4. INFORMATION ABOUT WORKING TIME	39

Introduction

This document is an annex to the Eurostat report on annual adjustment of remuneration and pension. While the main results concerning specific indicator and correction coefficients for staff and pensioners are presented in the report, the purpose of this annex is to give some explanations and statistical analyses of the results as well as detailed tables with statistical information.

Article 64 and 65 and Annex XI of the Staff Regulations, which are in force since 1 May 2004 define the method for the annual adjustment of the remuneration and pension of Community officials.

The value of the adjustment is equal to the product of the specific indicator and the change in the cost of living index in Brussels. Changes in the cost of living in places of employment other than Brussels and Luxembourg are derived indirectly from the value of the adjustment for Brussels and changes in the economic parities between Brussels and those other places.

Chapters 1, 2 and 3 of this report examine respectively:

- the changes in the purchasing power of salaries of central government civil servants in Member States (specific indicator);
- the changes in the cost of living for Brussels;
- the economic parities and the correction coefficients.

All figures and calculations contained in this report are based on data supplied by the responsible authorities in the Member States. For any information concerning this annex, please contact Eurostat in Luxembourg:

1. EVOLUTION OF PURCHASING POWER OF NATIONAL OFFICIALS

1.1. General remarks on the calculation of the specific indicator

The *specific indicator* is a measure to represent the average change in the purchasing power of central government civil servants in Member States of the European Communities. It is measured by the real net salary increase in the central government civil service.

One of the basic elements of the annual salary adjustment procedure is the principle of **parallel development** of the salaries, in terms of purchasing power of national central government civil servants and of officials of the European Communities. The **specific indicator** is the methodological tool allowing the implementation of this principle of parallelism.

Article 65 and Annex XI determine the basic principles of the method, but these have to be filled with practical procedures. Therefore, we provide here a set of commonly agreed basic definitions. If specific situation in a given country makes it meaningful to deviate from these definitions to ensure a better application of the spirit of the method, then Eurostat, in agreement with that country may do so.

1.1.1. Elements of remuneration

All elements of remuneration that affect the purchasing power of civil servants should be taken into account in calculating the gross remuneration. All general bonuses and premiums, which are part of the salary, should be reported. In general following elements should be taken into account:

- basic salaries,
- all allowances and bonuses (e.g. general premiums, child benefit, family allowances)
- non-pensionable lump-sum payments (e.g. annual holiday pay, Christmas bonus)

Not to be included:

- regional allowances granted to compensate for 'cost-of-living' differences.
- Increase due to promotion or seniority.
- Person-specific special allowances, for example, for exceptional performance.

1.1.2. Net remuneration

In order to get net remuneration following elements should be deducted from the gross remuneration:

- the amount of compulsory social deductions (social security and occupational pension scheme contributions),
- general taxes on income and
- other compulsory deductions (mutual assistance contribution, temporary contribution, etc.).

1.1.3. Reference period

In order to calculate the specific indicators for the year (t) the remuneration of central government civil servants on a fixed date of the year ($t-1$) is to be compared with the remuneration on the same date of the year (t).

The method is based on the comparison of a snapshot of a national remuneration system in the month of July of the current year with the equivalent snapshot in the month of July of the previous year. A snapshot of the system, however, does not simply mean the remuneration grid in a particular month; rather, the remuneration level of the reference population employees in that month, including 1/12 of all annually paid elements such as Christmas bonuses, annual holiday pay, lump-sum payments etc.

If Member States report remuneration data of a given month/year again, (e.g. data concerning remuneration of July 2003 sent in 2003 and again in 2004), the data should be exactly the same. If not, they have to provide Eurostat with a clear justification (e.g. change in the structure of grades and categories in the public administration or other corrections leading to retroactive corrections).

France sent some revised data for July 2003. The justification was a slight change in the methodology, in order to improve the data quality. Till 2003 France used to estimate the rate of premia on the basis of some groups of grades, including staff that was not in the central administration. From 2004 France is able to provide much more accurate estimates of the rate of premia at the level of each grade and to exclude staff not in the central administration. In order to compare like with like, France presented a new version of the 2003 data.

1.1.4. Reference population

The reference population relates to permanent statutory staff of the sub-sector "**central governments**" (**S.1311 of ESA95**) of Member States. It should be noted that the sub-sector S.1311 in ESA 95 is defined as follows:

"The sub-sector central government includes all administrative departments of the State and other central agencies whose competence extends normally over the whole economic territory, except of the administration of social security funds."

