a. Mortality tables

Depending on deposit taking corporations and non-financial corporations. For the central bank the annual report indicates that the German mortality rate table DAV 2004R is used.

b. Entitlement statistics; other relevant statistics

Not available

4. Reforms incorporated in the model

Not relevant

5. Specific assumptions

a. How are careers modelled?

Not relevant

b. How are survivor pensions calculated?

Not relevant

c. How is the retirement age modelled over time?

Not relevant

d. Other specific features of the model

Not relevant

6. Any other comments

Values of private occupational schemes are retrieved from financial accounts (Tables 6 and 7) and sector accounts (Table 8).

3. Table 29 column D: Defined contribution schemes (funded, general government)

There are no funded defined contribution schemes managed by general government in Luxembourg.

4. Table 29 column E: Defined benefit schemes (funded, for general government employees, classified in financial corporations)

There are no funded defined benefit schemes for general government employees classified in financial corporations in Luxembourg.

5. Table 29 column F: Defined benefit schemes (funded, for general government employees, classified in general government)

There are no funded defined benefit schemes for general government employees classified in general government in Luxembourg.

6. Table 29 column G: Defined benefit schemes (unfunded, for general government

employees, classified in general government)

1. General description of the scheme and the calculation model

a. Coverage of the scheme

Column G covers special pension schemes for the public sector in Luxembourg or more precisely public pension schemes primarily for civil servants of central government, local government and social security funds administrations, for employees of the Luxembourgish National Railway Company (SNCFL) as well as for employees of some public corporations classified outside general government whose employees are subject to a special pension scheme differing from the general scheme. This amounts to less than 10% of the total workforce. All schemes covered in column G are mandatory.

Since the public pension system has been reformed in 1999, there exist two distinct pension schemes for the public sector:

- i. On one hand, the original scheme, now known as the transitional special pension scheme, concerns civil servants and persons treated as such who were in post on 31 December 1998 or had been appointed by that date. Here, pension benefits are calculated based on the final salary earned by the civil servant.
- ii. On the other hand, the new special pension scheme essentially corresponds to the general pension scheme, diverging only in a few selected procedural and funding arrangements. It applies to civil servants who entered the public service after 31 December 1998. The new special pension scheme retains the status of a special scheme, but it is based on the same principles as the general scheme with the exception of the absence of an income ceiling for the assessment of contributions.

The supplementary table covers all types of pensions, including disability and survivors' pensions. Supplementary pensions for former local government workers resulting from a collective agreement are not covered by the table, as data for those schemes is missing. The forfait d'éducation also known as "Mammerent" is excluded as social assistance from the scope of Table 29.

b. Institutional set-up		
Data sources/ suppliers		Centre de gestion du personnel et de l'organisation de l'État (CGPO)
	-	Caisse de prévoyance des fonctionnaires et employés communaux (CPFEC)

In line with AWG assumptions, real wage indexation

The model is based on standard actuarial mathematics for social security schemes and on actuarially assumed transition probabilities (mortality rates, disability rates, retirement rates, etc.) which are used to map the transition of an insured person (active person, inactive person and pensioner) from a given year onto the next year's status.

The development of the active insured population is linked to the evolution of total employed population and earnings assumptions, which, in turn, are explicitly linked to the assumptions on macroeconomic growth and the wage share of GDP.

Exogenous assumptions on insurance periods spent outside of Luxembourg and on complementary insurance periods (childcare, education) are included.

b. How are survivor pensions calculated?

In line with current legislation.

c. How is the retirement age modelled over time?

The legal retirement age is kept constant over time, in line with current legislation.

d. Other specific features of the model

Projections cover 48 projection years, which is equal to the length of the AWG projection period (51 projection years for the reference year 2018).

6. Any other comments

Shifts between the general scheme and special pension schemes are possible. Employees of central government (*employés de l'Etat*) fulfilling certain criteria (in terms of age or years of service) are moving for instance from the general scheme to the special pension scheme for civil servants.

7. Table 29 column H: Social security pension schemes (unfunded)

1. General description of the scheme and the calculation model

a. Coverage of the scheme

The general pension scheme in Luxembourg is based on a system of compulsory insurance. All those who are covered by pension insurance in Luxembourg belong to the general pension scheme, apart from civil servants of central government, local government and social security funds administrations, the employees of the Luxembourgish National Railway Company (SNCFL) and employees of some public corporations, which have their own statutory schemes (the special pension schemes for the public sector). People belonging to a pension scheme by virtue of working for an international body are not subject to a national scheme. It follows that the coverage of the general pension scheme is close to 90%.

