

Data extracted: May 2025

Planned article update: 12 August 2025

Highlights

This article presents the Eurostat [Business Cycle Clock](#) (BCC), a tool showing different economic cycle phases for the euro area using a clock-type graph. The clock is designed to represent the empirically observed sequence of turning points of the business, growth and acceleration cycles. Its indications are based on three synthetic indicators: the growth cycle coincident indicator (GCCCI), the business cycle coincident indicator (BCCI) and the acceleration cycle coincident indicator (ACCI), which are all experimental in nature (see [Context](#) for more methodological information).

Business Cycle Clock's indications for the euro area

According to the latest Business Cycle Clock's indications, the euro area economy continues to be in a slowdown phase with decelerating growth as from February 2024.

The ongoing slowdown phase of the euro area economy is also substantially confirmed by a dating exercise covering the period up to Q3 2024, which identified the peak of the growth cycle in Q4 of 2022.

The current slowdown is largely attributed to the industrial sector's downturn, whereas the services sector continues to grow. The economic situation continues to be characterised by a high degree of uncertainty due to several factors, such as ongoing geopolitical instability and tensions in international trade. However, the absence of recessionary signals constitutes a positive element in this scenario.

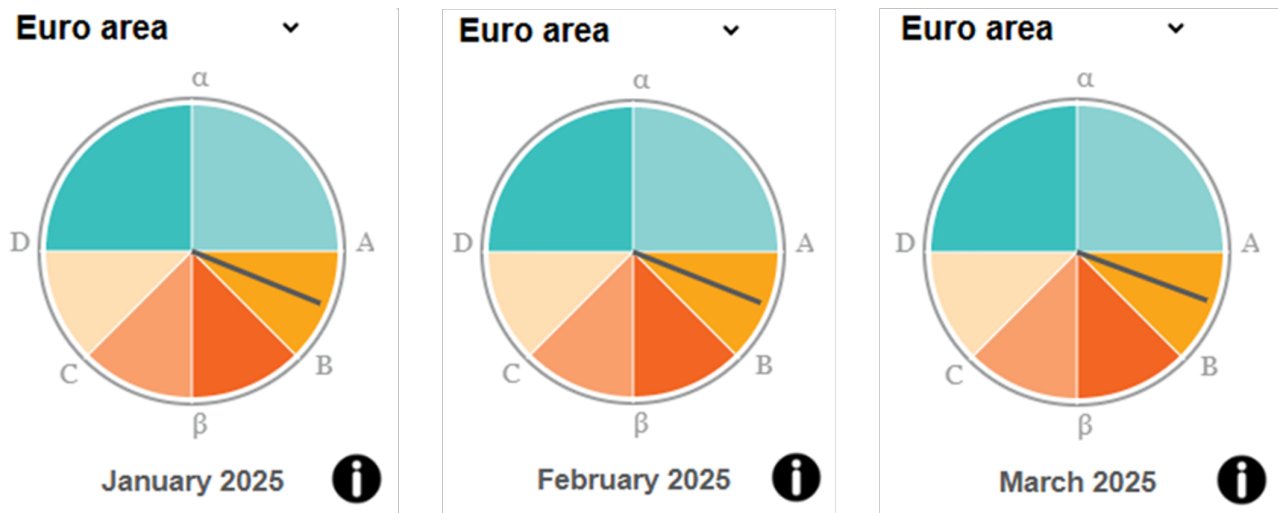

Figure 1: Business Cycle Clock's indications for the euro area Source: Eurostat (BCC)

The BCC tool signal shown in Figure 1 is based on three coincident cyclical indicators: the growth cycle coincident indicator (GCCl), the business cycle coincident indicator (BCCI) and the acceleration cycle coincident indicator (ACCI). They are estimated in the detecting exercise (see [Context](#) for more methodological information).

Growth cycle coincident indicator

In Q4 2024, the growth cycle coincident indicator (GCCl) increased from 0.94 in October to 0.97 in December 2024, indicating that the euro area economy is still in a slowdown phase.

Business cycle coincident indicator

The business cycle coincident Indicator (BCCI) remained stable at zero in Q4 2024, confirming the absence of recessionary signals.

Acceleration cycle coincident indicator

In Q4 2024, the acceleration cycle coincident indicator (ACCI) increased from 0.95 in October to 0.99 in December 2024, confirming the ongoing phase of decelerating growth of the euro area economy.

Data sources

The GCCI and BCCI are estimated using the following input variables:

- [industrial production index \(IPI\)](#) ,
- [unemployment rate](#) ,
- [manufacturing employment expectations for the months ahead](#) ,
- [financial situation of consumers over the last 12 months](#) .