The reference population should however exclude the following groups:

- the armed forces, security forces, police forces, frontier guards, etc.;
- teachers, staff of national health services;
- ministers of religion, if directly paid by central government;
- diplomats and magistrates.

1.1.5. Sample of family types

The specific indicator for each country is calculated on the basis of remuneration data of officials of two different family statuses - **single** and **married with two dependent children**, and each with a weight of 50%.

1.1.6. Function groups

According to Annex XI Eurostat is obliged to provide a specific indicator for each of the two function group: Administrator (AD) and Assistants (AST). Therefore, the posts in the national reference population should be classified, according to the nature of the duties to which they relate, in these two function groups – each should comprise several grades (see section 4.7).

- Function group **AD** relates to staff engaged in administrative, advisory, linguistic and scientific duties that require university education or equivalent professional experience.
- Function group **AST** relates to staff engaged in executive, technical and clerical duties that require an advanced level of secondary education or equivalent professional experience.

1.1.7. Sample of grades

Out of the reference population the Member States may select a sample of the more important grades in terms of staff numbers for each of the above mentioned function groups. Grades having only a small proportion of the total number of staff may not be taken into the sample.

The sample should be representative of the reference population. The ratio between the number of staff in the grades covered by the sample and the number in the reference population should normally be more than 75%.

1.1.8. Calculation of country specific indicator

On receipt of the data from the Member States Eurostat calculates specific indicators for each of the countries separately. The steps leading to these calculations are:

- Average gross and net remunerations for each grade are then aggregated to two function groups (AD and AST). They are calculated by taking weighted averages of the grades belonging to these groups. The sample size (number of civil servants in the sample of each grade) is taken as weight.
- The average gross and net remunerations for the two function groups are then aggregated to overall gross and net remunerations in the central government civil service by taking weighted average of the remunerations of these two groups, where the total number of civil servants in each of the groups is taken as weights.
- For each of the function group as well as for the overall remunerations the following changes for the period July – July are calculated:
 - Gross nominal
 - Net nominal
 - Gross real
 - Net real
- The increases in real terms are calculated by taking account of increase in consumer price indices (CPI) for this period.
- The overall real net increase in remuneration is called the **country specific indicator**.

1.2. Specific indicator - results by functional groups

Table 1.2 sets out the gross and net specific indicators both in nominal and real terms for each of the two function-groups.

Table 1.2

Nominal changes in the remuneration of national civil servants in the twelve-month period to 1st July 2004 (1.7.2003 = 100)

Country	Nominal change			Real change		
	AD	AST	Total	AD	AST	Total

						98.8

1.3. Remuneration and taxes

An analysis of the changes in the nominal gross and nominal net specific indicators in relation to the rate of inflation makes it possible to follow changes in statutory deductions and general tax items over the reference period. This year there is no unique development to be seen in the eight countries in the sample (see Table 1.3).

Table 1.3

Changes in the nominal gross and nominal net specific indicators in relation to the rate of inflation for the twelve-month period to 1st July 2004

Country	Gross remuneration	Net remuneration	12 Months CPI
BE	101.9	101.7	102.3
DE	98.9	100.8	101.7
ES	103.0	102.5	103.5
FR	101.3	101.5	102.4
IT	100.0	100.0	102.4
LU	104.1	103.1	102.6
NL	101.5	98.0	101.4
UK	102.4	102.4	103.0
EUR 15	100.9	101.2	

1.4. Cumulative specific indicators

Table 1.4 illustrates the changes in the remuneration of central government civil servants since 1990. This table shows the evolution of gross and net specific indicators at current prices, the development in consumer price indices as well as gross and net specific indicators in real terms. Over the period 1990-2003 the real net specific indicator for the European Union has increased by 3.1%.

Table 1.4

Changes in the purchasing power of salaries of civil servants in the central government in the Member States (1990=100)

Country	Nominal gross specific indicator	Nominal net specific indicator	Consumer price indices	Real gross specific indicator	Real net specific indicator
BE	144.7	142.5	133.5	108.2	107.1

UK	165.5	167.1	146.9	113.3	114.2
EUR 15	146.8	145.0		102.7	101.9

1.5. Control Indicators

Annex XI mentions explicitly, between the possible control indicators, the real per capita emoluments in central government. Eurostat measures the variation, at constant prices, in the per capita wage bill in sub-sector S.1311 of the national accounts (per capita salary of central government). As this indicator is expressed in gross terms, it is compared with the gross specific indicator.

