Programmes for the eradication, control and monitoring of certain animal diseases and zoonoses

Control programme of Salmonella in breeding, laying and broiler flocks (*Gallus gallus*) and in flocks of turkeys (*Meleagris gallopavo*)

Approved* for 2010 by Commission Decision 2009/883/EC

Czech Republic

* in accordance with Council Decision 2009/470/EC
Request for the Community’s financial contribution for salmonella control programme in turkey flocks

Member State: Czech Republic

Disease: Salmonella spp.

Animal population covered by the program: Breeding and fattening turkeys

Year of implementation: 2010

Date sent to the Commission: 24. 4. 2009
Part A

General requirements for the national salmonella control programmes

(a) state the aim of the programme

The target of the programme is to:

- reduce the maximum percentage of fattening turkey flocks remaining positive of Salmonella enteritidis and Salmonella typhimurium to 1% or less by 31 December 2012, and to
- reduce the maximum percentage of adult breeding turkey flocks remaining positive of Salmonella enteritidis and Salmonella typhimurium to 1% or less by 31 December 2012.

In the case when less than 100 flocks of adult breeding or fattening turkeys are kept, the target of the programme shall be that no more than one flock of adult breeding or fattening turkeys remained positive by 31 December 2012.

The target of this national programme is established in accordance with the Community target pursuant to Article 4(1) of Regulation (EC) No 2160/2003 aimed at the reduction of the prevalence of Salmonella enteritidis and Salmonella typhimurium in turkeys, as specified by Commission Regulation (EC) No 584/2008.

The programme will be applied for 3 years from 1 January 2010 to 31 December 2012.

(c) Specific requirements laid down in Parts E of Annex II to Regulation (EC) No 2160/2003

Regulation (EC) No 2160/2003 establishes a Community target for the reduction of the prevalence of all salmonella serotypes with public health significance in turkeys at the level of primary production. Such reduction is important in view of the strict measures which are to apply to fresh meat from infected flocks of turkeys in accordance with that Regulation from 12 December 2010. In particular, fresh poultry meat, including turkey meat, may not be placed on the market for human consumption unless salmonella is absent in 25 grams of such meat.
1. General

Prevalence of Salmonella enteritidis and Salmonella typhimurium in turkey flocks

Monitoring on prevalence of Salmonella spp. in turkey flocks is not performed currently and so no data concerning animal health situation in the Czech Republic are available. Results of a baseline study in flocks of breeding and fattening turkeys performed pursuant to Commission Decision 2006/662/EC are considered to be a starting (initial) value. The study was performed between 1 October 2006 and 30 September 2007 with the following results:

A) Fattening turkeys

A total of 194 flocks of fattening turkeys were tested in the Czech Republic, with the prevalence of Salmonella spp. of 42.7%; S. enteritidis (32.4 %) was the most frequently reported serotype in the flocks, followed (in decreasing order) by S. saintpaul (19.7 %), S. agona (18.3 %), S. zanzibar (15.5 %), S. typhimurium (5.6 %), S. indiana (2.8 %), S. blockey (2.8 %), S. infantis (2.8 %) and S. derby (1.4 %). The prevalence of S. enteritidis and S. typhimurium was within the study reported at the level of 18.4 % (see the graph above).
**B) Breeding turkeys**

![Graph showing prevalence of Salmonella Enteritidis - S. Typhimurium among turkey flocks in various countries.](image)

(Note: States with zero prevalence are arranged according to the number of flocks tested.)

A total of 4 flocks of breeding turkeys were tested in the Czech Republic within the study with no salmonella detected in environmental samples.

1.2. The structure and organisation of the relevant competent authorities.

The State Veterinary Administration of the Czech Republic (hereinafter referred to as the "SVA CR") is the central authority responsible for supervising and coordinating all activities in the field of veterinary care. The SVA CR shall, in accordance with § 47 of Act No 166/1999 concerning veterinary care and amending certain related laws, as amended (Veterinary Act), as amended, enforce its powers in the entire territory of the Czech Republic and shall coordinate activities of RVAs as well. The national monitoring programme is established on the basis of § 48(1) and § 10 of Veterinary Act and with regard to Decree No 356/2004 concerning the monitoring of zoonoses and zoonotic agents and amending Decree...
No 299/2003 concerning measures for prevention and eradication of contagious diseases and diseases communicable from animals to man.

The Ministry of Agriculture of the Czech Republic (hereinafter referred to as the “MA”) shall, in accordance with § 44(1)(a) of Veterinary Act, establish the principal trends and tasks in the field of veterinary care and control their implementation and shall specify, on the basis of animal health situation, compulsory preventive and diagnostic actions in accordance with § 44(1)(d) of Veterinary Act as well. Detailed rules are laid down by the “Methodology of Animal Health Control and Ordered Vaccination” (hereinafter referred to as the “Methodology”), approved by the MA and published in the Official Journal of the MA. The SVA CR shall be, in accordance with the legislation in force (Veterinary Act), empowered to perform supervision on all activities imposed by the Methodology; RVAs shall perform supervision on activities of farmers and private veterinarians provided by the Methodology.

Official checks at other stages of the food chain

Microbiological checks at different stages of food chain shall be performed by the following organisations:

In accordance with Act No 110/1997 concerning foodstuffs and tobacco products and amending and supplementing certain related laws, as amended, the SVA CR has already established rules for regular microbiological monitoring of poultry carcasses at
slaughterhouses and during their further processing in establishments manufacturing meat products. Pooled neck skin samples are taken from carcasses after chilling. In the case of positive results, slaughterhouse operators shall take all measures necessary for improvement of hygiene conditions and check HACCP system at the same time.

In accordance with Act No 146/2002 concerning the Czech Agriculture and Food Inspection Authority and amending certain related laws, as amended, the Czech Agriculture and Food Inspection Authority (hereinafter referred to as the “CAFIA”) shall perform checks on foodstuffs of plant origin at their production and placing on the market, as well as on trade in foodstuffs.

In accordance with Act No 20/1966 concerning public health care, as amended, Public Health Protection Authorities (authorities of the Ministry of Public Health) shall act in the field of catering. In the case of any suspicion on food-borne infection, they shall inform the SVA and CAFIA thereof.

1.3. Approved laboratories where samples collected within the programme are analysed.

Laboratories performing testing for Salmonella spp. within this programme shall be designated in accordance with Article 12 of Regulation (EC) No 2160/2003.

Samples taken within this programme (samples taken by operators and by official veterinarians) shall be examined in laboratories of the State Veterinary Institutes (hereinafter referred to as the “SVIs”); activities of the laboratories shall be co-ordinated by the National Reference Laboratory (hereinafter referred to as the “NRL”) and the laboratories shall be linked with the Information System of the SVA CR as well. The laboratories concerned are the following:

SVI Prague - NRL
SVI Jihlava
SVI Olomouc

The State Veterinary Institutes examine samples taken by operators and by official veterinarians.

1.4. Methods used in the examination of the samples in the framework of the programme

Transport and preparation of samples

Samples shall be sent by express mail, courier, or collection line to laboratories designated for the detection of Salmonella spp. within this programme within 24 hours after collection. At the laboratory, samples shall be kept refrigerated until examination, which shall be carried out within 48 hours following their receipt and 96 hours following sampling.

The pair(s) of boot/sock swabs shall be carefully unpacked to avoid dislodging adherent facial material, pooled and placed in 225 ml of buffered peptone water (BPW) which has been pre-warmed to room temperature. The sample shall be swirled to fully saturate it and culture shall be continued by using the detection method referred to in this programme.
Detection method

Methods used in the examination will be performing in accordance with Annex of Commission Regulation (EC) No 584/2008.

The detection method recommended by the Community Reference Laboratory (CRL) for salmonellae in Bilthoven, the Netherlands, shall be used. That method is described in the current version of draft Annex D to ISO 6579 (2002) standard: “Detection of Salmonella spp. in animal faeces and in samples of the primary production stage”. In that detection method, a semi-solid medium (modified semi-solid Rappaport-Vassiladis medium, MSRV) is used as the single selective enrichment medium.

Serotyping

At least one isolate from each positive sample shall be serotyped, following the Kaufmann-White scheme.

Storage of strains

At least one isolated strain per flock and per year shall be collected and stored for future phagetyping or anti-microbial susceptibility testing, using the normal methods for culture collection, which must ensure integrity of the strains for a minimum of two years.

1.5. Official controls (including sampling schemes) at flock, flock and/or herd level.

Frequency and status of sampling at flocks

a) Farmers shall ensure taking samples from environment of each flock of fattening or breeding turkeys according to an established schedule.

b) Samples shall be taken by trained persons, i.e. by farmers, veterinarians, or other persons designated by farmers. The training shall be performed and certificates on the training issued by the relevant Regional Veterinary Administration (hereinafter referred to as the "RVA").

b) Official samples shall be taken by inspectors from the relevant RVA.

Sampling by operators

Taking of samples from environment shall be performed in each flock according to the following schedule:

A) Fattening turkeys:

Within three weeks before the birds are moved to a slaughterhouse, so as to results of testing are available prior to the movement to the slaughterhouse.

B) Breeding turkeys:

a) Day-old turkeys: 10 swabs from internal surfaces of at least 10 boxes or baskets used for the transport of day-old turkeys. The swabs shall be taken after the arrival of the turkeys to the holding, prior to their unloading. All swabs must be pooled into one sample. When the turkeys come from two different hatcheries, a separate pooled sample shall be
prepared for each hatchery. When the turkeys are delivered within several days, samples are taken each day according to the above mentioned scheme:

b) at 4 weeks of age;
c) 2 weeks before moving to the laying phase or laying unit;
d) every 5th week during the laying period.

Official sampling

A) Fattening turkeys:

a) at least once a year all flocks on 10% of holdings with more than 500 fattening turkeys;
b) all flocks on holdings when one flock tested positive for Salmonella enteritidis or Salmonella typhimurium in samples taken within the previous sampling on the initiative of a farmer;
c) each time the RVA considers it necessary.

A sampling carried out by the RVA may replace the sampling on the initiative of a farmer.

B) Breeding turkeys:

a) at least once a year all flocks on 10% of holdings with more than 250 adult breeding turkeys between 30 and 45 weeks of age;
b) once a year all flocks on holdings in the case of detection of Salmonella enteritidis or Salmonella typhimurium during the previous 12 months;
c) once a year all holdings with elite, great grand parents and grand parent breeding turkeys;
d) all flocks on holdings in the case of detection of Salmonella enteritidis or Salmonella typhimurium from samples taken at the hatchery by food business operator or within the frame of official controls, to investigate the origin of infection.

A sampling carried out by the RVA may replace the sampling on the initiative of a farmer.

Sampling protocol

A) Fattening turkeys:

- Two pairs of boot/stock swabs shall be taken. For free range flocks of turkeys, samples shall only be collected in the area inside the house. All boot/stock swabs must be pooled into one sample.
- In flocks with less than 100 turkeys, where it is not possible to use boot/stock swabs as access to the houses is not possible, they may be replaced by hand drag swabs, where the boot swabs or socks are worn over gloved hands and rubbed over surfaces contaminated with fresh faeces.
- Before putting on the boot/stock swabs, their surface shall be moistened with maximum recovery diluent (MRD: 0.8% sodium chloride, 0.1% peptone in sterile deionised water), or sterile water or any other diluent approved by the National Reference Laboratory at the SVI in Prague.
- The use of water containing antimicrobials or additional disinfectants shall be prohibited. The recommended way to moisten boot swabs shall be to pour the liquid inside before putting them on. Alternatively, boot swabs or socks may be autoclaved.
with diluents within autoclave bags or jars before use. Diluents may also be applied after boots are put on using a spray or wash bottle.

- It shall be ensured that all sections in a house are represented in the sampling in a proportionate way. Each pair should cover about 50% of the area of the house. On completion of sampling the boot/sock swabs shall be carefully removed so as not to dislodge adherent material. Boot swabs may be inverted to retain material. They shall be placed in a bag or pot and labelled.

- The RVA shall perform training of farmers and/or other persons designated by farmers to guarantee the correct application of the sampling protocol.

- In the case of sampling by the RVA because of suspicion of salmonella presence and in any other case considered appropriate, the RVA shall satisfy itself by conducting further tests as appropriate so that the results of examinations for salmonella presence in flocks of turkeys are not affected by the use of antimicrobials in those flocks.

- Where the presence of Salmonella enteritidis and Salmonella typhimurium is not detected but antimicrobials or inhibitory effect on bacterial growth are detected, the flock shall be considered as an infected flock of turkeys for the purpose of the Community target.

B) Breeding turkeys:

Samples shall be taken in accordance with one of the following methods:

A. Pooled faecal samples:

- Separate samples of fresh faeces each weighing not less than 1 g shall be taken at random from the number of sites indicated in the following table:

<table>
<thead>
<tr>
<th>Number of birds in the flock</th>
<th>Number of faecal samples to be taken from the flock</th>
</tr>
</thead>
<tbody>
<tr>
<td>250 - 349</td>
<td>200</td>
</tr>
<tr>
<td>350 - 449</td>
<td>220</td>
</tr>
<tr>
<td>450 - 799</td>
<td>250</td>
</tr>
<tr>
<td>800 - 999</td>
<td>260</td>
</tr>
<tr>
<td>1,000 and more</td>
<td>300</td>
</tr>
</tbody>
</table>

Faeces may be pooled for analysis up to a minimum of two pools.

or:

B. Five pairs of boot swabs:

Boot swabs used shall be sufficiently absorptive to soak up moisture. Tubegauze "socks" are also acceptable. The surface of the boot swab shall be moistened using appropriate diluent (e.g. 0.8% sodium chloride, 0.1% peptone in sterile deionised water, or sterile water). Walking around shall be done in a manner which will sample representatively all parts of the sector, including littered and slatted areas when slats are safe to walk on. All separate pens within a house shall be included in the sampling. On completion of sampling, boot swabs must be removed carefully so as not to dislodge adherent material.
The boot swabs may be pooled for analysis into a minimum of two pools.

**Official controls (including sampling protocols) at the level of feedingstuffs**

Supervision on foodstuffs in the Czech Republic shall be performed by the following organisations:

- State Veterinary Administration of the Czech Republic (SVA CR);
- Central Institute for Supervising and Testing in Agriculture (CISTA);
- Institute for the State Control of Veterinary Biologicals and Medicaments (ISCVBM).

Official controls on feed safety (where the production and placing on the market of feedingstuffs are concerned) shall be performed by the CISTA, in accordance with Act No 91/1996 on feedingstuffs, as amended.

The SVA CR performs, by means of the relevant RVA, examination of feedingstuffs intended for farm animals for the detection of salmonella, in accordance with Regulation (EC) No 1774/2002. The relevant RVA shall take samples in establishments producing compound feedingstuffs; samples of finished feedingstuffs before dispatch shall be taken, at a volume proportionate to the manufacturer's throughput.

The ISCVBM shall perform official controls on medicated feedingstuffs.

1.6. **Measures taken by the competent authorities with regard to animals or products in which the presence of Salmonella spp. have been detected, in particular to protect public health, and any preventive measures taken, such as vaccination.**

**A) Fattening turkeys**

- Farmer shall record the result into the “Food Chain Information” at the dispatch of turkeys to a slaughterhouse.
- Farmer shall perform a check on efficacy of preventive measures aimed at bio-safety of the holding.
- Farmer shall take samples of feedstuffs from bins; the samples shall be sent for laboratory examination for the detection of Salmonella spp.
- A thorough mechanical cleansing, disinfection, disinsectisation and rat extermination shall be performed following dispatch of turkeys to a slaughterhouse; as well as safe disposal of faeces or litter.
- Farmer shall take swab samples for laboratory check on efficacy of disinfection.
- New birds may be introduced only upon confirmation of efficacy of disinfection.

**B) Breeding turkeys**

a) **Measures taken following the detection of S. enteritidis and/or S. typhimurium in faecal samples taken by a farmer**

In the case of the presence of monitored salmonella serovars (S. enteritidis, S. typhimurium) in faecal samples taken by a farmer, an official sampling shall be performed by an official veterinarian from the RVA in each positive flock, in order to confirm the results. Faecal and dust samples shall be taken in accordance with Regulation (EC) No 584/2008 and
bacteriological analyses thereof shall be performed at the NRI for salmonellae at the SVI in Prague.

The confirmatory sampling shall be performed as follows:

- 5 pairs of boot swabs (1 pair = 1 sample);
- 2 dust samples collected from multiple places throughout the house (2 x 250 ml)

A sub-sample, weighting 25 g and prepared from each faecal and dust sample, shall be used for the analysis; all samples shall be analysed separately.

In the case of a suspicion on the presence of inhibitory substances, the laboratory shall perform a confirmatory test, in order to exclude the use of antibiotics likely to affect the results of the confirmatory analysis.

