipment (second hands one) (part of AN.1131),
- repair of motor vehicles (part of AN.1131),
- aircraft and satellites (part of AN.1131),
- locomotives and railway rolling stock (part of AN.1131),
- ships (part of AN.113) (part of AN.1131),
- hardware (part of AN.1132),
- communication equipment (part of AN.1132),
- other machinery and equipment (part of AN.1139),
- furniture (part of AN.1139),
- weapon systems (AN.114),
- cultivated biological resources - tree, crop and plant resources yielding repeat products (part of AN.115),

- cultivated biological resources - animal resources yielding repeat products (part of AN.115),
- research and development (AN.1171),
- mineral exploration (AN.1172),
- software and databases (AN.11731+AN.11732),
- entertainment, literary or artistic originals (AN.1174).

The estimates of GFCF by institutional sector are obtained applying a top-down approach: in every industry, the value of GFCF by asset calculated for S1 is appropriately distributed to all sectors engaged in that activity, given some constraints for GFCF of S.13, S.12 and S.15, as described below.

Therefore, by construction GFCF by institutional sector (reported in table 8. Non-financial accounts by sector, ESA 2010 TP) is totally consistent with:

- the value of GFCF calculated for Total economy (S.1), recorded in the supply and use table and included in the GDP value);
- the value of GFCF by industry and by asset (table 22. Cross-classification of gross fixed capital formation by industry and by asset, ESA 2010 TP);
- the value of GFCF for General government within the consolidated annual account of General government.

The methodology is carried out in three phases:

- an independent estimation of GFCF value is calculated for the following sectors: Financial corporations (see below, Sector S.12), General government (see below, Sector S.13) and Non-profit institutions serving households (see below, Sector S.15), by industry and by asset; estimates for these sectors, in fact, rely on specific sources and methods;
- from the total value of GFCF of S.1, by industry and by asset, the values calculated in the first step are subtracted;
- finally, the remaining part of GFCF is assigned to Non-financial corporations and Households, by industry and by asset on the basis of relevant shares (partition coefficients). The procedure to derive these shares differs by type of asset, according to the data sources.

GFCF in **dwellings** (net of S.12, S.13 and S.15) is divided using information derived from residential and non-residential real estate sales (DS30). For every transaction the following information is available:

- date,
- type of building,
- size,
- price,
- any tax paid on the transactions,
- nature of the seller/purchaser: individuals (i.e. private persons, PP) or others (NPP)
- if the seller is other than a private person (NPP), also the fiscal code is indicated.

Dwellings owned by PP are totally assigned to Households. Information on taxes paid for every transaction allows to get more detailed estimates, in particular the distinction between:

- dwellings purchased by households for own-occupancy as residence home (for which particular tax relieves exist), assigned to consumer households, S.14C;
- households' dwellings purchased for investment purposes and rented, assigned to producer households S.14C.

As to NPP, in order to assign the acquisition/disposal to the relevant buyer/seller institutional sector, information provided by DS30 is matched with statistical registers (ASIA Enterprises-DS20, S.13 list and other registers) by fiscal code. On the basis of the information provided by such sources (size class/legal form/activity of the unit), it is possible to identify the institutional sector of each unit, according to the Italian criteria used in National Accounts for defining institutional sectors.

For **other types of asset** (hardware; furniture; machinery and equipment; non-residential buildings; land improvements; tree, crop and plant resources yielding repeat products; animal resources yielding repeat products; software and databases):

- in industries where S.11 or S.14P represent more than 95% (in terms of hours worked), GFCF by asset is divided between the two sectors using the weight of each sector (% in terms of hours worked);
- in all the other industries, GFCF by asset is assigned to S.11 and S.14 on the basis of information derived from structural business statistics (SBS): Survey on financial statements of large enterprises (SCI) (DS6), Survey on small and medium-sized enterprises and on the exercise of arts and professions (PMI) (DS7), Economic outcomes of agricultural holdings (RICA-REA) (DS17). They represent the main sources used to calculate P.51G by industry, too.

From SBS, the values  $a_{kji}$  are obtained, where:

$a$  = acquisitions of asset  $j$ , in industry  $i$ , for units with size class + legal form  $k$

$i$  (1,..., 98) = industry

$j$ (1,..., 8) = asset (hardware; furniture; machinery and equipment; non-residential buildings; land improvements; tree, crop and plant resources yielding repeat products; animal resources yielding repeat products; software and databases).

$k$  (1,2) where  $k = 1$  identifies enterprises with size class 1-5 people employed and legal form sole proprietorships and simple partnerships;

$k = 2$  identifies enterprises with size class 6+ people employed.

According to the Italian criteria used to define S.11 and S.14P (see paragraph 3 of section B),

- $a_{1ji}$  is a first raw estimate of GFCF calculated for Producer households in asset  $j$  in industry  $i$ ;
- $a_{2ji}$  is a first raw estimate of GFCF calculated for Non-financial corporations in asset  $j$  in industry  $i$ .

Then the weight of each sector is calculated:

$$w_{sij} = \frac{a_{kij}}{a_{.ij}}$$

where

$s$  = sector (S.11 or S.14)

$a_{.ij} = a_{1ij} + a_{2ij}$

This weight  $w_{sij}$  represents the *partition coefficient* used to divide the amount of GFCF by industry, **net** of General government, Financial corporations and Non-profit institutions serving households:

$$GFCF_{sij} = [GFCF_{S.1ij} - (GFCF_{S.12ij} + GFCF_{S.13ij} + GFCF_{S.15ij})] \times w_{sij}$$

where

$GFCF_{sij}$  = GFCF of sector  $s$  (Non-financial corporations or Households) in industry  $i$  and asset  $j$

$GFCF_{S.1ij}$  = GFCF of S.1 in industry  $i$  and asset  $j$

$GFCF_{S.12ij}$  = GFCF of S.12 in industry  $i$  and asset  $j$

$GFCF_{S.13ij}$  = GFCF of S.13 in industry  $i$  and asset  $j$

$GFCF_{S.15ij}$  = GFCF of S.15 in industry  $i$  and asset  $j$

As to **non-residential buildings**, a share of the total is assigned to Households as producers, S.14C, that represents the investment by natural persons (not covered by SBS as they are not enterprises) who acquire non-residential buildings in order to rent them: in this case a market output of households is identified (NACE Div. Real estate activities 68, Renting and operating of own or leased real estate, 68.2).

Such a share of the total GFCF in non-residential buildings has been calculated as the percentage of non-residential buildings rented by natural persons: this information is provided by the Revenue Agency, that makes available the distribution of the stock of non-residential buildings by type of owner (individuals/enterprises) and by type of use (instrumental buildings/buildings acquired for investment purpose): in average around 14% of the total non-residential buildings are rented by the owners who are individuals and are then assigned to Producer Households.

The remaining share of GFCF in non-residential buildings is assigned to all the other sectors (S.11, S.12, S.13, S.15) and to the small enterprises included in S.14P. The same procedure described above for the other assets (using SBS information on acquisitions) is used:

$$GFCF_{sij} = [GFCF_{S.1ij} - (GFCF_{S.14i} + GFCF_{S.12ij} + GFCF_{S.13ij} + GFCF_{S.15ij})] \times w_{sij}$$

where

$s$  = sector (S.11 or S.14-enterprises)

$j$  = non-residential buildings

$i$  = industry

$GFCF_{S.14i}$  = GFCF in non-residential buildings of S.14-individuals = 14% GFCF in non-residential buildings calculated S.1.

For GFCF in **road transport equipment**, the same procedure is used but *partitional coefficients* are calculated from an administrative data source, the public motor vehicle register (DS31), provided to Istat by UNRAE (Unione Nazionale Rappresentanti Autoveicoli Esteri, Association of foreign car makers), at micro level.

The register includes the following information:

- brand, model, type of supply, engine displacement and other technical variables for

the vehicle;

- fiscal code of both, the buyer and the seller;
- value of the invoice.

Two types of registration are recorded:

- First registrations (records used to estimate GFCF in new motor vehicles)
- Changes of ownership (records used to estimate GFCF in second-hand vehicles).

By matching information provided by the public motor vehicle register and all the available statistical registers, by fiscal code, it is possible to identify the nature of the ownership (individuals, enterprises). According to the type of ownership, cars and caravan are allocated to GFCF if the owners are:

- enterprises,
- individuals recorded in the business registers and carrying out one of the following activities: taxi and car and driver hire, driving schools, trade intermediaries, insurance agents, car rental, and financial promoters (NACE, classes 46.11-46.19, 49.32, 66.19, 66.22, 77.1).

All the other cars and caravan whose owner is an individuals are considered as Household consumption.

Other types of motor-vehicles (trucks and bus) are allocated entirely to GFCF.

On the basis of information provided by statistical registers (size/legal form/activity of the unit), it is possible:

1. to identify the sector of each unit, according to the Italian criteria used in National Accounts for defining Non-financial corporations and Households;
2. then, to calculate the weight of each of these two institutional sectors on their sum, by industry;
3. to apply these partition coefficients to the total value of GFCF in road transport equipment net of S.12, S.13 and S.15, by industry.

As to those assets for which no information is available from business statistics and administrative sources, the estimation of P51G is based on specific hypothesis:

- GFCF (net of S.12, S.13 and S.15) in repair of motor vehicles are proportionally distributed to S.11 and S.14 using the shares of GFCF in road transport equipment calculated for these sectors,
- GFCF (net of S.12, S.13 and S.15) in costs of ownership transfer are proportionally distributed to S.11 and S.14 using the shares of GFCF in dwellings and other buildings and structures calculated for these sectors;
- GFCF (net of S.12, S.13 and S.15) in rail transport equipment, other structures and research and development are totally assigned to S.11;
- GFCF (net of S.12, S.13 and S.15) in other assets (aircraft, ships, entertainment, literary or artistic originals) in each industry are assigned on the bases of the weight of each sector in that industry, expressed in terms of worked hours;
- weapon systems is zero by definition for S.11 and S.14.

## *Sector S.12*

### A. Sources

Annual financial statements of insurance corporations (DS2),

Survey on financial statements of large enterprises (SCI) (DS6),

Survey on small and medium-sized enterprises and on the exercise of arts and professions (PMI) (DS7)

Supervisory reporting by the FIs to the Bank of Italy (DS8),  
Annual financial statements of banks (DS32),  
Statistical survey on research and development in business enterprises (DS33).

### B. Methods

P.51G is calculated for Bank of Italy and banks on the basis of information available in their annual financial statements. Data for banks are provided by the Italian Banking Association (ABI), at micro level.

Values of GFCF are estimated from the detailed information reported in the “Notes to financial statements” on annual acquisitions, major improvements and disposals, by type of asset: instrumental land, instrumental buildings, land acquired for investment purpose, buildings acquired for investment purpose, furniture, machinery, other instrumental assets.

The information from financial statements of banks is integrated with other sources; in particular, for estimating software and hardware, information reported in the supervisory data base collected by the Bank of Italy (DS8) is used.

No aggregated and detailed information is available for the other financial intermediaries classified in S.123. As a consequence, to estimate the P.51G of this sub-sector, an indirect method is applied, assuming that they have a production system quite similar to the one of banks (capital and labor resources structure): per capita values of gross fixed capital formation (*GFCF/jobs*), by asset, calculated for banks are applied to jobs calculated in Nation Accounts for the other financial intermediaries.

An exception is the estimate of P.51G of Non-Money Market Funds: the supervisory data base collected by the Bank of Italy (DS8) for these units provides very detailed information on the acquisitions, major improvements and disposals of buildings, by type. The estimate of P.51G for Insurance corporations derives from the aggregated annual financial statements items (DS2) provided by the Supervisory Authority on Insurance Companies (IVASS).

The estimate of P.51G for financial auxiliaries derives from the value of P.51G calculated for the NACE Rev. 2 section 66 “Activities auxiliary to financial services and insurance activities”, using information provided by business surveys (DS6 and DS7).

GFCF in R&D and in software for own final use, not covered by the mentioned sources, equal the values calculated for NACE 64, NACE 65 and NACE 66. Information from the Istat survey on research and development in business enterprises (DS33), based on the Frascati Manual, is used.

#### *Sector S.13*

The estimation method is described in the Italy EDP Inventory (<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

#### *Sector S.14*

Data sources and estimation methods for S.14 are described above (see Sector S.11).

#### *Sector S.15*

No information is available from statistical and administrative sources.

Therefore, the value of P.51G for this sector is obtained indirectly, assigning to S.15 a share of gross fixed capital formation, by industry and by asset, that equals the weight of this sector in that industry in terms of worked hours.

An exception is the value of GFCF in Research and Development. Information from the Istat survey on research and development in business enterprises (DS33), based on the Frascati Manual, is used.

	<i>S.14/P Producer Households</i>	<i>0</i>	<i>-754</i>
S.15	NPISH	0	0
S.2	Rest of the world	0	0

#### **10.1. Description of compilation procedures**

### **USES**

*Sector S.1*

The initial estimate of changes in inventories by industry is obtained using as a principal source Frame- SBS data. The estimates are carried out at the level of 98 industries, by type of inventories and by product (256).

The data available refer to changes in inventories (flow variables); definitions and valuation criteria are in line with the principles of business accounting. Transition to the national accounts definitions is obtained by excluding the holding gains/losses component and adding an increase for the net operating surplus in the evaluation of inventories of work in progress.

After this step, independent estimates for agriculture and the General Government sector are included, since they refer to industries/institutional sectors out of the scope of observation of Frame-SBS. Changes in inventories of agricultural products are estimated using data derived from the survey “Estimate of areas and outputs of farm cultivations”. Changes in inventories for S.13 are reported in General Government non-financial accounts (DS15) are used for estimating P.52.

## *Sector S.11*

### A. Sources

Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)

### B. Methods

P.52 by institutional sector is estimated by industry (98) and by type of inventories:

- materials and supplies;
- work-in-progress;
- finished goods;
- goods for resale

The estimates of P.52 by institutional sector are obtained applying a top-down approach: in every industry, the value of changes in inventories by type calculated for S.1 is distributed to all sectors engaged in that activity.

Since estimates for S.1 are already adjusted in order to be compliant with ESA2010 definitions and exhaustiveness, also the derived values for S.11 are compliant and exhaustive.

Given the estimation method, by construction P.52 by institutional sector is totally consistent with:

- the value of P.52 calculated for Total economy (S.1), recorded in the supply and use table and included in the GDP value);
- the value of P.52 by industry and by type;
- the value of P.52 for General government within the consolidated annual account of General government.

From the total value of P.52 available for S.1, by industry and by type, the value for S.13 is subtracted; then, the remaining part is assigned to Non-financial corporations, Financial corporations and Households, by industry and by type of inventories on the basis of relevant shares (*partition coefficients*).

In NACE Section A (agriculture), P.52 is divided between S.11 and S.14 according to the weight of each sector (in terms of worked hours).

In all the other industries, changes in inventories by type is assigned to S.11 and S.14 on the basis of information derived from Frame-SBS (DS12), that is the same source used to calculate P.52 by industry, too (see section Sector S.1). Frame-SBS (DS12) provides data on change of inventories for materials and supplies; work-in-progress; finished goods; goods for resale. Information is on the annual flows and not on the end-of-year stocks. Furthermore, when the value of P.52 is calculated for Total economy (S.1), micro data included in Frame-SBS (DS12) are treated in order to be compliant with ESA2010 definitions (see section Sector S.1); therefore, no other adjustment is required for the derived values of S.11.

From Frame-SBS, the values of changes in inventories  $a_{kji}$  are obtained, where:

$a$  = changes in inventories  $j$ , in industry  $i$ , for units with size class + legal form  $k$ .

$j$  (1,..., 4) = finished goods, work-in-progress, materials and supplies, goods for resale.

$i$  (1,..., 98) = industry

$k$  (1,2) = size class + legal form; where  $k = 1$  identifies enterprises with size class 1-5 people employed and legal form sole proprietorships and simple partnerships;  $k = 2$  identifies enterprises with size class 6+ people employed)

According to the Italian criteria used to define S.11 and S.14,

- $a_{1ji}$  is a first raw estimate of P.52 calculated for Households in type  $j$  in industry  $i$ ;
- $a_{2ji}$  is a first raw estimate of P.52 calculated for Non-financial corporations in type  $j$  in industry  $i$ .