The gross specific indicator and the control indicator are different by definition and it is natural to expect them to show some differences. Indeed, changes in the control indicator are determined not only by variations in collective labour agreements but also by intrinsic factors (changes in the average age of the reference population, promotion to higher categories, etc.) and by changes in incidental salary components such as overtime payments, productivity incentives, and early retirement compensation.

Furthermore, there are certain factors which distort the statistical comparability of the two indices (the quality of the sample used to calculate the specific indicator, differences in the reference populations, part-time work, employers' social contributions, etc.). The deflator used for the control indicator is the consumers' expenditure deflator in the national accounts; the deflator for the specific indicator is the national consumer price index. In addition control indicator values for the reference period are often estimates.

Eurostat identifies differences between the two indicators during the reference period, therefore puts a greater emphasis on the medium-term trend analysis. For some Member States there are in fact divergences. However, if the conceptual and statistical differences between the gross specific indicator and in the control indicator are netted out, they show a parallel development. Table 1.5 shows the medium term trend in real gross per capita remuneration and the per capita real wage bills. The table presents the changes in these two indicators for the period 1990-2004.

More detailed tables on several control indicators are presented in Annex 2.

Table 1.5
Comparison of the gross specific indicator and the control indicator in real terms
Medium-term trend (1990 = 100)

2. CHANGES IN THE COST OF LIVING IN BRUSSELS

2.1. Brussels International Index

Article 64 and Annex XI of the Staff Regulations state that Eurostat shall draw up an index, based on the data provided by the Belgian authorities, to measure the changes in the cost of living for officials of the Communities in Brussels.

This index, known as Brussels International Index, shall take into account the changes between June of the previous year and June of the current year and shall be based on methodology defined by the Working Group on Article 64 of the Staff Regulations.

Following price indices are used to calculate Brussels International Index:

- 1) For all basic headings except for those stated in point 2) and 3) Belgian harmonised indices of consumer prices (HICP) are used.
- 2) In order to take account of specific situation in Brussels for the following 9 basic headings Brussels specific consumer price indices are used. These indices are provided by the Belgian Ministry of Economic Affairs.
 - Distribution of water
 - Electricity
 - Gas
 - Other services in respect of personal transport equipment
 - Passenger transport by road
 - Combined passenger transport
 - Restaurants, cafes and like
 - Accommodation services
 - Hairdressing salons and personal grooming establishments
- 3) The figures for the basic headings for accommodation costs for tenants (rents index) and owner-occupiers (imputed rents index) are replaced in the Brussels International Index by an index calculated by Eurostat based on the results of an annual survey carried out among EC staff employed in Brussels.

The weights used to aggregate the 80 basic headings of this index are derived from family budget surveys (FBS) carried out among EU officials in Brussels. The details of the calculation of this index corresponding to this annual review are given in the Eurostat Report. Table 2.1 shows both the annual and cumulative changes in the Brussels cost-of-living index since 1991.

During the years 1990-2003 this index was calculated as a weighted index composed of Joint Index and the Brussels capital component index. Since 2004, according to the new Staff Regulations it is calculated as Brussels International Index as described above.

Table 2.1
Brussels Cost-of-living index

	Measure for increase in cost-of-living in Brussels*	
	Previous year = 100	1990 = 100
1991	104.1	104.1
1992	103.5	107.7
1993	102.2	110.1
1994	102.4	112.8
1995	100.9	113.8

2004	101.9	133.7

Till 2003: Weighted index, composed of Joint Index and Brussels Index
 2004 - : Brussels International Index

3. EQUIVALENCE OF PURCHASING POWER OF EC OFFICIALS IN THE MEMBER STATES

3.1. Economic parities and correction coefficients

The object of the economic parities is to compare the relative costs of living of European institution officials in Brussels (reference city) and in each of the capitals and other places of employment for which a correction coefficient has been set. The method used is to compare the price of a "basket" of goods and services purchased by the average official in Brussels with the price of the same basket in each of the other places of employment. The average of all the price ratios is the "economic parity".