Pending the completion of the confirmatory examination, the RVA shall impose at least the following measures:

a) bacteriological analysis of feeds and water, if necessary, for the detection Salmonella spp.;

b) in the case of a positive result of the detection of S. enteritidis and/or S. typhimurium, hatching eggs shall be suspended pending the completion of the confirmatory analyses;

c) a thorough mechanical cleansing and disinfection of the house, as well as other premises (e.g., stores of feeds and litter), shall be performed. A thorough mechanical cleansing of halls and technologies, followed by disinfection and safe disposal of faeces or litter shall be performed on completion of each production cycle.

In the case of a negative result of the confirmatory examination, the RVA shall lift the measures and the flock shall be considered negative.

b) Measures taken in the case of positive official samples and positive confirmatory examinations for S. enteritidis and/or S. typhimurium.

The RVA shall perform an epidemiological investigation in the holding, aimed at the detection of the possible source of the infection and shall impose at least that:

a) further bacteriological examination of feeds for the detection Salmonella spp. is performed, if necessary;

b) all birds, including day-old turkeys, in the positive flock must be slaughtered or destroyed so as to reduce as much as possible the risk of spreading salmonella. Slaughtering must be carried out in accordance with Community legislation on food hygiene. By-products derived from such birds and not intended for human consumption must be disposed of in accordance with Regulation (EC) of the European Parliament and of the Council No 1774/2002 laying down health rules concerning animal by-products not intended for human consumption;

c) non-incubated eggs must be destroyed;

d) where eggs for hatching are still present in a hatchery, they must be destroyed or treated in accordance with Regulation (EC) of the European Parliament and of the Council No 1774/2002;

e) after slaughtering or destruction of birds from infected flocks, a thorough cleansing and disinfection, as well as disposal of faeces or litter, must be performed in accordance with the instructions of the relevant RVA;
1) the relevant RVA performs the supervision on the efficacy of the disinfection carried out by the farmer. the checks on the efficacy of the disinfection shall be performed by means of bacteriological testing of swabs, in accordance with the method specified by the NRF.

Use of antimicrobials shall be governed by Regulation (EC) No 1177/2006

- Antimicrobials (e.g. antibiotics) shall act be used as a special method for the control of salmonella infections in poultry.
- Only antimicrobials registered by the Institute for the State Control of Veterinary Biologicals and Medicaments (hereinafter referred to as the "ISCVBM") may be used for the treatment.
- Antimicrobials may be used only after the authorisation by and under the supervision of the relevant RVA and they may be applied only in poultry showing clinical signs of the disease suggesting that an excessive suffering of the birds could occur. Results of bacteriological examination and anti-microbial susceptibility test must be available prior to the treatment.
- In exceptional cases, antimicrobials may be applied prior to the results of bacteriological examination and anti-microbial susceptibility test are available, provided that samples are taken by the official veterinarian prior to the application. If sampling has not been performed prior to the application of antimicrobials, flocks shall be considered infected by salmonella.
- Requirements for the use of antimicrobials shall not apply to substances, microorganisms and preparations authorised as feed additives pursuant to Article 3 of Regulation (EC) No 1831/2003 of 22 September 2003 on additives for use in animal nutrition (e.g. probiotics, acidifiers).

Vaccination

Vaccines shall be selected by the private veterinarian in charge, provided that the following conditions are complied with:

- vaccination of breeding and fattening turkeys against salmonella shall be voluntary;
- vaccines used must have valid registration by the ISCVBM Brno and must comply with the requirements of Commission Regulation (EC) No 1177/2006. Dosage,
- application method and use in various age categories are established by the vaccine manufacturer;
- when live attenuated vaccines are used, this fact must be recorded in the application form for the laboratory examination of faecal samples.

1.7. National legislation relevant to the implementation of the programmes, including any national provisions concerning the activities set out in the programme.

- Act No 166/1999 concerning veterinary care and amending certain related laws (Veterinary Act), as amended;
- Act No 154/2000 concerning pedigree breeding, breeding and registration of farm animals and amending certain related laws (Breeding Act), as amended;
- Act No 146/2002 concerning the Czech Agriculture and Food Inspection Authority and amending certain related laws, as amended;
- Act No 29/1966 concerning public health care, as amended;
1.8. Any financial assistance provided to food and feed businesses in the context of the programme.

Farmers are compensated for costs and losses connected with the detection of a salmonellosis of poultry which have arisen as a result of enforcement of emergency veterinary measures pursuant to § 67, § 68, § 69 and § 70 of Veterinary Act.

2. Concerning food and feed businesses covered by the programme

2.3. Relevant guidelines for good animal husbandry practices or other guidelines (mandatory or voluntary) on biosecurity measures defining at least:

Hygiene management at farms:

Farmers shall draw up and comply with sanitation rules for their holdings, keep records on all disinfections and preventive actions performed. The sanitation rules must include checks on efficacy of disinfection, as well as on other preventive measures.

Measures to prevent incoming infections carried by animals, feed, drinking water, people working at farms

Operation rules covering all farming procedures from day-old turkeys to the dispatch of birds to a slaughterhouse must be drawn up for all turkey holdings. Records pursuant to Breeding Act must be kept in all holdings.

In order to implement the principles of good farming practice properly, it is necessary to apply “all in/all out” system. Mechanical cleansing of halls and technologies, followed by subsequent efficient disinfection, disinfection and rat extermination, shall be performed on completion of each production cycle.

The relevant RVA shall perform the supervision on efficacy of disinfection carried out by farmers.

Hygiene in transporting animals to and from farms.

In accordance with § 7 of Veterinary Act, for transport of animals only such means of transport and facilities may be used which:

- meet the requirements for animal transport of the species involved as to the construction, arrangement and equipment, do not affect animal health, do not cause
any pain or suffering to animals, prevent the animals from escape or falling out and protect them from unfavourable weather effects;

- are protected so that water, feed, litter, faeces or other waste cannot leak or fall out of them;
- are cleaned and disinfected both before and after the transport.

2.4. Routine veterinary supervision of farms.

In accordance with Act No 166/1999, as amended, farmers are responsible for animal health. Routine veterinary supervision shall be performed by a private veterinarian. The official veterinary supervision of farms and private veterinarians is carried out by official veterinarians of relevant Regional Veterinary Administration.

2.5. Registration of farms.

Each holding keeping flocks of turkeys shall be assigned, by the entrusted person, by a registration number of the holding, and all farmer’s records shall be kept in accordance with Breeding Act and Decree No 136/2004, as amended.

2.6. Record-keeping at farms.

Record keeping in holdings shall be performed in accordance with Regulation (EC) No 852/2004. Such records must include at least the following information:

- the date of receipt of the poultry;
- the origin of the poultry;
- the number of the poultry;
- performance data;
- death rate;
- feed suppliers;
- types and duration of the use of feed additives, withdrawal periods;
- monitoring of feed and water intake;
- performed examinations and diagnoses established by the veterinarian in charge, together with results of laboratory testing, if necessary;
- types of medicaments used (in particular antimicrobials), start and end of application thereof;
- the date of vaccination and the type of vaccine used;
- results of all previous health checks of poultry from the flock concerned;
- the number of turkeys intended for slaughtering;
- estimated date of slaughtering;
- the date of slaughtering and results thereof (back report from the slaughterhouse on veterinary examination);
- results of checks on disinfection efficacy;
- results of routine sampling of poultry feeds and water for the purpose of checks on compliance with withdrawal periods;
- results of checks for the detection of salmonellae performed in accordance with the requirements of Regulation (EC) 2160/2003 of the European Parliament and of the Council, i.e. the National Programme.
2.7. Documents to accompany animals when dispatched

Within a region, a farmer shall hand over to a consignee (in the case of another holding) written information on results of laboratory testing of the flock for monitored *salmonella* serotypes, i.e. the date of the last sampling and its results, as well as the results of all testing of the flock concerned (positive/negative).

Veterinary certificate for the movement of animals intended for further keeping outside the territory of a region, or food chain information for the movement of animals for slaughtering (or health attestation) must contain, in addition to other data, the results of all laboratory testing of the flock for monitored salmonella serotypes performed during the life cycle of the flock (negative/positive), as well as the date of the last sampling and its results.

In the case of intra-Community trade, a consignment of animals must be accompanied by a veterinary certificate pursuant to Commission Regulation (EC) No 599/2004 of 30 March 2004 concerning the adoption of a harmonised model certificate and inspection report linked to intra-Community trade in animals and products of animal origin.

2.8. Other relevant measures to ensure the traceability of animals.

Each flock must have an unique identification. The identification shall consist of the registration number of the holding, the identification of the flock, and the identification of the hall; e.g. in the following format: “CZ12345678-02/2006 hala Pod rybníkem”.

More flocks may be placed in the same hall during one year, however, such flocks must bear different numbers; e.g. 02/2006 and 06/2005.

Farmers shall be responsible for the proper identification of flocks.

The identification of a flock must be indicated in application form for laboratory examination, in the relevant documents accompanying the animals at their movement, and in all other records.
2. **Historical data on the epidemiological evolution of zoonotic salmonellosis specified in point 1:**

**Prevalence of Salmonella enteritidis and Salmonella typhimurium in turkey flocks**

Monitoring on prevalence of Salmonella spp. in turkey flocks is not performed currently and so no data concerning animal health situation in the Czech Republic are available. Results of a baseline study in flocks of breeding and fattening turkeys performed pursuant to Commission Decision 2006/662/EC are considered to be a starting (initial) value. The study was performed between 1 October 2006 and 30 September 2007 with the following results:

A) **Fattening turkeys**

![Graph showing prevalence of Salmonella Enteritidis - S. Typhimurium](image)

A total of 194 flocks of fattening turkeys were tested in the Czech Republic, with the prevalence of Salmonella spp. of 42.7%; S. enteritidis (32.4 %) was the most frequently reported serotype in the flocks, followed (in decreasing order) by S. saintpaul (19.7 %), S. agona (18.3 %), S. zanzibar (13.5 %), S. typhimurium (5.6 %), S. Indiana (2.8 %), S. blythe (2.8 %), S. infantis (2.8 %) and S. derby (1.4 %). The prevalence of S. enteritidis and S. typhimurium was within the study reported at the level of 18.4 % (see the graph above).
B) Breeding turkeys

(Note: States with zero prevalence are arranged according to the number of flocks tested).

A total of 4 flocks of breeding turkeys were tested in the Czech Republic within the study with no salmonella detected in environmental samples.

3. **Description of the submitted programme:**

The main objectives of the programme are monitoring and control of zoonotic Salmonella serotype (S. enteritidis, S. typhimurium) in the turkey flocks.

The target of the programme is to:

- reduce the maximum percentage of fattening turkey flocks remaining positive of Salmonella enteritidis and Salmonella typhimurium to 1% or less by 31 December 2012, and to
- reduce the maximum percentage of adult breeding turkey flocks remaining positive of Salmonella enteritidis and Salmonella typhimurium to 1% or less by 31 December 2012.

In the case when less than 100 flocks of adult breeding or fattening turkeys are kept, the target of the programme shall be that no more than one flock of adult breeding or fattening turkeys remained positive by 31 December 2012.

The target of this national programme is established in accordance with the Community target pursuant to Article 4(1) of Regulation (EC) No 2160/2003 aimed at the reduction of the prevalence of Salmonella enteritidis and Salmonella typhimurium in turkeys, as specified by Commission Regulation (EC) No 584/2008.

Sampling in turkey flocks is carried out by an operator or by a private veterinarian. Only named and approved laboratories of the State Veterinary Institutes will carry out the examination and validated methods of bacteriological examination will be used. The testing (samples taken by operators and official veterinarians) will be performed in the NRL in SVI Prague and in SVIs in Jihlava and Olomouc. The using of the appropriate methods will be coordinated and under the control of the National Reference Laboratory for salmonella at the SVI in Prague. The NRL for Salmonella will be team up with CRL.

Official checks at the level of poultry flocks are organised and carried out by the relevant Regional Veterinary Administration.

In case of positive result for S. enteritidis and/or S. typhimurium, measures are taken with regard to:

- check on efficacy of preventive measures aimed at bio-safety of the holding;
- a thorough mechanical cleansing, disinfection, disinsectisation and rat extermination shall be performed following dispatch of broilers to a slaughterhouse; as well as safe disposal of faeces or litter;
- laboratory check on efficacy of disinfection.
4. Measures of the submitted programme

4.1. Summary of measures under the programme

Duration of the programme:

First year: 2010

Control

Testing

Last year: 2012

4.2. Designation of the central authority in charge of supervising and coordinating the departments responsible for implementing the programme:

The State Veterinary Administration of the Czech Republic (hereinafter referred to as the "SVA CR") is the central authority responsible for supervising and coordinating all activities in the field of veterinary care. The SVA CR shall, in accordance with § 47 of Act No. 166/1999 concerning veterinary care and amending certain related laws, as amended (Veterinary Act), as amended, enforce its powers in the entire territory of the Czech Republic and shall coordinate activities of RVAs as well. The national monitoring programme is established on the basis of § 48(1) and § 10 of Veterinary Act and with regard to Decree No. 356/2004 concerning the monitoring of zoonoses and zoonotic agents and amending Decree No. 299/2003 concerning measures for prevention and eradication of contagious diseases and diseases communicable from animals to man.

The Ministry of Agriculture of the Czech Republic (hereinafter referred to as the "MA") shall, in accordance with § 44(1)(a) of Veterinary Act, establish the principal trends and tasks in the field of veterinary care and control their implementation and shall specify, on the basis of animal health situation, compulsory preventive and diagnostic actions in accordance with § 44(1)(d) of Veterinary Act as well. Detailed rules are laid down by the "Methodology of Animal Health Control and Ordered Vaccination" (hereinafter referred to as the "Methodology"), approved by the MA and published in the Official Journal of the MA. The SVA CR shall, in accordance with the legislation in force (Veterinary Act), empowered to perform supervision on all activities imposed by the Methodology; RVAs shall perform supervision on activities of farmers and private veterinarians provided by the Methodology.

4.3. Description and delimitation of the geographical and administrative areas in which the programme is to be implemented:

The program shall apply in the whole territory of the Czech Republic. The territory is divided into 14 regions.
Regions in the Czech Republic

4.4.1. Measures and applicable legislation as regards the registration of holdings:
Each holding keeping flocks of turkeys shall be assigned, by the entrusted person, by a registration number of the holding, and all farmer’s records shall be kept in accordance with Breeding Act and Decree No 136/2004, as amended.

4.4.2. Measures and applicable legislation as regards the identification of animals:
The programme will be performed in the birds without individual identification.

4.4.3. Measures and applicable legislation as regards the notification of the disease:
Designated laboratory shall send results of examination of samples taken and sent within implementation of this programme to the relevant RVA; the copy thereof shall be sent to a farmer or a private veterinarian. The farmer must provide on request reports on examinations to the RVA.

In accordance with § 11 of Veterinary Act
(1) The keeper, persons employed by the keeper in keeping, transporting, gathering and selling animals and other persons coming into contact with animals and animal products who, with regards to their profession, qualification and experience, are able to recognize signs suggesting a suspicion of presence of a dangerous contagious disease or a disease communicable from animals to man shall be obliged to notify the Regional Veterinary Administration without delay of such suspicion or to ensure that it is notified.

(2) The obligation of the persons to notify shall become void as soon as the official veterinarian or private veterinarian are notified of the suspected presence of a dangerous contagious disease or a disease communicable from animals to man.

4.4.4. Measures and applicable legislation as regards the measures in case of a positive result:

Measures taken following detection of S. enteritidis and/or S. typhimurium in faecal samples
A) Fattening turkeys
- Farmer shall record the result into the “Food Chain Information” at the dispatch of turkeys to a slaughterhouse.
- Farmer shall perform a check on efficacy of preventive measures aimed at bio-safety of the holding.
- Farmer shall take samples of feedingstuffs from bins; the samples shall be sent for laboratory examination for the detection of Salmonella spp.
- A thorough mechanical cleansing, disinfection, disinsectisation and rat extermination shall be performed following dispatch of turkeys to a slaughterhouse; as well as safe disposal of faeces or litter.
• Farmer shall take swab samples for laboratory check on efficacy of disinfection.
• New birds may be introduced only upon confirmation of efficacy of disinfection.

B) Breeding turkeys

a) Measures taken following the detection of S. enteritidis and/or S. typhimurium in faecal samples taken by a farmer

In the case of the presence of monitored salmonella serovars (S. enteritidis, S. typhimurium) in faecal samples taken by a farmer, an official sampling shall be performed by an official veterinarian from the RVA in each positive flock, in order to confirm the results. Faecal and dust samples shall be taken in accordance with Regulation (EC) No 584/2008 and bacteriological analyses thereof shall be performed at the NRL for salmonellae at the SVL in Prague.

The confirmatory sampling shall be performed as follows:

• 5 pairs of boot swabs (1 pair = 1 sample);
• 2 dust samples collected from multiple places throughout the house (2 x 250 ml)

A sub-sample, weighting 25 g and prepared from each faecal and dust sample, shall be used for the analysis: all samples shall be analysed separately.

