RESEARCH PAPER

Agricultural Land Prices and Rents data for the European Union

December 2016

In recent years, the European Commission has acknowledged the need for comparable statistics on agricultural land prices and rents in the EU. Actions were undertaken to develop a common methodology for data collection on land prices and rents which was agreed in December 2010.

Since then, Eurostat and the relevant national authorities have been undertaking work to develop land prices and rents data within the framework of the common methodology. This has resulted in most Member States having produced data on Land Prices and Rents for the period 2011-2014, while aiming to respect the common methodology. Some Member States have already published data on their own national web sites. Others however, have not yet done so but have provided data to Eurostat and agreed to their inclusion in this paper, with the exception of a few countries that wish some or all of their data to remain confidential, at least for the time being. 23 countries have provided Land Prices data to Eurostat and 21 have provided data on Rents, though not always for all the years in question and not always complete data sets.

This paper provides a summary of the history behind the common methodology, a description of the work carried out and the results arising from it. Data are provided where agreed with the Member States. The paper explains the strengths and limitations of the results as well as the issues and challenges being faced.

Eurostat intends to take steps to progressively improve the completeness, quality and comparability of the data and the paper outlines the steps foreseen to move towards regular production.

Agricultural Land Prices and Rents data for the European Union

December 2016

1. INTRODUCTION

This paper presents results of work carried out by Eurostat and the relevant national authorities, usually National Statistical Institutes (NSIs) or ministries of agriculture, on agricultural land prices and rents. The reference period in question is 2011 to 2014 inclusive, following the launch of a common methodology agreed between the European Commission (Eurostat) and the Member States in 2010.

The aim of the land price statistics is to show the value of one hectare of agricultural land in the reference period (calendar year). The agricultural land rent represents the price of renting one hectare of agricultural land in the reference period (calendar year). In both cases, the field of observation should include the arable land and/or the permanent grassland.

2. BACKGROUND

For many years prior to the current decade, Eurostat had asked the Member States for data on prices and rents of agricultural land as these figures were indicators for the impact on the Common Agricultural Policy (CAP).

The situation was, however, not satisfactory:

- many member states did not deliver data
- the data delivered were not complete
- the data were not following common definitions
- the sources behind the data were very different

It could therefore be said that no comprehensive, EU-wide statistics on land prices and rents had ever been established. Rather, only a collection of available data had been taking place.

The enlargement of the European Union in the first decade of the 21st Century highlighted the unsatisfactory situation regarding data on land prices, because very few new EU Member States were providing such information. However, there was already a lack of data from existing Member States.

The 2003 CAP reform gave priority to subsidies primarily linked to the agricultural land itself (Single Farm Payment), to enhance market orientation. The change from mainly production related subsidies to land subsidy, raised further still the need for reliable and comparable prices on agricultural land.

Acknowledging the need for comparable statistics on agricultural land prices and rents in the EU, actions were undertaken by Eurostat to develop a common methodology for data collection on land prices and rents. A first version of the methodology was presented at the Agricultural Accounts and Prices Working Group in December 2008. A subsequently set up Task Force (made up of participants from several Member States as well as Eurostat and other European Commission services) worked further on the methodology in 2009, and the final version of the common methodology was established in the meeting of the said Working Group of December 2010.

The common methodology was generally agreeable to the Member States and they agreed to begin producing data on land prices and rents in line with it, starting with reference year 2011. Some countries still expressed concerns regarding the data collection, the level of aggregation and the availability of the first data collected based on the common methodology. The common methodology could not incorporate all Member States' views but they were taken into consideration as much as possible.

Since then, most but not all Member States have provided Eurostat with data on land prices and rents for the "experimental" period of 2011-2014. For the first time, this has included regional data. Given the need to ensure appropriate quality of its established statistics, Eurostat has needed to collect and monitor data covering several years, before taking steps to move towards regular production.

In addition to the background given above, this report summarises the common methodology used and presents the data that the Member States have agreed can be published at this stage. The data are presented within the context of this research paper. At the time of publication of this paper, no data have been published on Eurostat's public database, and no harmonised metadata relating to individual Member States have been provided. Readers are therefore reminded of the overall research nature of this paper and its contents, notwithstanding that some countries have already published data on agricultural land prices and rents for the years covered by this paper on a national basis.