The supplementary table covers all types of pensions, including disability and survivors' pensions. The forfait d'éducation also known as "Mammerent" is excluded as social assistance from the scope of Table 29.

b. Institutional set-up	
Data sources/ suppliers	 Caisse nationale d'assurance pension (CNAP)
	 Centre commun de la sécurité sociale (CCSS)
Which institution is	The Inspection générale de la sécurité sociale (IGSS) in cooperation with STATEC.
running/managing the	
calculations?	
c. Major formulas: Benefi	it formula; Indexation of benefits
Benefit formula	Pension = max(MinPens, P1 + P2 + P3 + P4),
	Where P1=p1*TCl, (TCl = total contributory income) P2=(AGE+CY-p2_1)*p2_2*TCl, if AGE+CY>p2_1, (CY = contributory years) P3=min(40, QY)/40*p3*REF, (REF = reference amount ≈ social minimum wage, QY = contributory + credited non-contributory years) P4=min(40, QY)/40*0.025*REF With annually changing parameters p1, p2_1, p2_2, and p_3
Indexation of benefits	Initial calculation: 100% consumer price index (CPI) + 100% real wages

Pensions in payment : 100% CPI + 100% real wages as long as global contribution rate sufficient, 100% CPI + max. 50% real wages afterwards
d. Type and structure of the calculation model
The national pension model used for providing actuarial estimates of future expenditure and contributions base
of the general and special pension schemes in Luxemburg in line with the economic and demographic framework
used in the AWG projections exercise is a standard deterministic cohort-based pension projection model. It is a
fully customized version of the ILO generic pension modelling tool and it closely complies with local socia
insurance legislation in Luxembourg and captures national pension peculiarities. It is based on macro simulation techniques, whence the projections rely on grouped data. Under the model, each
status of an insured person (active person, inactive person, and pensioner) is explicitly modelled, distinguishing
new persons from initial stock, and associated values (average salary, average pension, etc.) are projected year
by year.
2. Assumptions and methodologies applied
a. Discount rate
4% in the baseline scenario
b. Wage growth
0.9% real wage growth on average, in line with AWG assumptions (1.1% for the reference year 2018)
3.1% nominal wage growth on average, in line with AWG assumptions
c. Valuation method: ABO/PBO
PBO
3. Data used to run the model
a. Mortality tables
AWG assumptions
b. Entitlement statistics; other relevant statistics
Projections are based on individual register data available in the data warehouse at the IGSS. Based on the
compulsory membership of people to the national social protection system, individual administrative data is
available in common operational files of the Social security institutions in Luxembourg.
Main administrative data relates to protected people monthly income declarations, which are at the basis of the
computation of the contributions. Other important administrative data is related to monthly benefits paid out
by the institutions. Both sources are essential to gather information on disposable income of protected people.
4. Reforms incorporated in the model
The 2012 pension reform is fully incorporated in the model. In line with AWG assumptions, real wage indexation
is reduced to 25% once the financial resources of the general pension scheme are insufficient. For further details
please see the pension country fiche on AWG pension projections.
5. Specific assumptions
a. How are careers modelled?
The model is based on standard actuarial mathematics for social security schemes and on actuarially assumed
transition probabilities (mortality rates, disability rates, retirement rates, etc.) which are used to map the
transition of an insured person (active person, inactive person and pensioner) from a given year onto the next
year's status.
The development of the active insured population is linked to the evolution of total employed population and
earnings assumptions, which, in turn, are explicitly linked to the assumptions on macroeconomic growth and the
wage share of GDP.
Exogenous assumptions on insurance periods spent outside of Luxembourg and on complementary insurance
periods (childcare, education) are included.
b. How are survivor pensions calculated?
In line with current legislation
c. How is the retirement age modelled over time?
The legal retirement age is kept constant over time, in line with current legislation.
d. Other specific features of the model
Projections cover 48 projection years, which is equal to the length of the AWG projection period (51 projection
years for the reference year 2018). 6. Any other comments

Shifts between the general scheme and special pension schemes are possible. Employees of central government (*employés de l'Etat*) fulfilling certain criteria (in terms of age or years of service) are moving for instance from the general scheme to the special pension scheme for civil servants.

8. Table 29 column K: Entitlements of non-resident households

1. General description and the calculation model

a. Coverage of the scheme

The entitlements of non-resident households cover only the non-resident participation in the general pension scheme (column H). In special pension schemes (column G) pension relationships with the rest of the world are considered as zero in line with the AWG projections.

b. Institutional set-up		
Data	- Caisse nationale d'assurance pension (CNAP)	
sources/methods	- Centre commun de la sécurité sociale (CCSS)	
Which institution is running/managing the calculations?	STATEC in cooperation with the Inspection générale de la sécurité sociale (IGSS).	
2. Any other comments		
The entitlements of non-resident households in the general pension scheme (column H) are calculated for all		

The entitlements of non-resident households in the general pension scheme (column H) are calculated for a rows based on direct information.