In the case of a suspicion on the presence of inhibitory substances, the laboratory shall perform a confirmatory test, in order to exclude the use of antibiotics likely to affect the results of the confirmatory analysis.

Pending the completion of the confirmatory examination, the RVA shall impose at least the following measures:

d) bacteriological analysis of feeds and water, if necessary, for the detection Salmonella spp.;
e) in the case of a positive result of the detection of S. enteritidis and/or S. typhimurium, hatching eggs shall be suspended pending the completion of the confirmatory analyses;

f) a thorough mechanical cleansing and disinfection of the house, as well as other premises (e.g. stores of feeds and litter), shall be performed. A thorough mechanical cleansing of halls and technologies, followed by disinfection and safe disposal of faeces or litter shall be performed on completion of each production cycle.

In the case of a negative result of the confirmatory examination, the RVA shall lift the measures and the flock shall be considered negative.

b) Measures taken in the case of positive official samples and positive confirmatory examinations for S. enteritidis and/or S. typhimurium.

The RVA shall perform an epidemiological investigation in the holding, aimed at the detection of the possible source of the infection and shall impose at least that:

g) further bacteriological examination of feeds for the detection Salmonella spp. is performed, if necessary;
h) all birds, including day-old turkeys, in the positive flock must be slaughtered or destroyed so as to reduce as much as possible the risk of spreading salmonella. Slaughtering must be carried out in accordance with Community legislation on food
hygiene. By-products derived from such birds and not intended for human consumption must be disposed of in accordance with Regulation (EC) of the European Parliament and of the Council No

i) 1774/2002 laying down health rules concerning animal by-products not intended for human consumption;

j) non-incubated eggs must be destroyed;

k) where eggs for hatching are still present in a hatchery, they must be destroyed or treated in accordance with Regulation (EC) of the European Parliament and of the Council No 1774/2002;

l) after slaughtering or destruction of birds from infected flocks, a thorough cleansing and disinfection, as well as disposal of faeces or litter, must be performed in accordance with the instructions of the relevant RVA;

m) the relevant RVA performs the supervision on the efficacy of the disinfection carried out by the farmer; the checks on the efficacy of the disinfection shall be performed by means of bacteriological testing of swabs, in accordance with the method specified by the NRL.

4.4.5. Measures and applicable legislation as regards the different qualifications of animals and birds:

The flocks are defined in accordance with the Council and Parliament Decision No 2160/2003/EC as an epidemiological unit:

"Flock" means all poultry of the same health status kept on the same premises or in the same enclosure and constituting a single epidemiological unit; in the case of housed poultry, this includes all poultry sharing the same airspace.

Each flock must have a unique identification. The identification shall consist of the registration number of the holding, the identification of the flock, and the identification of the hall; e.g. in the following format: "CZ12345678-02/2006 hala Pod rybníkem".

More flocks may be placed in the same hall during one year, however, such flocks must bear different numbers; e.g. 02/2006 and 06/2006.

Farmers are responsible for the proper identification of flocks.

4.4.6. Control procedures and in particular rules on the movement of animals liable to be affected or contaminated by a given disease and the regular inspection of the holdings or areas concerned:

The result about detection of S. enteritidis and/or S. typhimurium in faecal samples shall be recorded into the "Food Chain Information" at the dispatch of turkeys to a slaughterhouse.

4.4.7. Measures and applicable legislation as regards the control (testing, vaccination,…) of the disease:

Use of antimicrobials shall be governed by Regulation (EC) No 1177/2006

* Antimicrobials (e.g. antibiotics) shall not be used as a special method for the control of salmonella infections in poultry.
Only antimicrobials registered by the Institute for the State Control of Veterinary Biologicals and Medicaments (hereinafter referred to as the “ISCVBM”) may be used for the treatment.

Antimicrobials may be used only after the authorisation by and under the supervision of the relevant RVA and they may be applied only in poultry showing clinical signs of the disease suggesting that an excessive suffering of the birds could occur. Results of bacteriological examination and anti-microbial susceptibility test must be available prior to the treatment.

In exceptional cases, antimicrobials may be applied prior to the results of bacteriological examination and anti-microbial susceptibility test are available, provided that samples are taken by the official veterinarian prior to the application. If sampling has not been performed prior to the application of antimicrobials, flocks shall be considered infected by salmonella.

Requirements for the use of antimicrobials shall not apply to substances, microorganisms and preparations authorised as feed additives pursuant to Article 3 of Regulation (EC) No 1831/2003 of 22 September 2003 on additives for use in animal nutrition (e.g. probiotics, acidifiers).

Vaccination

Vaccines shall be selected by the private veterinarian in charge, provided that the following conditions are complied with:

- vaccination of breeding and fattening turkeys against salmonella shall be voluntary;
- vaccines used must have valid registration by the ISCVBM Brno and must comply with the requirements of Commission Regulation (EC) No 1177/2006. Dosage, application method and use in various age categories are established by the vaccine manufacturer;
- when live attenuated vaccines are used, this fact must be recorded in the application form for the laboratory examination of faecal samples.

4.4.8. Measures and applicable legislation as regards the compensation for owners of slaughtered and killed animals:

Farmers shall be compensated for costs and losses which have arisen as a result of the enforcement of emergency veterinary measures pursuant to § 67, § 68, § 69 and § 70 of Veterinary Act.

4.4.9 Information and assessment on bio-security measures management and infrastructure in place in the flocks/holdings involved

Measures taken following detection of *S. enteritidis* and/or *S. typhimurium* in faecal samples

- Farmer shall perform a check on efficacy of preventive measures aimed at bio-safety of the holding.
5. **General description of the costs and benefits:**

\[ 1€ = 27.469 \text{ CzK (on the date 31 March 2009)} \]

It is estimated that the programme will cost **3 056 850,- Czk (111 283,63 €)** in the year 2010.

**SAMPLING BY OPERATORS – 909 500,- CzK (33 110,05,- €)**

The price involves bacteriological testing for Salmonella spp., serotyping, lagotyping, detection of the inhibition substance. We estimate 1 500 bacteriological tests for detection of Salmonella spp., in faeces, 500 bacteriological tests for detection of Salmonella sp. in feedstuffs, 550 tests for serotyping, 105 tests for phagotyping, 400 tests for efficacy of disinfection.

**OFFICIAL SAMPLING – 327 350,- CzK (11 917,07 €)**

The price involves laboratory investigation for detection of Salmonella spp., serotyping, lagotyping, detection of the inhibition substance, tests for efficacy of disinfection, tests for detection of the inhibition substances. We estimate 300 bacteriological tests for detection of Salmonella sp. in faeces, 120 tests for serotyping, 50 tests for phagotyping, 50 tests for detection of the inhibition substances and 50 tests for efficacy of disinfection.

It is estimated that costs for destruction of positive breeding turkey flocks will be **1 820 000,- Czk (66 256,51-€)**

The competent authority wishes 50% of co-financing of the total cost to be considered by the Commission.

(a) the destruction of flocks of breeding turkeys or the difference between the estimated value of breeding turkeys and the income from the sale of the heat-treated meat obtained from such poultry, destruction costs, transport costs, cleaning and disinfection costs and salaries costs;

(b) the costs of diagnostics tests performed in the frame of the programme

6. **Data on the epidemiological evolution during the last five years**

6.1. **Evolution of zoonotic salmonellosis**

**Prevalence of Salmonella enteritidis and Salmonella typhimurium in turkey flocks**

Monitoring on prevalence of Salmonella spp. in turkey flocks is not performed currently and so no data concerning animal health situation in the Czech Republic are available. Results of a baseline study in flocks of breeding and fattening turkeys performed pursuant to Commission Decision 2006/662/EC are considered to be a starting (initial) value. The study was performed between 1 October 2006 and 30 September 2007 with the following results:
A total of 194 flocks of fattening turkeys were tested in the Czech Republic, with the prevalence of Salmonella spp. of 42.7%. S. enteritidis (32.4%) was the most frequently reported serotype in the flocks, followed (in decreasing order) by S. saintpaul (19.7%), S. agona (18.3%), S. zanzibar (15.5%), S. typhimurium (5.6%), S. indiana (2.8%), S. blockey (2.8%), S. infantis (2.8%) and S. derby (1.4%). The prevalence of S. enteritidis and S. typhimurium was within the study reported at the level of 18.4% (see the graph above).
B) Breeding flocks

(Note: States with zero prevalence are arranged according to the number of flocks tested)

A total of 4 flocks of breeding turkeys were tested in the Czech Republic within the study with no salmonella detected in environmental samples.

7. Targets

7.1. Detection method

The detection method recommended by the Community Reference Laboratory (CRL) for salmonellae in Bilthoven, the Netherlands, shall be used. That method is described in the current version of draft Annex D of ISO 6579 (2002): "Detection of Salmonella spp. in animal faeces and in samples of the primary production stage". In that detection method, a semi-solid medium (modified semi-solid Rappaport-Vassilakis medium, MSRV) is used as the single selective enrichment medium. This detection method is in compliance with Commission Regulation (EC) No 584/2008.

Serotyping

At least one isolate from each positive sample shall be serotyped, following the Kaufmann-White scheme.

Pagotyping

Pagotyping shall be carried out in accordance with the HPA Colindale, London in one isolate from each positive sample for Salmonella enteritidis.

Testing for inhibition substances

Testing for inhibition substances shall be carried out when it is appropriate, mainly in case of suspicion for using antibiotics as a special method for the control of salmonella infections in poultry.

**I. Testing**

1. **Cost of the analysis**

- Test: Number of bacteriological tests (cultivation) planned to be carried out in the framework of farmer sampling
  - 1000 units: 530 CZK = 530,000 CZK (22,343.34 €)

- Test: Number of serotyping of relevant isolates tests planned to be carried out in the framework of farmer sampling
  - 200 units: 730 CZK = 146,000 CZK (6,315.08 €)

- Number of PGS typing tests planned to be carried out in the framework of farmer sampling
  - 100 units: 400 CZK = 40,000 CZK (1,456.19 €)

- Number of bacteriological tests (cultivation) planned to be carried out in the framework of farmer sampling in feedstuffs
  - 100 units: 550 CZK = 55,000 CZK (2,022.29 €)

- Test: Number of serotyping of relevant isolates tests planned to be carried out in the framework of farmer sampling in feedstuffs
  - 50 units: 730 CZK = 36,500 CZK (1,328.78 €)

- Number of PGS typing tests planned to be carried out in the framework of farmer sampling in feedstuffs
  - 5 units: 400 CZK = 2,000 CZK (72.81 €)

**Total**

- 909,500 CZK (33,110.05 €)

**TOTAL: 2,147,350 CZK (78,173.58 €)**

Sampling by operator is paying from SVA and due to reason we request financial contribution for bacteriological testing.
CZ Annex of National Salmonella Control Programme (SCP) in turkey flocks applied from 1 January 2010

1) Frequency and status of sampling

2) Reporting of results

We confirm that reporting in the programme is in compliance with Commission Regulation (EC) No 584/2008. Annual report will include total number of fattening and adult breeding flocks tested in the framework of SCP and total number of fattening and adult breeding flocks infected with Salmonella enteritidis and Salmonella typhimurium. All other serotypes of Salmonella spp. will be reported too. The fattening turkey flock will be considered positive when the presence of Salmonella enteritidis or Salmonella typhimurium was detected in the framework of SCP. The breeding turkey flock will be considered positive in the case of positive result of official sampling or in the case of positive result of official sample taken in order to exclude the false positive result of operator sampling. The confirmation method is based on technical specifications referred to in Article 5 of Commission Decision 2004/665/EC (5 pooled faeces samples and 2 pooled dust samples analysed separately). For statistical purpose an infected flock is counted only once regardless of how often Salmonella has been detected in this flock during reported year.

3) Structure of production

<table>
<thead>
<tr>
<th>Number of holdings with turkey flocks in the Czech Republic in the year 2008</th>
</tr>
</thead>
<tbody>
<tr>
<td>Holdings with rearing breeding turkey flocks</td>
</tr>
<tr>
<td>Holdings with adult breeding turkey flocks</td>
</tr>
<tr>

</tr>
<tr>
<td>up to 4,999 animals</td>
</tr>
<tr>
<td>5,000 animals and more</td>
</tr>
<tr>
<td>In total</td>
</tr>
</tbody>
</table>

4) Production of feed

As regards production and placing on the market of feedingstuffs official controls on feed safety are performed by the CISTA (Central Institute for Supervising and Testing in Agriculture), in accordance with Act No 91/1996 on feedingstuffs, as amended.

The feedingstuffs are produced mainly by specialised firms and bought by farmers.
Request for the Community’s financial contribution for salmonella control programme in flocks of broilers

Member State: Czech Republic

Disease: Salmonella spp.

Animal population covered by the program: Broilers (Gallus gallus)

Year of implementation: 2010

Date sent to the Commission: 24. 4. 2009
Part A

General requirements for the national salmonella control programmes

(a) State the aim of the programme

The aim of the programme is to reduce the percentage of flocks of broilers remaining positive of Salmonella enteritidis and Salmonella typhimurium to 1% or less by 31 December 2011.

The aim of the national programme is established in accordance with the Community target pursuant to Article 4(1) of Regulation (EC) No 2160/2003 aimed at reduction of the prevalence of Salmonella enteritidis and Salmonella typhimurium in broilers as specified by Commission Regulation (EC) No 646/2007. The epidemiology unit for the control programme is flock of poultry as defined in Article 2 (3b) of Regulation (EC) 2160/2003.

Broilers — birds leaving for slaughter

(c) Specific requirements laid down in Parts E of Annex II to Regulation (EC) No 2160/2003

The national programme complies with the specific requirements laid down in Part E of Annex II to Regulation (EC) No 2160/2003:

From 12 December 2010 fresh poultry meat from broilers, may not be placed on the market for human consumption unless it meets the following criterion:

"Salmonella: absence in 25 grams"

(d)

1. General

Prevalence of Salmonella enteritidis and Salmonella typhimurium in flocks of broilers

Monitoring on prevalence of Salmonella spp. in flocks of broilers is not performed and so no data concerning animal health situation are available. Results of a baseline study in flocks of broilers performed pursuant to Commission Decision 2005/636/EC of 1 September 2005 concerning a financial contribution by the Community towards a baseline survey on the prevalence of Salmonella spp. in broiler flocks of Gallus gallus to be carried out in the Member States are considered to be a starting (initial) value. The study was performed between 1 October 2005 and 30 September 2006 with the following results:

In total 334 flocks were tested in accordance with baseline study, 22.5% flocks were positive for Salmonella spp; 14.4% flocks were positive for S. enteritidis and 0.6% flocks were positive for S. typhimurium.

In accordance with baseline study, observed flock prevalence for S. enteritidis and/or for S. typhimurium is estimated 9.6% in the Czech Republic.
1.2. National control programme for Salmonella infections in flocks of broilers

National control programme for Salmonella infections in flocks of broilers was applied from 1 January 2009.

1.2.1. Prevalence per Salmonella serotype in the framework of operator sampling

In total 1,297 flocks of broilers were tested for Salmonella spp. within period 1 January – 31 March 2009. 48 flocks were positive for S. enteritidis, no flocks was positive for S. typhimurium. In total 56 flocks were positive for other Salmonella serotypes.

Prevalence per Salmonella serotype in the framework of operator sampling

Prevalence: 37.50% 12.50% 40.63% 6.25%

1.3. The structure and organisation of the relevant competent authorities.

The State Veterinary Administration of the Czech Republic (hereinafter referred to as the “SVA CR”) is the central authority responsible for supervising and coordinating all activities in the field of veterinary care. The SVA CR shall, in accordance with § 47 of Act No 166/1999 concerning veterinary care and amending certain related laws, as amended (Veterinary Act), as amended, enforce its powers in the entire territory of the Czech Republic and shall coordinate activities of RVAs as well. The national monitoring programme is established on the basis of § 48(1) and § 10 of Veterinary Act and with regard to Decree No 356/2004 concerning the monitoring of zoonoses and zoonotic agents and amending Decree No 299/2003 concerning measures for prevention and eradication of contagious diseases and diseases communicable from animals to man.

The Ministry of Agriculture of the Czech Republic (hereinafter referred to as the “MA”) shall, in accordance with § 44(1)(a) of Veterinary Act, establish the principal trends and tasks in the field of veterinary care and control their implementation and shall specify, on the basis of animal health situation, compulsory preventive and diagnostic actions in accordance with § 44(1)(d) of Veterinary Act as well. Detailed rules are laid down by the “Methodology of Animal Health Control and Ordered Vaccination” (hereinafter referred to as the “Methodology”), approved by the MA and published in the Official Journal of the MA. The SVA CR shall, in accordance with the legislation in force (Veterinary Act), empowered to perform supervision on all activities imposed by the Methodology; RVAs shall perform supervision on activities of farmers and private veterinarians provided by the Methodology.
Official checks at other stages of the food chain

Microbiological checks at different stages of food chain shall be performed by the following organisations:

In accordance with Act No 110/1997 concerning foodstuffs and tobacco products and amending and supplementing certain related laws, as amended, the SVA CR has already established rules for regular microbiological monitoring of poultry carcasses at slaughterhouses and during their further processing in establishments manufacturing meat products. Pooled neck skin samples are taken from carcasses after chilling. In the case of positive results, slaughterhouse operators shall take all measures necessary for improvement of hygiene conditions and check HACCP system at the same time.