3. SUMMARY OF THE COMMON METHODOLOGY

3.1 EU agricultural land price statistics

The aim of these statistics is to show the value of one hectare of free agricultural land in the reference period (calendar year). Therefore, depending on the data sources in each Member State, these prices can be collected from the owner of agricultural land who is selling agricultural land for agricultural use (selling prices) or from the person who is purchasing agricultural land for agricultural use (purchase prices).

3.1.1 Field of observation

The price of one hectare of agricultural land sold/purchased for agricultural use is proposed as the observation unit. The field of observation should include the arable land and/or permanent grassland sold to (or purchased from) private owners or estate agencies who sell land for agricultural use and should exclude transactions for non-agricultural purposes (lifestyle buyers, construction sites etc.) and transactions of land between relatives.

The categories of land for which prices are observed are arable land and permanent grassland. Member States are not obliged to provide data for land categories below 5 per cent of utilized agricultural land based on the latest Farm Structure Survey data.

- Arable land - land worked (ploughed or tilled) regularly, generally under a system of crop rotation.

For those MS for which the irrigable arable land area exceeds 15 per cent of the total Utilised Agricultural Area (UAA) according to the latest Farm Structure Survey (FSS) data available and the price differences per hectare show significant higher level (more than 50 percent) in comparison with the non-irrigable arable land price per hectare, the information provided should also be broken down into irrigable and non-irrigable arable land.

The distinction between irrigable and non-irrigable land area is made on the basis of the FSS definitions below:

- irrigable arable land – arable land area which could, if necessary, be irrigated in the reference year using the equipment and the quantity of water normally available on the holding;

- non-irrigable arable land - arable land area which cannot be irrigated due to the lack of water for irrigation on the holding.¹
- Permanent grassland - land used permanently (for five years or more) to grow herbaceous forage crops, through cultivation (sown) or naturally (self-seeded) and which is not included in the crop rotation on the holding.

3.1.2 Reference period of the results

The agricultural land prices should represent the average price of the sold/purchased arable land (irrigable and non irrigable), and permanent grassland in a calendar year.

3.1.3 Price of agricultural land

According to the market price concept, the price of agricultural land (arable land, permanent grassland) is the price received/paid by the holder in free trade without deduction of taxes or levies (except deductible VAT) and without the inclusion of subsidies.

The selling/purchase price of land should:

- include the value of related levies/taxes (other than deductible VAT);
- exclude the entitlements related to the land;
- exclude the value of any monetary compensation received by farmers for the sale/acquisition of the Utilized Agricultural Area;
- exclude the value of any building on the sold/purchased agricultural land ;
- exclude inheritance transfers;

3.1.4 Aggregation at country level

Agricultural land prices at NUTS 0 and NUTS 1 levels are aggregated by calculating a weighted average using the regional (NUTS 2) average price and the information on area (NUTS 2) provided by the latest data from Farm Structure Survey (FSS) by category of land (arable land, permanent grassland). Agricultural land prices for year n, n+1 and n+ 2 will be weighted by the FSS data of year n.

3.2 EU agricultural land rent statistics

The agricultural land rent represents the price of renting one hectare of agricultural land in the reference period (calendar year). The renting prices should be collected from the person renting the agricultural land for agricultural use (renting price paid).

3.2.1 Field of observation

The renting price of one hectare of arable land and/or permanent grassland rented for agricultural use is proposed as the observation unit. The renting prices at NUTS 2 level represent an average price of arable land and permanent grassland.

3.2.2 Reference period of the results

The agricultural land rent prices should represent the average price for renting the arable land and permanent grassland in a calendar year.

3.2.3 Rent of agricultural land

Rents correspond to payments made to the owner of land in return for him making assets available to another unit. No distinction is made taking into consideration the duration of the renting contract/agreement and the time for contracting. Therefore, all rents for land

¹ Represents the price of arable land which is not included under irrigable arable land

(even if the land is rented for more than one year) should be taken into account for the calculation of average rent.

The rental price of agricultural land should:

- include the payments in kind valued at the current year price
- include the value of related levies/taxes;
- exclude the entitlements related to the land
- exclude the rentals of buildings or dwellings situated on it and any other expenses related to other assets except the agricultural land (current maintenance expenditure on buildings, buildings insurance, depreciation of buildings, rents paid for the professional use of non-residential buildings etc.)

3.2.4 Aggregation at country level

The aggregation of agricultural rents at NUTS 0 and NUTS 1 levels is made by calculating a weighted average using the regional (NUTS 2) average renting price and the information on rented area (NUTS 2) provided by the latest data available from the Farm Structure Survey (FSS). Agricultural land rents for year n, n+1 and n+ 2 will be weighted by the FSS data of year n.