Then the weight of each sector in terms of P.52 are calculated:

$$w_{sij} = \frac{a_{kij}}{a_{.ij}}$$

where

$s$  = sector (S.11 or S.14)

$a_{.ij} = a_{1ij} + a_{2ij}$

This weight  $w_{sij}$  represents the *partition coefficient* used to divide the amount of P.52 by industry net of General government:

$$P52_{sij} = (P52_{S1ij} - P52_{S13ij}) \times w_{sij}$$

$P52$  = changes in inventories

$s$  = sector (S.11 or S.14)

$j$  = type of inventories

$i$  = industry

#### *Sector S.12*

P.52 for S.12 only concern NACE Division 66 (Frame-SBS data). For other units, no information is available but it can be assumed that the amount of changes in inventories for them is negligible: units included in those activities are not expected to have changes in inventories in finished goods, goods for resale and work in progress but just P.52 in materials and supplies, if only inventories of office supplies.

#### *Sector S.13*

The estimation method is described in the Italy EDP Inventory

(<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

#### *Sector S.14*

Data sources and estimation methods for S.14 are described above (see Sector S.11). Changes in inventories only refer to S.14C.

#### *Sector S.15*

The value of P.52 for S.15 is assumed to be immaterial and is set equal to zero.

#### *Sector S.2*

## 11. P.53 – Acquisitions less disposals of valuables

Table D.22 - Acquisitions less disposals of valuables - Year 2015 (million EUR)

Institutional sectors		Resources	Uses
S.1	Total economy	0	2.160
S.11	Non-financial corporations	0	158
S.12	Financial corporations	0	78
S.13	General government	0	0
S.14	Households	0	1.924
	<i>S.14/C Consumer Households</i>	<i>0</i>	<i>1.875</i>
	<i>S.14/P Producer Households</i>	<i>0</i>	<i>49</i>
S.15	NPISH	0	0
S.2	Rest of the world	0	0

### 11.1. Description of compilation procedures

#### USES

##### *Sector S.1*

The estimate of the capital formation in valuables is obtained through the commodity-flow approach. The commodity-flow approach guarantees that the estimate includes all the acquisitions of new goods of domestic output and all the acquisitions and transfers (of both new and of existing goods) carried out with non-residents. In particular, the estimate includes the acquisitions of jewellers, art dealers, households, corporations that do not perform trading activity of this type of product, and museums. In turn, the available data sources do not allow the estimation of transactions on existing goods between residents.

In the Italian product classification (256), valuables refer to capital formation in products 86 (“Basic precious metals and other non-ferrous metals”), product 134 (“Jewels and articles of goldsmithery and dress jewellery”), product 243 (“Creative, artistic, and entertainment services”) and product 244 (“Services of libraries, archives, museums, and other cultural services”).

##### *Sector S.11*

#### B. Methods

Since there is no statistical or administrative information on P.53 by institutional sectors, the estimates are obtained with a “top-down” approach that relies on specific assumptions on the allocation of the different types of valuables. In particular the attribution to S.11, S.12 and S.14 is determined through fixed ratios, considering the type of asset. The annual amount of P.53 in the asset “AN. 131 Precious metals and stones” is mainly assigned to S.12 (non-monetary gold, silver, etc. acquired/sold by banks and other financial intermediaries), S.14 (acquisitions/disposals by households) and, residually, to S.11; around 50% of the total value of P.53 in the asset “AN. 132 Antiques and other art objects” is assigned to S.11 (mainly museums and art dealers), while the residual amount is distributed almost equally between S.12 and S.14; around 95% of the total amount of P.53 in the asset “AN. 133 Other valuables” (mainly jewellery; it represents 90% of the total value of P.53) is assigned to households (S.14).

To date no P.53 is estimated for S.13 and S15.

S.2	Rest of the world	0	0

### **12.1. Description of compilation procedures**

#### **USES**

*Sector S.1*

Consumption of fixed capital (CFC) is estimated through the Perpetual Inventory Method (PIM) by industry and by asset, excluding animals (accordingly with ESA 2010 par. 3.140).

For all assets, except R&D and weapons systems, the straight line model of depreciation is adopted, by which the market value of an asset is assumed to decline by the same amount each period. This amount is equal to  $1/T$  of the initial value of the asset, where T is the service life for that particular asset. The retirements are distributed around the

average service life (constant over time) according to a truncated normal distribution (with truncation limits set at +/- 40% of average service life and the variance set so that 90% of retirements occur between +/- 25% of the average service life).

The geometric depreciation function with a constant annual depreciation rate is used for weapons systems and research and development. According to the geometric model, net capital stock and consumption of fixed capital are obtained in accordance with the formula:

$$K_t = K_{t-1} (1 - \text{delta}) + I_t$$

where  $K_t$  and  $K_{t-1}$  are, respectively, the net stock at the end of period t and t-1,  $I_t$  is gross fixed capital formation (at chain-linked values) of year t and  $\text{delta}$  represents the depreciation rate (assumed constant over time). For R&D, the depreciation rate is obtained as  $2/N$ , where N is the service life (double-declining balance rate). For weapons systems the depreciation rate is obtained as  $1.65/N$ . Consumption of fixed capital in period t is simply obtained multiplying the depreciation rate for the capital stock at the end of period t-1.

The main sources for fixing service lives are the following:

- for machinery and equipment, computer hardware, communication equipment and furniture, they are derived from the results of the survey on service lives of machinery and equipment in Italy that was run in 2011 by the Bank of Italy in collaboration with Istat;
- for road works and other civil engineering works, they have been set according to the recommendations from the GNP Committee on the Consumption of Fixed Capital on Roads, Bridges etc. (GNIC 011, 2003);
- for research and development, the service life has been set according to the recommendations from the second Task Force on the capitalisation of R&D in National Accounts (see Manual on measuring Research and Development on ESA 2010, Eurostat, 2014).
- for the remaining assets, service lives have been set relying on expert advice and other countries' estimates.

### *Sector S.11*

The value of CFC is estimated by applying two different estimation methods, according to the type of assets.

- The PIM method is used for the following assets: Computer hardware, Communication equipment, Furniture, Other machinery and equipment, Road transport equipment, Other transport equipment, Computer Software and databases, Entertainment, literary or artistic originals, Research and Development, Cultivated biological resources, Mineral explorations, Other structures.

The functions and the underlying hypothesis described above for Sector S.1 are adopted. Service lives are, in general, the same as for Total economy; for some assets, though, service lives differ according to the owner industry (Communication equipment, Furniture, Other machinery and equipment). In this case the relevant service life for each sector is a weighted average of service lives by asset and industry: the weight is represented by GFCF of the sector in that asset and that industry, year 2011.

- As for CFC for Dwellings and Non-residential buildings, since the time series of GFCF by institutional sector currently available are too short to apply the PIM,

another approach is used. The value of CFC for Dwellings and Non-residential buildings (including costs of ownership transfer) is estimated as a share of the CFC of the total economy (net of S.13), by type of buildings. This share is calculated as the weight of dwellings and of non-residential buildings (stock of fixed assets, as reported in the Balance Sheets by institutional sector, table 26 ESA 2010TP) of the sector on the value of dwellings and of non-residential buildings for Total economy (net of S.13).

*Sector S.12*

The estimation method for S.12 is the same described above, in Section Sector S.11.

*Sector S.13*

The estimation method is described in the Italy EDP Inventory (<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

*Sector S.14*

Estimation method for S.14 is the same described above, in Section Sector S.11.

*Sector S.15*

S.1	Total economy	0	1.184
S.11	Non-financial corporations	0	1.623
S.12	Financial corporations	0	21
S.13	General government	0	450
S.14	Households	0	-910
	<i>S.14/C Consumer Households</i>	<i>0</i>	<i>-425</i>
	<i>S.14/P Producer Households</i>	<i>0</i>	<i>-485</i>
S.15	NPISH	0	0
S.2	Rest of the world	0	-1.184

#### 13.1. Description of compilation procedures

##### USES

##### *Sector S.1*

The value of NP for Total economy equals the value - with opposite sign - calculated for S.2 in the Balance of Payments (DS1) data: they are acquisitions less disposals of non-produced assets exchanged with the Rest of the world, in particular contracts, licenses, permits. Transactions among resident sectors sum to zero, except for the relevant costs of ownership transfer, that are GFCF by ESA definitions.

##### *Sector S.11*

##### A. Sources

Balance of Payments (DS1),  
Land sales (DS34).

##### B. Methods

By construction the value of NP by institutional sector is totally consistent with NP calculated for Total Economy and with the value estimated for S.13 (they are constrains for the estimates of the other sectors).

NP calculated for Non-financial corporations includes all acquisition less disposals of non-produced assets (contracts, licenses, permits) exchanged with the Rest of the world (this amount equals the value of NP calculated for S.2, with opposite sign).

NP for S.11 also includes transactions of contracts, leases and licences with S13, that, to date, is assumed to take place only with non-financial corporations, since no further information is available .

Finally the value of exchanges of agricultural land among all sectors is estimated.

The value of acquisitions and disposals of land under cultivation is derived using data on land sales provided by the Tax and Revenue Agency (administrative data).

The database reports the following information:

- date of the transaction,
- size of traded land,
- price paid on the transaction,
- any tax paid on the transaction,
- nature of the seller/purchaser (individual-private person, PP, or others, NPP),
- if the seller is other than a private person (NPP), also the legal form is indicated.

On the basis of information provided (mainly, nature of the seller/purchaser and legal form), it is possible to identify the sector for each part included in the transaction. To date, no estimate exists for land underlying buildings.

#### *Sector S.12*

Only exchanges of agricultural land is estimated for S.12 (see Sector S.11).

#### *Sector S.13*

The estimation method is described in the Italy EDP Inventory (<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

#### *Sector S.14*

Only exchanges of agricultural land is estimated for S.14 (see Sector S.11).

#### *Sector S.15*

The value of NP for S.15 is set equal to zero (not relevant value).

#### *Sectors S.2*

##### A. Sources

Balance of Payments (DS1)

##### B. Methods

BoP data provides information on NP.

### 14.1. Description of compilation procedures

#### USES

##### *Sectors S.1*

Not applicable

##### *Sector S.2*

#### A. Sources

Balance of payments (DS1)

#### B. Methods

Export and import of goods are compiled by the Bank of Italy in the framework of the Balance of Payments, relying on data on foreign trade statistics compiled by Istat in compliance with EU regulations<sup>21</sup>. Intrastat forms, including both statistical and fiscal information, are the base to measure trade with EU member states. As for extra-EU countries, the survey relies on the administrative information of S.A.D. (Single Administrative Document). Data for both sources are collected and provided to Istat by the Customs and Monopoly Agency.

According to ESA2010 and BPM6 two adjustments are needed to foreign trade:

- for goods entering a country to be transformed without changing economic ownership (processing), only the processing service is recorded, while the value of goods entering and subsequently leaving the country is excluded;
- goods purchased abroad and sold in another country without crossing the national border (merchanting), are recorded as net exports of goods and not as exports of services.

---

<sup>21</sup> Commission Regulation n.1982/2004 of 18/11/2004 and amendments (Intrastat), Commission Regulation N.113/2010 of 9/2/2010 and amendments (Extrastat).

Istat is responsible for the measurement of processing services, while the estimate of merchanting is carried out by the Bank of Italy.

Istat also carries out the estimates of imports and exports resulting from illegal activities (imports and exports of narcotics and imports of smuggled cigarettes), that have to be included both in NA and in BoP.

Imports of goods are valued at both CIF and FOB. In particular, statistics on foreign trade provide data on CIF valuation and the transition to FOB assessment is ensured by an adjustment for the total of imports. The adjustment items are provided directly by the Bank of Italy. Exports of goods are valued FOB, as provided by the statistics on foreign trade.

#### 16.1. Description of compilation procedures

##### USES

###### *Sectors S.1*

Not applicable

###### *Sector S.2*

###### A. Sources

Balance of payments (DS1)

###### B. Methods

Export of FISIM is calculated By the Bank of Italy in the framework of the compilation of BoP, and is provided to Istat. It corresponds to the sum of FISIM on loans granted by resident operators in S.122 and S.125 to non-resident operators, and of FISIM on deposits of non-resident operators in resident financial intermediaries (S.122). In NA export of FISIM among resident/non-resident financial intermediaries, that is included in BoP, is deducted from the calculation, in compliance with ESA 2010.

For the compilation of financial intermediation service charges indirectly measured (FISIM) two sources are used: the stock of loans and deposit of resident Financial Intermediaries towards non-resident sectors and the related interests; the stock of loans and deposits of resident sectors in the non-resident financial sector and the related interests. The FISIM calculation model is perfectly integrated with the model of income

from other investments, which uses information from the accounts matrix for flows and stocks of financial intermediaries and from direct reporting for the stocks in other sectors. The interest rate used is the interbank interest rate, calculated as the ratio of the interests on loans and deposits and the amount of loans and deposits (between resident and non-resident financial intermediaries). The calculation of FISIM is made taking into account the reference rates of the euro and the US dollar, that are the prevailing currencies of stocks.

## RESOURCES

Not applicable

### 16.2. Additional details

The calculation of imported and exported FISIM requires the use of an external reference rate. The external reference rate is calculated as the ratio between interest accrued on loans and deposits and the stock of loans and deposits between resident banks (S.122) and non-resident financial intermediaries (S.122 and S.125). Resident intermediaries belonging to the S.125 sector are not included, since at the moment no data are available on interest accrued on the operations with non-resident financial intermediaries. The collection of such data by the Bank of Italy started in 2014, so their integration in the calculation is likely to happen in the next few years. Please note that data currently used for the calculation of the external reference rate, based on the available stocks, represent 90% of the operations between resident and non-resident intermediaries.

Balance of payments (SD1)

#### B. Methods

FISIM imported by each institutional sector, excluding the producer sectors, is calculated as the sum of FISIM imported on loans and FISIM imported on deposits. FISIM imported on loans and deposits of each resident institutional sector are estimated through a top-down approach: the total value of imported FISIM on loans and deposits estimated by the Bank of Italy is allocated to user institutional sectors according to the underlying stocks, in order to properly allocate imported FISIM between final and intermediate consumption.

The BoP provides P.72F flows. To ensure consistency of the BoP data with ESA 2010 definitions, data are adjusted to net FISIM imported by domestic FISIM producing units (Interbank FISIM). Data required to make this adjustment are provided by BoP.

## 20. D.1 – Compensations of employees

Table D.31 - Compensations of employees - Year 2015 (million EUR)

Institutional sectors		Resources	Uses
S.1	Total economy	656,865	652,581
S.11	Non-financial corporations	0	410,958
S.12	Financial corporations	0	32,387
S.13	General government	0	162,074
S.14	Households	656,865	44,182
	<i>S.14/C Consumer Households</i>	<i>656,865</i>	<i>18,859</i>
	<i>S.14/P Producer Households</i>	<i>0</i>	<i>25,323</i>
S.15	NPISH	0	2,980
S.2	Rest of the world	2,131	6,415

The estimate of compensation of employees is carried out by industry and by institutional sector, separately for each individual component (wages and salaries, and social contributions, actual and imputed). The estimation procedure differs by type of producer (enterprises, non-profit institutions, market and non-market, and General Government) and, for market enterprises, according to the economic sector. Estimates of the declared component are carried out at the micro level (for each employer): this makes it possible to simultaneously obtain the estimates by industry and by institutional sector.

About 99% of the estimate of the paid compensation of employees is based on sources that directly provide the value of the variable of interest. The percentage rises to 100% for Financial Corporations and General Government. For Non-financial corporations only 1% of the basic value of the compensation of employees is estimated by indirect methods. This refers to:

- D.1 paid by the units classified in the sector S.11 that operate in section A of the NACE Rev.2 (agriculture, forestry and fishing).
- D.1 paid by market NPIs classified in sector S.11, for which no suitable information is available.

The use of indirect methods rises to about 10% of the basic estimate in the case of Households. This share refers to:

- D.1 paid by units classified in sector S.14 (Producer Households) operating in section A of NACE Rev.2.
- the estimate of actual contributions (social contributions and annual provisions to the severance fund) of condominium concierges.
- the annual provisions to the severance fund of paid domestic staff (section T of NACE Rev.2)

For NPISHs, the use of indirect methods accounts for 5% of the basic estimates: this is the case of the units for which no suitable information exists and for which the compensation of employees are estimated by applying average hourly values obtained from the Census data to the hours worked by employees.