The system works as follows: the total range of goods and services constituting the consumption of the average European institution official is divided into 80 basic headings (such as meat, footwear, motor cars, books). A price ratio between the place of employment and Brussels is established for each of these headings; this is called the basic parity. Price surveys are conducted on products selected to represent the basic heading and specified in the necessary detail to enable prices in a sufficiently narrow range to be collected.

The Staff Regulations require each basic parity to be checked by direct survey at least once every five years. In practice checks are carried out at shorter intervals as part of the European Comparison Programme (ECP). At each annual salary review around one third of the basic price parities are replaced by new parities produced by the latest price survey.

For the 2004 annual review, new parities obtained from price surveys have been integrated for the following groups:

- Furniture, glassware and table ware (survey spring 2002);
- Transport and other goods and services (survey autumn 2002).

The 80 basic parities are then updated using the price index ratio between the place of employment and Brussels.

Housing is dealt with differently. Special rent surveys of estate agents are carried out each year at each place of employment, including Brussels, to calculate an economic parity for the basic heading "accommodation costs for tenants". The calculation follows a methodology that has been developed by Eurostat in collaboration with the national statistical institutes of the Member States, based on the principle that the parity used should be calculated in such a way to allow European institution officials outside Brussels to live in dwellings of comparable quality to those occupied by European institution officials in Brussels. The basic parity "accommodation costs of owner-occupiers" is calculated by reference to the rent the owner-occupiers would pay if they were tenants (these are known as "imputed rents").

In order to calculate the overall economic parities weights have to be applied to each basic heading according to its relative importance in the consumption basket. These weights are calculated directly from the results of the special family budget surveys conducted among European and international civil servants every five years. The resulting structure reflects the consumption of the average international civil servant in Brussels and in each country or place of employment. No new consumption pattern has been introduced in this year's review.

Using the 80 basic parities and the specific weights the overall parity is calculated in two ways: the first uses the consumption pattern for the reference city (Brussels) (this is a type of Laspeyres index); the second uses the consumption pattern for the place of employment (this is a type of Paasche index). In accordance with standard practice for international comparisons both types of index are calculated and the geometric mean of the results (a Fisher index) is the one actually used as the economic parity.

The correction coefficients applicable to the salaries of the European institution officials working in the capitals and places of employment other than Brussels and Luxembourg, which are calculated for the month of July, are determined on the basis of the relationships between the economic parities and the exchange rates fixed by the Commission and specified in the Staff Regulations for the relevant countries. The correction coefficient operates as a percentage adjustment to salaries to take account of the cost of living differences between Brussels and the various duty stations.

The details of the economic parities calculation, at the level of 12 main consumption groups, are shown in table 3.1 for all capitals and other places apart from Brussels and Luxembourg. This table also includes information about the consumption weights by country and by expenditure groups.

3.2. Rents and rent parities

Changes in the rent parities are provided in the Table 3.2 which shows also the average rents by type of dwelling on which the calculation is based. These average rents are in fact weighted moving averages, based on a six-year model, to take into account the average occupancy length. Any annual updating of rents during the life of the typical lease is included in the model by using the appropriate adjustment indices.

3.3. Purchasing power parities - analysis of results

3.3.1. Major changes in the economic parities from 2003 to 2004

The calculation of correction coefficients used for salary adjustment in places other than Brussels and Luxembourg involves the revision of some of the elementary parities each year. For the 2004 salary adjustment two new price surveys have been incorporated: *furniture, glassware and tableware (conducted in spring 2002)* and *transport and other goods and services (conducted in autumn 2002)*. The rent parities have been calculated for 2004 according to the moving-average model approved by the Article 64 Working Party.

The introduction of new prices from the latest price surveys affects 18 (out of 80) elementary parities and accounts for about 27% (EU average) of the consumption weight.

Moreover, rent surveys are carried out every year in all Member States. A six-years moving average model is used for calculating rent parities: the rent parities for 2004 are based on the relative trend in the real-estate markets in Brussels and other places of employment between 1999 and 2004. These parities are, therefore, affected by the following factors:

- introduction of rent data for the year 2004,
- deletion of the rent data for 1998
- price indices used for updating the rents for 1999 - 2003 to price of 2004, and

All these effects, as well as the total change in rent parities, are shown in table 3.4.

