This article presents the very latest unemployment figures for the European Union (EU), the euro area and individual Member States, complemented by an overview of long-term developments since the year 2000.

**Recent developments**

**Unemployment in the EU and the euro area**

Eurostat estimates that 15.802 million men and women in the EU-28 \(^1\), of whom 12.529 million were in the euro area (EA-19) \(^2\), were unemployed in April 2019. Compared with March 2019, the number of persons unemployed decreased by 108 000 in the EU-28 and by 64 000 in the euro area. Compared with April 2018, unemployment fell by 1.394 million in the EU-28 and by 1.147 million in the euro area.

---

\(^1\)In line with Eurostat’s guidelines for disseminating data when the EU is enlarged, aggregate data series in this article refer to the official composition of the EU in the most recent month for which data are available; from July 2013 onwards this is the EU with 28 Member States, EU-28.

\(^2\)In line with Eurostat’s guidelines for disseminating data when the euro area is enlarged, aggregate data series in this article refer to the official composition of the euro area in the most recent month for which data are available; from the reference month of January 2015 onwards this will be the euro area with 19 Member States, EA-19.
Figure 1: Change in the number of unemployed persons (compared to previous month, in thousands), seasonally adjusted, January 2011 - April 2019

The euro area seasonally-adjusted unemployment rate was 7.6 % in April 2019, down from 7.7 % in March 2019 and from 8.4 % in April 2018. The EU-28 unemployment rate was 6.4 % in April 2019, stable compared with March 2019 and down from 7.0 % in April 2018.

Unemployment in the Member States

Among the Member States, the lowest unemployment rates in April 2019 were recorded in Czechia (2.1 %), Germany (3.2 %) and the Netherlands (3.3 %). The highest unemployment rates were observed in Greece (18.5 % in February 2019), Spain (13.8 %) and Italy (10.2 %).
Compared with a year ago, the unemployment rate fell in all Member States except Luxembourg and Poland where it remained stable while an increase was registered in Denmark (from 5.2 % to 5.3 %). The largest decreases were registered in Greece (from 20.6 % to 18.5 % between February 2018 and February 2019), Estonia (from 6.0 % to 4.1 % between March 2018 and March 2019) and Spain (from 15.6 % to 13.8 %).

In April 2019, the unemployment rate in the United States was 3.6 %, down from 3.8 % in March 2019 and from 3.9 % in April 2018.
Youth unemployment

In April 2019, 3.213 million young persons (under 25) were unemployed in the EU-28, of whom 2.308 million were in the euro area. Compared with April 2018, youth unemployment decreased by 246 000 in the EU-28 and by 151 000 in the euro area. In April 2019, the youth unemployment rate was 14.2 % in the EU-28 and 15.8 % in the euro area, compared with 15.4 % and 17.2 % respectively in April 2018. In April 2019, the lowest rates were observed in Germany (5.3 %) and the Netherlands (6.2 %), while the highest were recorded in Greece (38.8 % in February 2019), Spain (32.7 %) and Italy (31.4 %).
Youth unemployment rates, EU-28 and EA-19, seasonally adjusted, January 2000 - April 2019 (%) Source: Eurostat (une_rt_m)

Unemployment levels and rates move in a cyclical manner, largely related to the general business cycle. However, other factors such as labour market policies and demographic developments may also influence the short and long-term evolution.

Longer-term unemployment trends

Trends in the EU: Unemployment rate at all-time low

At the beginning of 2000, above 20.5 million persons were unemployed in the EU-28, corresponding to 9.2 % of the total labour force. The unemployment trend at that moment was downwards. In the second quarter of 2001 the number of unemployment persons had dropped to 19.6 million and the unemployment rate to 8.7 %. A long period of increasing unemployment followed. At the end of 2004 the number of jobseekers available for work reached 21.2 million, while the unemployment rate was 9.2 %.

At the beginning of 2005 a period of steadily declining unemployment started, lasting until the first quarter 2008. At that time, EU-28 unemployment hit a low of 16.2 million persons (equivalent to a rate of 6.8 %) before rising sharply in the wake of the economic crisis. Between the second quarter 2008 and mid-2010 the unemployment level went up by more than 6.7 million, taking the rate up to 9.7 %, at that time the highest value recorded since the start of the series in 2000. The decline of unemployment in the following three quarters was a deceptive sign of an end of the crisis and of a stable improvement in labour market conditions in the EU-28. In fact, since the second quarter 2011 and until the second quarter of 2013 unemployment steadily and markedly increased taking it to the record level of 26.5 million, corresponding to a record rate of 11 %. Since then the rate has started to decrease, reaching the record low of 6.6 % at the end of 2018.
Trends in the euro area

The unemployment rate in the euro area (EA-19) followed roughly the same trend as in the EU-28. However, between 2000 and the beginning of 2004 the unemployment rate in the euro area was below that recorded in the EU-28. This pattern was subsequently reversed as, between 2005 and the beginning of 2008, unemployment declined more rapidly in the Member States which do not yet have the euro. As in the EU-28, during the economic crisis unemployment increased at a considerable pace, with the exception of the period between mid-2010 and mid-2011 where it temporarily declined. The unemployment level peaked at 19.3 million in the second quarter of 2013, before going down since the second part of 2013 and reaching 13 million at the end of 2018.