In accordance with Act No 146/2002 concerning the Czech Agriculture and Food Inspection Authority and amending certain related laws, as amended, the Czech Agriculture and Food Inspection Authority (hereinafter referred to as the “CAFIA”) shall perform checks on foodstuffs of plant origin at their production and placing on the market, as well as on trade in foodstuffs.

In accordance with Act No 20/1966 concerning public health care, as amended, Public Health Protection Authorities (authorities of the Ministry of Public Health) shall act in the field of catering. In the case of any suspicion on food-borne infection, they shall inform the SVA and CAFIA thereof.
1.3. Approved laboratories where samples collected within the programme are analysed.

Laboratories performing testing for Salmonella spp. within this programme shall be designated in accordance with Article 12 of Regulation (EC) No 2160/2003.

Samples taken within this programme (samples taken by operators and by official veterinarians) shall be examined in laboratories of the State Veterinary Institutes (hereinafter referred to as the “SVIs”); activities of the laboratories shall be co-ordinated by the National Reference Laboratory (hereinafter referred to as the “NRL”) and the laboratories shall be linked with the Information System of the SVA CR as well. The laboratories concerned are the following:

- SVI Prague – NRL
- SVI Jihlava
- SVI Olovo

The State Veterinary Institutes examine samples taken by operators and by official veterinarians.

1.4. Methods used in the examination of the samples in the framework of the programme

Methods used in the examination will be performing in accordance with Annex of Commission Regulation (EC) No 646/2007.

Examination of samples

Transport and preparation of samples

Samples shall be sent by express mail, courier, or collection line to laboratories designated for the detection of Salmonella spp. within this programme within 25 hours after collection. At the laboratory samples shall be kept refrigerated until examination, which shall be carried out within 48 hours following receipt.

The pair of boot/sock swabs shall be carefully unpacked to avoid dislodging adherent faecal material, pooled and placed in 225 ml of buffered peptone water (BPW) which has been prewarmed to room temperature. The sample shall be swirled to fully saturate it and culture shall be continued by using the detection method referred to in this programme.

Detection method

The detection method recommended by the Community Reference Laboratory (CRL) for salmonellae in Buitheven, the Netherlands, shall be used. That method is described in the current version of draft Annex D of ISO 6579 (2002): “Detection of Salmonella spp. in animal faeces and in samples of the primary production stage”. In that detection method, a semi-solid medium (modified semi-solid Rappaport-Vassiliadis medium, MSRV) is used as the single selective enrichment medium. This detection method is in compliance with Commission Regulation (EC) No 646/2007.

Serotyping

At least one isolate from each positive sample shall be serotyped, following the Kaufmann-White scheme.
Storage of strains
At least one isolated strain per flock and per year shall be collected and stored for future phagotyping or anti-microbial susceptibility testing, using the normal methods for culture collection, which must ensure integrity of the strains for a minimum of two years.

1.5. Official controls (including sampling schemes) at feed, flock and/or herd level.

Frequency and status of sampling at flocks

a) Farmer keeping chickens to be slaughtered at a slaughterhouse shall ensure taking samples from environment of each flock according to established schedule.

b) Samples shall be taken by trained persons, i.e. by operators, veterinarians, or other persons designated by farmers. The training shall be performed by the relevant Regional Veterinary Administration (hereinafter referred to as the "RVA").

c) Official samples shall be taken by inspectors from the relevant RVA.

Sampling by operators
Taking of samples from environment shall be performed in each flock, within three weeks before the chickens are moved to a slaughterhouse, so as to results of testing are available prior to the movement to the slaughterhouse.

Official sampling
Official sampling shall be performed each year in at least one flock of broilers on 10 % of holdings with more than 5 000 birds. Furthermore, official sampling shall be performed each time the RVA considers it necessary.

Sampling carried out by a farmer may be replaced by the sampling on the initiative of the RVA.

Sampling protocol
- Two pairs of boot/socks swabs shall be taken. For free range flocks of broilers, samples shall only be collected in the area inside the house. All boot/sock swabs must be pooled into one sample.
- In flocks with less than 100 broilers, where it is not possible to use boot/sock swabs as access to the houses is not possible, they may be replaced by hand drag swabs, where the boot swabs or socks are worn over gloved hands and rubbed over surfaces contaminated with fresh faeces.
- Before putting on the boot/sock swabs, their surface shall be moistened with maximum recovery diluents (MRD: 0.8 % sodium chloride, 0.1 % peptone in sterile deionised water), or sterile water or any other diluent approved by the National Reference Laboratory at the SVI in Prague.
The use of water containing antimicrobials or additional disinfectants is prohibited. The recommended way to moisten boot swabs is to pour the liquid inside before putting them on. Alternatively, boot swabs or socks may be autoclaved with diluents within autoclave bags or jars before use. Diluents may also be applied after boots are put on using a spray or wash bottle.

All sections in a house are represented in the sampling in a proportionate way. Each pair should cover about 50% of the area of the house. On completion of sampling the boot/sock swabs shall be carefully removed so as not to dislodge adherent material. Boot swabs may be inverted to retain material. They shall be placed in a bag or pot and labelled.

The RVA will perform training of operators and/or other persons designated by farmers to guarantee the correct application of the sampling protocol.

In the case of sampling by the RVA because of suspicion on salmonella presence and in any other case considered appropriate, the RVA shall satisfy itself by conducting further tests as appropriate so that the results of examinations for salmonella presence in flocks of broilers are not affected by the use of antimicrobials in those flocks.

Where the presence of Salmonella enteritidis and Salmonella typhimurium is not detected but antimicrobials or bacterial growth inhibitory effect are detected, the flock shall be considered as an infected flock of broilers for the purpose of the Community target.

Official controls (including sampling protocols) at the level of feedingstuffs

Supervision on foodstuffs in the Czech Republic is performed by the following organisations:
- State Veterinary Administration of the Czech Republic (SVA CR);
- Central Institute for Supervising and Testing in Agriculture (Cistra);
- Institute for the State Control of Veterinary Biologicals and Medicaments (ISCVBM).

Official controls on feed safety (where production and placing on the market of feedingstuffs are concerned) shall be performed by the CISTA, in accordance with Act No 91/1996 on feedingstuffs, as amended.

The SVA CR performs, by means of the relevant RVA, examination of feedingstuffs intended for farm animals for the detection of Salmonella, in accordance with Regulation (EC) No 1774/2002. The relevant RVA shall take samples in establishments producing compound feedingstuffs; samples of finished feedingstuffs before dispatch shall be taken, at a volume proportionate to the manufacturer's throughput.

The ISCVBM perform official controls on use of antimicrobials, vaccines and medicated feedingstuffs.

Official controls (including sampling protocols) at other stages of food chain

The SVA CR performs monitoring on presence of Salmonella at poultry slaughterhouses; 15 neck skin samples are taken there monthly by a person specifically trained for the purpose.
1.6. Measures taken by the competent authorities with regard to animals or products in which the presence of Salmonella spp. have been detected, in particular to protect public health, and any preventive measures taken, such as vaccination.

- Farmer shall record the result into the "Food Chain Information" at the dispatch of broilers to a slaughterhouse.
- Farmer shall perform a check on efficacy of preventive measures aimed at bio-safety of the holding.
- Farmer shall take samples of feedingstuffs from bins; the samples shall be sent for laboratory examination for the detection of Salmonella spp.
- A thorough mechanical cleansing, disinfection, disinsectisation and rat extermination shall be performed following dispatch of broilers to a slaughterhouse: as well as swabbing to detect the presence of faeces or litter.
- Farmer shall take swab samples for laboratory check on efficacy of disinfection.
- New birds may be introduced only upon laboratory confirmation of efficacy of disinfection.

Use of antimicrobials shall be governed by Regulation (EC) No 1177/2006

- Antimicrobials (e.g. antibiotics) shall not be used as a special method for the control of salmonella infections in poultry.
- Antimicrobials may be used only after authorisation by and under supervision of the relevant RVA and they may be applied only in poultry showing clinical signs of the disease suggesting that an excessive suffering of birds could occur. Results of bacteriological examination and anti-microbial susceptibility test must be available prior to the treatment.
- Only antimicrobials registered by the Institute for the State Control of Veterinary Biologicals and Medicaments (hereinafter referred to as the "ISCVBM") may be used for the treatment.
- In exceptional cases, antimicrobials may be applied prior to the results of bacteriological examination and anti-microbial susceptibility test are available, provided that samples are taken by the official veterinarian prior to the application. If sampling has not been performed prior to the application of antimicrobials, stocks shall be considered infected by Salmonella.
- Requirements for the use of antimicrobials shall not apply to substances, microorganisms and preparations authorised as feed additives pursuant to Article 3 of Regulation (EC) No 1831/2003 of 22 September 2003 on additives for use in animal nutrition (e.g. probiotics, acidifiers).

Vaccination

Vaccines shall be selected by the private veterinarian in charge, provided that the following conditions are complied with:

- Vaccination of broilers against Salmonella is voluntary.
- Vaccines used must have valid registration by the ISCVBM Brno and must comply with requirements of Commission Regulation (EC) No 1177/2006. Dosage, application method and use in various age categories are established by the vaccine manufacturer.
1.7. National legislation relevant to the implementation of the programmes, including any national provisions concerning the activities set out in the programme.

- Act No 166/1999 concerning veterinary care and amending certain related laws (Veterinary Act), as amended;
- Act No 154/2000 concerning pedigree breeding, breeding and registration of farm animals and amending certain related laws (Breeding Act), as amended;
- Act No 146/2002 concerning the Czech Agriculture and Food Inspection Authority and amending certain related laws, as amended;
- Act No 20/1966 concerning public health care, as amended;
- Decree No 356/2004 concerning the monitoring of zoonoses and zoonotic agents and amending Decree No 299/2003 concerning measures for prevention and eradication of contagious diseases and diseases communicable from animals to man;
- Decree No 296/2003 concerning animal health and its protection, animal movement and transportation and authorisation and professional qualification for performance of certain professional veterinary activities, as amended;
- Decree No 136/2004 specifying in detail identification and registration of animals, registration of holdings and persons specified by Breeding Act.

1.8. Any financial assistance provided to food and feed businesses in the context of the programme.

Farmers are compensated for costs and losses connected with the detection of a salmonellosis of poultry which have arisen as a result of enforcement of emergency veterinary measures pursuant to § 67, § 68, § 69 and § 70 of Veterinary Act.

It is supposed that testing of samples taken by operators will be fully/partly compensated from the state budget.

2. Concerning food and feed businesses covered by the programme

2.3. Relevant guidelines for good animal husbandry practices or other guidelines (mandatory or voluntary) on biosecurity measures defining at least:

Hygiene management at farms:

Farmers shall draw up and comply with sanitation rules for their holdings, keep records on all disinfections and preventive actions performed. The sanitation rules must include checks on efficacy of disinfection, as well as on other preventive measures.

Measures to prevent incoming infections carried by animals, feed, drinking water, people working at farms.
Operation rules covering all farming procedures from day-old chicks to dispatch of broilers to a slaughterhouse must be drawn up for all broiler holdings.

In order to implement principles of good farming practice properly, it is necessary to apply “all in/all out” system. Mechanical cleansing of halls and technologies, followed by subsequent efficient disinfection, disinsectisation and rat extermination, shall be performed on completion of each production cycle.

The relevant RVA shall perform supervision on efficacy of disinfection carried out by farmers.

Hygiene in transporting animals to and from farms.

In accordance with §7 of Veterinary Act, for transport of animals only such means of transport and facilities may be used which:

- meet the requirements for animal transport of the species involved as to the construction, arrangement and equipment, do not affect animal health, do not cause any pain or suffering to animals, prevent the animals from escape or falling out and protect them from unfavourable weather effects;
- are protected so that water, feed, litter, faeces or other waste cannot leak or fall out of them;
- are cleaned and disinfected both before and after the transport.

2.4. Routine veterinary supervision of farms.

In accordance with Act No 166/1999, as amended, farmers are responsible for animal health. Routine veterinary supervision shall be performed by a private veterinarian. The official veterinary supervision of farms and private veterinarians is carried out by official veterinarians of relevant Regional Veterinary Administration.

Suspicion on infectious disease shall be declared and official sampling shall be performed in the case of drop in feed and water intake by more than 20 % and/or poultry deaths higher than 3 % per one week.

2.5. Registration of farms

Each holding keeping more than 1 000 head of broilers shall be assigned, by the entrusted person, by a registration number of the holding, and all farmer's records shall be kept in accordance with Breeding Act and Decree No 136/2004.
2.6. Record-keeping at farms.

Record keeping in holdings shall be performed in accordance with Regulation (EC) No 852/2004. Such records must include at least the following information:

- the date of receipt of the poultry,
- the origin of the poultry,
- the number of the poultry,
- performance data,
- death rate,
- feed suppliers,
- types and duration of use of feed additives, withdrawal periods,
- monitoring of feed and water intake,
- performed examinations and diagnoses established by the veterinarian in charge, together with results of laboratory testing, if necessary,
- types of medicaments used (in particular antimicrobials), start and end of application thereof,
- the date of vaccination and the type of vaccine used;
- results of all previous health checks of poultry from the flock concerned;
- the number of broilers intended for slaughtering,
- estimated date of slaughtering;
- the date of slaughtering and results thereof (back report from the slaughterhouse on veterinary examination);
- results on checks on disinfection efficacy;
- results of routine sampling of poultry feeds for the purpose of checks on compliance with withdrawal periods;
- results of checks for the detection of Salmonella spp. performed in accordance with requirements of Regulation (EC) 2150/2003 of the European Parliament and of the Council, i.e. the National Programme.

2.7. Documents to accompany animals when dispatched

The breeders are obliged to apply for the veterinary certificate comprising the health attestation issued by a private veterinarian, if the animal to be moved outside the territory of the region. The obligation is laid down in Article 6 of Veterinary Act No. 166/1999 as amended.

The animals to be moved to slaughterhouses must be accompanied by the food chain information referred to in to Regulation (EC) No 853/2004.

In the case of intra-Community trade, the consignment of animals have to be accompanied by the veterinary certificate in accordance with Commission Regulation (EC) No. 599/2004 concerning the adoption of a harmonised model certificate and inspection report linked to intra-Community trade in animals and products of animal origin.
2.8. Other relevant measures to ensure the traceability of animals.

Each flock must have a unique identification. The identification shall consist of the registration number of the holding, the identification of the flock, and the identification of the hall; e.g. in the following format: “C7,12345678-02/2006 hala Pod ryboukem”.

More flocks may be placed in the same hall during one year, however, such flocks must bear different numbers, e.g. 02/2006 and 06/2006.

Farmers are responsible for the proper identification of flocks.

The identification of a flock must be indicated in application form for laboratory examination, in food chain information at the dispatch of poultry to a slaughterhouse, and in all other records kept pursuant to point 2.6.
Part B

2. Historical data on the epidemiological evolution of zoonotic salmonellosis specified in point 1:

Prevalence of Salmonella enteritidis and Salmonella typhimurium in flocks of broilers

Monitoring on prevalence of Salmonella spp. in flocks of broilers is not performed and so no data concerning animal health situation are available. Results of a baseline study in flocks of broilers performed pursuant to Commission Decision 2005/636/EC of 1 September 2005 concerning a financial contribution by the Community towards a baseline survey on the prevalence of Salmonella spp. in broiler flocks of Gallus gallus to be carried out in the Member States are considered to be a starting (initial) value. The study was performed between 1 October 2005 and 30 September 2006 with the following results:

In total 334 flocks were tested in accordance with baseline study, 22.5% flocks were positive for Salmonella spp, 14.4% flocks were positive for S. enteritidis and 0.6% flocks were positive for S. typhimurium.

In accordance with baseline study, observed flock prevalence for S. enteritidis and/or for S. typhimurium is estimated 9.6% in the Czech Republic.

3. Description of the submitted programme:

The main objectives of the programme are monitoring and control of zoonotic Salmonella serotype (S. enteritidis, S. typhimurium) in the poultry broilers flocks.

The aim of the programme is to reduce the percentage of flocks of broilers remaining positive of Salmonella enteritidis and Salmonella typhimurium to 1 % or less by 31 December 2011.

The national programme is established in accordance with the Community target pursuant to Article 4(1) of Regulation (EC) No 2160/2003 aimed at reduction of the prevalence of Salmonella enteritidis and/or Salmonella typhimurium in broilers as specified by Commission Regulation (EC) No 646/2007.