## 21. D.11 – Wages and salaries

Table D.32 - Wages and salaries - Year 2015 (million EUR)

Institutional sectors		Resources	Uses
S.1	Total economy	481,737	477,637
S.11	Non-financial corporations	0	301,471
S.12	Financial corporations	0	22,997
S.13	General government	0	112,823
S.14	Households	481,737	38,140
	<i>S.14/C Consumer Households</i>	<i>481,737</i>	<i>17,416</i>
	<i>S.14/P Producer Households</i>	<i>0</i>	<i>20,724</i>
S.15	NPISH	0	2,206
S.2	Rest of the world	1,309	5,409

### 21.1. Description of compilation procedures

#### USES

##### S.1

Data S.1 are obtained as sum of all relevant resident sectors.

##### Sectors S.11, S.14PA. Sources

Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)

Archive of Earnings, Hours and Total Labor cost (RACLI register) (DS35)

Archive of employees in agriculture (DS36)

Survey on the structure of wages and salaries and labour costs (DS42)

Labour Force Survey (LFS) (DS37)

Uniemens archive (DS28)

##### B. Methods

The estimation procedure of wages and salaries is the same for sectors S.11 and S.14P.

In general, as for estimates of output, there are separate procedures for the declared and undeclared component of labour input.

The main source used to estimate wages and salaries of regular employees is the Frame-SBS register which, for each enterprise, provides the following detail of labour costs: wages, social contributions, provisions to the severance fund and other staff costs.

The item "Other staff costs" (once components relating to external workers are subtracted from the cost of labour and added to intermediate costs) contains elements that belong to labour costs but may have a different nature: wages and salaries in cash, wages and salaries in kind or imputed contributions. The preliminary results of the Survey of the structure of wages and salaries and labour costs (referring to year 2012) made it possible to break down this item into the three components listed above, using a stratification based on the weight of the item "other costs" on wages and salaries and on the size class of enterprises. The Survey on the Structure of wages and salaries and labour costs (for the year 2012) measures the components of labour costs per enterprise/institution (with more

than 10 employees) with a very high level of detail for wages and social contributions. Such source provides detailed information on the components of labour costs, particularly for compensation in kind and imputed contributions.

The following adjustments have been performed on basic data:

1. A further correction to Frame-SCI data concerns enterprises who did not respond to the survey and whose financial statement data is unavailable. For these enterprises the Archive of Earnings, Hours and Total Labour Cost, RACLI archive, is an alternative source. For all enterprises not included in Frame-SBS, an integration for missing data has been introduced. Employers are obliged to pay contributions to social security funds for each employee: RACLI contains estimates derived from the integrated data of the social security archives of labour costs by enterprise for the production units included in the ASIA-enterprises scope of observation.
2. In analogy to the methodology adopted for the compilation of Frame-SBS for enterprises with less than 100 persons employed, an analysis was performed and corrections were made, if necessary, on the values of the labour cost items of Frame-SCI, for offsetting effects due to the presence of external staff costs (temporary contracts and quasi-subordinates).

For units out of scope of observation of Frame-SBS, that is units that perform their economic activity in Section A (Agriculture) and for market non-profit institutions, estimates are obtained with the use of different data sources and methodologies.

Administrative and statistical sources are used in the National Accounts department to build an integrated database for all units operating in section A that includes information on employers, employees and labour costs. For missing values, integration is carried out at a level of 3-digit NACE Rev.2 and NUTS 2.

Market NPIs are treated together with NPISHs (sector S.15) therefore the estimation procedure of the different components of compensation of employees is described in the relevant paragraph.

Other adjustments are carried out in order to obtain exhaustive estimates. These components may be referred either to observed or non-observed economy and are included in the *Exhaustiveness* categories N1-N7 of the Process Table. The exhaustiveness components are:

- Estimate of compensation for employees of enterprises outside the scope of observation of Frame-SBS. Wages and salaries are estimated using administrative data, mainly Uniemens archive.
- Estimate of the component of wages and salaries in kind not included in the income value measured by the sources used (column N7 in the PT). These are the meals eaten by the staff of the NACE Rev.2 section I at the work place and tips that employees receive from their clients in some activities (hotels and restaurants, hairdressers, taxis, condominium concierges).
- Wages and salaries referred to undeclared employees are estimated by means of an indirect procedure: the average hourly salaries paid to undeclared workers are applied to the undeclared hours worked. The average hourly wage of undeclared positions is estimated by means of a wage differential between declared and undeclared workers, calculated starting from information from the Labour force survey, which is applied to the average hourly wage of declared jobs (by industry and size class). The Labour Force survey is used to estimate a differential of wage between declared and undeclared employees in the institutional sectors in which they are present. As a general rule, the average value of wage and salaries per working hour is applied to

the number of hours worked by unregistered employees at a level of institutional sector, economic activity (98 industries: an aggregation of NACE Rev.2 groups) and size class (6 classes:1-5, 6-9, 10-19, 20-99, 100-249, 250 and more).

### *Sector S.12*

#### A. Sources

Financial statement of the Bank of Italy (DS38)

Supervisory reports to the Bank of Italy (DS8)

Financial statements of insurance corporations (DS2)

COVIP annual report (DS3)

Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)

InfoCamere archive of financial statements (DS24)

#### B. Methods

Data sources (DS8 and D38) provide all details necessary to estimate the components of compensation of employees as indicated in ESA 2010 (wages and salaries, actual contributions and imputed contributions) for the Central Bank, banks and other financial intermediaries supervised by the Bank of Italy.

As for the Insurance Corporations, the estimate of compensation of employees is based on supervisory information collected by the IVASS (Institute for the Supervision of Insurance), that provides separate data for wages and salaries, social contributions and provisions for severance pay and similar.

As for pension funds the COVIP annual report gives information on compensation of employees.

Compensation of employees of financial auxiliaries is calculated on the basis of Frame-SBS for SMEs, and follows the procedures described for sectors S.11 and S.14P. For large enterprises, information on the economic aggregates has been taken from any available administrative source (mainly from the InfoCamere archive).

### *Sector S.13*

The estimation method is described in Italy EDP Inventory

(<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

### *Sector S.14C*

#### A. Sources

Archive of domestic work relationships (DS29)

Uniemens Archive (DS28)

#### B. Methods

Data source (DS29) provides information on hours worked, hourly contributions and compensation paid by Households for domestic staff, adjusted for the components of "cash in hand" and wages and salaries in kind.

Data source (DS28) provides information on wages and salaries and contributions paid for condominium concierges.

## *Sector S.15*

### A. Sources

Census survey of non-profit institutions 2011 (CISINP) (DS22)

Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)

Uniemens Archive (DS28)

### B. Methods

The main source used to estimate the compensation of employees of non-profit institutions (NPIs) other than social cooperatives is the Census of Non-profit Institutions. The detail of expenses available in the CISINP allows estimating the compensation of employees incurred by market NPIs and NPISHs surveyed in 2011 census. In particular, the compensation of employees (D.1) is calculated by using the labor costs item, that includes both wage and salaries, and employers social contributions. An indirect approach is used for the years following 2011.

A specific source was used to assess the compensation of employees of the religious organisations in their activities that belong to Division 94: the "Report envisaged by art. 44 of Law No. 222 of 20 May 1985, relating to the use of the sums received in 2011 by the Central Institute for the Sustenance of the Clergy and the Italian Episcopal Conference under Articles 46 and 47 of the same Law".

An indirect approach is applied to estimate the compensation of employees of the NPIs not included in the census survey: the average hourly compensation of employees by industry and by enterprise's size class are calculated for market NPIs and NPISHs included in the census; these values are then applied to the hours worked by employees of the non-surveyed institutions.

To disaggregate compensation of employees in its components for both NPIs and NPISHs, an indirect approach is followed. The latter is based on the structure by industry and size class of the components of compensations of employees of market enterprises.

## *Sectors S.2*

### A. Sources

Balance of Payments (DS1)

### B. Methods

The BoP provides wages and salaries received by resident workers from foreign enterprises.

Compensation of employees is calculated using various combined sources, mainly data provided by the so-called counterparty countries that concern individuals residing in Italy who are employed in those countries. The main counterparty countries are Switzerland, San Marino and Monaco.

No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and to ensure the exhaustiveness of the estimates.

## **RESOURCES**

### *S.1*

Data for S.1 correspond to resources of S.14C

### *Sector S.14C*

This transaction for consumer households includes wages and salaries paid to resident workers by resident and non-resident units.

### *Sector S.2*

#### A. Sources

Balance of Payments (DS1)

#### B. Methods

The BoP provides information on wages and salaries received by foreign workers from resident enterprises and institutions.

The calculation of labour income paid to foreign workers in Italy makes use of information on the number of non-EU seasonal workers in agriculture and tourism, published annually by the Ministry of the Interior. The total amount of labour income is derived by multiplying the number of seasonal workers (available in detail by region of employment) by the national average income. With regards to cross-border workers in the fields of industry and services, the main data source is represented by the sample survey of the Bank of Italy (direct reporting) on non-financial transactions made by non-financial and insurance companies. The picture is made complete by Treasury data on wages paid by the Bank of Italy to the local staff of Italian embassies and consulates abroad, on behalf of Government units.

In order to comply with the principle of gross remuneration, both revenues and payment estimates are adjusted to account for taxes and contributions paid by workers and companies (the adjustment is made by using annual coefficients supplied by the OECD).

No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and to ensure the exhaustiveness of the estimates.

## **22. D.12 – Employers’ social contributions**

Table D.33 - Employers’ social contributions - Year 2015 (million EUR)

<b>Institutional sectors</b>		<b>Resources</b>	<b>Uses</b>
S.1	Total economy	175,127	174,943
S.11	Non-financial corporations	0	109,486
S.12	Financial corporations	0	9,390
S.13	General government	0	49,251
S.14	Households	175,127	6,042
	<i>S.14/C Consumer Households</i>	<i>175,127</i>	<i>1,443</i>
	<i>S.14/P Producer Households</i>	<i>0</i>	<i>4,599</i>
S.15	NPISH	0	774
S.2	Rest of the world	822	1,006

The domain of observation of the estimation of employers’ social contributions extends to all institutional sectors. Each institutional unit, as employer, is obliged to pay a share

of social contributions, corresponding to a rate on wages and salaries, in order to provide their employees with access to social benefits. These benefits include both those provided while on the job (for example to cover risks/events such as sickness, maternity, disability, etc.), and those due after the employee's retirement.

The employers' social contributions may be actual or imputed. Both are recorded on the uses side of the generation of primary income account (respectively, as D.121 and D.122) in correspondence to the sectors that give rise to the payment; on the resources side, the contributions are recorded in the secondary distribution of income account (respectively, as D.611 and D.612) attributing them to the institutional sectors that receive the payments made by employers. The two amounts are the same at the level of total economy (S.1), although with a different distribution between sectors.

### 23. D.121 – Employers' actual social contributions

Table D.34 - Employers' actual social contributions - Year 2015 (million EUR)

Institutional sectors		Resources	Uses
S.1	Total economy	163,697	163,513
S.11	Non-financial corporations	0	104,019
S.12	Financial corporations	0	7,644
S.13	General government	0	45,313
S.14	Households	163,697	5,803
	<i>S.14/C Consumer Households</i>	<i>163,697</i>	<i>1,386</i>
	<i>S.14/P Producer Households</i>	<i>0</i>	<i>4,417</i>
S.15	NPISH	0	735

#### 23.1. Description of compilation procedures

##### USES

##### *Sector S.1*

- Data for S.1 are obtained as sum of private market producers (S.11, S.12, S.14), NPISHs (S.15) and GG (S.13)

##### *Sector S.11, S.12, S.14*

##### A. Sources

Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)

Financial statement of the Bank of Italy (DS38)

Supervisory reports to the Bank of Italy (DS8)

Financial statements of insurance corporations (DS2)

Report on the financial statements of social security institutions (BICEP) (DS40)

InfoCamere archive of financial statements (DS24)

COVIP annual report (DS3)

Archive of domestic work relationships (DS29)

Uniemens Archive (DS28)

### B. Methods

The quantification of the actual contributions for the total economy (S.1) is obtained from the side of the units receiving payments from employers. In Italy most of the actual social contributions are paid to Social Security Funds (sub-sector S.1314) and to a lesser extent to Pension Funds (sub-sector S.129), the latter fulfilling the function of "supplementary pensions". Actual contributions also include the annual provision to the severance fund.

The estimation method ensures complete coverage of the field of observation through the use of reliable sources such as the financial statements of institutions receiving payments.

The sub-sector that collects the largest share of contributions, about 88% of the total of actual social contributions paid by public and private employers, is that of Social Security Funds. The source used is the Istat Report on the financial statements of social security institutions. The estimate is currently performed using the Time Adjusted Cash method.

In addition to actual contributions collected by Social Security Funds and Pension Funds, there are contributions that remain with the employer, namely the provision for severance fund (TFR), also called settlement or severance pay, which in Italy constitutes a portion of wages and salaries that the employer pays directly to the employee upon termination of the work relationship. Employers must set aside yearly the amounts that form the fund needed to pay the severance indemnity. This component is estimated using information from enterprises (on the basis of the same sources used to estimate wages and salaries, depending on the economic activity sector).

The total amount of actual social contributions is therefore obtained as the sum of contributions collected by Social Funds and Pensions Funds and the provisions for severance fund.

The total amount net of the contributions paid by S.13 and non-profit institutions corresponds to the component paid by market private employers. An alternative source from the enterprises' side is that of financial statements which is used to estimate wages and salaries. The latter is used to subdivide the total amount of contributions estimated with primary sources by industry and institutional sector. The difference between the estimate on the enterprises side and the one on the side of Social Security Funds and Pension Funds is included in the column "Data validation" of the PT.

### *Sector S.13*

The estimation method is described in Italy EDP Inventory

(<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

### *Sector S.15*

#### A. Sources

Census survey of non-profit institutions 2011 (CISINP) (DS22)

Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)

Uniemens Archive (DS28)

#### B. Methods

The actual contributions of NPISHs are estimated with an indirect approach, by applying to the compensation for employees the actual contributions rate (i.e. the ratio between

actual contribution and compensation of employees) estimated for enterprises in the same domains.

*Sector S.2*

A. Sources

Balance of payments (DS1)

B. Methods

The BoP data provides actual social contributions paid by foreign employers for resident workers.

No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and to ensure the exhaustiveness of the estimates.

**RESOURCES**

*Sector S.1*

### 24.1. Description of compilation procedures

#### USES

##### *Sector S.1*

- Data for S.1 are obtained as sum of private market producers (S.11, S.12, S.14), NPISHs (S.15), and GG (S.13)

##### *Sectors S.11, S.12, S.14*

#### A. Sources

Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)

Survey on the Structure of wages and salaries and the labour costs(DS42)

Financial statement of the Bank of Italy (DS38)

Supervisory reports to the Bank of Italy (DS8)

Financial statements of insurance corporations (DS2)

InfoCamere archive of financial statements (DS24)

Archive of domestic work relationships (DS29)

Uniemens Archive (DS28)

#### B. Methods

The imputed social contributions are estimated by splitting the balance sheet item "Other staff costs" between wages and salaries in cash, in kind or imputed contributions according to preliminary results obtainable from the Survey on the Structure of wages and salaries and the labour costs (referring to year 2012), taking into account the weight of the item "Other costs" on wages and salaries and the enterprise size class.

The cost of the first three days of sickness paid by the employer is subtracted from the wages and salaries and added to the imputed contributions. The estimation of this component is based on the preliminary data of the Survey on the structure of wages and salaries and labour costs, which allows to measure the average incidence (on the value of

wages and salaries) of this component for a given economic activity. The total value was consistent with the results of one-off studies carried out by INPS on total days of sickness (both paid by the employer and by the Social Security fund) in the private sector. There are no other sources available to update this information annually (the survey is carried out every four years), or to estimate it in more detail.

#### *Sector S.13*

The estimation method is described in Italy EDP Inventory (<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

##### *Sectors S.14, S.15*

Not applicable.

##### *Sector S.2*

#### A. Sources

Balance of Payments (DS1)

#### B. Methods

Taxes on products received by RoW mainly refer to duties on imports (D.212) and taxes on products except VAT (D.214) and they include: customs and agricultural duties, sugar levies, milk and grains co-responsibility levies and other levies, compensatory monetary amounts on exports.

Istat calculates taxes on products paid by Italy to the European Union on the basis of the information on unilateral transfer flows provided by the State General Accounting Department (GAD). These figures are used by the Bank of Italy in the compilations of the Balance of Payments.