Trends in the United States and Japan

In 2000, the unemployment rate in the United States was around 4 %, considerably lower than in the EU. It remained much lower until early 2008, when unemployment started to increase rapidly. By the beginning of 2009 the unemployment rate in the United States had reached the same level as in the EU-28, and stayed above the EU-28 rate until the beginning of 2010. Since then the US unemployment rate has followed a downwards path which has taken it to 3.8 % at the end of 2018. In Japan, between 2000 and 2018, unemployment rates were much lower than in the EU, ranging between 5.4 % in the third quarter 2009 and 2.4 % in the fourth quarter of 2018.
Youth unemployment

Higher youth unemployment in the euro area than in the EU since mid-2012

Youth unemployment rates are generally much higher, even double or more than double, than unemployment rates for all ages. As for the rate for the total population, the youth unemployment rate in the EU-28 sharply declined between 2005 and 2007, reaching its minimum value (15.1 %) in the first quarter of 2008. The economic crisis, however, severely hit the young. From the second quarter of 2008, the youth unemployment rate has taken an upward trend peaking in 23.9 % in the first quarter 2013, before receding to 14.8 % at the end of 2018. The EU-28 youth unemployment rate was systematically higher than in the euro area between 2000 and mid-2007. Since then and until the third quarter 2010 these two rates were very close. Afterwards the indicator moved more sharply in the EA-19 than in the EU-28, first downwards until mid-2011, then upwards until the end of 2012 (see also Figure 4). In the middle of 2012 the euro area youth unemployment rate overtook the EU-28 rate, and the gap increased until the end of the year. The gap became even larger in the second part of 2013 and during 2014 and 2015, when the rate for the euro area went down less than the rate for the EU-28. The gap remained at relatively high level during 2018.

Difference between rate and ratio

High youth unemployment rates do reflect the difficulties faced by young people in finding jobs. However, this does not necessarily mean that the group of unemployed persons aged between 15 and 24 is large, as many young people are studying full-time and are therefore neither working nor looking for a job (so they are not part of the labour force which is used as the denominator for calculating the unemployment rate). For this reason, youth unemployment ratios are also calculated, according to a somewhat different concept: the unemployment ratio calculates the share of unemployed for the whole population. Table 2 shows that youth unemployment ratios in the EU are much lower than youth unemployment rates; they have however also risen due to the effects of the crisis on the labour market starting in 2008. More recently, they have however also reached a record low during the course of 2018.

Male and female unemployment

Similar developments in male and female unemployment since mid-2013
Historically, women have been more affected by unemployment than men. In 2000, the unemployment rate for women in the EU-28 was around 10%, while the rate for men was below 8%. By the end of 2002, this gender gap had narrowed to around 1.4 percentage points and between 2002 and mid-2007 this gap remained more or less constant. Since the first quarter of 2008, when they were at their lowest levels of 6.3% and 7.4% respectively, the male and female unemployment rates in the EU-28 converged, and by the third quarter of 2009 the male unemployment rate was higher. The decline of the men’s rate during 2010 and the first half of 2011 and the corresponding stability in the women’s rate over the same period brought the male rate below the female one once again. Since then the two rates have risen at the same pace until mid-2013, when they reached their highest value of 10.9% for men and 11% for women. Starting end-2013 both the male and the female rates began to decline and reached respectively 6.3% and 6.9% at the end of 2018.

(1) data not available

Source: Eurostat (une_rt_a, une_ltu_a)

**Data sources**

An unemployed person is defined by Eurostat, according to the guidelines of the International Labour Organization, as someone aged 15 to 74 without work during the reference week who is available to start work within the next two weeks and who has actively sought employment at some time during the last four weeks. The unemployment rate is the number of people unemployed as a percentage of the labour force.
In addition to the unemployment measures covered here, Eurostat also publishes statistics for persons who fulfil only partially the definition of unemployment. These persons are not included in the official ILO unemployment concept and have a varying degree of attachment to the labour market. The indicators on underemployment and potential additional labour force participants supplement the unemployment rate to provide a more complete picture of the labour market.

There is currently no specific legal basis for producing and disseminating monthly unemployment data. However, these monthly data are estimates based on results of the European Union Labour force survey (EU LFS), which is a continuous household survey carried out in all Member States in accordance with European legislation and on the basis of harmonised definitions. These results are interpolated/extrapolated to monthly data using national survey data and/or national monthly series on registered unemployment. The quarterly LFS results are always used as a benchmark to ensure international comparability. As for most Member States the results from the LFS for a full quarter are available 90 days after the end of the reference period, the most recent figures are usually provisional. For many countries monthly unemployment data are calculated by Eurostat, while several countries actually supply those figures directly from the LFS.