Sampling in poultry flocks is carried out by an operator or by a private veterinarian. Only named and approved laboratories of the State Veterinary Institutes will carry out the examination and validated methods of bacteriological examination will be used. The testing (samples taken by operators and official veterinarians) will be performed in the NRL in SVI Prague and in SVIs in Jihlava and Olomouc. The using of the appropriate methods will be co-ordinated and under the control of the National Reference Laboratory for salmonella at the SVI in Prague. The NRL for Salmonella will be team up with CRI.

Official checks at the level of poultry flocks are organised and carried out by the relevant Regional Veterinary Administration.

In case of positive result for S. enteritidis and/or S. typhimurium, measures are taken with regard to:

- check on efficacy of preventive measures aimed at bio-safety of the holding;
- a thorough mechanical cleansing, disinfection, disinsectisation and rat extermination shall be performed following dispatch of broilers to a slaughterhouse; as well as safe disposal of faeces or litter;
- laboratory check on efficacy of disinfection.
4. Measures of the submitted programme

4.1. Summary of measures under the programme

Duration of the programme:
First year: 2009
Last year: 2011

1. Control
2. Testing

4.2. Designation of the central authority in charge of supervising and coordinating the departments responsible for implementing the programme:

The State Veterinary Administration of the Czech Republic (hereinafter referred to as the “SVA CR”) is the central authority responsible for supervising and coordinating all activities in the field of veterinary care. The SVA CR shall, in accordance with § 47 of Act No 166/1999 concerning veterinary care and amending certain related laws, as amended (Veterinary Act), as amended, enforce its powers in the entire territory of the Czech Republic and shall coordinate activities of RVAs as well. The national monitoring programme is established on the basis of § 48(1) and § 10 of Veterinary Act and with regard to Decree No 156/2004 concerning the monitoring of zoonoses and zoonotic agents and amending Decree No 299/2003 concerning measures for prevention and eradication of contagious diseases and diseases communicable from animals to man.

The Ministry of Agriculture of the Czech Republic (hereinafter referred to as the “MA”) shall, in accordance with § 44(1)(a) of Veterinary Act, establish the principal trends and tasks in the field of veterinary care and control their implementation and shall specify, on the basis of animal health situation, compulsory preventive and diagnostic actions in accordance with § 44(1)(d) of Veterinary Act as well. Detailed rules are laid down by the “Methodology of Animal Health Control and Ordered Vaccination” (hereinafter referred to as the “Methodology”), approved by the MA and published in the Official Journal of the MA. The SVA CR shall be, in accordance with the legislation in force (Veterinary Act), empowered to perform supervision on all activities imposed by the Methodology; RVAs shall perform supervision on activities of farmers and private veterinarians provided by the Methodology.
4.3. Description and delimitation of the geographical and administrative areas in which the programme is to be implemented:

The program shall apply in the whole territory of the Czech Republic. The territory is divided into 14 regions.

Regions in the Czech Republic:

- CZ01: Capital City Prague
- CZ02: Central Bohemian Region
- CZ03: Southern Bohemian Region
- CZ04: Region of Karlovy Vary
- CZ05: Region of Liberec
- CZ06: Region of Olomouc
- CZ07: Region of Pardubice
- CZ08: Region of Plzen
- CZ09: Southern Moravian Region
- CZ10: Region of Usti nad Labem
- CZ11: Region of Zlin
- CZ12: Moravia-Silesian Region

4.4. Measures implemented under the programme

4.4.1. Measures and applicable legislation as regards the registration of holdings:

Each holding keeping broilers delivered to a slaughterhouse shall be assigned, by the entrusted person, by a registration number of the holding, and all farmer's records shall be kept in accordance with Breeding Act and Decree No 139/2004, irrespective of the number of birds kept.

4.4.2. Measures and applicable legislation as regards the identification of animals:

The programme will be performed in the birds without individual identification.

4.4.3. Measures and applicable legislation as regards the notification of the disease:

Designated laboratory shall send results of examination of samples taken and sent within implementation of this programme to the relevant RVA; the copy thereof shall be sent to a farmer or a private veterinarian. The farmer must provide on request reports on examinations to the RVA.

In accordance with § 11 of Veterinary Act

(1) The keeper, persons employed by the keeper in keeping, transporting, gathering and selling animals and other persons coming into contact with animals and animal products who, with regards to their profession, qualification and experience, are able to recognize signs suggesting a suspicion of presence of a dangerous contagious disease or a disease communicable from animals to man shall be obliged to notify the Regional Veterinary Administration without delay of such suspicion or to ensure that it is notified.

(2) The obligation of the persons to notify shall become void as soon as the official veterinarian or private veterinarian are notified of the suspected presence of a dangerous contagious disease or a disease communicable from animals to man.

4.4.4. Measures and applicable legislation as regards the measures in case of a positive result:

Measures taken following detection of *S. enteritidis* and/or *S. typhimurium* in faecal samples

- Farmer shall record the result into the “Food Chain Information” at the dispatch of broilers to a slaughterhouse.
- Farmer shall perform a check on efficacy of preventive measures aimed at bio-safety of the holding.
- Farmer shall take samples of feedingstuffs from bins; the samples shall be sent for laboratory examination for the detection of Salmonella spp.
- A thorough mechanical cleansing, disinfection, disinfestation and rat extermination shall be performed following dispatch of broilers to a slaughterhouse; as well as safe disposal of faeces or litter.
- Farmer shall take swab samples for laboratory check on efficacy of disinfection.
- New birds may be introduced only upon confirmation of efficacy of disinfection.

4.4.5. Measures and applicable legislation as regards the different qualifications of animals and herds:

The flocks are defined in accordance with the Council and Parliament Decision No 2160/2003/EC as an epidemiological unit:

"Flock" means all poultry of the same health status kept on the same premises or in the same enclosure and constituting a single epidemiological unit; in the case of housed poultry, this includes all poultry sharing the same airspace.

Each flock must have a unique identification. The identification shall consist of the registration number of the holding, the identification of the flock, and the identification of the hall; e.g. in the following format: “CZ12345678-02/2006 hala Pod rybníkem”.

More flocks may be placed in the same hall during one year, however, such flocks must bear different numbers; e.g. 02/2006 and 06/2006.

Farmers are responsible for the proper identification of flocks.

4.4.6. Control procedures and in particular rules on the movement of animals liable to be affected or contaminated by a given disease and the regular inspection of the holdings or areas concerned:

The result about detection of S. enteritidis and/or S. typhimurium in faecal samples shall be recorded into the “Food Chain Information” at the dispatch of broilers to a slaughterhouse.

4.4.7. Measures and applicable legislation as regards the control (testing, vaccination,...) of the disease:

Use of antimicrobials shall be governed by Regulation (EC) No 1177/2006

- Antimicrobials (e.g. antibiotics) shall not be used as a special method for the control of salmonella infections in poultry.
- Antimicrobials may be used only after authorisation by and under supervision of the relevant RVA and they may be applied only in poultry showing clinical signs of the disease suggesting that an excessive suffering of birds could occur. Results of bacteriological examination and anti-microbial susceptibility test must be available prior to the treatment.
- Only antimicrobials registered by the Institute for the State Control of Veterinary Biologicals and Medicaments (hereinafter referred to as the “ISCVBM”) may be used for the treatment.
- In exceptional cases, antimicrobials may be applied prior to the results of bacteriological examination and anti-microbial susceptibility test are available, provided that samples are taken by the official veterinarian prior to the application. If
sampling has not been performed prior to the application of antimicrobials, flocks shall be considered infected by salmonella.

- Requirements for the use of antimicrobials shall not apply to substances, microorganisms and preparations authorised as feed additives pursuant to Article 3 of Regulation (EC) No 1831/2003 of 22 September 2003 on additives for use in animal nutrition (e.g. probiotics, acidifiers).

**Vaccination**

Vaccines shall be selected by the private veterinarian in charge, provided that the following conditions are complied with:

- Vaccination of broilers against Salmonella is voluntary.
- Vaccines used must have valid registration by the ISCVBM Brno and must comply with requirements of Commission Regulation (EC) No 1177/2006. Dosage, application method and use in various age categories are established by the vaccine manufacturer.
- When live attenuated vaccines are used, this fact must be recorded in the application form for the laboratory examination of faecal samples.

**4.4.8. Measures and applicable legislation as regards the compensation for owners of slaughtered and killed animals**

Farmers can ask for cost and losses connected with the detection of a salmonellosis of poultry which have arisen as a result of enforcement of emergency veterinary measures pursuant to § 67, § 68, § 69 and § 70 of Veterinary Act.

**4.4.9 Information and assessment on bio-security measures management and infrastructure in place in the flocks/holdings involved**

**Measures taken following detection of S. enteritidis and/or S. typhimurium in faecal samples**

- Farmer shall perform a check on efficacy of preventive measures aimed at bio-safety of the holding.
5. General description of the costs and benefits:

1 € 27,469 CzK (on the date 31 March 2009)

It is estimated that the programme will cost 4 671 250,- Czk (170 055,34,- €) in the year 2010.

**SAMPLING BY OPERATORS** 4 430 500,- CzK (161 290,91 €)

The price involves bacteriological testing for Salmonella spp., serotyping, fagotyping, detection of the inhibition substance. We estimate 5 000 bacteriological tests for detection of Salmonella spp. in faeces, 400 bacteriological tests for detection of Salmonella sp. in feedstuffs, 450 tests for serotyping, 255 tests for fagotyping, 400 tests for efficacy of disinfection.

**OFFICIAL SAMPLING** – 240 750,- CzK (8 764,43€)

The price involves laboratory investigation for detection of Salmonella spp., serotyping, fagotyping, detection of the inhibition substance, tests for efficacy of disinfection, tests for detection of the inhibition substances. We estimate 100 bacteriological tests for detection of Salmonella sp. in faeces, 25 tests for serotyping, 5 tests for fagotyping, 50 tests for detection of the inhibition substance and 50 tests for efficacy of disinfection.

Laboratory testing for samples taken by operator and official samples is paid from the state budget.

The competent authority wishes 50% of co-financing of the total cost to be considered by the Commission.

The financial contribution by the Community of the programmes shall be for the costs of diagnostics tests performed in the frame of the programme.
6. Data on the epidemiological evolution during the last five years

6.1. Evolution of zoonotic salmonellosis

Prevalence of Salmonella enteritidis and Salmonella typhimurium in flocks of broilers

Results of a baseline study in flocks of broilers carried out in the Member States between 1 October 2005 and 30 September 2006 are considered to be a initial value.

In accordance with baseline study, prevalence for S. enteritidis and/or for Salmonella typhimurium is estimated 9.6% in the Czech Republic.

National control programme for Salmonella infections in flocks of broilers was applied from 1 January 2009.

In total 1297 flocks of broilers were tested for Salmonella spp. within period 1 January – 31 March 2009 in the framework of operator sampling 48 flocks were positive for S. enteritidis, no flocks was positive for S. typhimurium. In total 56 flocks were positive for other Salmonella serotypes.

Prevalence per Salmonella serotype in the framework of operator sampling within period 1 January – 31 March 2009.

For zoonotic Salmonellosis indicate the serotypes covered by the control programmes: (a1) for Salmonella Enteritidis, (a2) for Salmonella Typhimurium, (a3) for other serotypes specify as appropriate, (a4) for Salmonella Enteritidis or Salmonella Typhimurium.
7. Targets

7.1. Detection method

The detection method recommended by the Community Reference Laboratory (CRL) for salmonellae in Billoozen, the Netherlands, shall be used. That method is described in the current version of draft Annex D of ISO 6579 (2002): “Detection of Salmonella spp. in animal faeces and in samples of the primary production stage”. In that detection method, a semi-solid medium (modified semi-solid Rappaport-Vassiladis medium, MSRV) is used as the single selective enrichment medium. This detection method is in compliance with Commission Regulation (EC) No 646/2007.

Serotyping

At least one isolate from each positive sample shall be serotyped, following the Kaufmann-White scheme.

Phagotyping

Phagotyping shall be carried out in accordance with the HPA Colindale, London in one isolate from each positive sample for Salmonella enteritidis. Positive samples are phagotypised in the National Institute of Public Health in Brno.

Testing for inhibition substances

Testing for inhibition substances shall be carried out when it is appropriate, mainly in case of suspicion for using antibiotics as a special method for the control of salmonella infections in poultry.
7.2. Targets related to testing in the whole territory of the Czech Republic

7.2.1. Targets on diagnostic tests

Sampling by operator is paying from SVA and due to reason we request financial contribution for bacteriological testing.
CZ Annex of National Salmonella Control Programme (SCP) in flocks of broilers of Gallus gallus applied from 1 January 2020

1) Sampling

2) Results and reporting

We confirm that reporting results of SCP is in accordance with Commission Regulation (EC) No 645/2007. For calculation of prevalence and for verification of the Community target a flock of broilers is considered positive when the presence of Salmonella enteritidis or Salmonella typhimurium was detected in the framework of SCP. Report includes total number of tested flocks, number of flocks sampled by competent authority, number of flock sampled by the food business operator and total number of infected flocks for each status of sampling. All serotypes of Salmonella spp. are reported. All exceptional cases are investigated by RVA and explanation of exceptional cases is part of report if appropriate.

3) Structure of production

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

4) Production of feed

As regards production and placing on the market of feedingstuffs official controls on feed safety are performed by the CISTA (Central Institute for Supervising and Testing in Agriculture), in accordance with Act No 91/1996 on feedingstuffs, as amended.

The feedingstuffs are produced mainly by specialised firms and bought by farmers.
Request for the Community’s financial contribution for salmonella control programme in laying hens flocks

Member State: Czech Republic

Disease: Salmonella spp.

Animal population covered by the program:

Gallus gallus – laying hens producing table eggs

Year of implementation: 2010

Reference of this document: State Veterinary Administration of the Czech Republic

Department of Animal Health and Welfare

Slezská 7

CZ 120 56 Prague 2

Fax: +420 227 010 195
E-mail: epio@svser.cz

Date sent to the Commission: 24. 4. 2009
General requirements for the national salmonella control programmes

(a) The aim of the programme

The aim of the National Control Programme for Salmonella Infections in Laying Hens (Gallus gallus) producing table eggs, to be applied from the year 2008 (hereinafter referred to as the “National Programme”) is reduction of the prevalence of Salmonella enteritidis (SE) and Salmonella typhimurium (ST) in laying hens flocks and to ensure that adequate and effective measures for monitoring and control of salmonella infections are taken in laying flocks. The reduction of the prevalence of the Salmonella in laying hens flocks will be focused on achievement of the targets laying down in Commission Regulation (EC) No. 1168/2006.

In accordance with Commission Regulation (EC) No. 1168/2006, targets of the Programme are the following:

Annual minimum percentage decrease of adult laying hen positive flocks at least of:

a) 10 %, in the case when prevalence in the previous year was under 10 %,
b) 20 %, in the case when prevalence in the previous year was between 10 and 19 %,
c) 30 %, in the case when prevalence in the previous year was between 20 and 39 %,
d) 40 %, in the case when prevalence in the previous year was of 40 % or more.

With regard to the target in 2008, the results of the baseline study which was carried out according to 2004/665/EC will be used as reference. On this account the prevalence of Salmonella enteritidis and Salmonella typhimurium of 62.5% detected during the study will be considered to be a starting/initial value (according to the EFSA Journal (2006) 81, 1-71, “Preliminary Report on the Analysis of the Baseline Study on the Prevalence of Salmonella in Laying Hen Flocks of Gallus gallus,” published on 14 June 2006).

Consequently, decrease in the number of positive adult laying hen flocks of 40 % during the first year. Prevalence under 37.5 %, after the first year, prevalence under 26.3 % during second year and prevalence under 18.4 % during third year of application of the programme, should be reached.
### Targets of the programme:

<table>
<thead>
<tr>
<th>Year</th>
<th>Prevalence in previous year (%)</th>
<th>Percentual decrease of positive flocks (% in accordance with Commission Regulation No. 1168/2008 at least)</th>
<th>Estimated prevalence of positive flocks to be reached (%) at the end of the year</th>
</tr>
</thead>

**Laying hens:**
- rearing flocks — day-old chicks
  - pullets two weeks before moving to laying phase or laying unit
- laying flocks — every 15 weeks during the laying phase

(c) Specific requirements laid down in Parts D of Annex II to Regulation (EC) No 2160/2003

As within the previously performed monitoring reproduction flocks of meat poultry and laying poultry combinations, as well as production flocks of laying hens producing table eggs were not distinguished, no results from the past distinguished in such a way are available till 1 January 2007.

From 2001 to 2006 there was no evidence per flocks, data on the evolution of the disease for years 2001-2006 was kept only per holdings. Evidence per flocks has been established since 1 January 2007.