Changes in the global parities from one year to the next come mainly from both prices and rent revisions, but may also be affected by the trend in the price indices used to update the elementary parities at the date of the adjustment (1.7.2004) and by changes in the consumption structures (updated every five to seven years by the introduction of new FBS results). Details of the changes in the economic parities from 2003 to 2004, including a decomposition of these effects, are given in table 3.3.

The biggest increases in global economic parities can be observed in Bratislava (+4.0%) and Riga (+3.8%). Some relevant decreases were observed in London (-1.1%) and Helsinki (-1.0%).

The biggest increases in the rent parity can be observed in Vilnius (+8.2%), Rome (+6.4%) and Varese (+6.2%) while the biggest decreases were recorded in Dublin (-8.4%) and London (-4.9%).

Concerning the considerable decrease in the correction coefficient for The Netherlands (-4.0%), it has to be stressed that, in accordance with the Staff Regulations, starting from 2004, The Hague has replaced Amsterdam for calculating the global parity for the staff in the Netherlands. The rent parity in The Hague, which is much lower than in Amsterdam, explains most of the decrease.

It is not possible to compare Amsterdam and The Hague in 2004, as rent data were no more collected in Amsterdam. In 2003 the rent parity for Amsterdam was 1.820, leading to a global correction coefficient of 115.1. For The Hague the corresponding values would have been 1.545 for the rent parity (-15.1% compared to Amsterdam) and 111.2 for the global correction coefficient (-3.4% compared to Amsterdam).

* In 2003 rent parity for The Hague was 15.1% less than for Amsterdam

3.3.2. Differences in the correction coefficients calculated with and without the rent element

The rent parities, due to their associated high consumption weights (22% EU average) influence in a quite significant way the global parities and consequently the correction coefficients. The analysis of correction coefficients calculated with and without the rent element for the same place of employment makes it easier to isolate the effect of rent differences separately from differences arising from other causes.

In 2004 for 10 places out of 28, the rent correction coefficient (ratio between the rent parity and the exchange rate) is under 100. This means that the average rents used for calculating the economic parities are lower in these places than in Brussels.

For 6 places out of 28 the correction coefficient without rent is higher than the global correction coefficient. This means that, for these places, the rents lead to a reduction of global correction coefficient.

More details on the effect of rent on the 2004 correction coefficients are given in table 3.5.

Table 3.5
Effect of rent on the correction coefficients - 2004

3.4. Correction coefficients for the pensioners

The correction coefficients for the pensioners with a reference date of 1 July 2004 have been calculated on the basis of following information:

- Parities for all goods and services, except for rents, as used for the calculation of the correction coefficients for active staff. These parities are based on bilateral comparison of prices of about 3000 goods and services between different capital cities and Brussels.
- Country rent parities: For calculating country rent parities the following procedure has been applied. Calculate a spatial adjustment factor in the form of national/capital ratio of market rents derived from an official database like CPI, household budget survey, housing register etc. With the help of this adjustment factor transform the capital city rent parity from Article 64 estate agency rent surveys to country rent parity. No such adjustment factors were available for The Netherlands and Malta. For these two countries average country rents were compared directly with the average rents in Belgium (all derived from ECP-PPP rent surveys).
- Consumption weights for the pensioners calculated on the basis of a wide scale family budget survey done in 2000.

Table 3.6 presents the pensioners correction coefficients for 1 July 2004, calculated according to the procedure described above. It also shows a comparison with those for active staff.

Among all Member States, Denmark has the highest country-based CC (in case of capital-based CC it is UK). The biggest differences between capital CCs and country CCs can be observed in the UK and Hungary. In Germany the country CC is marginally higher than the capital CC, while in Austria the two CCs are at the same level. In all other countries the country CCs is lower than capital CCs. Without rents, the two sets of CCs are very close.

It should be mentioned that the new Staff Regulations guarantee a minimum CC of 100 for pensioners, whatever is the result of Eurostat's calculations.

4. INFORMATION ABOUT WORKING TIME

Eurostat collects statistical information on differences in the working hours in all Member States. Information about statutory or contractual weekly working hours in central governments (Table 4.1), number of days annual leave (Table 4.2) and number of public holidays per year (Table 4.3) are shown below. In all these tables the situation in July 2004 has been compared with that in July 2003.

Table 4.5.A
Statutory or contractual weekly working hours in central governments