The last 2 variables are from the [Business and consumer surveys \(BCS\)](#) conducted by the European Commission's Directorate-General for Economic and Financial Affairs. The ACCI is estimated using the [Economic Sentiment Indicator](#) , a synthetic indicator from the BCS.

Context

The main purpose of the Business Cycle Clock (BCC) is to complement the information contained in the [euro indicators dashboard](#) by extracting signals on the state of the economy. The BCC tool depicts in a visually appealing and intuitively understandable way cyclical developments in the euro area economy. The clock is structured according to the so-called $\alpha AB\beta CD$ approach, which is based on an empirically observed sequence of turning points of the acceleration, business and growth cycles (see Figure 5).

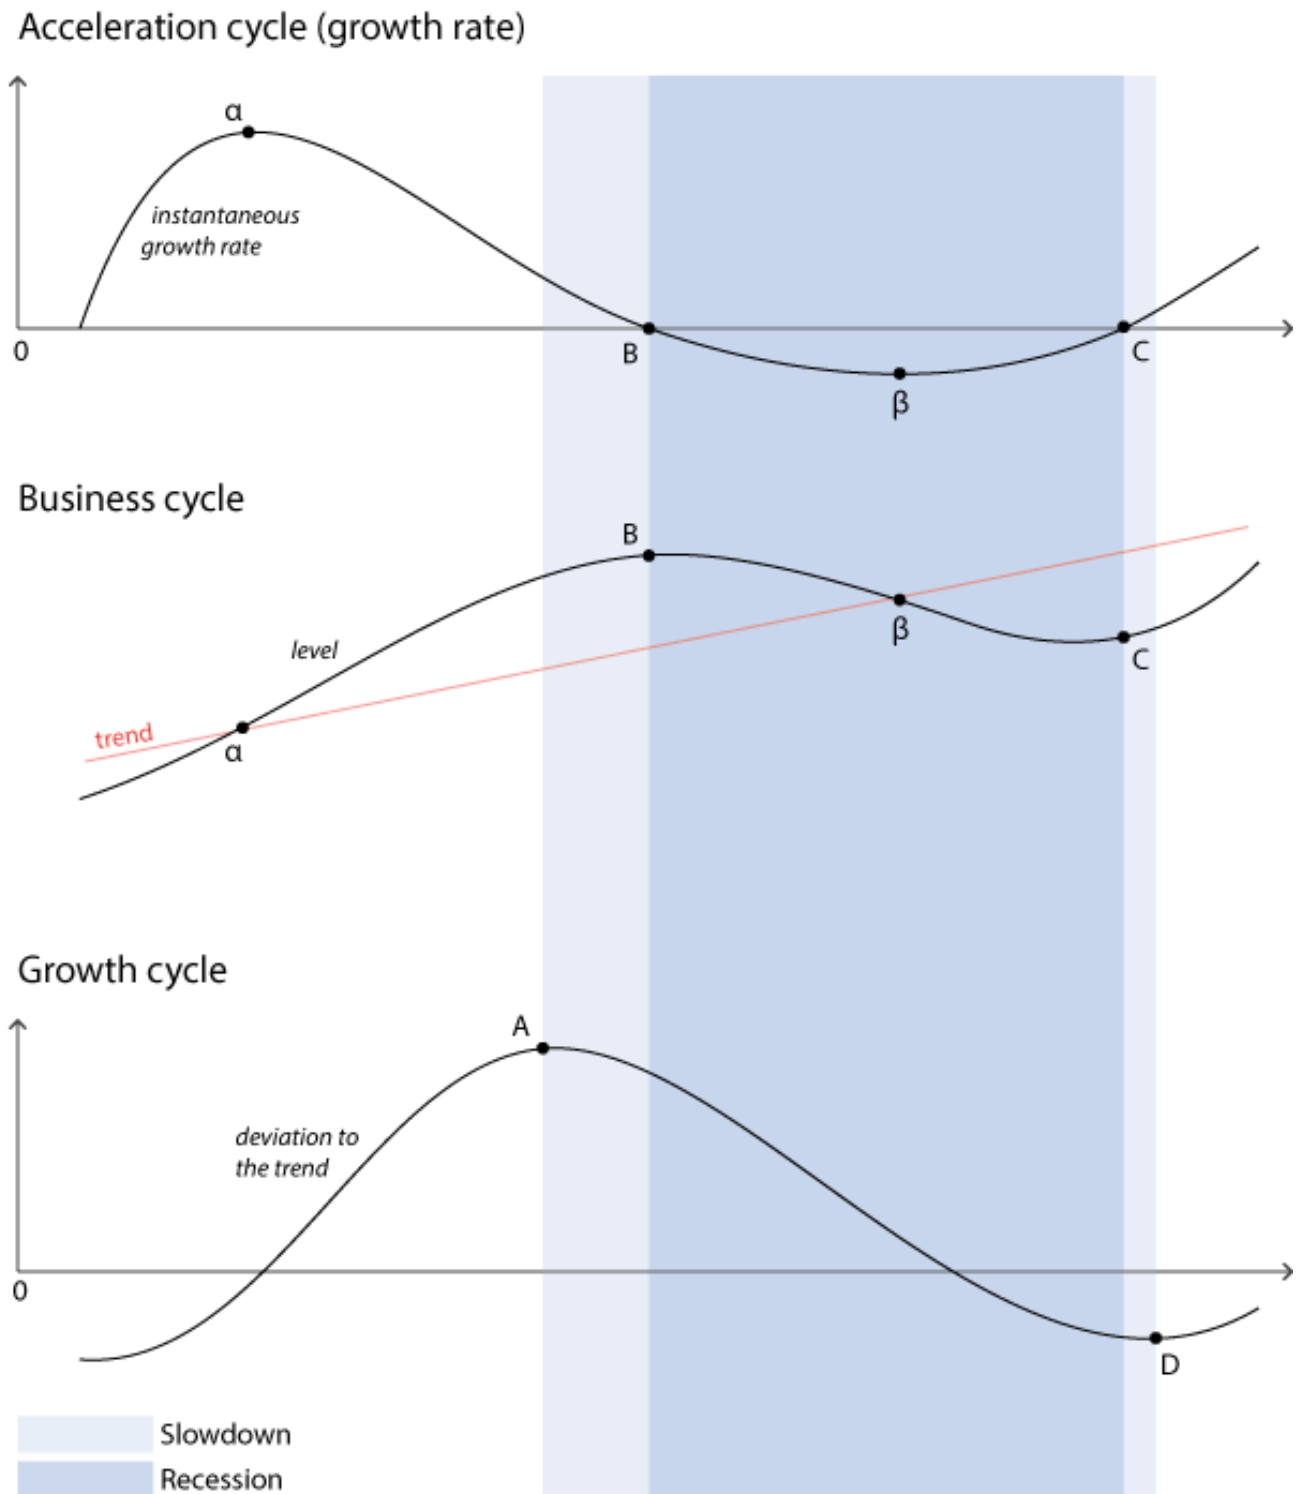

Figure 5: Acceleration, business and growth cycles

The *business cycle* is meant to reproduce the cycle of the global level of activity of an economy. The turning points of this cycle, named B for peaks and C for troughs, separate periods of negative growth (recessions) from periods of positive growth (expansions). The *growth cycle* can be defined as the deviation of the reference series (GDP for example) to the trend. The growth cycle has turning points named A for peaks and D for troughs. Peak A is reached when the growth rate decreases below the trend growth rate. Symmetrically, trough D is reached when the growth rate overpasses it again. The *acceleration cycle*, also called the growth rate cycle, relating to increases and decreases in the growth rate of the economic activity. The peak, turning point α , represents a local maximum of the growth rate. On the contrary, the trough (turning point β) indicates a local minimum of the growth rate. The acceleration cycle is characterised by the highest number of fluctuations and a high degree of volatility. The BCC tool is based on two complementary exercises: the dating system with the results shown in the line chart in the lower part of the tool and the detecting system with the results appearing in the clocks in the upper part of the tool (see Figure 6).