3.3 Data sources for land prices and rents

Bearing in mind the general objective established in the target methodology, the statistical data can be collected by means of:

- Direct observation of land prices and rents by category of agricultural land described in the target methodology. In this case, the agricultural holding is contacted directly and asked about prices of actual transactions related to the holding or about an average theoretical price/rent. The data can be collected through separate surveys or be integrated into the system of surveys which already exists (i.e. land use surveys, agricultural economic indicators, FSS etc.)
- Statistical data collection via a network of experts – "expert estimates". This practice could involve experts from the regional statistical offices, local representations of the ministries of agriculture, agents from the real estate agencies at the regional level, the agricultural advisory service, etc.
- Use of administrative data to obtain statistical information. This method of data collection should be used only when the information provided by administrative sources proves to be of equal quality to the information obtained from statistical surveys (the information from administrative sources is often prone to significant under-reporting and does not provide any breakdown by type of land).

In some cases, Member States could combine one or both of the first two data collection methods mentioned above with the administrative data sources.

Since the adoption of the common methodology, three different series of Eurostat grants have been made available to Member States in order to support their work in this regard. The activity reports submitted as part of these contracts have provided Eurostat information on how these Member States have attempted to adopt the common methodology. Some, but not all Member States that have not used the grant option, have also provided Eurostat with information on their methodology. This has been used to help assess the consistency of the approaches used with the agreed common methodology. Such information cannot however, be considered as harmonised metadata. Grant support may be available in future to facilitate further developments.

While the current common methodology has been in place since the end of 2010, Eurostat has naturally been looking to see if developments could be made to reinforce and possibly improve the methodology over time.

The current common methodology was thus examined by a Task Force on Agricultural Land Prices and Rents, made up chiefly of participants from Member States (plus the Directorate-General for Agriculture and Rural Development of the European Commission) and chaired by Eurostat, which met in September 2016. The Task Force concluded that some improvements to the common methodology could be made and should be discussed at the Working Group on Agricultural Accounts and Prices foreseen to take place in February 2017. These issues relate to areas such as coverage, thresholds applied for data collection and validation, and aggregation.

4. SUMMARY OF DATA PROVIDED BY THE MEMBER STATES

In practice, and as the work continues, the availability of data varies across the EU. Some national statistical authorities had been compiling and, in some cases, publishing land prices and rents data for many years and have also published data for the years 2011 onwards, following the agreement to use the aforementioned common methodology. For some others, the notions of publishing such data only really began with the introduction of the common methodology.

While individual Member States always have the right to publish their own data nationally, Eurostat should ideally only move towards publishing the data when all or most EU Member States have data available (naturally of publishable quality). While a research paper represents work in progress, formal publication by Eurostat on its database will almost automatically result in direct comparisons being made by users between Member States' data. This means that high quality metadata will be of particular importance, amongst other things, to aid understanding of issues relating to the comparability of data between Member States or indeed with regard to comparability between regions within the same Member State, as relevant.

The table below indicates the number of countries from the 28 EU Member States that have provided data (by year and type of data).

		2011	2012	2013	2014
Land price	Arable land	20	20	22	23
	Irrigable	4	4	4	4
	Non-irrigable	5	5	5	5
	Permanent grassland	17	18	21	21
Land rent		17	15	21	21

As can be seen above, out of the 28 EU Member States, 23 have provided Land Prices data to Eurostat and 21 have provided data on Rents, though not all countries have provided data for every year 2011-2014. The distinction between irrigable and non-irrigable land is only relevant in certain Member States and this largely accounts for the numbers reported.

In addition, it should be mentioned that not all countries have provided full data sets and not every country has provided to NUTS 2 level. This can be seen in the data annexed to this paper. Where any Member State provided data in national currency, Eurostat has converted these into euros at current exchange rates, for the purposes of this research paper.

While most Member States have agreed to Eurostat publishing their data in the annex of this paper, four have placed partial or complete confidentiality requirements on their data.

For those Member States that have not provided data in line with the common methodology, only blanks appear in the annex for these cases (including those Member States that have provided no data at all). This paper does not address the issue of when such information from these countries might become available.

Comparable metadata are not yet readily available but will be needed once regular production has been established. Eurostat can thus provide no statistical commentary on the data herein; rather, the paper provides a snapshot of the current state of development and the history behind it on the path towards future regular production.