## 26. D.29 – Other taxes on production

Table D.37 - Other taxes on production - Year 2015 (million EUR)

Institutional sectors		Resources	Uses
S.1	Total economy	60,739	60,739
S.11	Non-financial corporations	0	25,488
S.12	Financial corporations	0	6,000
S.13	General government	60,739	9,697
S.14	Households	0	19,447
	<i>S.14/C Consumer Households</i>	<i>0</i>	<i>8,720</i>
	<i>S.14/P Producer Households</i>	<i>0</i>	<i>10,727</i>
S.15	NPISH	0	107
S.2	Rest of the world	0	0

### 26.1. Description of compilation procedures

#### USES

##### *Sector S.1*

Taxes on production paid by S.1 correspond to the resources of S.13. Table D.38 shows the detail of other taxes on production by type as included in National Accounts for the year 2015.

Taxes on production by type are allocated to economic activities. The “Regional tax on productive activities” (IRAP) is broken down according to the distribution of the tax revenue by economic activity, that is provided by the Department of Finance. Some types of taxes on production may be directly assigned to a specific industry. Otherwise, the breakdown criterion refers to the distribution by economic activity of the relevant tax base.

Additional information enables to estimate other taxes on production at the level of 98 industries, separately for private market producers (S.11, S.12, S.14), NPISHs (S.15) and GG (S.13) (see table D.39).

Table D.38 - Other taxes on production by type - Year 2015 (million EUR)

<b>D.29 - Other taxes on production</b>	60,739
Regional tax on productive activities (IRAP)	28,072
Municipal real estate tax (IMU)	19,828
Surcharge accruing to chambers of commerce	1,277
Motor vehicle duty paid by enterprises	1,446
Duty on official franchises	1,132
Municipal tax on collective services (TASI)	4,760
Local tax for environmental protection	571
Other special taxes on production	289
Other taxes on production n.e.c.	608
National resolution fund contributions	2,346
Other	410

*Sectors S.11, S.12. S.14P*

A. Sources

General Government non-financial accounts (DS15)

B. Methods

The estimate of other taxes on production paid by these sectors follows an indirect approach. The total amount of D.29 paid by private market producers is allocated to sectors according to the distribution by industry of output.

*Sector S.13*

The estimation method is described in Italy EDP Inventory

(<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

*Sector S.14C*

A. Sources

General Government non-financial accounts (DS15)

B. Methods

Other taxes on production paid by consumer households only include the Municipal real estate tax, which is referred to owner-occupied dwellings.

## 27.1. Description of compilation procedures

### USES

#### Sector S.1

Data for S.1 corresponds to uses of sectors S.13

#### Sector S.13

For S.13, the estimation method of this transaction is described in the Italy EDP Inventory (<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

#### Sector S.2

##### A. Sources

Balance of payments (DS1)

##### B. Methods

Subsidies on products paid by RoW mainly consist of endowments granted by the European Structural Funds (ESF, EAGF) and by EU institutions. Istat uses the information on unilateral transfers provided by the State General Accounting Department (GAD) to estimate these flows. These figures are provided to the Bank of Italy and included in the Balance of Payments.

### RESOURCES

#### Sector S.1

The amount of subsidies on products is allocated to the total economy (S.1N not subdivided into sectors) and it corresponds to uses figures for S.13 and S.2.

## 28. D.39 – Subsidies on production

## 28.1. Description of compilation procedures

### USES

#### *Sector S.1*

Data for S.1 corresponds to uses of S13

*Sectors S.11, S.12, S.14, S.15, S.2*

Not applicable

#### *Sector S.13*

For S.13, the estimation method of this transaction is described in the Italy EDP Inventory (<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

#### *Sector S.2*

##### A. Sources

Balance of payments (DS1)

##### B. Methods

Subsidies on productions paid by RoW mainly consist of endowments granted by the European Structural Funds (ESF, EAGF) and by EU institutions. Istat estimates these flows on the basis of the information on unilateral transfers provided by the State General Accounting Department (GAD). Bank of Italy uses these figures in the compilations of the Balance of Payments.

### RESOURCES

#### *Sector S.1*

Subsidies on production received by S.1 correspond to uses of S13 and S2.

They are measured from the side of the units that provide the subsidy. This way of recording ensures the exhaustive coverage of the units that grant the subsidies and the exhaustive coverage of transactions performed during the year.

The main data sources used to compile GG accounts are the State budget (Rendiconto generale dello Stato), the financial statements of all public units included in S.13 and the comprehensive surveys of central and local public administrations. These sources are integrated with highly detailed information provided by other entities involved in the granting activity on behalf of the State (namely, the Ministry for Agricultural Policies, AGEA, Artigiancassa, Mediocredito centrale, etc.) or the EU.

Subsidies on production mainly include:

- subsidies to producers granted through the national intervention agencies (e.g. FEAGA co-financing);
- grants for interest relief provided by the State and local authorities;
- other economic support transfers to producers, paid irrespective of the volume of output (e.g. vocational training, wage subsidies, support for employment, etc.)

Other subsidies on production are broken down by industry on the basis of the distribution of the output of the industries which receive them.

Table D.42 - Subsidies on production by sector and divisions- Year 2015 (million EUR)

Divisions	S.11	S.12	S.13	S.14/P	S.14/C	S.14	S.15	Total

## 29.1. Description of compilation procedures

### USES

#### *Sector S.1*

Data for S.1 are obtained as sum of all relevant resident sectors.

#### *Sector S.11*

##### A. Sources

The data sources are Financial Accounts (DS13) and statistics on market interest rates and stocks of deposits, loans and securities collected and published by the Bank of Italy in the reports of the "Statistics series of the Bank of Italy" (DS9).

##### B. Methods

Interest are estimated through a detailed procedure where for each instrument and for each counterpart sector the average market rates (annual average of quarterly data at the end of the quarter) are multiplied by the average stocks (quarterly average) deriving from Financial Accounts.

If direct sources are available for the counterpart sector, these are used instead of the method described above.

#### *Sector S.12*

##### A. Sources

For S121 data are gathered from Bank of Italy's financial statement (DS38) .

For S128 aggregate financial statements of insurance corporations data are available. Data are collected by IVASS (DS2).

For S122 aggregate financial statements of banks data are available. This data are collected and published by Bank of Italy (DS32). This data are integrated with the amounts obtained from the annual financial statements of "Cassa depositi e Prestiti S.p.a."(DS11)

For the subsectors other than those mentioned above, the data sources are Financial Accounts (DS13) and the statistics on market interest rates on deposits, loans and securities collected and published by the Bank of Italy in the reports of the "Statistics series of the Bank of Italy"(DS9).

##### B. Methods

For the sectors for which direct balance sheet data are available, the amounts are allocated on the basis of the direct information and if this isn't possible, the allocation is based on the stocks by instrument and counterpart sector available in Financial Accounts.

For the sectors for which direct information isn't available, interest are estimated through a detailed procedure where for each instrument and for each counterpart sector the average market rates (annual average of quarterly data at the end of the quarter) are multiplied by the average stocks (quarterly average) deriving from Financial Accounts.

If direct sources are available for the counterpart sector, these are used instead of the method described above.

### *Sector S.13*

The estimation method is described in Italy EDP Inventory

(<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

### *Sector S.14*

#### A. Sources

The data sources are Financial Accounts (DS13) and statistics on market interest rates and stocks of loans securities collected and published by the Bank of Italy in the reports of the "Statistics series of the Bank of Italy" (DS9).

#### B. Methods

Interest are estimated through a detailed procedure where for each instrument and for each counterpart sector the average market rates (annual average of quarterly data at the end of the quarter) are multiplied by the average stocks (quarterly average) deriving from Financial Accounts.

If direct sources are available for the counterpart sector, these are used instead of the method described above.

The interests of S.14C, S.14P and NPISH are processed according to a top-down method. The values estimated at the aggregate level (S.14 + S.15), once balanced, are broken down on the basis of the stock of loans.

### *Sector S.15*

#### A. Sources

The data sources are Financial Accounts (DS13) and statistics on market interest rates and stocks of loans securities collected and published by the Bank of Italy in the reports of the "Statistics series of the Bank of Italy" (DS9).

#### B. Methods

Interest are estimated through a detailed procedure through which the average market rates (average of the end of period data of quarters) are multiplied by the average stocks (average of the quarters) deriving from Financial Accounts for each instrument and for each counterpart sector.

If direct sources are available for the counterpart sector, these are used instead of the method described above.

The interests of S.14C, S.14P and NPISH are processed according to a top-down method. The values estimated at the aggregate level (S.14 + S.15), once balanced, are broken down on the basis of the stock of loans.

### *Sector S.2*

#### A. Sources

Balance of payments (SD1), Imported and exported FISIM (SD10)

#### B. Methods

Interests are calculated separately according to the type of instrument and the functional class of the BoP (direct investment, portfolio investment, other investment, reserve assets).

*Interest on debt instruments classified as portfolio investments.*

Revenues resulting from ownership by a resident investor of financial instruments issued by non-residents are recorded as receivables, while revenues resulting from ownership by a non-resident investor of financial instruments issued by residents are recorded among payables.

The information needed is derived from the *Centralized Securities Database (CSDB)*, which registers all euro-denominated securities, all securities issued by entities established in the EU as well as those that may be held or traded by EU resident investors.

Interests on debt securities represent the amount that the debtor is committed to pay to the creditor over a given period of time, under the terms established by the financial instrument, without affecting the capital loaned. They are calculated according to the *debtor approach* and are recorded on an accrual basis. The accrued income is obtained by multiplying the average stock by the quota of daily interests and the number of relevant days. The calculation of daily interest is based on the information available in the CSDB, such as the coupon rate, the frequency of payments and the date from which interest becomes payable. The use of the information in the CSDB, which is updated on a monthly basis, ensures consistency with the standards of the BPM6, also with respect to index-linked securities and the collection of fees and taxes.

*Interest on accounts and deposits, loans, trade receivables and payables and other assets, classified as direct investments and other investments.*

The estimation process of the interest consists of several phases.

First of all, the interest for the banking sector is calculated based on the information on interests earned on deposits and loans with non-resident counterparties, provided quarterly in the Account Matrix.

Therefore, a matrix is built containing the interest rates differentiated by instrument (accounts and deposits, loans, trade receivables and payables, technical reserves of insurance companies) and groups of currencies (euro, US dollar, other): the rates are obtained by integrating the information coming from the banking sector with the market rates for non-financial loans and deposits for households. The main sources of information are the sample survey of interest rates, published monthly by the Bank of Italy, the ECB Statistical Data Warehouse and Bloomberg.

Finally, the interest rates are applied to the relevant stocks of financial assets and liabilities,

The use of a model based on the accrued interest rates ensures the compliance with the accrual principle and does not require corrections and adjustments related to taxes and contributions.

Interests on accounts and deposits and loans are calculated net of the FISIM component, whose estimate is based on the difference between the rate applied and the reference rate (which is assumed to be equal to the interbank rate derived from the Account Matrix). The component is thus included in the Financial Services, in accordance with the recommendations of the BPM6

*Interest on debt instruments of direct investments*

Interests on debt securities are computed with the methodology outlined for *portfolio investments* whereas interests on other financial instruments are calculated using the approach laid down for *other investments*. The accrual principle and, just in the case of debt securities, the debtor approach are adopted.

### *Interest on the instruments classified as reserves*

Interests in this category are calculated on the SDRs, the reserve position in the IMF and other reserve assets. They are derived from the internal accounting data of the Bank of Italy and are recorded according to the accrual principle (point 2).

The remuneration rate of each asset is applied to their stock.

For SDRs and the reserve position in the IMF, the income is determined by applying to the relevant stock the rate of remuneration published by the IMF. In particular, for the SDRs included in the liabilities of the monetary authority, the interests paid as allocation are accounted as income from other investments.

For accounts and deposits, the interbank interest rate used is the one that refers to the prevailing currency.

For debt securities, the calculation is made according to the methodology used for *portfolio investments* income.

The BoP provides the D.41 payable by Row to resident units, broken down by counterpart geographical area and counterpart sector. Moreover BoP provides data on interbank FISIMs to make the adjustment needed to ensure consistency of the BoP data (BPM6 definitions) with ESA 2010 definitions: in fact interbank FISIM with Row must be null according to ESA2010, while they are included in BoP flows.

## **RESOURCES**

### *Sector S.1*

Data for S.1 are obtained as sum of all relevant resident sectors.

### *Sector S.11*

#### A. Sources

The data sources are Financial Accounts (DS13) and the statistics on market interest rates and stocks of deposits, loans and securities collected and published by the Bank of Italy in the reports of the "Statistics series of the Bank of Italy"(DS9).

#### B. Methods

Interest are estimated through a detailed procedure where for each instrument and for each counterpart sector the average market rates (annual average of quarterly data at the end of the quarter) are multiplied by the average stocks (quarterly average) deriving from Financial Accounts.

If direct sources are available for the counterpart sector, these are used instead of the method described above.

### *Sector S.12*

#### A. Sources

For S121 data are gathered from Bank of Italy's financial statement (DS38) .

For S128 aggregate financial statements of insurance corporations data are available. Data are collected by IVASS. (DS2)

For S122 aggregate financial statements of banks data are available. This data are collected and published by Bank of Italy (DS32). This data are integrated with the amounts obtained from the annual financial statements of "Cassa depositi e Prestiti S.p.a."(DS11).

For the subsectors other than those mentioned above, the data sources are Financial Accounts (DS13) and the statistics on market interest rates on deposits, loans and securities collected and published by the Bank of Italy in the reports of the "Statistics series of the Bank of Italy"(DS9).

#### B. Methods

For the sectors for which balance sheet data are available, the amounts are allocated on the basis of the direct information and if this isn't possible, the allocation is based on the stocks by instrument and counterpart sector deducible from the Financial Accounts.

For the sectors for which direct information aren't available, interest are estimated through a detailed procedure where for each instrument and for each counterpart sector the average market rates (annual average of quarterly data at the end of the quarter) are multiplied by the average stocks (quarterly average) deriving from Financial Accounts.

If direct sources are available for the counterpart sector, these are used instead of the method described above.

#### *Sector S.13*

The estimation method is described in Italy EDP Inventory

(<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

#### *Sector S.14*

##### A. Sources

The data sources are Financial Accounts (DS13) and the statistics on market interest rates and stocks of deposits and securities collected and published by the Bank of Italy in the reports of the "Statistics series of the Bank of Italy"(DS9).

##### B. Methods

Interest are estimated through a detailed procedure where for each instrument and for each counterpart sector the average market rates (annual average of quarterly data at the end of the quarter) are multiplied by the average stocks (quarterly average) deriving from Financial Accounts..

If direct sources are available for the counterpart sector, these are used instead of the method described above.

The interests of S.14C, S.14P and NPISH are compiled according to a top-down method. The values estimated at the aggregate level (S.14 + S.15), once balanced, are broken down on the basis of the stocks of deposits and securities.

#### *Sector S.15*

##### A. Sources

The data sources are Financial Accounts (DS13) and the statistics on market interest rates and stocks of deposits and securities collected and published by the Bank of Italy in the reports of the "Statistics series of the Bank of Italy"(DS9).

##### B. Methods

Interest are estimated through a detailed procedure where for each instrument and for each counterpart sector the average market rates (annual average of quarterly data at the end of the quarter) are multiplied by the average stocks (quarterly average) deriving from Financial Accounts..

If direct sources are available for the counterpart sector, these are used instead of the method described above.

The interests of S.14C, S.14P and NPISH are compiled according to a top-down method. The values estimated at the aggregate level (S.14 + S.15), once balanced, are broken down on the basis of the stocks of deposits and securities.

## *Sector S.2*

### A. Sources

Balance of payments (SD1), Imported and exported FISIM (SD10)

### B. Methods

Please refer to methods for D.41 Uses described above.

The BoP provides the D.41 receivable by Row to resident units, broken down by counterpart geographical area and counterpart sector. Moreover BoP provides data on interbank FISIMs to make the adjustment needed to ensure consistency of the BoP data (BPM6 definitions) with ESA 2010 definitions: in fact interbank FISIM with Row must be null according to ESA2010, while they are included in BoP flows.

## **29.2. Balancing adjustments across all sectors**

Once estimated the flows of interest paid and received by each sector, they are balanced through a whom-to-whom matrix. The balancing procedure is based on the Stone-based<sup>22</sup> method, that involves the use of a reliability rate, defined by variances assigned to each cell according to the robustness and coverage of the data used in the estimation procedure. Of course flows that are gathered from direct sources have variance equal to zero and are not changed; only the flows initially estimated through a stock X interest rate approach are modified.