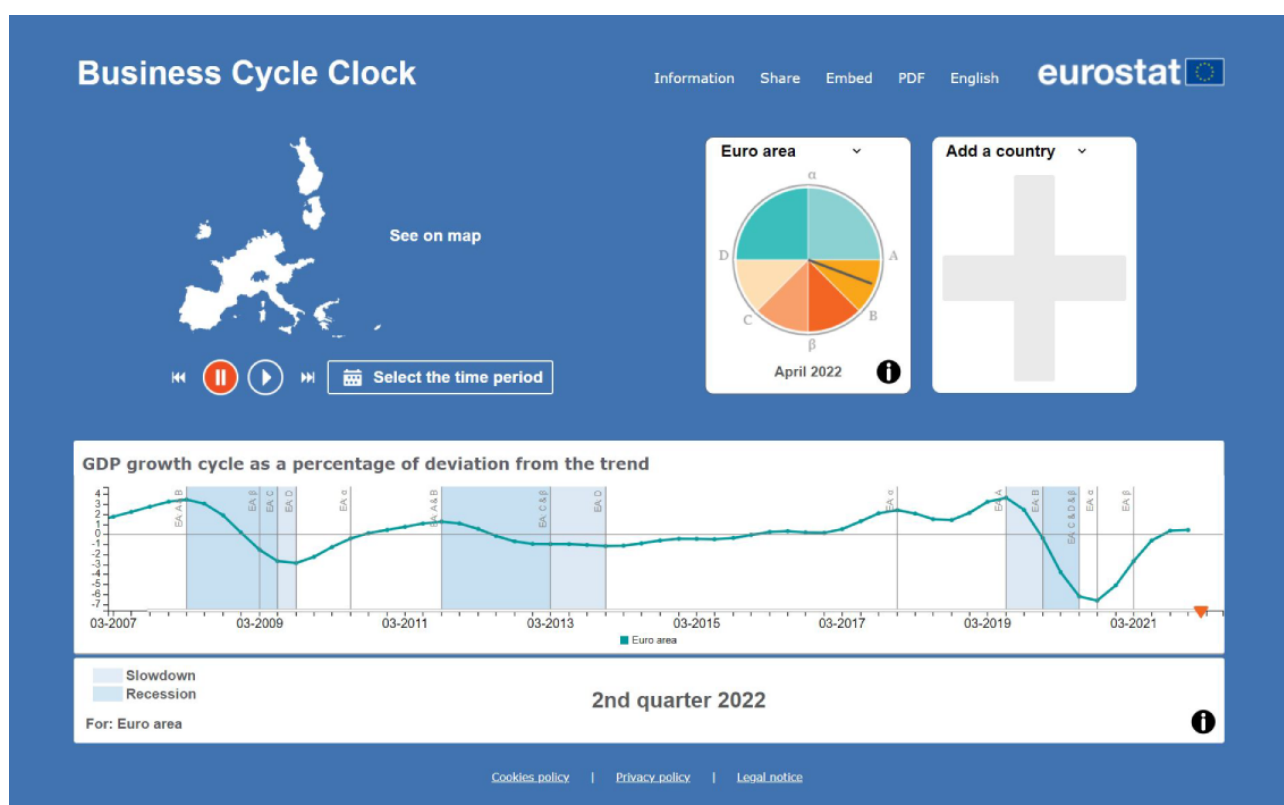

Figure 6: Business Cycle Clock – upper and lower parts

The *dating exercise* is designed to identify past turning points simultaneously in the acceleration, business and growth cycles having the $\alpha AB\beta CD$ framework as reference. The turning points are identified by means of a non-parametric dating rule very similar to the one proposed by Harding and Pagan (2002)¹. The main reference series for the dating exercise is the quarterly GDP in volume, complemented by the industrial production index (IPI). The dating exercise is carried out on a quarterly basis. The turning points identified in the last 3 years are considered provisional and are then subject to revisions.

The *detecting exercise* is based on a purely parametric approach using the Markov switching models as the main modelling methodology. Three coincident cycle indicators are estimated: the business cycle coincident indicator (BCCI), the growth cycle coincident indicator (GCCCI) and the acceleration cycle coincident indicator (ACCI). The business cycle coincident indicator (BCCI) provides the probability of a recession and signals the peaks and troughs of the business cycle. The growth cycle coincident indicator (GCCCI) provides the probability of a slowdown in the economy and signals the peaks and troughs of the growth cycle. The acceleration cycle coincident indicator (ACCI) provides the probability of a deceleration in the growth rate and signals the peaks and troughs of the growth

¹Harding D., Pagan A. (2002), Dissecting the cycle: A methodological investigation, *Journal of Monetary Economics*, 49, 365-381 .

rate cycle.

A multivariate Markov switching model is used to simultaneously estimate turning points for the growth and the business cycles. Turning points of the acceleration cycle are estimated independently by using a univariate Markov switching model. These estimations are carried out on a monthly basis. The location of the hand in the BCC tool is based on the values of the 3 cyclical coincident indicators for the acceleration, business and growth cycles, in particular on their positioning with respect to the 0.5 threshold (see Table 1).