According to the baseline study, which was carried out according to 2004/665/EC, prevalence of Salmonella enteritidis an/or Salmonella typhimurium was 62.5%. This prevalence will considered to be a starting (initial value).

In 2007 the monitoring and control programme of salmonella spp. in laying hens flocks producing table eggs was established on the national level and prevalence of positive laying flocks during production period for Salmonella enteritidis and typhimurium reached 24% at the end of 2007.

Vaccination of laying hens flocks is mandatory since 1 January 2007.

In 2008 the prevalence of positive flocks during productive period was reduced to 7.57%.

The monitoring and the control of salmonella spp. in laying hens producing table eggs in 2007:

1.2. The structure and organisation of the relevant competent authorities

The State Veterinary Administration of the Czech Republic (hereinafter referred to as the “SVA CR”) is the central authority responsible for supervising and coordinating all activities in the field of veterinary care. The SVA CR shall, in accordance with § 47 of Act No 166/1999 concerning veterinary care and amending certain related laws, as amended (Veterinary Act), as amended, enforce its powers in the entire territory of the Czech Republic and shall coordinate activities of Regional Veterinary Administrations (hereinafter referred to as the “RVAs”) as well. The national monitoring programme is established on the basis of § 48(1) and § 10 of Veterinary Act and with regard to Decree No 356/2004 concerning the monitoring of zoonoses and zoonotic agents and amending Decree No 299/2003 concerning measures for prevention and eradication of contagious diseases and diseases communicable from animals to man.

The Ministry of Agriculture of the Czech Republic (hereinafter referred to as the “MA”) shall, in accordance with § 44(1)(a) of Veterinary Act, establish the principal trends and tasks in the field of veterinary care and control their implementation and shall specify, on the basis of animal health situation, compulsory preventive and diagnostic actions in accordance with § 44(1)(d) of Veterinary Act as well. Detailed rules are laid down by the “Methodology of Animal Health Control and Ordered Vaccination” (hereinafter referred to as the “Methodology”), approved by the MA and published in the Official Journal of the MA. The SVA CR shall be, in accordance with the legislation in force (Veterinary Act), empowered to perform supervision on all activities imposed by the Methodology; RVAs shall perform supervision on activities of farmers and private veterinarians provided by the Methodology.
Official checks at other stages of the food chain

Microbiological checks at different stages of food chain shall be performed by the following organisations:

In accordance with Act No 110/1997 concerning foodstuffs and tobacco products and amending and supplementing certain related laws, as amended, the SVA CR shall establish rules for regular microbiological monitoring of poultry carcasses at slaughterhouses and during their further processing in establishments manufacturing meat products. Pooled neck skin samples are taken from carcasses after chilling. In the case of positive results, slaughterhouse operators shall take all measures necessary for improvement of hygiene conditions and check HACCP system at the same time.

In accordance with Act No 146/2002 concerning the Czech Agriculture and Food Inspection Authority and amending certain related laws, as amended, the Czech Agriculture and Food Inspection Authority (hereinafter referred to as the “CAFLA”) shall perform checks on foodstuffs of plant origin at their production and placing on the market, as well as on trade in foodstuffs.

In accordance with Act No 20/1966 concerning public health care, as amended, Public Health Protection Authorities (authorities of the Ministry of Public Health) shall act in the
field of catering. In the case of any suspicion on food-borne infection, they shall inform the SVA and CAPA thereof.

1.3. Approved laboratories where samples collected within the programme are analysed.

All samples taken within this programme shall be examined only in laboratories of the State Veterinary Institutes (hereinafter referred to as “SVIs”); activities of the laboratories shall be co-ordinated by the National Reference Laboratory (hereinafter referred to as the “NRL”) and the laboratories shall be linked with the Information System of the SVA CR as well. The laboratories concerned are the following:

- SVI Prague – National reference laboratory for salmonella
- SVI Jihlava
- SVI Olomouc

State Veterinary Institutes will examine samples taken by operator and by official veterinarian.

1.4. Methods used in the examination of the samples in the framework of the programme.

Methods used in the examination will be performing in accordance with Annex of Commission Regulation (EC) No 1168/2006.

Testing methods used by laboratories under the control programme for official sampling and sampling taken on the initiative of the operator are identical.

Testing is carried out by the SVI Prague, SVI Jihlava and SVI Olomouc. SVI in Prague was named as the NRL for Salmonellosis.

Laboratory examination comprising detection of Salmonella spp. shall be carried out in accordance with the method recommended by the Community RL in Bilthoven, Netherlands. The method is a modification of ISO 6579 (2002), where a semi-solid medium (MSRV) is used as the single selective enrichment medium. Methods of the examination is performing in accordance with Annex of Commission Regulation (EC) No 1168/2006

Serotyping shall be carried out in at least one isolate from each positive sample, following the Kaufmann-White scheme.

Phagotyping shall be carried out in accordance with the HPA Colindale, London.

Testing for inhibition substances shall be carried out when it is appropriate.
Tests for distinguishing between "field" and vaccination strains shall be carried out when it is appropriate.

1.5. Frequency of sampling

Frequency of sampling by farmers
- day-old chicks
- pullets two weeks before moving to laying phase or laying unit
- every 15 weeks;
- initial sampling – at the age of 24 ± 2 weeks

1.5.1. Official controls (including sampling schemes) at feed, flock and/or flock level.

Official sampling at flock level:
- a) in one flock once per year, and/or
- b) at the age of 24 ± 2 weeks in laying flocks housed in buildings where salmonella was detected in the preceding flock; and/or
- c) in any case of suspicion on Salmonella enteritidis or Salmonella typhimurium infection, as a result of the epidemiological investigation of food-borne outbreaks, in accordance with Article 8 of Directive 2003/99/EC of the European Parliament and of the Council;
- d) in all other laying flocks on the holding in case Salmonella enteritidis or Salmonella typhimurium are detected in one laying flock on the holding;
- e) in cases where the RVA considers it appropriate.

Sampling protocol for feeds and table eggs:
- a) Complete feedingstuff manufacturing plants shall be sampled for bacteriological examination by RVAs. The number of samples taken shall be based on feed turnout in the previous year. Samples shall be taken on a random basis, in numbers prescribed by the SVA CR. Final complete feedingstuffs shall be taken, either at manufacturing plants prior to their dispatch or directly on holdings.
- b) Samples of table eggs shall be taken at egg sorting or packaging plants, either within the HACCP programme, or at any suspicion on salmonella infection in primary production of table eggs.
1.6. Measures taken by the competent authorities with regard to animals or products in which the presence of Salmonella spp. have been detected, in particular to protect public health, and any preventive measures taken, such as vaccination.

Measures taken in the case of salmonella detection (S. enteritidis and/or typhimurium) in faeces

The relevant RVA shall order at least the following measures:

1) table eggs coming from infected flocks may be used for human consumption only if treated in a manner that guarantees the destruction of all Salmonella serotypes with public health significance in accordance with Community legislation on food hygiene;

Eggs shall be:
(a) considered as Class B eggs as defined in Article 2(4) of Commission Regulation (EC) No 557/2007 laying down detailed rules for implementing Council Regulation (EC) No 1028/2006 on marketing standards for eggs (1);

(b) marked with the indication referred to in Article 10 of Commission Regulation (EC) No 557/2007 which clearly distinguishes them from Class A eggs prior to being placed on the market;

(c) prohibited access to packaging centres unless the competent authority is satisfied with the measures to prevent possible cross-contamination of eggs from other flocks;

2) performance of bacteriological examination of feed for the presence of Salmonella spp. and water if necessary;

3) performance of thorough cleansing and disinfection, both in the hall and in other service premises (e.g. feed and litter stores); performance of thorough mechanical cleansing and disinfection, as well as safe removal of faeces and litter after completion of each production cycle;

When birds from infected flocks are slaughtered or destroyed, steps must be taken to reduce the risk of spreading zoonoses as far as possible. Slaughtering shall be carried out in accordance with Community legislation on food hygiene. Products derived from such birds may be placed on the market for human consumption in accordance with Community legislation on food hygiene. If not destined for human consumption, such products must be used or disposed of in accordance with Regulation (EC) No 1774/2002;

Thorough cleansing and disinfection, including safe removal of faeces or litter must be performed after slaughtering or killing of poultry from infected flocks;

4) In order to exclude false-positive initial results from the samples taken by operator, the official veterinarian from the relevant RVA shall carry out official sampling for confirmation of the infection. The confirmation method shall be carried out according to Annex I, 4 (b)(i) of Commission Regulation No 1237/2007, amending Regulation EC No 2160/2003 of the European Parliament and of the Council and Decision 2006/696/EC, as regards the placing on the market of eggs from Salmonella infected flocks of laying hens.

- 8 -
The confirmation method will be based on the technical specifications referred to in Article 5 of Commission Decision 2004/665/EC (seven samples); however, a sub-sample of 25 grams must be collected of each faecal material and dust sample for analysis; all samples must be analysed separately. The RVA may lift the restrictions if the flock is not confirmed by this confirmation method. In addition to the sampling, the RVA shall verify the absence of the use of antimicrobials, potentially affecting the result of the analyses of the sampling.

Vaccination

a) Vaccination of poultry against Salmonella enteritidis is obligatory within this programme.

b) Vaccines used must have valid registration by the Institute for the State Control of Veterinary Biologicals and Medicaments (hereinafter referred to as the “ISCVBM”) and must comply with requirements of Commission Regulation (EC) No. 1177/2006. Dosage, application method and use in various age categories are established by the vaccine manufacturer.

c) According to this programme, vaccination of pre-layering pullets shall be performed during their rearing period, so as to the vaccination and re-vaccination are completed prior to the planned start of their laying period.

Vaccines shall be selected by the private veterinarian in charge, provided that the following conditions are complied with:

- Live attenuated vaccines against salmonellae may not be used within the National Programme unless the manufacturer provides adequate method for distinguishing between “field” and vaccination strains.

- Live attenuated vaccines may not be used in laying hens during the laying period.

- Vaccination against Salmonella enteritidis aimed at the reduction of spreading rate and contamination of eggs shall be used in all pre-layering pullets during their rearing period by 1 January 2008 at the latest, for the period of 3 years at least.

Vaccination programme against S. enteritidis has to be approved by RVA and RVA carry out control of the vaccination programme.

The relevant RVA may authorize, from 1 January 2009, derogations from this provision, provided that:

- it is satisfied on the nature of preventive measures taken by the farmer on the holding in question; and

- the farmer demonstrates absence of Salmonella enteritidis during 12 months preceding introduction of pullets to the holding.

Use of antimicrobials shall be governed by Regulation (EC) No 1177/2006

- Antimicrobials (e.g. antibiotics) shall not be used as a special method for the control of salmonella infections in poultry.
Only antimicrobials registered by the Institute for the ISCVBM may be used for the treatment.

Antimicrobials may be used only after authorisation by and under supervision of the relevant RVA and they may be applied only in poultry showing clinical signs of the disease suggesting that an excessive suffering of birds could occur. Results of bacteriological examination and anti-microbial susceptibility test must be available prior to the treatment.

In exceptional cases, antimicrobials may be applied prior to the results of bacteriological examination and anti-microbial susceptibility test are available, provided that samples are taken by the official veterinarian prior to the application. If sampling has not been performed prior to the application of antimicrobials, flocks shall be considered infected by Salmonella.

1.7. National legislation relevant to the implementation of the programmes, including any national provisions concerning the activities set out in the programme.

h) Act No. 166/1999 concerning veterinary care and amending certain related laws, as amended (Veterinary Act);

i) Act No. 134/2000 concerning pedigree breeding, breeding and registration of farm animals and amending certain related laws, as amended (Breeding Act);

j) Act No. 146/2002 concerning the Czech Agriculture and Food Inspection Authority and amending certain related laws, as amended;
k) Act No. 29/1966 concerning public health care, as amended;

l) Decree No. 356/2004 concerning the monitoring of zoonoses and zoonotic agents and amending Decree No. 299/2003 concerning measures for prevention and eradication of contagious diseases and diseases communicable from animals to man;

m) Decree No. 296/2003 concerning animal health and its protection, animal movement and transportation and authorization and professional qualification for performance of certain professional veterinary activities;

n) Decree No. 136/2004 laying down details for identification of animals and their registration and registration of holdings and person designated by Breeding Act.

1.8. Any financial assistance provided to food and feed businesses in the context of the programme.

Farmers shall be compensated for costs and losses connected with the detection of a salmonellosis of poultry which have arisen as a result of enforcement of emergency veterinary measures pursuant to § 67, § 68, § 69 and § 70 of Veterinary Act.

Farmers shall be compensated for the costs connected with vaccination and revaccination against salmonelloses (i.e. the price of vaccine used). Compensation will be paid after vaccination and compensation is up to 6,- CzK per 1 vaccinated bird.

It is supposed that laboratory testing will be fully/partly paid from the state budget for samples taken by farmers.

2. Concerning food and feed businesses covered by the programme

2.3. Relevant guidelines for good animal husbandry practices or other guidelines (mandatory or voluntary) on biosecurity measures defining at least:

Hygiene management at farms

For all laying holdings, farming regulations covering all farming procedures starting from one-day old chicks’ stage, their rearing, introduction of pre-laying pullets intended for future production of table eggs up to keeping of laying hens must be drawn up.

“TECHNOLOGICAL PROCEDURES” in holdings shall be applied pursuant to the type of laying poultry kept (Hisex, Isa, I.Korno, Dominant etc.).

In egg sorting/packaging plants that are parts of such holdings, HACCP principles shall be applied; certain companies shall be certified pursuant to ISO standards or other European certification programmes (Germany, the Netherlands), respectively, as well.

Application of a single introduction of birds is an absolute pre-condition of good farming practice. After completion of each production cycle (i.e. laying of table eggs), a mechanical cleansing of halls and technologies, followed by subsequent effective disinfection, disinsection and rat extermination shall be performed. The relevant RVA must perform checks on disinfection efficacy by bacteriological examination of swab samples.
Measures to prevent incoming infections carried by animals, feed, drinking water, people working at farms

According to §3 of Decree No. 296/2003 concerning animal health and its protection, animal movement and transportation and authorization and professional qualification for performance of certain professional veterinary activities:

- keepers must ensure protection of their holdings, in particular by means of prevention of access of free birds to halls by covering windows and ventilation openings by nets;
- feed and water are administered to poultry inside a hall or under a projecting roof sufficiently discouraging free birds and preventing contacts of free birds with feed or water intended for the poultry.

Farmers shall draw up and comply with sanitation rules for their holdings, keep records on all disinfections and preventive actions performed.

Hygiene in transporting animals to and from farms

In accordance with §7 of Veterinary Act, for transport of animals only such means of transport and facilities may be used which:

- meet the requirements for animal transport of the species involved as to the construction, arrangement and equipment, do not affect animal health, do not cause any pain or suffering to animals, prevent the animals from escape or falling out and protect them from unfavourable weather effects;
- are protected so that water, feed, litter, faeces or other waste cannot leak or fall out of them;
- are cleaned and disinfected both before and after the transport.

2.4. Routine veterinary supervision of farms

In accordance with Act No 166/1999, as amended, farmers are responsible for animal health.

Routine veterinary supervision shall be performed by a private veterinarian. The official veterinary supervision of farms and private veterinarians is carried out by official veterinarians of relevant Regional Veterinary Administration.

2.5. Registration of farms

Holdings in the Czech Republic are registered in the Database of Farms in accordance to the provisions of the law No. 154/2000, Breeding Act and corresponding Decree No. 136/2004 laying down details for identification of animals and their registration and registration of holdings and persons established by Breeding Act.
2.6. Record-keeping at farms.

The records kept by farmers must, according to the type of poultry kept, include at least the following information:

- data of receipt of the poultry,
- origin of the poultry,
- number of the poultry,
- productivity of the species (e.g. increase in weight),
- date of birth,
- feed suppliers,
- type and duration of use of feed additives and withdrawal periods,
- consumption of feeds and water,
- performed checks/tests and diagnoses established by the veterinarian in charge, together with results of laboratory examinations, if necessary,
- type of a medicine applied, start and end of its application,
- data of vaccination and type of vaccine used,
- increase in weight during the rearing period,
- results of all health checks performed previously,
- number of birds intended for slaughtering,
- estimated date of the slaughtering.

Additional checks necessary for establishment of diagnosis provided that the poultry:

- is affected by a disease communicable to man or shows individual or mass signs producing suspicion of affection by such disease,
- shows disorders of general health status or signs of a disease which may render their meat unfit for human consumption,
- regular sampling of feeds and water for checking compliance with withdrawal periods,
- results of testing for presence of zoonotic agents in accordance with requirements of Regulation (EC) No. 2160/2003.

2.7. Documents to accompany animals when dispatched

The breeders are obliged to apply for the veterinary certificate comprising the health attestation issued by a private veterinarian, if the animal to be moved outside the territory of the region. The obligation is laid down in Article 6 of Veterinary Act No. 166/1999 as amended.