## **30. D.41 – Interest**

Table D.44 - Interest - Year 2015 (million EUR)

<b>Institutional sectors</b>		<b>Resources</b>	<b>Uses</b>
S.1	Total economy	112,968	134,095

	<i>S.14/P Producer Households</i>	<i>0</i>	<i>0</i>
S.15	NPISH	0	0
S.2	Rest of the world	9,923	17,242

### **31.1. Description of compilation procedures**

For incorporated enterprises where no self-employed workers are identified by the procedure used to calculate labour input (see paragraph 56 of section D), dividends are estimated through a whom-to-whom matrix approach applied to micro-data.

In this context, information gathered from Chamber of Commerce Archive and from Information System on employment (DS43) allows to delineate the structure of the ownership of incorporated enterprise (taking into account both the typology of firms and the typology of the owner in terms of institutional sector). The structure of ownership related to S.2 is defined starting from the information gathered from Balance of Payments.

This structure of ownership (for resident and non-resident owners and enterprises) is used to determine the whom-to-whom matrix of dividends paid and received, through a two-steps procedure. In the first step, total dividends paid by institutional sectors are defined and broken-down by receiving sector according to the whom-to-whom structure of ownership (taking into account relative constraints on total paid dividends or on some peculiar relationship). In the second step, dividends received are calculated starting from the composition of dividends paid (also in this case taking into account possible constraints on total received dividends or on some peculiar relationship). Finally, a Stone-based balancing procedure is used to obtain coherence between total dividends paid and received.

## **USES**

### *Sector S.1*

Data for S.1 are obtained as sum of all relevant resident sectors.

### *Sector S.11*

#### A. Sources

Frame-SBS (DS12)

#### B. Methods

For S.11 Frame-SBS is used to define the whole amount of “regular” profits for each enterprise. To define the amount of dividends paid, legal reserve is subtracted from profits

### *Sector S.12*

#### A. Sources

Frame-SBS (DS12), Supervisory reporting by the FIs to the Bank of Italy (DS8), Financial Statements of Insurance Companies (DS2), InfoCamere archive of Financial statements (DS24), Information system on employment (D43)

#### B. Methods

In order to estimate dividends of financial corporations, S.12 is broken down into four components: financial intermediaries; Holding Corporations (HC) ; insurance companies; financial auxiliaries. Data on dividends paid are gathered from Supervisory reporting by the FIs to the Bank of Italy for financial intermediaries, from InfoCamere archive of financial statements for HC, from Frame-SBS for financial auxiliaries, from Financial Statements of Insurance Companies for insurance companies. For financial intermediaries, Supervisory reporting by the FIs to the Bank of Italy provides the information about total dividends paid; the same is true for Insurance corporations, since their financial statements allow to calculate the amount of distributed dividends. For HC and financial auxiliaries, the amount of profits is determined as in the case of S.11.

*Sector S.13, S.14, S.15*

Not applicable

*Sector S.2*

A. Sources

Balance of payments (DS1)

B. Methods

Balance of Payments contains information about total outward dividends of non-resident units. The structure of ownership (resident shareholders of non-resident enterprises) is defined by applying a theoretical sub-structure to the information about the stock of (domestic and foreign) financial and non-financial assets owned by resident and non-resident agents.

**RESOURCES**

*Sector S.1*

Data for S.1 are obtained as sum of all relevant resident sectors.

*Sector S.11*

Dividends received by S.11 are determined from the structure of the whom-to-whom matrix representing the share of dividends paid by resident and non-resident institutional units that are received by S.11 (please refer to the description of the compilation method, page 160).

*Sector S.12*

A. Sources

Frame-SBS (DS12), Supervisory reporting by the FIs to the Bank of Italy (DS8), Financial Statements of Insurance Companies (DS2), InfoCamere archive of Financial statements (DS24)

B. Methods

For financial intermediaries, total received dividends are gathered from Supervisory reporting by the FIs, while total inward dividends for insurance companies are derived from Financial Statements of Insurance Companies. Relating to financial auxiliaries and HC, the same method as in case of S.11 is followed.

*Sector S.13*

General Government non-financial accounts (DS15) contains information about the whole amount of dividends that are received by S.13. The estimation method is described in Italy EDP Inventory. (<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

*Sector S.14*

For household consumers, the approach to calculate incoming dividends is the same as in case of S.11.

### *Sector S.15*

Up to now, S.15 does not receive any dividends.

### *Sector S.2*

#### A. Sources

Balance of payments (SD1)

#### B. Methods

Balance of Payments contains information about total inward dividends of non-resident agents, while the same informative source also contains information about the structure of non-resident shareholders of resident units.

### **31.2. Balancing adjustments across all sectors**

Using methods described along this section a whom-to-whom matrix can be built. In order to balance total inward and outward dividends a Stone balancing procedure is applied, taking as constraint information for total (inward and, if applies, outward) dividends for S.13, S.2 and financial intermediaries.

## **32. D.422 – Withdrawals from the income of quasi-corporations**

Table D.46 - Withdrawals from the income of quasi-corporations - Year 2015 (million EUR)

<b>Institutional sectors</b>		<b>Resources</b>	<b>Uses</b>
S.1	Total economy	58,512	58,509
S.11	Non-financial corporations	0	56,303
S.12	Financial corporations	0	2,206
S.13	General government	0	0
S.14	Households	58,512	0
	<i>S.14/C Consumer Households</i>	<i>58,512</i>	<i>0</i>
	<i>S.14/P Producer Households</i>	<i>0</i>	<i>0</i>
S.15	NPISH	0	0
S.2	Rest of the world	0	3

### **32.1. Description of compilation procedures**

#### **USES**

#### *Sector S.1*

Data for S.1 are obtained as sum of all relevant resident sectors.

#### *Sector S.11*

#### A. Sources

Frame-SBS (DS12)

## B. Methods

The information provided by Frame-SBS allows to calculate profits of the whole population of quasi-corporations operating in all industries (including financial auxiliaries). The withdrawal, completely received by consumer households (S.14), is calculated on total profit, including the share generated by non-observed activities, by applying, to each quasi-corporation, a coefficient (defined taking into account different strata in terms of industry, size and turnover class), which represents the share of profits which is actually withdrawn (and, consequently, is not reinvested in the productive unit or used as legal reserve).

*Sector S.12*

### A. Sources

Frame-SBS (DS12)

### B. Methods

Withdrawals from the income of quasi-corporations are only applicable to financial auxiliaries, whose income is received by consumer households (S.14). The amount of income to be withdrawn from quasi-corporation is calculated as in the case of S.11 (see above).

*Sector S.13, S.14, S.15*

*Sector S.1*

Data for S.1 are obtained as sum of all relevant resident sectors.

*Sector S.11, S.12, S.13, S.15, S.2*

Not Applicable

*Sector S.14: Income distributed by producer households to consumer households*

As explained in Section A par. 6, given the large number of very small productive units to be classified, according to their features, in the Households sector, separate accounts are compiled and disseminated in Italy for HH as consumers and HH as producers. This implies some assumptions to be made on the share of mixed income that the entrepreneur makes available for final consumption, it is to say that he “ideally” transfers to his family for consumption purposes. This flow is the “Income distributed by producer households to consumer households” (Table D.47): in short, it is calculated as gross mixed income less what is retained in the enterprise for self-financing, it is property income and current taxes paid by producer households and consumption of fixed capital, as a proxy of GFCF.

Table D.47 - Income distributed by producer households to consumer households - Year 2015 (million EUR)

Institutional sectors		Resources	Uses
S.1	Total economy	228,226	228,226
S.11	Non-financial corporations	0	0
S.12	Financial corporations	0	0
S.13	General government	0	0
S.14	Households	228,226	228,226
	<i>S.14/C Consumer Households</i>	<i>228,226</i>	<i>0</i>
	<i>S.14/P Producer Households</i>	<i>0</i>	<i>228,226</i>
S.15	NPISH	0	0
S.2	Rest of the world	0	0

### 33. Other income distributed by corporations

Table D.48 - Other income distributed by corporations - Year 2015 (million EUR)

Institutional sectors		Resources	Uses
S.1	Total economy	41,056	41,056
S.11	Non-financial corporations	0	40,639
S.12	Financial corporations	0	417
S.13	General government	0	0
S.14	Households	41,056	0
	<i>S.14/C Consumer Households</i>	<i>41,056</i>	<i>0</i>
	<i>S.14/P Producer Households</i>	<i>0</i>	<i>0</i>
S.15	NPISH	0	0
S.2	Rest of the world	0	0

In Italy, sector S.11 includes corporations employing self-employed workers ( see Section A, par.6 “*The level of the profit share in Italy*”). In order to represent the remuneration of self-employed workers in corporations, the same methodology applied for quasi-corporations is used (see above). In the national publication, this income is disseminate as “Other income distributed by corporations” with the code D.423.

#### 33.1. Description of compilation procedures

##### USES

##### Sector S.1

Data for S.1 are obtained as sum of all relevant resident sectors.

*Sector S.11*

A. Sources

Frame-SBS (DS12)

B. Methods

Frame-SBS provides the information allowing to calculate profits of the corporations employing self-employed workers classified in sector S.11. The income, including the share generated by non-observed activities, is received by consumer households (S.14) and is calculated by applying, to each enterprise, a coefficient (defined taking into account different strata in terms of industry, size and turnover class), which allows to define the share of profits which is actually withdrawn (and, consequently, is not reinvested in the productive unit or used as legal reserve).

*Sector S.12*

A. Sources

Frame-SBS (DS12)

B. Methods

Other income distributed by enterprise employing self-employed workers is only applicable to financial auxiliaries, whose income is received by consumer households (S.14). The amount is calculated as in the case of S.11 (see above).

*Sector S.13, S.14, S.15, S.2*

Not applicable

**RESOURCES**

*Sector S.11, S.12, S.13, S.15, S.2*

Not applicable

*Sector S.14*

Income distributed by corporations that employ self-employed workers is received by consumer households (S.14).

### 34. D. 43 - Reinvested earnings on foreign direct investments

Table D.49 - Reinvested earnings on FDI by institutional sectors - Year 2015 (million EUR)

Institutional sectors		Resources	Uses
S.1	Total economy	-2.780	6.732
S.11	Non-financial corporations	-5.140	4.914
S.12	Financial corporations	2.360	1.818
S.13	General government	0	0
S.14	Households	0	0
	<i>S.14/C Consumer Households</i>	<i>0</i>	<i>0</i>

S.15	NPISH	0	0
S.2	Rest of the world	6.732	-2.780

#### 34.1. Description of compilation procedures

##### USES

###### *Sector S.1*

- Reinvested earnings on FDI (D.43) payable for total economy (S.1) are obtained as sum of uses of sectors S.11 and S.12.

###### *Sector S.11*

###### A. Sources

Balance of payments (DS1)

###### B. Methods

The BoP provides information on the reinvested earnings on FDI paid by non-financial corporations to non-resident units broken down by counterpart geographical area. No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and to ensure the exhaustiveness of the estimates.

###### *Sector S.12*

###### A. Sources

Balance of payments (DS1)

###### B. Methods

The BoP provides information on the reinvested earnings on FDI paid by financial corporations to non-resident units broken down by counterpart geographical area. Information is available for the following sub-sectors: central bank, MFIs, financial corporations other than MFIs. No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and to ensure the exhaustiveness of the estimates.

### *Sector S.13*

There are no transactions of reinvested earnings between the GG and the RoW.

### *Sectors S.14-S.15*

Not applicable

### *Sector S.2*

#### A. Sources

Balance of payments (DS1)

#### B. Methods

The Framework for Direct Investment Relationships (FDIR) defines the population of investors and investee companies to be included in the statistics on direct investments. According to the FDIR, all creditor and debtor relationships between companies belonging to the same group have to be classified as direct investments. This also applies to the balance of assets and liabilities between fellow enterprises, i.e. enterprises that belong to the same group.

Reinvested earnings (RIE) represent the direct investors' proportion, in terms of equity held, of the earnings that foreign subsidiaries, associates and branches do not distribute as dividends. They are defined as the direct investor's share of the total consolidated profits earned by the direct investment enterprise in the reference period (after allowing for tax, interest and depreciation) less dividends due for payment in the reference period, even if these dividends relate to profits earned in previous periods. Reinvested earnings are to be recorded in the period in which they are earned.

Data on reinvested earnings are compiled by the Bank of Italy. The current system, in place since 2010, is mainly based on direct reporting by the parties involved in cross-border transactions. Data is collected on a sample basis for non-financial and insurance companies and on a census basis for financial intermediaries. The sample of non-financial companies includes companies with total assets of more than one million euro. The choice of the threshold is based on the results of several preliminary analyses conducted on resident companies involved in FDI relations with foreign counterparties. The analyses showed a strong correlation between FDI phenomena and company size, measured by total assets. They also showed that for companies with total assets below the 1 million mark, FDI phenomena become rather insignificant over time (the last estimate refers to 2012 and shows an incidence below 1% for outward investments and 3% for inward investments); therefore, their inclusion in the sample would not be efficient.

Non-financial companies in the sample were selected based on specific stratification variables: the size (assessed by the balance sheet assets), the geographic area and the presence or absence of foreign direct investments. In order to cover the whole universe of Italian enterprises, with the relevant stratification variables, the Bank of Italy set up its own Register of Companies. The register combines different sources of information, its fulcrum being the list of all corporations registered with the Chambers of Commerce (around one million in 2015). The list of national enterprises is enriched with registry data, financial statement information (in particular assets and value of production), data on foreign investments included in the note to the financial statements, information about the list of shareholders (for determining the non-resident ones), data on payments made by means of a resident bank.

FDI stock and flows data, collected through sample surveys, are regularly checked and validated by comparison with other administrative sources (list of shareholders filed with the chambers of commerce, annual statements of the companies and press releases).

All information used for the calculation of current operating income based on the Current Operating Performance Concept (COPC), including capital gains and losses, are provided separately by the reporting agents, both in the case of foreign direct investment (data referred to the foreign counterpart) and of direct investment in the reporting country (data referred to the reporting company). The same reporting agents also provide information on the dividends deliberated within each direct investment relationship, as debtor or creditor (method I in the GNIC/052).

Both outward and inward direct investments in unlisted companies are valued at the Own Funds at Book Value (OFBV), which should ensure the inclusion of indirect relations. Instead, the equity of listed companies is evaluated, at market value.

The BoP data provides the reinvested earnings on FDI paid by Row to resident institutional units broken down by counterpart geographical area and counterpart sector. No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and to ensure the exhaustiveness of the estimates.

## **RESOURCES**

S.12	Financial corporations	31	17,403
S.13	General government	0	0
S.14	Households	17,238	0
S.15	NPISH	3	0
S.2	Rest of the world	92	548

### **35.1. Description of compilation procedures**

#### **USES**

##### *Sector S.1*

Data for S.1 correspond to uses of Insurance corporations (S.128).

##### *Sector S.11*

Not applicable

##### *Sector S.12*

### A. Sources

Financial Statements of Insurance Corporations (DS2)

### B. Methods

The estimate of D.441 payable by insurance corporations is carried out separately for life and non-life insurance. The transaction D.441 corresponds to implicit premium supplements included in the output of insurance corporations and it consists in the sum of all incomes received from the investments of insurance technical reserves. Table D.51 shows the calculation of D.441 payable by S.128 in 2015.