The following LFS data are used in the calculations of the monthly unemployment rates published in this article:

- For Czechia, Germany, Italy, the Netherlands, Austria, Romania, Finland and Sweden: monthly LFS data up to and including April 2019.
- For Greece: monthly data up to and including February 2019.
- For Denmark and Portugal: monthly data (3 month moving average) up to and including March, April and May 2019.
- For Estonia and Hungary: monthly data (3 month moving average) up to and including February, March and April 2019.
- For the United Kingdom: monthly data (3 month moving average) up to and including January, February 2019.
- For Belgium, Bulgaria, Ireland, France, Croatia, Latvia, Lithuania, Luxembourg, Malta, Slovenia and Slovakia: quarterly data up and including Q4 2018.
- For Spain, Cyprus and Poland: quarterly data up and including Q1 2019.

Monthly unemployment and employment series are calculated first at the level of four categories for each Member State (males and females 15-24 years, males and females 25-74 years). These series are then seasonally adjusted and all the national and European aggregates are calculated. Monthly unemployment figures are published by Eurostat as rates (as a percentage of the labour force) or levels (in thousands), by gender and for two age groups (persons aged 15-24, and those aged 25-74). The figures are available as unadjusted, seasonally adjusted and trend series. There are monthly estimates for all EU-28 Member States. Data for the EU-28 aggregate start in 2000 and for the euro area (EA-18) in April 1998; the starting point for individual Member States varies.

Member States may publish other rates such as register-based unemployment rates, or rates based on the national LFS or corresponding surveys. These rates may vary from those published by Eurostat due to a different definition or methodological choices.

Source data for tables and graphs

The detailed tables are available here.
The unemployment rate is an important indicator with both social and economic dimensions. Rising unemployment results in a loss of income for individuals, increased pressure with respect to government spending on social benefits and a reduction in tax revenue. From an economic perspective, unemployment may be viewed as unused labour capacity.

The International Labour Organization definition of the unemployment rate is the most widely used labour market indicator because of its international comparability and relatively timely availability. Besides the unemployment rate, indicators such as employment and job vacancies also give useful insights into labour market developments.

The time series on unemployment are used by the European Commission, other public institutions, and the media as an economic indicator; banks may use the data for business cycle analysis. Finally, the general public might also be interested in changes in unemployment.

The unemployment rate is considered to be a lagging indicator. When there is an economic downturn, it usually takes several months before the unemployment rate begins to rise. Once the economy starts to pick up again, employers usually remain cautious about hiring new staff and it may take several months before unemployment rates start to fall.

Male, youth and long-term unemployment appear to be more susceptible to cyclical economic changes than overall unemployment. Indeed, social policymakers often face the challenge of remedying these situations by designing ways to increase employment opportunities for various groups of society, those working in particular economic activities, or those living in specific regions.

Globalisation and technological progress have an ever-increasing effect on daily life, and the demand for different types of labour and skills is evolving at a rapid pace. While enterprises try to improve their productivity and become more competitive and innovative, they may well seek to pass on risk to the labour force through greater flexibility - both in relation to those already in employment, as well as those searching for a new job. Within the context of the European employment strategy (EES), there are a number of measures that are designed to help encourage people to remain in work or find a new job, including: the promotion of a life-cycle approach to work, encouraging lifelong learning, improving support to those seeking a job, as well as ensuring equal opportunities.

The integrated employment guidelines for 2008-2010 encouraged Member States, among others, to:

- work with renewed endeavour to build employment pathways for young people and reduce youth unemployment, in particular, through adapting education and training systems in order to raise quality, broaden supply, diversify access, ensure flexibility, respond to new occupational needs and skills requirements, and;
- take action to increase female participation and reduce gender gaps in employment, unemployment and pay, through better reconciliation of work and private life and the provision of accessible and affordable childcare facilities and care for other dependants.

The guidelines also set a number of additional benchmarks, whereby Member States were encouraged:

- to ensure that by 2010 every unemployed person is offered a job, apprenticeship, additional training or another employability measure (for young persons leaving school within four months, and for adults within no more than 12 months), and;
- to work towards 25% of the long-term unemployed participating in training, retraining, work practice, or other employability measures by 2010.

The current economic crisis has however reversed much of the progress achieved in Europe since 2000. The Europe 2020 strategy put forward by the European Commission sets out a vision of Europe's social market economy for the 21stcentury. As part of the flagship initiatives, 'An agenda for new skills and jobs' and 'Youth on the move', (youth) unemployment rates will be targeted via by a range of policies, including proposals aimed at education and training institutions, or measures for the creation of a (work) environment conducive to higher activity rates and higher labour productivity. There are also initiatives aimed at improving the entry rate of young people into the labour market.