It should also be noted that some countries have provided data for 2015, but these are not included here as the paper concerns the period 2011-2014. It is expected that 2015 data can be made available at a later time.

5. SUMMARY ANALYSIS OF THE DATA, ISSUES AND CHALLENGES

Some countries have been collecting and compiling information on agricultural land prices and rents for many years at different levels of details and aggregation.

The data provided to Eurostat alone cannot give a picture of its quality and therefore the future availability of the metadata files will be of crucial importance.

Following the assessment of the information provided by the countries, the following main issues and challenges can be highlighted when discussing comparability of data and quality in general:

- Methodological information provided by the countries does not always give the possibility to assess if the data are fully in line with the current common methodology of Eurostat;
- Each country has its own particularities as regards the different elements that are having an impact on the price of agricultural land (soil type, climate, hydrology, legal context, etc.); in larger countries, agricultural land from different regions can have a very different price due to the variations in soil characteristics or climate;
- The size of the country is also an important factor when establishing the methodology for the collection of data on land prices and rents;
- Each method for data collection should be adapted to the country particularities and national needs (e.g. sampling methods, number and type of variables, etc.). However, the method should give the possibility to provide the comparable information at more aggregated level following the common methodology. It has been noted that:
 - Different methods for aggregation of data on agricultural land prices and rents at NUTS 2/NUTS 1 level have a serious impact on data comparability;
 - Statistical representativeness of collected data is another important factor having an impact on the quality and the comparability of collected data. The sample size used for the investigation of the prices should fulfil certain statistical requirements;

- Exclusion of different areas and or survey units (for example covering only legal persons, or applying physical or economic thresholds to cover only part of the target population) can influence the comparability of the collected data.

6. CONCLUSIONS AND CURRENT/FUTURE DEVELOPMENTS

This report provides the status of work on Agricultural Land Prices and Rents including the currently available data from the work carried out by Eurostat and the national statistical authorities, following the introduction of the common methodology at the end of 2010. It is marked as version 1.0 which gives scope for future revisions of the paper, if deemed necessary.

The paper has been designated as a Research Paper as Eurostat is not ready to start regular production, but wishes to provide information on the work carried out so far and the history to it. The data provided herein may of course be subject to revision between the time of publication of this paper and that of regular production. Those data that have been provided confidentially have been entered in the annex as "c" while blanks have been left in the cases where no data in line with the common methodology have been provided.

The paper shows price and rent levels for most but not all Member States at down to NUTS 2 level where possible and available.

This paper represents an important step for the EU national authorities and Eurostat in moving towards regular production of Agricultural Land Prices and Rents data to a common methodology, which, depending on further consultation and agreement with EU Member States, is presently planned to commence in Q4 2017/Q1 2018.

From the work to date, it can be seen that there are some substantive differences between Member States (and indeed regions). Appropriate metadata, which should provide some insight to these differences are not currently available.

Land Prices and Rents is a very complex domain. Comparability issues are not easily solved and especially not in the short term.

Eurostat considers that there are four key issues facing the European Statistical System (ESS) with respect to moving towards regular production:

- 1) All EU Member States should provide data. This is not presently the case. Failing this, as many Member States as possible should provide data.
- 2) All Member States which provide data should provide data sets which are as comprehensive as possible, which is not presently the case.
- 3) There are comparability issues which can only be addressed on an ongoing longer term basis. This highlights the need for high quality metadata to accompany regular production data to help support interpretation of the data, including the limitations of making comparisons between Member States or between regions.
- 4) The common methodology, while fit for purpose as a basis for commencing regular production, statistics, would benefit from further refining in order to promote improved comparability and quality.

With the aim of starting regular production in Q4 2017/Q1 2018, Eurostat will endeavour to obtain more data from more Member States and to improve, where relevant, the comprehensiveness and quality of the existing 2011-2014 data that it already has. Comprehensive metadata will be sought. In addition, 2015 data (and possibly 2016 data) should also be available for publication at that time.

In parallel however, efforts to develop the methodology including with respect to comparability issues will continue on an ongoing basis with a view to longer term improvements. To this end, the aforementioned task force was established and has been working on improvements to the methodology. Possible future grants would offer Member States the opportunity to help implement improvements, though inevitably this would take time to have any measureable effect.

Finally, it should be mentioned that the issues in this paper are to be discussed by the EU Member States' representatives at the next meeting of the Working Group on Agricultural Accounts and Prices, foreseen to take place in February 2017. This will have an impact on decisions relating to future regular production and on possible future methodological developments.