Table D.51 - D.441 payable by insurance corporations - Year 2015 (million EUR)

	Non-life insurance	Life insurance
D.441 payable by insurance corporations =	1,899	13,462
+ interest received - interest paid	1,844	12,700
+ dividend received	644	945
+ real estate operating surplus	92	20
- income from insurer own funds	687	1,080
+ balance between income and charges related to investment for policy holder who bear the investment risk	-	877

All figures are based on a proper reclassification of the financial statements of insurance corporations gathered by IVASS for supervisory purposes. The income earned on own funds is excluded from D.441 applying the guidelines of the GNP Committee Task Force on Insurance Measurement, separately for life and non-life insurance. Total property income from the joint investment of technical reserves and own funds of the insurance corporations is partitioned through a *pro-rata* approach according to the ratio:

Capital and reserves + Profit for financial year

---

Capital and reserves + Profit for financial year + Technical provisions + Technical provisions for life insurance policies where the investment is borne by policy holders

As to D.441 from life insurance, the counterpart sectors are S.14 and S.2. The data sources available do not provide information on the counterpart sectors of D.441 from non-life insurance paid by domestic insurance corporations. For the latter, the estimate of the income receivable by each counterpart sector is obtained with the following formula:

$$D.441 \text{ rec by } S_i = \frac{D.441 \text{ from non-life insurance}}{\text{Total gross non-life insurance premiums paid by } S_i} \times \frac{\text{Gross non-life insurance premiums paid by } S_i}{\text{Total gross non-life insurance premiums paid}}$$

*Sectors S.13, S.14, S.15*

Not applicable

Sector S.2

#### A. Sources

Balance of payments (DS1)

#### B. Methods

The estimation process is broken down into several phases and follows the method used in BoP to calculate interests on the other investments. Two rates are determined: a reference rate for the banking sector (differentiated by currency) and an interest rate for technical reserves of insurance companies (equal to the reference rate plus a spread). These rates are then multiplied by the reference stock of assets and liabilities. In particular, for the assets (amounts paid by resident units) the stock is equal to the amount of technical reserves attributable to non-resident policyholders, as reported by insurance companies in the financial questionnaires of the survey of Bank of Italy regarding the transactions of resident non-financial and insurance corporations with the Row (DR -

direct reporting system). For the liabilities (income received by resident units), the stock is equal to the value of foreign policies underwritten by households, as estimated from the reports of premiums paid abroad included in the non-financial questionnaire of DR.

The BoP provides total D.441 paid by Row to resident units broken down by counterpart geographical area and counterpart sector. No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and to ensure the exhaustiveness of the estimates.

## **RESOURCES**

### *Sector S.1*

Data for S.1 are obtained as sum of all relevant resident sectors.

### *Sectors S.11, S.12, S.15*

#### A. Sources

Financial Statements of Insurance Corporations (DS2)

Survey on the financial statements of large enterprises (SCI) (DS6)

### A. Sources

Financial accounts (DS13)

Bank of Italy report on mutual investment funds (DS14)

### B. Methods

Bank of Italy provides information on the primary income received and reinvested on behalf of shareholders' by Non-MMF investment funds that it supervised. No adjustment is needed to ensure consistency of the data with ESA 2010 definitions and to ensure the exhaustiveness of the estimates.

*Sectors S.13, S.14, S.15*

Not applicable

## *Sector S.2*

### A. Sources

Balance of payments (DS1)

### B. Methods

The income receivable by resident units resulting from the ownership of mutual investment fund shares are calculated on a security-by-security basis, depending on the stock data (calculated in the context of portfolio investments) and using the information on individual securities contained in the Centralized Securities Database (CSDB). This information is related to the daily accrued interest and the amount, timing and date of dividend payment. In detail:

- if the fund paid dividends at the end of the reference period, the income recorded is equal to the dividend;
- if the fund did not pay dividends during the reporting period (or in the case of accumulation funds), income is calculated as the product of the daily income, the average stock, the average price and the number of days in the reference period; this amount is entirely considered reinvested income;
- if the fund paid dividends during the reference period, the income is made up of two elements: the dividend paid and the reinvested income (the product of the daily income, the average stock, the average price and the number of days following the dividend payment).

The method is the same both for income received by resident investors in foreign funds (liabilities side) and for income paid by Italian funds to non-resident underwriters (asset side).

The BoP provides the D.443 payable by Row to resident units, broken down by counterpart geographical area and counterpart sector. No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and to ensure the exhaustiveness of the estimates

General Agricultural Census (DS17)

Farm Structure Survey (FSS) (DS19).

GG non-financial accounts (DS15)

Annual report of Council for Agricultural Research and Economics (CREA) (DS18)

## B. Methods

Rents of land for S.1 includes the following items:

- Rents of agricultural land;
- Other rents of land paid to S.13

The estimate of the first component is calculated grossing up the average rental value through the rented surface of agricultural land. The latter is provided by the 6th General Agricultural Census and from the Farm Structure Survey (FSS). The average rental value is taken from the annual report of the Council for Agricultural Research and Economics (CREA).

The second component is taken from GG accounts.

### *Sector S.11, S.14*

Rents of agricultural land of S.1 are allocated to these sectors using information from the 6th General Agricultural Census and from the Farm Structure Survey (FSS).

An indirect approach is used to allocate the other rents received by GG based on the distribution of output between sectors.

S.15	NPISH	0	52
S.2	Rest of the world	1,734	2,940

#### 39.1. Description of compilation procedures

##### USES

*Sector S.1*

Taxes on income paid by S.1 correspond to the sum of the entries of S.13 and S.2.

As for current taxes receivable by S.13, the estimate of the tax burden imposed on the other units is carried out by type of tax. Table D.56 - shows the detail of current taxes by type as received by GG and as paid by counterpart sectors for the year 2015. Most types of taxes are levied by GG on the income or wealth of units classified into one definite institutional sector, such as capital gains tax (only paid by consumer households) or substitute tax on the budget revaluation of business assets (only paid by the corporate sector) and are, hence, directly attributable. When a one-to-one matching is not possible, generally the estimate of amount paid by each sector or group of sectors relies on the distribution of the relevant tax base.

The information available only provides total current taxes paid to GG by corporations and non-commercial entities, including GG. Once subtracted current taxes paid by S.13, the remaining amount has to be allocated to sectors S.11 and S.12. Taxes paid by S.12 are taken from supervisory data; hence the amount paid by the non-financial corporations is obtained as residual.

Only private resident units pay taxes to non-resident institutions: BoP data provide separately the amounts paid by Financial corporations, on one side, and all other sectors, on the other; to allocate this total to households and non-financial corporations the relevant proportion of D5 paid by these sectors to GG is used as a proxy.

Table D.56 - Current taxes on income and wealth paid by type - Year 2015 (million EUR)

	Current taxes paid to GG by						Total taxes received by S.13

### *Sectors S.11*

#### A. Sources

General Government non-financial accounts (DS15)

#### B. Methods

Taxes on income paid by non-financial corporations mainly refer to corporate income tax (IRES). As pointed out above, for S.11 this transaction is calculated by deducting the amounts paid by S.13 and S.12 from the total taxes liabilities of corporations and non-commercial entities.

### *Sectors S.12*

#### A. Sources

General Government non-financial accounts (DS15)

Financial Statements of Insurance Corporations (DS)

Supervisory reporting by the FIs to the Bank of Italy (DS8)

InfoCamere archive of financial statements (DS24)

Covip annual report (DS3)

#### B. Methods

Data sources provide direct information on the current taxes paid by the MFIs, other FIs, holding corporations, insurance corporations and financial auxiliaries. The note to annual financial statements provide all data to identify all types of taxes paid by corporations and to exclude those types to be classified as other taxes on production (mainly IRAP) or capital taxes.

### *Sector S.13*

The taxes on income paid by GG mainly refer to tax on income of non-commercial entities included in sector S.13 and withholding tax on interests and other property income. The estimation method is described in Italy EDP Inventory (<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

### *Sector S.14*

#### A. Sources

General Government non-financial accounts (DS15)

#### B. Methods

Most part of taxes paid by households are directly attributable to the sub-sectors of consumer households or producer households according to the precondition of the tax. Taxes on income paid by consumer households (S.14C) mainly refer to personal tax on income (IRPEF) and withholding tax on interest and other property income. For the latter, the amounts paid by households are computed according to the distribution of the relevant tax base, namely gross interests or other property income. For the producer households (S.14P), the most relevant tax is the tax on rentals.

### *Sector S.15*

#### A. Sources

General Government non-financial accounts (DS15)

#### B. Methods

NPSHIs only paid withholding tax on interest and the amount is estimated on the basis of the share of gross interests received by the sector.

### *Sectors S.2*

#### A. Sources

Balance of Payments (DS1)

#### B. Methods

BoP provides taxes on income paid by non-resident units to GG, that mainly refer to current taxes paid by cross-border workers and foreign investors. No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and to ensure the exhaustiveness of the estimates.

## **RESOURCES**

### *Sector S.1*

Data for S.1 corresponds to the resources of S.13

### *Sector S.13*

The estimation method is described in Italy EDP Inventory (<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

### *Sector S.2*

#### A. Sources

Balance of Payments (DS1)

#### B. Methods

BoP provides the value of taxes on income received by RoW from resident units broken-down by counterpart institutional sector and geographical area. No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and to ensure the exhaustiveness of the estimates

#### 40. D.59 – Other current taxes

Table D.57 - Other current taxes - Year 2015 (million EUR)

Institutional sectors		Resources	Uses
S.1	Total economy	7,922	7,922
S.11	Non-financial corporations	0	1,419
S.12	Financial corporations	0	291
S.13	General government	7,922	0
S.14	Households	0	6,212
	<i>S.14/C Consumer Households</i>	<i>0</i>	<i>5,876</i>
	<i>S.14/P Producer Households</i>	<i>0</i>	<i>336</i>
S.15	NPISH	0	0
S.2	Rest of the world	0	0

#### 40.1. Description of compilation procedures

##### USES

##### *Sector S.1*

Other current taxes paid by S.1 correspond to the resources of S.13.

The estimation method is the same as taxes on income and it is described in paragraph 39.

##### *Sectors S.11*

##### A. Sources

General government accounts (DS15)

##### B. Methods

S.11 only pays a particular type of Other current taxes, it is “Other taxes on income”: half of this type of taxes is allocated to total households (30% to S.14C and 20% to S.14P) and half to non-financial corporations (Table D.56).

##### *Sectors S.12*

##### A. Sources

General government accounts (DS15)

Financial Statements of Insurance Corporations (DS2)

Supervisory reporting by the FIs to the Bank of Italy (DS8)

Balance of payments (DS1)

##### B. Methods

BoP data provides actual social contributions received by resident employers from non-resident workers. No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and to ensure the exhaustiveness of the estimates.

##### RESOURCES

##### *Sector S.1*

Data for S.1 are obtained as sum of all relevant resident sectors

##### *Sector S.11, S.14, S.15*

For these sectors, this transaction refers to the annual provision to the severance funds (see paragraph 23 of section D).

##### *Sector S.12*

Employers’ actual contributions received by S.12 include:

- the annual provision to the severance funds for employees of the units classified in S.12 (see paragraph 23 of section D)
- the employers' actual contributions collected by the Pension Funds.

#### *Sector S.13*

The estimation method is described in Italy EDP Inventory

(<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

#### *Sector S.2*

##### A. Sources

Balance of payments (DS1)

##### B. Methods

BoP data provides actual social contributions received by non-resident employers from resident workers. No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and to ensure the exhaustiveness of the estimates.

## **42. D.612 – Employers' imputed social contributions**

Table D.59 - Employers' imputed social contributions - Year 2015 (million EUR)

<b>Institutional sectors</b>		<b>Resources</b>	<b>Uses</b>
S.1	Total economy	11,430	11,430
S.11	Non-financial corporations	5,467	0
S.12	Financial corporations	1,746	0
S.13	General government	3,938	0
S.14	Households	239	11,430
	<i>S.14/C Consumer Households</i>	<i>57</i>	<i>11,430</i>

S.15	NPISH	0	179
S.2	Rest of the world	1.543	4.336

## 45.1. Description of compilation procedures

### USES

#### *Sector S.1*

- Data for S.1 are obtained as sum of all relevant resident sectors

#### *Sector S.11, S.14P*

##### A. Sources

Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)

InfoCamere archive of financial statements (DS24)

##### B. Methods

For these sectors, Social benefits refer to social imputed contributions (see paragraph 24 of section D) and the severance pay (TFR) paid by the employers to employees at the end of the employment relationship. Data sources (DS12 and DS24) provide information to estimate these transactions.

#### *Sector S.12*

##### A. Sources

Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)

Financial statement of the Bank of Italy (DS33)

Supervisory reports to the Bank of Italy (DS8)

Financial statements of insurance corporations (DS2)

InfoCamere archive of financial statements (DS24)

COVIP annual report (DS3)

##### B. Methods

Social benefits in cash paid by S.12 include:

- the social imputed contributions (see paragraph 24 of section D);
- the severance pay (TFR) paid by the employers to employees at the end of the employment relationship. Financial statement of Bank of Italy (DS33), financial intermediaries (DS8), insurance corporations (DS2), financial auxiliaries (DS12, DS24) provide the informations to estimate this transaction.
- the benefits in cash paid by Pension Funds to the members. Data are provided by COVIP (DS3).

#### *Sector S.13*

The estimation method is described in Italy EDP Inventory

(<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

#### *Sector S.14C, S.15*

For these sectors, Social benefits refer to social imputed contributions (see paragraph 24 of section D) and the severance pay (TFR) paid by the employers to employees at the end of the employment relationship. No information is available for severance pay (TFR) paid

in the year by employers classified in sectors S.14C and S.15. We assume that this amount is equal to the annual provision to the relevant fund included in D.121.

*Sector S.2*

A. Sources

Balance of payments (DS1)

B. Methods

BoP data provides cash benefits paid by non-resident employers to resident workers. No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and to ensure the exhaustiveness of the estimates.

**RESOURCES**

*Sector S.1*

Data for S.1 corresponds to resources of S.14

*Sector S.11, S.12, S.13, S.15*

Not applicable

*Sector S.14C*

This transaction includes benefits in cash received by resident households from resident and non-resident units.

*Sector S.2*

A. Sources

Balance of payments (DS1)

B. Methods

BoP data provides benefits in cash received by non-resident households from resident units.

**46. D.63 – Social benefits in kind**

Table D.63 - Social benefits in kind - Year 2015 (million EUR)

Institutional sectors		Resources	Uses
S.1	Total economy	193.104	193.104
S.11	Non-financial corporations		
S.12	Financial corporations		
S.13	General government		183.994
S.14	Households	193.104	
	<i>S.14/C Consumer Households</i>	<i>193.104</i>	
	<i>S.14/P Producer Households</i>	<i>0</i>	
S.15	NPISH	0	9.110
S.2	Rest of the world		

#### 46.1. Description of compilation procedures

##### USES

###### *Sector S.1*

Data for S.1 are obtained as sum of uses of S.13 and S.15

###### *Sector S.11, S.12, S.14*

Not applicable

###### *Sector S.13, S.15*

This transactions corresponds to P.31 (see paragraph 7 of section D)

###### *Sector S.2*

Not applicable

##### RESOURCES

###### *Sector S.1*

Data for S.1 corresponds to resources of S.14

###### *Sector S.11, S.12, S.13, S.15*

Not applicable

###### *Sector S.14C*

The benefits in kind received by consumer households corresponds to individual consumptions expenditure of S.15 and S.13.

###### *Sector S.2*

Not applicable

#### 47. D.71 – Net non-life insurance premiums

Table D.64 - Net non-life insurance premiums - Year 2015 (million EUR)

Institutional sectors		Resources	Uses
S.1	Total economy	19,517	19,112
S.11	Non-financial corporations	0	5,841
S.12	Financial corporations	19,517	326
S.13	General government	0	863
S.14	Households	0	12,049
	<i>S.14/C Consumer Households</i>	<i>0</i>	<i>10,912</i>
	<i>S.14/P Producer Households</i>	<i>0</i>	<i>1,137</i>
S.15	NPISH	0	32
S.2	Rest of the world	1,380	1,785

## **47.1. Description of compilation procedures**

### **USES**

#### *Sector S.1*

Data for S.1 are obtained as sum of all relevant sectors.

#### *Sectors S.11*

##### A. Sources

Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)

##### B. Methods

Data source provide information on non-life gross actual premiums paid by non-financial corporations to Italian and foreign insurance companies. Net non-life insurance premiums payable by private resident units are allocated to each sector according to the distribution of gross actual premiums.

#### *Sectors S.12*

##### A. Sources

Financial Statements of Insurance Corporations (DS2)

Supervisory reporting by the FIs to the Bank of Italy (DS8)

Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)

##### B. Methods

Data sources provide information on gross actual premiums paid by insurance corporations (DS2), banks and OFIs (DS8) and financial auxiliaries (DS12) to Italian and foreign insurance companies. Like for S.11, the distribution of non-life gross actual premiums is used to estimate the share of net non-life premiums to be allocated to financial corporations

#### *Sectors S.13*

The estimation method is described in Italy EDP Inventory

(<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

#### *Sectors S.14*

##### A. Sources

Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)

Household Expenditure Survey (DS5)

##### B. Methods

Data source provide information on gross actual premiums paid by enterprises included in producer households (DS12) and consumer households (DS5). The distribution of non-life gross actual premiums is used to estimate the share of net non-life premiums to be allocated to producer and consumer households

### *Sectors S.15*

Data sources do not provide information for sector S.15. An indirect approach is used. Non-life net and gross actual premiums paid by private non-market institutions are computed by applying to output of S.15 the ratio gross/net premium to output calculated for non-financial corporations.