How the clock hand position is computed

		ACCI			
		<0.5		>0.5	
		BCCI		BCCI	
		<0.5	>0.5	<0.5	>0.5
GCCCI	<0.5	Sector 6		Sector 1	
	>0.5	Sector 5	Sector 4	Sector 2	Sector 3

eurostat 

Table 1: How the clock hand position is computed

The clock has 6 sectors (see Figure 7), which can be interpreted as follows:

- In the upper and lower right quadrants of the clock, sectors 1, 2 and 3 indicate a decrease in the growth rate. In the first quadrant, the growth rate is still above the trend growth rate. At point A, the growth rate slips below the trend growth rate. In the second quadrant, the growth rate is below the trend growth rate. At point B, it becomes negative and at point β , the growth rate reaches a minimum.
- In the lower and upper left quadrants of the clock, sectors 4, 5 and 6 indicate an increase in the growth rate. In the third quadrant, the growth rate is still below the trend. At point C, it becomes positive and at point D, it overpasses the trend growth rate.

The names of the sectors are included in Figure 7.

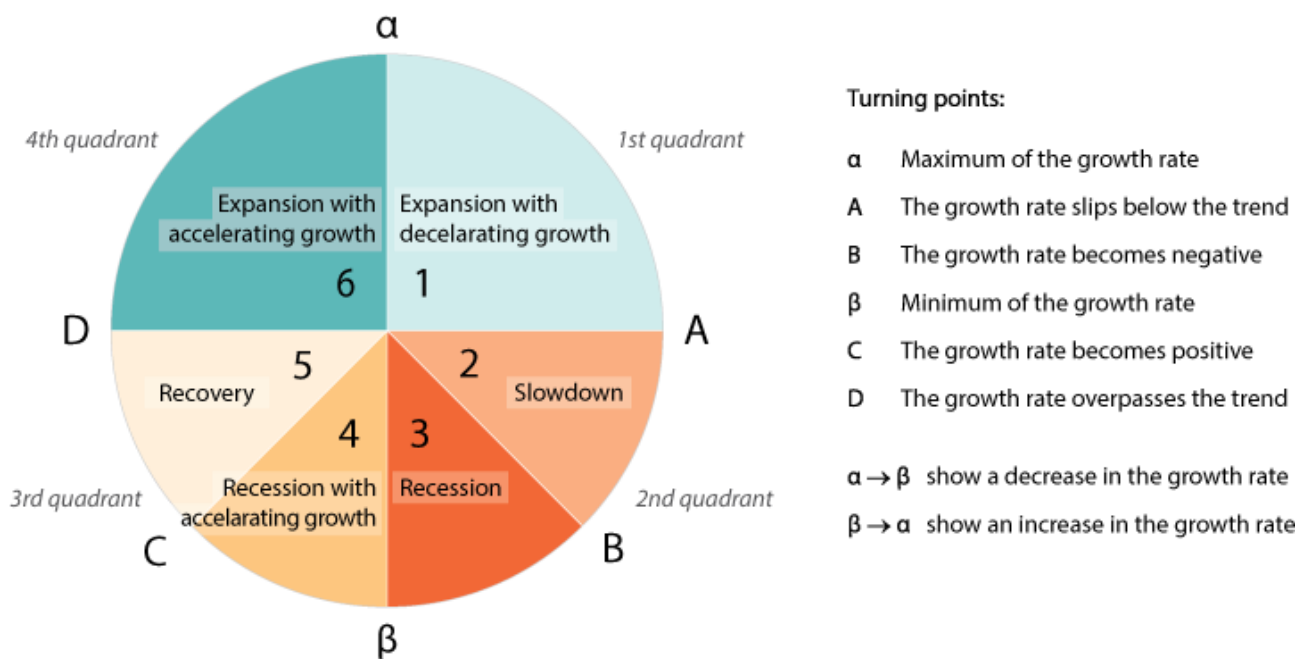

Figure 7: Cyclical phases indicated by the Business Cycle Clock in quadrants and sectors

The BCC and the cycle coincident indicators are presented in more detail in several chapters of the [Handbook on Cyclical Composite Indicators](#) and Eurostat's [Business Cycle Clock – A user's guide](#) (see also Billio, Ferrara, Mazzi, Moauro (2016)², Billio, Ferrara, Mazzi, Ruggeri-Cannata (2016)³, and Mazzi (2015)⁴). An overview of the methodology is also available in [The Eurostat Business Cycle Clock: a complete overview of the tool](#) (Ruggeri-Cannata (2021)⁵). Information on how the tool has been performing during the pandemic can be found in [The Eurostat business cycle clock and the pandemic: Some considerations](#) (Ruggeri-Cannata, Ronkowski (2022)⁶).