The animals to be moved to slaughterhouses must be accompanied by the food chain information referred to in to Regulation (EC) No 853/2004.

In the case of intra-Community trade, the consignment of animals have to be accompanied by the veterinary certificate in accordance with Commission Regulation (EC) No. 599/2004 concerning the adoption of a harmonised model certificate and inspection report linked to intra-Community trade in animals and products of animal origin.
2.8. Other relevant measures to ensure the traceability of animals.

Each flock must have a unique identification. The identification shall consist of the registration number of the holding, the identification of the flock, and the identification of the hall; e.g. in the following format: “CZ12345678-02/2006 hala Pod rybníkem”.

More flocks may be placed in the same hall during one year, however, such flocks must bear different numbers; e.g. 02/2006 and 06/2006.

Farmers shall be responsible for the proper identification of flocks.

The identification of a flock must be indicated in application form for laboratory examination, in food chain information at the dispatch of poultry to a slaughterhouse or in the veterinary certificate at the dispatch of poultry to another holding.
2. **Historical data on the epidemiological evolution**

As within the previously performed monitoring reproduction flocks of meat poultry and laying poultry combinations, as well as production flocks of laying hens producing table eggs were not distinguished, no results from the past distinguished in such a way are available till 1 January 2007.

From 2001 to 2006 there was no evidence per flocks, data on the evolution of the disease for years 2001-2006 was kept only per holdings. Evidence per flocks has been established from 1 January 2007.

According to the baseline study, which was carried out according to 2004/865/EC, prevalence of *Salmonella enteritidis* an/or *Salmonella typhimurium* was 62.5%. This prevalence will considered to be a starting (initial value).

Vaccination of laying hens flocks is mandatory since 1 January 2007.

In 2007 the monitoring and control programme of salmonella spp. in laying hens producing table eggs was established and prevalence of positive laying flocks for *Salmonella enteritidis* and *typhimurium* reached 24% at the end of 2007.

Prevalence of positive adult flocks of laying hens for *Salmonella enteritidis* and *Salmonella typhimurium* at the end of 2008 was 7.57%.
Description of the submitted programme:

The aim of the National Control Programme for Salmonella Infections in Laying Hens (Gallus gallus) producing table eggs is reduction of the prevalence of SE and ST in laying hens' flocks and to ensure that adequate and effective measures for monitoring and control of salmonella infections are taken in laying flocks. The reduction of the prevalence of the Salmonella in laying hens' flocks will be focused on achievement of the targets laying down in Commission Regulation (EC) No. 1168/2006 and Commission Regulation (EC) No 1177/2006.

Targets of the Programme are in accordance with Commission Regulation (EC) No. 1168/2006.

With regard to the target in 2008, the results of the baseline study which was carried out according to 2004/665/EC will be used as reference. On this account the prevalence of Salmonella enteritidis and Salmonella typhimurium of 62.5% detected during the study is considered to be a starting - initial value (according to the EFSA Journal (2006) 81, 1-71, "Preliminary Report on the Analysis of the Baseline Study on the Prevalence of Salmonella in Laying Hen Flocks of Gallus gallus," published on 14 June 2006).

Consequently, the reduction of percentage of positive laying hens' flocks to 37%, 5% must be reached in the first year of implementation of the programme (at the end of 2008) and within three years of application of the programme prevalence under 18%, 4% shall be reached.

The main measures are monitoring and control of commercial laying hens' flocks producing table eggs.

Only named and approved laboratories of the State Veterinary Institutes (hereinafter referred to as the "SVI") will carry out the examination and validated methods of bacteriological examination will be used. The testing (samples taken by operator and official veterinarian) will be performed in the NRL in SVI Prague and in SVIs in Jihlava and Olemouc. The using of the appropriate methods will be co-ordinated and under the control of the National Reference Laboratory for salmonella at the SVI in Prague. The NRL for Salmonella will team up with CRI...

Sampling in poultry flocks is carried out by an operator (farmer) or by a private veterinarian. Official sampling and samples for the confirmation are taken and sent for the examination by an official veterinarian of the relevant Regional Veterinary Administration. The National programme will be carried out in compliance with EU legislation according to Commission Regulation (EC) No. 1168/2006 and Commission Regulation (EC) No 1177/2006.

Table eggs coming from infected flocks may be used for human consumption only if treated in a manner that guarantees the destruction of all Salmonella serotypes with public health significance in accordance with Community legislation on food hygiene.

To reduce the prevalence of the 2 Salmonella serovars (S. enteritidis, S. typhimurium), to a level of 18.4% or lower within 3 years of application of the National programme, obligatory vaccination of poultry against Salmonella enteritidis will be carried out and official checks at the level of poultry flocks will be carried out by the relevant RVA to verify that:

- application of a single introduction of birds is an absolute pre-condition of good farming practice and if after completion of each production cycle (i.e. laying of table
eggs), a mechanical cleansing of halls and technologies, followed by subsequent effective disinfection, disinsection and rat extermination is performed:

- obligations laid down in National programme are fulfilled;
- relevant records are kept by farmers.
4. **Measures of the submitted programme**

4.1. **Summary of measures under the programme**

Duration of the programme: 3 years

First year: 2008  
Last year: 2010

- **Control**
  - Testing
  - Slaughter of positive animals
  - Killing of positive animals
  - Vaccination
  - Treatment according to the Commission Regulation (EC) No 1177/2006
  - Disposal of product

4.2. **Designation of the central authority in charge of supervising and coordinating the departments responsible for implementing the programme:**

The central authority competent for supervising and coordinating all activities in veterinary care is the State Veterinary Administration, which performs its powers at the whole territory of the Czech Republic (§ 47, Veterinary Act No 166/1999 Col. of Acts). SVA of the CR coordinates the activities of RVAs. The national monitoring and control programme for Salmonella is laid down on the base of § 48 point 1, and § 10, Veterinary Act No. 166/1999 as amended, and on regards to Decree No. 356/2004 about monitoring of zoonosis and zoonotis agents.

Ministry of Agriculture of the Czech Republic determines main strategies in a veterinary care and carries out their control as laid down in the Veterinary Act No. 166/1999 Article 44, Point 1a. The Ministry of Agriculture specifies obligatory preventive and diagnostics campaigns in accordance with the Veterinary Act, Article 44; Point 1d, based on the epidemiological situation. Related details are laid down in the “Methodology of Animal Health Controls and Prophylaxis” approved by the Ministry of Agriculture and issued in its Official Journal. According to the legislation (Veterinary Act 166/1999) the SVA CR has the legal power to supervise any action ordered by the “Methodology”. Regional veterinary administrations execute the legal powers as to supervise private veterinarians over their actions in the professional field as ordered by the “Methodology”.

The competent authority confirms its commitment to submit a complete report on actions and expenditures in the framework of this programme and to provide additional information when they are request by the Commission.
4.3. Description and delimitation of the geographical and administrative areas in which the programme is to be implemented:

The program shall apply in the whole territory of the Czech Republic. The territory of the Czech Republic is divided into 14 regions.

*This number includes all flocks (flocks in production and rearing flocks) in the country that were sampled in the framework of the national salmonella control programme at least once during the reported year. Flocks sampled more than once are counted only once.
4.4. Measures implemented under the programme

4.4.1. Measures and applicable legislation as regards the registration of holdings:

Holdings in the Czech Republic are registered in the Database of Farms in accordance to the provisions of the law No. 154/2000, Breeding Act and corresponding Decree No. 136/2004 laying down details for identification of animals and their registration and registration of holdings and person established by Breeding Act.

4.4.2. Measures and applicable legislation as regards the identification of animals:

The programme will be performed in poultry without individual identification.

4.4.3. Measures and applicable legislation as regards the notification of the disease:

Designated laboratory shall send results of examination of samples taken and sent within implementation of this programme to the relevant RVA; the copy thereof shall be sent to a farmer or a private veterinarian. The farmer must provide on request reports on examinations to the RVA.

In accordance with § 11 of Veterinary Act

(1) The keeper, persons employed by the keeper in keeping, transporting, gathering and selling animals, and other persons coming into contact with animals and animal products who, with regards to their profession, qualification and experience, are able to recognize signs suggesting a suspicion of presence of a dangerous contagious disease or a disease communicable from animals to man shall be obliged to notify the Regional Veterinary Administration without delay of such suspicion or to ensure that it is notified.

(2) The obligation of the persons to notify shall become void as soon as the official veterinarian or private veterinarian are notified of the suspected presence of a dangerous contagious disease or a disease communicable from animals to man.

4.4.4. Measures and applicable legislation as regards the measures in case of a positive result:

Measures taken in the case of salmonella detection (S. enteritidis and/or typhimurium) in faeces samples

The relevant RVA shall order at least the following measures:

1) table eggs coming from infected flocks may be used for human consumption only if treated in a manner that guarantees the destruction of all Salmonella serotypes with public health significance in accordance with Community legislation on food hygiene.
Eggs shall be:
(a) considered as Class B eggs as defined in Article 2(4) of Commission Regulation (EC) No 557/2007 laying down detailed rules for implementing Council Regulation (EC) No 1028/2006 on marketing standards for eggs (1);

(b) marked with the indication referred to in Article 10 of Commission Regulation (EC) No 557/2007 which clearly distinguishes them from Class A eggs prior to being placed on the market;

(c) prohibited access to packaging centres unless the competent authority is satisfied with the measures to prevent possible cross-contamination of eggs from other flocks;

2) performance of bacteriological examination of feed for the presence of Salmonella spp. and water if necessary;

3) performance of thorough cleansing and disinfection, both in the hall and in other service premises (e.g. feed and litter stores); performance of thorough mechanical cleansing and disinfection, as well as safe removal of faeces and litter after completion of each production cycle;

When birds from infected flocks are slaughtered or destroyed, steps must be taken to reduce the risk of spreading zoonoses as far as possible. Slaughtering shall be carried out in accordance with Community legislation on food hygiene.Products derived from such birds may be placed on the market for human consumption in accordance with Community legislation on food hygiene. If not destined for human consumption, such products must be used or disposed of in accordance with Regulation (EC) No 1774/2002;

Thorough cleansing and disinfection, including safe removal of faeces or litter must be performed after slaughtering or killing of poultry from infected flocks;

4) In order to exclude false-positive initial results from the samples taken by operator, the official veterinarian from the relevant RVA shall carry out official sampling for confirmation of the infection. The confirmation method shall be carried out according to Annex 1.4 (b)(i) of Commission Regulation No 1237/2007, amending Regulation EC No 2160/2003 of the European Parliament and of the Council and Decision 2006/696/EC, as regards the placing on the market of eggs from Salmonella infected flocks of laying hens.

The confirmation method will be based on the technical specifications referred to in Article 5 of Commission Decision 2004/665/EC (seven samples); however, a sub-sample of 25 grams must be collected of each faecal material and dust sample for analysis; all samples must be analysed separately. The RVA may lift the restrictions if the flock is not confirmed by this confirmation method. In addition to the sampling, the RVA shall verify the absence of the use of antimicrobials, potentially affecting the result of the analyses of the sampling.
4.4.5 Measures and applicable legislation as regards the different qualifications of animals and flocks.

"The flocks" are defined in accordance with the Council and Parliament Decision No 2160/2003/EC as:

- All poultry of the same health status kept on the same premises or in the same enclosure and constituting a single epidemiological unit; in the case of housed poultry, this includes all poultry sharing the same airspace.

Each flock must have a unique identification. The identification shall consist of the registration number of the holding, the identification of the flock, and the identification of the hall; e.g. in the following format: "CZ12345678: 02/2006 hales Pod rybnikem".

More flocks may be placed in the same hall during one year, however, such flocks must bear different numbers; e.g. 02/2006 and 06/2006.

Farmers shall be responsible for the proper identification of flocks.

4.4.6 Control procedures and in particular rules on the movement of animals liable to be affected or contaminated by a given disease and the regular inspection of the holdings or areas concerned:

The breeders are obliged to apply for the veterinary certificate comprising the health attestation issued by a private veterinarian, if the animal to be moved outside the territory of the region. The obligation is laid down in Article 6 of Veterinary Act No. 166/1999 as amended.

The animals to be moved to slaughterhouses must be accompanied by the food chain information referred to in Regulation (EC) No 853/2004.

In the case of intra-Community trade, the consignment of animals have to be accompanied by the veterinary certificate in accordance with Commission Regulation (EC) No. 599/2004 concerning the adoption of a harmonised model certificate and inspection report linked to intra-Community trade in animals and products of animal origin.

Positive result for S. enteritidis and S. typhimurium shall be recorded into the veterinary certificate/security chain information/intra-Community trade veterinary certificate.

Regional Veterinary Administration shall supervise if all measures ordered by the RVA are fulfilled.
4.4.7. Measures and applicable legislation as regards the control (testing, vaccination, ...) of the disease:

Sampling in laying flocks shall be performed pursuant to an established scheme, either by farmers, or by private veterinarians; official samples shall always be taken by the relevant RVA officer (official veterinarian).

Frequency of sampling by farmers

- day-old chicks
- pullets two weeks before moving to laying phase or laying unit
- every 15 weeks;
- initial sampling: at the age of 24 ± 2 weeks

Official sampling

- in one flock once per year; or
- at the age of 24 ± 2 weeks in laying flocks housed in buildings where salmonella was detected in the preceding flock; or
- in any case of suspicion on Salmonella enteritidis or Salmonella typhimurium infection, as a result of the epidemiological investigation of food-borne outbreaks, in accordance with Article 8 of Directive 2003/99/EC of the European Parliament and of the Council;
- in all other laying flocks on the holding in case Salmonella enteritidis or Salmonella typhimurium are detected in one laying flock on the holding;
- in cases where the RVA considers it appropriate.

Sampling protocol

In order to maximise sensitivity of sampling, both faecal material and the environment shall be sampled at least as provided for in (a) and (b):

a) in cage flocks, $2 \times 150$ grams of naturally pooled faeces shall be taken from all belts or scrapers in the house after running the manure removal system; however, in the case of step cage houses without scrapers or belts $2 \times 150$ grams of mixed fresh faeces must be collected from 60 different places beneath the cages in the dropping pits;

b) in barn or free-range houses, two pairs of boot swabs or socks shall be taken, without changing over boots between boot swabs.

In the case of official sampling, 3 samples of 150 grams of naturally pooled faeces shall be taken and these 3 samples will be separately tested. Checks on sanitation programme,
vaccination programme and compliance with zoo-hygiene preventive measures shall be carried out together with official sampling.

Where the presence of S. enteritidis or S. typhimurium is not detected but antimicrobials or bacterial growth inhibitory effect are, it shall be accounted for as an infected laying flock.

**Transport and preparation of samples**

Samples shall be sent by express mail, courier or collection line to the laboratories, on the day of collection. At the laboratory, samples shall be kept refrigerated until examination, which shall be carried out within 48 hours following receipt.

**Boot swab samples**

The following procedure shall be followed at the laboratory:

a) Two pairs of boot swabs (or socks) shall be carefully unpacked to avoid dislodging adhered faecal material, pooled and placed in 225 ml of Buffered Peptone Water (BPW) which has been pre-warmed to room-temperature;

b) the sample shall be swirled to fully saturate it and culture shall be continued using the detection method above mentioned.

**Faecal material and dust samples**

The following procedure shall be followed at the laboratory:

a) Faecal samples shall be pooled, thoroughly mixed and 25 gram sub-sample shall be collected for culture;

b) the 25 gram sub-sample shall be added to 225 ml of BPW which has been pre-warmed to room-temperature;

c) culture of the sample shall be continued using the detection method above mentioned.

If ISO standards on the preparation of faeces for the detection of salmonella are agreed on, they shall be applied and replace the above provisions on sample preparation.
Vaccination

d) Vaccination of poultry against Salmonella enteritidis shall be obligatory within this programme.

e) Vaccines used must have valid registration by the ISCVBM Brno and must comply with requirements of Commission Regulation (EC) No. 1177/2006. Dosage, application method and use in various age categories are established by the vaccine manufacturer.

f) According to this programme, vaccination of pre-laying pullets shall be performed during their rearing period, so as to the vaccination and re-vaccination are completed prior to the planned start of their laying period.

Vaccines shall be selected by the private veterinarian in charge, provided that the following conditions are complied with:

- Live attenuated vaccines against salmonellae may not be used within the National Programme unless the manufacturer provides adequate method for distinguishing between “field” and vaccination strains.
- Live attenuated vaccines may not be used in laying hens during the laying period.
- Vaccination against S. enteritidis aimed at the reduction of spreading rate and contamination of eggs shall be used in all pre-laying pullets during their rearing period by 1 January 2008 at the latest, for the period of 3 years at least.

Vaccination programme against S. enteritidis has to be approved by RVA and RVA carry out control of the vaccination programme.

The relevant RVA may authorize, from 1 January 2009, derogations from this provision, provided that:

- it is satisfied on the nature of preventive measures taken by the farmer on the holding in question; and
- the farmer demonstrates absence of Salmonella enteritidis during 12 months preceding introduction of pullets to the holding.