### *Sectors S.2*

#### A. Sources

Balance of Payments (DS1)

#### B. Methods

BoP provides net premiums paid by non-resident units to Italian insurance corporations. No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and the exhaustiveness of the estimates.

## **RESOURCES**

### *Sector S.1*

Data for S.1 corresponds to the uses of S.12

### *Sectors S.12*

#### A. Sources

Financial Statements of Insurance Corporations (DS2)

#### B. Methods

Net non-life insurance premiums receivable by insurance corporations (S.128) are computed by deducting the insurance service charges from the total amount of actual premiums payable and the premium supplements attributable to insurance policy holders. The methodology to calculate premiums is described in paragraph 2 when the estimate of non-life insurance output is presented.

### *Sectors S.2*

#### A. Sources

Balance of Payments (DS1)

#### B. Methods

BoP provides net premiums paid resident units to foreign insurance corporations. No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and the exhaustiveness of the estimates.

#### 48. D.72 – Non-life insurance claims

Table D.65 - Non-life insurance claims - Year 2015 (million EUR)

Institutional sectors		Resources	Uses
S.1	Total economy	18,537	19,517
S.11	Non-financial corporations	5,328	0
S.12	Financial corporations	150	19,517
S.13	General government	72	0
S.14	Households	12,968	0
	<i>S.14/C Consumer Households</i>	<i>11,855</i>	<i>0</i>
	<i>S.14/P Producer Households</i>	<i>1,113</i>	<i>0</i>
S.15	NPISH	19	0
S.2	Rest of the world	2,628	1,648

#### 48.1. Description of compilation procedures

##### USES

##### *Sector S.1*

Data for S.1 corresponds to uses data for S.12.

##### *Sectors S.12*

For S.12 the transaction corresponds to net non-life insurance premiums received by resident insurance corporations.

##### *Sectors S.2*

##### A. Sources

Balance of Payments (DS1)

##### B. Methods

BoP provides non-life insurance claims paid to residents by foreign insurance corporations. No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and the exhaustiveness of the estimates.

##### RESOURCES

##### *Sector S.1*

Data for S.1 are obtained as sum of the uses of the resident sectors.

##### *Sectors S.11, S.12, S.14, S.15*

The available data sources do not provide reliable information on claims received by households and enterprises. These data are estimate through an indirect approach: non-life insurance claims paid by resident and foreign insurance corporations to private resident sectors are allocated to each sector according to the distribution of net non-life premiums.

### Sectors S.13

The estimation method is described in Italy EDP Inventory (<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

### Sectors S.2

#### A. Sources

Balance of Payments (DS1)

#### B. Methods

BoP provides non-life insurance claims received by non-resident units from Italian insurance corporations. No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and the exhaustiveness of the estimates.

## 49. D.74 – Current international cooperation

Table D.66 - Current international cooperation - Year 2015 (million EUR)

Institutional sectors		Resources	Uses
S.1	Total economy	1,168	1,944
S.11	Non-financial corporations	0	0
S.12	Financial corporations	0	0
S.13	General government	1,168	1,944
S.14	Households	0	0
	<i>S.14/C Consumer Households</i>	<i>0</i>	<i>0</i>
	<i>S.14/P Producer Households</i>	<i>0</i>	<i>0</i>
S.15	NPISH	0	0
S.2	Rest of the world	1,944	1,168

### 49.1. Description of compilation procedures

#### USES

##### Sector S.1

Data for S.1 corresponds to uses of sector S.13

##### Sectors S.11, S.12

Not applicable

##### Sectors S.13

The estimation method is described in Italy EDP Inventory (<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

*Sectors S.14, S.15*

Not applicable

*Sectors S.2*

A. Sources

Balance of Payments (DS1)

B. Methods

BoP includes the estimates of contributions and other current transfers from international organisations to GG provided by Istat.

No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and to ensure the exhaustiveness of the estimates.

**RESOURCES**

*Sector S.1*

Data for S.1 corresponds to resources of sector S.13

*Sectors S.11, S.12*

Not applicable

*Sectors S.13*

The estimation method is described in Italy EDP Inventory (<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

*Sectors S.14, S.15*

Not applicable

*Sectors S.2*

A. Sources

Balance of Payments (DS1)

B. Methods

BoP includes the estimates of contributions and other current transfers from GG to international organisations provided by Istat.

No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and to ensure the exhaustiveness of the estimates.

## 50. D.75 – Miscellaneous current transfers

Table D.67 - Miscellaneous current transfers - Year 2015 (million EUR)

Institutional sectors		Resources	Uses
S.1	Total economy	51,001	55,052
S.11	Non-financial corporations	1,360	6,246
S.12	Financial corporations	1,972	2,864
S.13	General government	18,462	9,477
S.14	Households	19,899	34,275
	<i>S.14/C Consumer Households</i>	<i>19,590</i>	<i>32,414</i>
	<i>S.14/P Producer Households</i>	<i>309</i>	<i>1,861</i>
S.15	NPISH	9,309	2,190
S.2	Rest of the world	6,581	2,530

### 50.1. Description of compilation procedures

#### USES

##### *Sector S.1*

Data for S.1 are obtained as sum of all relevant resident sectors

##### *Sectors S.11*

#### A. Sources

Balance of Payments (DS1)

General Government non-financial accounts (DS15)

2011 Census of non-profit institutions (CISINP) (DS22)

#### B. Methods

Table D.68 - shows current transfers paid by S.11 to counterpart sectors.

GG accounts only provide current transfers paid from market enterprises to S.13. The information available on the revenues of GG for current transfers from the enterprises does not allow to identify the counterpart sectors. An indirect approach is followed: for about 85% of current transfers received by GG, the counterpart sectors are identified according to the relevant distribution of value added; about 8% of current transfers are allocated to counterpart sectors according to the relevant distribution of employers' actual contributions; about 7% is directly allocated to non-financial corporations.

BoP data provides the amount of current transfers to non-resident units from non-financial corporations.

The estimate of current transfers to NPISHs (Table D.69) uses the information provided by CISINP for the year 2011 and updated with an indicator (a ratio on total output of S.15) for the following years.

## Sectors S.12

### A. Sources

Balance of Payments (DS1)

General Government non-financial accounts (DS15)

2011 Census of non-profit institutions (CISINP) (DS22)

Financial Statements of Insurance Corporations (DS2)

COVIP Annual Report (DS3)

Financial Statements of Bank of Italy (DS8)

Supervisory reporting by the FIs to the Bank of Italy (DS8)

### B. Methods

Table D.68 - shows current transfers paid by S.12 to counterpart sectors.

Current transfers from FIs to GG are calculated as for S.11 (see above).

BoP provides information on current transfers to non-resident units.

Supervisory data for insurance corporations and financial intermediaries provides information on current transfers to NPISHs.

This transaction includes the current transfers from the central bank to MFIs. It corresponds to an adjustment carried out to compensate the output of the central bank registered as intermediate consumption of MFIs.

Table D.68 - Miscellaneous current transfers whom-to-whom - Year 2015 (million EUR)

		D.75 receivable by sector							D.75 total uses	
		S.11	S.12	S.13	S.14	S14/C	S14/P	S.15		S.2
D.75 payable by sector	S.11 Non-financial corporations			5,581				472	193	<b>6,246</b>
	S.12 Financial corporations		1,930	409				525	0	<b>2,864</b>
	S.13 General government	871	13		4,988	4,679	309	3,605		<b>9,477</b>
	S.14 Households	202	0	12,472	10,506	10,506	0	4,708	6,388	<b>34,275</b>
	S.14/C Consumer Households	202		10,611	10,506	10,506		4,708	6,388	32,414
	S.14/P Producer Households			1,861	0			0	0	1,861
	S.15 NPISH	34			2,157	2,157		0	0	<b>2,190</b>
	S.2 Rest of the world	253	29		2,248	2,248				<b>2,530</b>
<b>D.75 total resources</b>		<b>1,360</b>	<b>1,972</b>	<b>18,462</b>	<b>19,899</b>	<b>19,590</b>	<b>309</b>	<b>9,309</b>	<b>6,581</b>	57,582

## Sectors S.13

The estimation method is described in Italy EDP Inventory (<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

## Sectors S.14

### A. Sources

Balance of Payments (DS1)

General Government non-financial accounts (DS15)

2011 Census of non-profit institutions (CISINP) (DS22)

Eu Silc (DS41)

## 15th General Population and Housing Census (DS44)

### B. Methods

Table D.68 - shows current transfers paid households (S.14C and S.14P) to counterpart sectors.

Current transfers from producer households to GG are calculated as for S.11 (see above).

Data sources allow to identify the current transfers from consumer households to S.13 and S.2.

The estimate of current transfers to NPISHs uses information provided by CISINP for the year 2011, updated with an indicator (a ratio on total output of S.15) for the following years.

Current transfers from consumer households to S.11 refer to transfers to market NPIs included in S.11 (source CISINP).

Current transfers between consumer households mainly refers to:

- current transfers for child support;
- current transfers to family members living away from home

The number of divorces and of students living in another location (calculated from the population census) is used to gross up the average amount of the current transfers mentioned above (mainly derived from Eu silc survey).

### *Sectors S.15*

#### A. Sources

General government accounts (DS15)

2011 Census of non-profit institutions (CISINP) (DS22)

#### B. Methods

Current transfers from NPISHs to consumer households are estimated with CISINP information for year 2011 and updated with an indicator (a ratio on total output of S.15) for the following years.

### *Sectors S.2*

#### A. Sources

Balance of Payments (DS1)

#### B. Methods

BoP provides information on current transfers to resident units from non-resident units, broken down by counterpart sectors. No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and to ensure the exhaustiveness of the estimates.

## **RESOURCES**

### *Sector S.1*

- Data for S.1 are obtained as sum of all relevant resident sectors

### *Sectors S.11, S.12, S.14, S.15*

Current transfers received by resident sectors derive from counterpart sectors estimates.

### Sectors S.13

The estimation method is described in Italy EDP Inventory (<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

### Sectors S.2

#### A. Sources

Balance of Payments (DS1)

#### B. Methods

BoP provides information on current transfers to non-resident units from resident units, broken down by counterpart sectors. No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and to ensure the exhaustiveness of the estimates.

## 51. D.76 – VAT-and GNI-based EU own resources

Table D.69 - VAT-and GNI-based EU own resources - Year 2015 (million EUR)

Balance of Payments (DS1)

### B. Methods

BoP includes the estimates of contributions of GG to the EU budget for the *third and fourth resource* and VAT refund to the UK provided by Istat.

## 52. D.8 – Adjustment for the change in pension entitlements (D.8)

Table D.70 - Adjustment for the change in pension entitlements - Year 2015 (million EUR)

Institutional sectors		Resources	Uses
S.1	Total economy	3,912	3,912
S.11	Non-financial corporations	0	820
S.12	Financial corporations	0	2,596
S.13	General government	0	0
S.14	Households	3,912	496
	<i>S.14/C Consumer Households</i>	<i>3,912</i>	<i>0</i>
	<i>S.14/P Producer Households</i>	<i>0</i>	<i>496</i>
S.15	NPISH	0	0
S.2	Rest of the world	0	0

### 52.1. Description of compilation procedures

The adjustment for the change in pension entitlements (D8) includes the following two components:

- the annual change in Provision for employee severance pay (in Italian “Fondo per il trattamento di fine rapporto del personale (TFR)”) of the enterprises with employees. The TFR provision is a financial liability of the enterprises; it is comparable to a post-retirement defined benefit and it is recognised according to an actuarial estimate of the amount of benefit accrued by employees discounted to present value. This component of D.8 is computed by deducting the amounts for severance payments made by the enterprises and included in the social benefits (D.62) from the total corresponding provisions, included in D.121 and D.61.
- the annual change in Pension Funds reserves, obtained by the following formula

Annual change in Pension Funds reserves =  
actual contributions paid to PFs by employers and employees  
+ supplements contributions attributed to the PFs beneficiaries  
- benefit paid by the PFs  
- value of associated service charges

## **USES**

### *Sector S.1*

Data for S.1 are obtained as sum of all relevant subsectors.

### *Sectors S.11*

#### A. Sources

Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)

#### B. Methods

Data source provide information to estimate severance payments and corresponding provisions made by non-financial corporations. These figures are included in the estimate of D.62 and D.61, respectively.

### *Sectors S.12*

#### A. Sources

Financial Statements of Insurance Corporations (DS2)

COVIP Annual Report (DS3) and COVIP report for SBS (DS4)

Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)

Supervisory reporting by the FIs to the Bank of Italy (DS8)

#### B. Methods

Data sources DS3 and DS4 allow to compute all components of the change in PFs reserves.

Data sources DS2, DS8 and DS12 provide information to estimate severance payments and provisions of banks and other financial intermediaries, insurance corporations and financial auxiliaries, respectively

### *Sectors S.13*

Not applicable

### *Sectors S.14*

#### A. Sources

Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)

#### B. Methods

The data refer to severance payments and provisions of producer units classified as producer households (S.14P).

*Sectors S.15*

For NPISHs, severance payments are equal to provisions of the year.

*Sectors S.2*

Not applicable

## RESOURCES

*Sector S.1*

Data for S.1 corresponds to the resources of S.14

*Sector S.14*

Only resident households are beneficiaries of change in pension entitlements (D.8)

*Sector S.2*

Not applicable

### 53. D.91 – Capital taxes

Table D.71 - Capital taxes - Year 2015 (million EUR)

Institutional sectors		Resources	Uses
S.1	Total economy	1,214	1,333
S.11	Non-financial corporations	0	163
S.12	Financial corporations	0	211
S.13	General government	1,214	0
S.14	Households	0	959
	<i>S.14/C Consumer Households</i>	<i>0</i>	<i>948</i>
	<i>S.14/P Producer Households</i>	<i>0</i>	<i>11</i>
S.15	NPISH	0	0
S.2	Rest of the world	119	0

#### 53.1. Description of compilation procedures

### USES

*Sector S.1*

Capital taxes paid by S.1 correspond to resources of sector S.13.

Table D.73 shows the detail of capital taxes by type as paid to GG by counterpart sectors for the year 2015. Most type of taxes are levied by GG on the value of assets of units classified into one definite institutional sector and a one-to-one attribution is possible. When a tax amnesty occurs, the amount paid by each sector or group of sectors is carried out according to the distribution of the relevant tax-base.

### Sectors S.11

#### A. Sources

General government accounts (SD15)

#### B. Methods

Capital taxes paid by non-financial corporations are computed by deducting the amounts paid by S.12 from the total taxes paid by corporations (Table D.72 - .

### Sectors S.12

#### A. Sources

General government accounts (SD15)

Financial Statements of Insurance Corporations (DS2)

Supervisory reporting by the FIs to the Bank of Italy (DS8)

Integrated statistical system of administrative and survey data for SBS estimations (Frame-SBS) (DS12)

#### B. Methods

Data sources provide information to identify the payments for capital taxes made by financial corporations.

### Sectors S.13

Not applicable

Table D.72 - Capital taxes paid by type - Year 2015 (million EUR)

	Capital taxes paid to GG by						Total taxes received by S.13
	S.11, S.12	S.14	S.14/C	S.14/P	S.15	S.2

### *Sectors S.14, S.15*

Not applicable

### *Sectors S.2*

#### A. Sources

Balance of Payments (DS1)

#### B. Methods

Investment grants consist of contributions paid by the European Structural Funds (ERDF, EAFRD, EAGF, EAGGF) to resident units: such amounts may be paid directly to beneficiaries (mainly corporations) or delivered to the Central or Local Government, which transfer them to the final beneficiaries.

Istat elaborates the capital revenues from EU institutions according to the information on unilateral transfer flows provided by the State General Accounting Department (GAD). These estimates are included by the Bank of Italy in the BoP.

No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and to ensure the exhaustiveness of the estimates.

## **RESOURCES**

### *Sector S.1*

Investment grants receivable by S.1 correspond to the sum of the uses data for sectors S.13 and S.2.

### *Sectors S.11, S.14P*

#### A. Sources

General government accounts (DS15)

Balance of payments (DS1)

#### B. Methods

BoP data allow to identify the investment grants received from the European institutions by the non-financial corporations sector.

