Statistics Explained

For an institution in charge of the [regular estimate](#), an **advance estimate** for the most recent [reference period \$T\$](#) is a [quantitative](#) evaluation of a generally [hard economic indicator](#) computed *during* the reference period T

Although it is calculated on the basis of an incomplete [coverage](#) (countries and series) it is produced using the same methodology that is employed for regular estimates. Statistical and econometric techniques are used to fill in the temporary incomplete observations. Hard, [soft](#), [unconventional](#) and [financial data](#) are used if they are observed during the reference period T