As for the amounts paid by GG, the information available allows to assign most types of the investment grants directly to the non-financial corporations sector. A residual category of capital grants is divided between the sectors S.11 and S.14P according to the distribution of the relevant gross fixed capital formation.

### *Sectors S.12*

No investment grants to the financial corporations have been reported in the data sources so far.

### Sectors S.13

The estimation method is described in Italy EDP Inventory (<http://ec.europa.eu/eurostat/documents/1015035/7110762/IT-EDP-Inventory-201512.pdf>).

### Sectors S.14C

#### A. Sources

General government accounts (DS15)

Balance of payments (DS1)

#### B. Methods

No investment grants to the households sector have been reported in the BoP data so far. GG accounts provide the value of investment grants received by consumer households (S.14C).

### Sectors S.15

No investment grants to the NPISHs have so far reported in the data sources.

### Sectors S.2

#### A. Sources

Balance of Payments (DS1)

#### B. Methods

Investment grants consist of payments to the European Structural Funds (ERDF, EAFRD, EAGF, EAGGF) made by S.13. Istat elaborates the capital payments to the European institutions according to the information on unilateral transfer flows provided by the State General Accounting Department (GAD). These estimates are used by the Bank of Italy in the compilations of the Balance of Payments.

No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and to ensure the exhaustiveness of the estimates.

## 55. D.99 – Other capital transfers

Table D.74 - Other capital transfers - Year 2015 (million EUR)

#### A. Sources

General government accounts (DS15)

Balance of payments (DS1)

Census of non-profit institutions (CISINP) (DS22)

#### B. Methods

Capital transfers receivable by NPISHs consist of legacies made by consumer households. CISINP provides information to estimate this amounts in 2011; for the following years, this transaction has been updated with an indicator (a ratio on total output of S.15).

No GG capital transfers to NPISHs have so far been reported.

### *Sectors S.2*

#### A. Sources

Balance of Payments (DS1)

#### B. Methods

This transaction consists of the other current transfers made by S.13 to non-resident institutions. Istat provides the estimate to the Bank of Italy for the compilations of the Balance of Payments.

No adjustment is needed to ensure consistency of the BoP data with ESA 2010 definitions and to ensure the exhaustiveness of the estimates.

## 56. EMP – EMPLOYMENT

### 56.1. Description of compilation procedures

Employment in NA is obtained at micro-level starting from two different databases that collect and integrate surveys and administrative sources. The aim of the calculation procedure is the measurement of employment in terms of jobs, persons employed and hours worked through an integration of information on labour demand (database on employers) and on labour supply (database on workers). A complete data set of micro data is available in time for the September release of annual labour input estimates referred to year t-2.

The current approach has been implemented for the first time on September 2014 on the reference year 2011. At the moment, definitive estimates are updated every year with the same approach. Provisional estimates are compiled through a simplified approach based on quarterly estimates (QNA).

The current approach to estimate labour input incorporates innovations and changes connected both to the sources of information, mainly represented by administrative sources, and to the methods that exploit data integration techniques at the micro level.

A set of integrated sources (statistical and administrative ones) is produced yearly that allows to estimate persons employed, jobs, hours worked and FTEUs according to ESA definitions and classifications. In particular, this set of integrated sources allows to produce two main databases:

- 1) the first one includes data on declared jobs collected from employers operating on the economic territory (so called database on employers);
- 2) the second one includes data on declared and undeclared workers engaged by resident production units (database on workers).

In the table below there is the list of the main sources used to produce the two databases.

Table D.75 - Sources used for the compilation of the two databases on employment

Sources on employers	Sources on workers
Employees:	Employees:
Asia Enterprises Business Register	Labour Force Survey
Asia Legal-Units Register	Multipurpose survey on households: aspects of daily life
Updated Census of public institutions 2011	Tax Register
Updated Census of non -profit institutions 2011	National archive of residence permits
Updated General Agricultural Census 2010	Archive of employees in private sector – INPS
Annual account of General Government employees compensation	Archive of employees in agriculture - INPS
Survey on financial statement of large enterprises (SCI)	Archive of employees in the entertainment industry - INPS
Survey on local units of large enterprises (IULGI)	Archive of employees in the public sector - INPS
Archive of domestic work relationship – Nat. Social Security Inst. (INPS)	Archive of domestic work relationship - INPS
	Archive of Italian journalists pension fund
Self-employed:	Self-employed:
Asia Enterprises Business Register	Labour Force Survey
Asia Legal-Units Register	Tax Register
Updated General Agricultural Census 2010	National archive of residence permits
Survey on financial statement of large enterprises (SCI)	Archive of separate management - INPS
Survey on local units of large enterprises (IULGI)	Archive of Italian journalists pension fund
Archive of separate management - National Social Security Institute (INPS)	Archive of self-employed in agriculture - INPS

The database on employers is based on sources providing information on the annual average of declared jobs for employees and self-employed per production unit. The database covers all the institutional units included in the ESA production boundary: enterprises, public and private institutions, households. In particular, the database is obtained integrating the business register (ASIA register of active enterprises), with units excluded from its coverage but included in the ESA production boundary. Integration is made at the level of institutional unit (identified by a fiscal code).

The database on workers is developed integrating statistical and administrative sources for each person employed, resident and non-resident, on the economic territory. The Labour Force Survey (LFS) integrated with administrative files (hereafter, LFS\_ADMIN) is the main source on workers for coverage and richness of information. Integration at micro level of survey data with administrative files is made every year through an innovative process based on micro linkage techniques and statistical models. This process identifies all the jobs of each individual included in the sample survey, merging information collected through the survey questionnaire (occupational status and detailed characteristics of the main and secondary jobs) with information on social contributions paid for each job resulting from administrative files. Consistency between jobs declared in the survey and those resulting from administrative files is checked yearly.

The results of the micro-linkage highlight the existence of a bias in the measure of employment in all sources, i.e. a possible under-coverage of the Labour Force Survey and over-coverage of administrative files. In particular, over-coverage of administrative files concerns payments of social contributions to labour input with weak signals in administrative files (for example, working positions for short periods or with low remuneration, or persons declaring themselves “not employed” or “not active” in the LFS). On the other hand, under-coverage of the survey concerns persons who do not declare to be employed, although there are significant signals in administrative files that they actually are employed.

A probabilistic model has been developed in order to measure and correct the statistical bias. The validation process is based on a probabilistic model which combines information collected by the survey and administrative information on the same individual in order to validate or discard administrative signals. Once administrative signals are validated, the estimation model assumes the existence of significant administrative signals as indicator of employment also for those persons declaring themselves not employed or not active in the survey. This latter assumption caused the re-classification of a relevant amount of persons resulting “not employed” or “not active” in the survey as employed in national accounts estimates. The LFS\_ADMIN database is the result of the above integration process.

In addition, combining survey information with administrative signals allows to classify each job as declared, when a validated administrative signal is linked to it (i.e. social contributions are paid for it), or as undeclared, in case of absence of validated administrative signals: The procedure allows to identify declared and undeclared persons employed and jobs (as annual average) in the same data source and to calculate for each job the corresponding amount of hours worked as recorded by the survey.

The LFS\_ADMIN database excludes, by definition, some components not covered by the sample survey. In particular, estimates are integrated to include the employed persons living in institutions, for whom data are derived from the 2011 Population census, and the non-resident workers.

Non-residents persons working for resident production units can be split in two sub-groups: persons who have a permission to stay and to work in the country, with a declared and/or an undeclared job; persons without a legal permission to stay in the country and who can only perform undeclared jobs.

The list of non-resident persons is linked, at micro level, with administrative files on social contributions in order to identify the declared jobs. For these people, a specific adjustment is made to take into account also the component of undeclared working positions: a coexistence ratio of declared and undeclared working positions is calculated for foreign residents in LFS\_ADMIN.

As regards to foreigners illegally staying in the country, the estimation of jobs is based only on an indirect approach.

The two databases on employers and on workers cover different components of employment which overlap with respect to the declared component (employees and self-employed); the undeclared component is covered only by the database on workers. Since there is a statistical convergence (checked every year between the two measures of declared persons employed), an additive approach is used. In particular, a first estimate of persons employed is obtained summing up declared workers who are employed according to the database on employers (this last considered the main source of information for national accounts) and undeclared persons who are employed on the basis of the database on workers.

However, other specific adjustments are needed to guarantee exhaustiveness and coverage of the ESA production boundary. In particular, labour input is integrated for the following industries and components:

- the industry of households as employers for domestic work;
- the accommodation and food service activities (Nace rev 2 cod 55, 56);
- the industry for land transports of passengers and goods (Nace rev 2 cod 49.3, 49.4);
- the households and own production for construction and agricultural activities;
- the illegal activities.

The compilation process described above permits to obtain labour input in terms of persons employed and jobs. Total hours worked are estimated multiplying per capita hours worked registered in the LFS\_ADMIN database by job type. Per capita data and jobs are identified by domain of estimation. The number of domains is influenced by sample constraints and reflects those labour characteristics which are relevant for hours worked such as: the economic activity of the production units, its size and legal status, employment status of the worker and kind of job, i.e. main or secondary job and declared or undeclared status. In the LFS\_ADMIN, per capita hours actually worked for declared employees is subjected to specific quality controls using other sources, such as business surveys (annual and quarterly) and temporary layoff hours provided by the National Institute of Social Security (INPS).

Starting from the annual estimate by industry, data by institutional sectors are derived as follows:

- for declared employment, the availability of data at micro level allows to obtain employment by institutional sector directly, classifying each unit/job on the basis of its economic characteristics. The variables used for the allocation in each sector are: the legal status, the size class of the enterprise and the economic activity. Please see the table 2 below

- for undeclared employment, the classification by sectors is obtained applying (separately for employees and self-employed) to annual data by industry (division level of Nace rev.2) and size of enterprise (undeclared employment is included only in small enterprises, with less than 20 persons employed) the structure by institutional sector of declared employment (net of S15 and S13 and Nace code 97). Separate structures are built for jobs, persons employed, hours worked and FTEUs.

Table D.76 - Declared work by institutional sector

	Legal status	Size class of persons employed	Economic activity (Nace rev 2)	Sources for declared employment
S11	Corporations Limited Companies (joint-stock company, limited-liability company, cooperative) Market non-profit institutions	all sizes	section K and T excluded	Business Register Asia Enterprises for sector A, Updated Agricultural Census 2010 (Business Register Asia Agriculture available yearly starting from 2019), Administrative files of INPS, Asia-Lati
	Quasi-corporations Unlimited partnerships	all sizes	section K and T excluded	
	Sole proprietorships and simple partnerships	more than five persons employed	section K and T excluded	
	Branches and other national resident units		section K and T excluded	
S12	Corporations Limited Companies (joint-stock company, limited-liability company, cooperative) Market non-profit institutions		section K + Head office (Nace code 70100)	Business Register Asia Enterprises
	Quasi-corporations Unlimited partnerships		section K only	
	Sole proprietorships and simple partnerships	units with employees	section K only	
	Branches and other national resident units		section K only	
S13	Public non-market producers Public non-market producers	all sizes	section K and T excluded	Annual account of General Government employees compensation (Register of public institutions available yearly starting from 2019)
S14	Consumer Households Dian final use producers	-	section K and T	Updated Agricultural Census 2010 (Farm Register and Business Register Asia Agriculture available yearly starting from 2019) Estimate of production for own final consumption (Agriculture and Construction)
	Households as employers of domestic personal	-	section T only	Archive of domestic work relationship of the National Social Security Institute (INPS)
	Producer Households Sole proprietorships and simple partnerships if active in sections other than K	less than five persons employed	section K and T excluded	Business Register Asia Enterprises
	Sole proprietorships and simple partnerships	self employed with no employees	Nace code 66 only	Business Register Asia Enterprises
	Non-structured microenterprise that can be identified with the entrepreneur himself and that are classified as "not active" from business Register (min. threshold)	self employed	section K and T excluded	Sample based estimate from Labour Force survey integrated with administrative files (LFS-ADMIN)
	Outworkers	self employed	section K and T excluded	Archive of separate management - INPS
S15	Private non-market producers (non-market NPIs) Recognized and not recognized associations, Religious societies, foundations, Public non-commercial institutions	all sizes	section K and T excluded	Updated Census of public institutions 2011, Updated Census of non-profit institutions 2011 (Register of private no profit institutions and Register of public institutions available yearly starting from 2019)

### Sector S.1

Data for S.1 are obtained as sum of all relevant resident sectors

### Sector S.11

#### A. Source

See Table D.75

#### B. Methods

See Table D.76 and general description of compilation process

### Sector S.12

#### A. Source

See Table D.75

## B. Methods

See Table D.76 and general description of compilation process

### *Sector S.13*

#### A. Source

See Table D.75

#### B. Methods

*See Table D.76*

A specific feature of this sector is the estimation of hours worked that are not derived multiplying per capita hours worked detected in the LFS\_ADMIN per jobs. In this case worked hours are estimated starting from the total amount of contractual hours of work for full time workers, for each professional category in each collective bargaining area (hours theoretically workable correspond to the weekly hours workable by contract multiplied by the 52 weeks in a year and by the number of jobs). This amount represents the hours that employees should work if they were never absence from work during the year. Then, survey information allows to adjust this amount with:

- the number of hours corresponding to the public holidays occurring during the year;
- the number of hours not worked because of vacations or illness, strikes, leaves (paid or not);
- the number of hours not worked for part-time employment;
- overtime hours, to be added.

Undeclared employment is not present in this sector.

### *Sector S.14*

#### A. Source

See Table D.75

Multipurpose survey on households: aspects of daily life and time use survey (SD21)

#### B. Methods

See Table D.76 and general description of compilation process

Exhaustiveness adjustments (non-response, missing units, non-registered units, deliberate misreporting, illegal activities)

#### Households as employers for domestic work (Nace rev 2 cod 97)

The «Multipurpose survey on households: aspects of daily life» contains specific questions about the use of domestic work in households. Therefore the survey allows to measure the total amount of persons who work for households. Jobs measured by the Multipurpose survey exceeding the direct estimates of declared and undeclared jobs in this industry are added as not declared in the NA estimates and classified in S14 (Households as consumers).

#### Construction activities of households for their own use.

Jobs and hours worked are estimated using statistical data gathered by the “Time Use Survey”, available every 4 years. The statistical survey is also aimed at collecting information on hours spent by family members to maintain their own dwelling. Jobs are

classified as declared self-employed jobs involved in secondary activities in S14 (Households as consumers).

#### Agricultural activities of households for their own use.

The labour input estimate is based on Agricultural Census data updated with a production index and annually integrated with a component that is indirectly obtained comparing this information with the total value of production for own use estimated independently in the Directorate for national accounts. Jobs are classified as declared self-employed involved in secondary activities in sector S14 (Households as consumers).

#### Unstructured microenterprises

These are units classified as not active by the business register, i.e. units resulting “not active in the year” and without employees. These units are excluded from ASIA-Enterprises but some of them may result “active” when the self-employed engaged by a specific unit is classified as employed in the unit itself in the LFS\_ADMIN database. The estimation of self-employed jobs engaged in these units is not obtained summing up jobs from an exhaustive list of units but is sample-based. In particular, it is obtained integrating three different sources of information: an internal source on employers for to each legal institutional unit (ASIA-LeU register), the LFS and the complete set of administrative files on social contribution (LFS\_ADMIN). The integration process allows to estimate jobs to be included in national accounts estimates: firstly, self-employed responding to the LFS and for whom a significant amount of social contributions is paid are identified; secondly, in the corresponding group a further selection is made, identifying among them only the workers who are recorded as owners of units listed in ASIA-LeU register; finally, among the production units identified in the first two steps, only those not present in other employers sources are accounted for. The final estimate is obtained grossing up jobs of the selected pool of workers using the Labour Force Survey sample weights. These are classified as declared self-employed in sector S14 (Producer Households).

#### Illegal activities

Persons involved in illegal activities are estimated using an indirect method starting from the estimates of the value added in the corresponding economic activities (wholesale and retail for drugs and smuggling of tobacco, personal services for prostitution) and comparing them to an average value per job. Employed persons in illegal activities are classified as undeclared self-employed in S14 (Households as producer).

#### *Sector S.15*

##### A. Source

See Table D.75

##### B Methods

See Table D.76. Not declared work is not considered in this sector.

## Annex D.1 - Share of estimates per transaction/sector

E80 – estimates dominate in the final value by more than 80%

E50 - estimates dominate in the final value between 50-80%

OE - observed value dominate final value, though estimates were used

OV - only observed values