4.4.8. Measures and applicable legislation as regards the compensation for owners of slaughtered and killed animals:

The farmers will be compensated by Ministry of Agriculture for costs and losses arisen in consequence with enforcement of emergency veterinary measures in accordance with the Act No. 166/1999 concerning veterinary care and amending certain related laws, as amended (Veterinary Act).

Farmers shall be compensated for the costs connected with vaccination and revaccination against salmonellosis (i.e. the price of vaccine used). Compensation will be paid after vaccination and compensation is up to 6,- CzK per 1 vaccinated bird.

It is supposed that laboratory testing will be fully/partly paid from the state budget for samples taken by farmers.
5. **General description of the costs and benefits:**

1C = 27,469 CzK (on the date 31.3.2009)

It is estimated that the programme will cost 76 693 550,- CzK (2 792 003,71,- €) in the year 2010.

The price involves laboratory testing for detection of Salmonella spp., serotyping, fagotyping, detection of the inhibition substance, testing for distinguishing between "field" and vaccination strains, compensation for destruction of positive flocks of laying hens (including costs for animals, slaughter and destruction of animals, transport costs, salaries, cleaning and disinfection) and costs for vaccines.

**Testing carried out in the framework of official testing:**

We estimate 1 100 bacteriological tests (cultivation) for detection of salmonella spp. in samples of faeces, 120 bacteriological tests (cultivation) in feeding stuffs and water, 215 tests for serotyping, 95 tests for fagotyping, 100 tests for control of distinguishing between "field" and vaccination strains, 100 tests for detection of the inhibition substances.

It is estimated that 20 laying flocks with 500 000 heads of animals will be positive for S. enteritidis or/and S. typhimurium in the framework of the programme. It is estimated that 500 000 laying hens will be destroyed/slaughtered in 2010.

It is estimated that cost for official testing will be 1 027 450,- CzK (37 403,98,- €).

It is estimated that cost for destruction/slaughtering of positive flocks of laying hens will be 34 650 000,- CzK (1 261 422,00,- €).

**Vaccination:**

It is expected that in total 250 flocks with 8 000 000 heads of animals will be vaccinated against Salmonella enteritidis. It is supposed that in total 40 000 000,- CzK (1 456 187,00,- €) will be compensated for vaccines.

**Testing carried out in the framework of samples taken by operators:**

We estimate 1500 bacteriological tests for detection of salmonella spp. in swabs from internal wall of transport boxes, fallen chicks, samples of pooled samples, samples of faeces, 70 tests for serotyping, 50 tests for fagotyping.

It is estimated that cost for testing carried out by operators will be 1 016 100,- CzK (36 990,79,- €).

It is supposed that testing of samples taken by operators will be fully/partly compensated from the state budget.
The competent authority wishes 50% of co-financing of the total cost to be considered by the Commission.

The financial contribution by the Community of the programmes shall be for:

(a) the destruction of flocks of laying hens or the difference between the estimated value of poultry and the income from the sale of the heat-treated meat obtained from such poultry, destruction costs, transport costs and salaries costs;

(b) the costs of diagnostics tests performed in the frame of the programme

(c) the costs of vaccine

In the Czech Republic monitoring of salmonella in laying hens holdings in the years 2001 – 2006 was carried out and was aimed for confirmation of the Salmonellosis infection. Due to the different testing scheme and approach, the data received on the basis of baseline study carried out according to the Commission Decision 2004/665/EC were not comparable to the data received on the basis of monitoring performed before baseline study.

### 7. Targets

#### 7.1. Targets related to testing in 2010

**Type of the test** | **Target population** | **Type of sample** | **Objective** | **Number of planned tests**
---|---|---|---|---
Detection of *Salmonella* spp. | Day-old chicks, rearing period, production period | Feces | control | 1500 |
Serotyping | Day-old chicks, rearing period, production period | Isolates from bacteriological investigation | control | 70 |
Fagotyping | Day-old chicks, rearing period, production period | Isolates from bacteriological investigation | control | 50 |
Detection of *Salmonella* spp. | During production period | Feces | control | 1000 |
Serotyping | During production period | | monitoring | 80 |
Fagotyping | During production period | | monitoring | 65 |
Detection of *Salmonella* spp. | Day-old chicks, rearing period, production period | Confirmatory test | Control | 100 |
Serotyping | Day-old chicks, rearing period, production period | Isolates from bacteriological investigation | control | 80 |
Fagotyping | Day-old chicks, rearing period, production period | Isolates from bacteriological investigation | monitoring | 20 |
Detection of *Salmonella* spp. | Day-old chicks, rearing period, production period | Feedingstuff/water | control | 200 |
Serotyping | Day-old chicks, rearing period, production period | Feedingstuff/water | control | 50 |
Detection of the inhibition substances | Day-old chicks, rearing period, production period | Organs | Control of use of antibiotics | 100 |
Efficiency of disinfection | Day-old chicks, rearing period, production period | Swabs | Control of disinfection | 120 |
Tests for distinguishing between “field” and vaccination strains | | Isolates from bacteriological investigation | Isolates from bacteriological investigation | 100 |
Detection method

The detection method recommended by the Community Reference Laboratory (CRL) for salmonellae in Bintéroven, the Netherlands, shall be used. That method is described in the current version of draft Annex D of ISO 6579 (2002): “Detection of Salmonella spp. in animal faeces and in samples of the primary production stage”. In that detection method, a semi-solid medium (modified semi-solid Rappaport-Vassiladis medium, MSRV) is used as the single selective enrichment medium. Methods used in the examination will be performed in accordance with Annex of Commission Regulation (EC) No 1168/2006.

Serotyping

At least one isolate from each positive sample shall be serotyped, following the Kaufmann-White scheme.

Flagotyping

- Flagotyping shall be carried out in accordance with the HPA Colindale, London in one isolate from each positive sample for Salmonella enteritidis. Flagotyping shall be carried in the National Institute of Public Health (NIPH) in Broo.

Testing for inhibition substances

To verify the absence of the use of antimicrobials, potentially affecting the result of the analyses of the sampling.

Tests for distinguishing between “field” and vaccination strains shall be carried out when it is appropriate.
7.1.3. Targets on testing of flocks

**TOTAL 1 016 100,- CZK (36 990.7- €)**
CZ Annex of Rational Salmonella Control Programme (SCP) in laying hens of Gallus gallus applied from 1 January 2010

1) Frequency of sampling

We confirm that frequency of sampling in SCP are in accordance with sampling requirements laid down in part B of Annex II to Regulation (EC) No 2160/2003 of the European Parliament and of the Council and in accordance with Commission Regulation (EC) 1168/2006.

2) Results and reporting

We confirm that reporting of results of the SCP is in accordance with Commission Regulation (EC) 1168/2006. Report includes the total number of flocks tested, number of flocks tested for each status of sampling, total number of infected flocks and number of infected flocks for each status of sampling. All exceptional cases are investigated by RVA and explanation of exceptional cases is part of report if appropriate.

The flock of laying hens is considered positive for S. enteritidis or S. typhimurium in the case of positive result of official sampling or in the case of positive result of official sample taken in order to exclude the false positive result of operator sampling. The confirmation method is based on technical specifications referred to in Article 5 of Commission Decision 2004/665/EC (5 pooled faeces samples and 2 pooled dust samples analysed separately). For statistical purposes an infected flock is counted only once regardless of how often Salmonella has been detected in this flock during reported year.

3) Structure of production

<table>
<thead>
<tr>
<th>Number of holdings in the year 2008</th>

</tr>
</thead>
<tbody>
<tr>
<td>day old chicks</td>
</tr>
<tr>
<td>rearing period</td>
</tr>
<tr>
<td>production period</td>
</tr>
</tbody>
</table>

4) Production of feed

As regards production and placing on the market of feedingstuffs official controls on feed safety are performed by the CISTA (Central Institute for Supervising and Testing in Agriculture), in accordance with Act No 91/1996 on feedingstuffs, as amended.

The feedingstuffs are produced mainly by specialised firms and bought by farmers.
Request for the Community's financial contribution for salmonella control programme in breeding flocks

Member State: Czech Republic

Disease: Salmonella spp.

Animal population covered by the program: BREEDING FLOCKS – Gallus gallus

Year of implementation: 2010

Date sent to the Commission: 24. 4. 2009
Part A

General requirements for the national salmonella control programmes

(a) The aim of the programme

Objectives of the programme is to monitor, on the basis of sampling in breeding poultry flocks, occurrence of invasive serotypes of S. enteritidis, S. typhimurium, S. infantis, S. virchow and S. hadar, and to take measures aimed in particular at the protection of public health, as well as health of other poultry populations. To ensure the reduction of percentage of positive adult breeding poultry flocks comprising at least 250 birds to 1% within the period of 3 years.

Breeding flocks of Gallus gallus:
- rearing flocks — day-old chicks
  - four-week-old birds
  - two weeks before moving to laying phase or laying unit
- adult breeding flocks — every second week during the laying period

(c) Specific requirements laid down in Parts C of Annex II to Regulation (EC) No 2160/2003

(d)

1.2. The structure and organisation of the relevant competent authorities

The State Veterinary Administration of the Czech Republic (hereinafter referred to as the “SVA CR”) is the central authority responsible for supervising and coordinating all activities in the field of veterinary care. The SVA CR shall, in accordance with § 47 of Act No 166/1999 concerning veterinary care and amending certain related laws, as amended (Veterinary Act), as amended, enforce its powers in the entire territory of the Czech Republic and shall coordinate activities of Regional Veterinary Administrations (hereinafter referred to as the “RVAs”) as well. The national monitoring programme is established on the basis of § 48(1) and § 10 of Veterinary Act and with regard to Decree No 356/2004 concerning the monitoring of zoonoses and zoonotic agents and amending Decree No 299/2003 concerning measures for prevention and eradication of contagious diseases and diseases communicable from animals to man.

The Ministry of Agriculture of the Czech Republic (hereinafter referred to as the “MA”) shall, in accordance with § 44(1)(a) of Veterinary Act, establish the principal trends and tasks in the field of veterinary care and control their implementation and shall specify, on the basis of animal health situation, compulsory preventive and diagnostic actions in accordance with § 44(1)(d) of Veterinary Act as well. Detailed rules are laid down by the “Methodology of Animal Health Control and Ordered Vaccination” (hereinafter referred to as the “Methodology”), approved by the MA and published in the Official Journal of the MA. The SVA CR shall be, in accordance with the legislation in force (Veterinary Act), empowered to perform supervision on all activities imposed by the Methodology. RVAs shall perform supervision on activities of farmers and private veterinarians provided by the Methodology.
Official checks at other stages of the food chain

Microbiological checks at different stages of food chain shall be performed by the following organisations:

In accordance with Act No 110/1997 concerning foodstuffs and tobacco products and amending and supplementing certain related laws, as amended, the SVA CR has already established rules for regular microbiological monitoring of poultry carcasses at slaughterhouses and during their further processing in establishments manufacturing meat products. Pooled neck skin samples are taken from carcasses after chilling. In the case of positive results, slaughterhouse operators shall take all measures necessary for improvement of hygiene conditions and check HACCP system at the same time.

In accordance with Act No 146/2002 concerning the Czech Agriculture and Food Inspection Authority and amending certain related laws, as amended, the Czech Agriculture and Food Inspection Authority (hereinafter referred to as the “CAKJA”) shall perform checks on foodstuffs of plant origin at their production and placing on the market, as well as on trade in foodstuffs.
In accordance with Act No 29/1966 concerning public health care, as amended, Public Health Protection Authorities (authorities of the Ministry of Public Health) shall act in the field of catering. In case of any suspicion on food-borne infection, they shall inform the SVA and CAPTA thereof.

1.3. Approved laboratories where samples collected within the programme are analysed.

Laboratories performing testing for Salmonella spp. within this programme shall be designated in accordance with Article 12 of Regulation (EC) No 2160/2003. Samples taken within this programme shall be examined in laboratories of the State Veterinary Institutes (hereinafter referred to as the "SVIs"); activities of the laboratories shall be co-ordinated by the National Reference Laboratory (hereinafter referred to as the "NRL"). The laboratories concerned are the following:

SVI Prague – NRL
SVI Jihlava
SVI Olomouc
SVIs examine samples taken by operator and by official veterinarians.

1.4. Methods used in the examination of the samples in the framework of the programme.

Methods used in the examination will be performing in accordance with Annex of Commission Regulation (EC) No 1003/2005.

Testing methods used by laboratories under the control programme for official sampling and sampling taken on the initiative of the operator are identical.

- Laboratory examination comprising detection of Salmonella spp. shall be carried out in accordance with the method recommended by the Community RL in Bilthoven, Netherlands. The method is a modification of ISO 6579 (2002), where a semi-solid medium (MSRV) is used as the single selective enrichment medium.

- Serotyping shall be carried out in at least one isolate from each positive sample, following the Kaufmann-White scheme.

- Phagotyping shall be carried out in accordance with the HPA Colindale, London.

- Testing for inhibition substances shall be carried out when it is appropriate.

- Tests for distinguishing between "field" and vaccination strains shall be carried out when it is appropriate.
1.5. Official controls (including sampling schemes) at feed, flock and/or herd level.

Official controls at the level of feedstuffs

Supervision on feedstuffs in the Czech Republic shall be performed by the following organisations:

State Veterinary Administration of the Czech Republic;

Central Institute for Supervising and Testing in Agriculture (CISTA);

Institute for the State Control of Veterinary Biologicals and Medicaments (ISCVBM).

Official controls on feed safety (where production and placing on the market of feedstuffs are concerned) shall be performed by the CISTA, in accordance with Act No 91/1996 on feedstuffs, as amended.

The SVA CR performs, by means of the relevant RVA, examination of feedstuffs intended for farm animals for the detection of Salmonella, in accordance with Regulation (EC) No 1774/2002. The relevant RVA shall take samples in establishments producing compound feedstuffs; samples of finished feedstuffs before dispatch shall be taken, at a volume proportionate to the manufacturer’s throughput.

The ISCVBM shall perform official controls on medicated feedstuffs, use of antimicrobials and use of vaccines.

Official controls at flock and/or holding level

Official checks at the level of poultry flocks are organised and carried out by the relevant RVA; the RVA also takes measures in the case of positive results.

Official samples are taken by relevant RVA in breeding poultry flocks.

Official sampling in breeding poultry flocks:

a) in age of 4 weeks
b) in 4 weeks from the start of laying phase
c) after 20 weeks of laying phase
d) 4 weeks prior to the end of laying phase
e) based on positive results in one flock, others flocks are officially sampled
f) each time when the Regional Veterinary Administration considers it necessary
Sampling carried out by operator:

a) day-old chicks: 10 swabs from internal surfaces of boxes or crates used for transportation of the chicks. A sample from the entire consignment of chicks is concerned that is, if appropriate, combined to form a pooled sample;
b) carcasses of chicks found after arrival of a veterinarian (acceptance of chicks). A sample from the entire consignment of chicks (at most 60 birds) is concerned that is, if appropriate, combined to form a pooled sample;
c) 2 weeks prior to laying phase
d) each 2 weeks during the laying phase.

1.6. Measures taken by the competent authorities with regard to animals or products in which the presence of Salmonella spp. have been detected, in particular to protect public health, and any preventive measures taken, such as vaccination.

(a) Performance of epidemiological inquiry in the holding, aimed at detection of source of the infection and, where appropriate, bacteriological examination of feed and water.

(b) The use of antimicrobials shall be carried out in accordance to Commission Regulation (EC) No 1177/2006. Antimicrobials shall not be used as a specific method to control salmonella in poultry.

The use of antimicrobials (in exceptional cases) is subject to authorization and supervision of RVA and is based, wherever possible, on the results of bacteriological sampling and of susceptibility testing.

(c) All poultry in the positive flock must be slaughtered or destroyed so as to reduce as much as possible the risk of spreading salmonella. Slaughtering must be carried out in accordance with the legislation on food hygiene. Products derived from such birds may be placed on the market for human consumption in accordance with Community legislation on food hygiene. If not destined for human consumption, such products must be used or disposed of in accordance with Regulation (EC) No 1774/2002 of the European Parliament and of the Council of 3 October 2002 laying down health rules concerning animal by-products not intended for human consumption.

(d) In order to exclude false-positive initial results from the samples taken by operator, the official veterinarian from the relevant RVA shall carry out official sampling for confirmation of the infection. The confirmation method shall be carried out according to Annex 1.4 (3)(i) of Commission Regulation No 1237/2007, amending Regulation EC No 2160/2003 of the European Parliament and of the Council and Decision 2006/696/EC, as regards the placing on the market of eggs from Salmonella infected flocks of laying hens.

The confirmation method will be based on the technical specifications referred to in Article 5 of Commission Decision 2004/665/EC (seven samples); however, a subsample of 25 grams must be collected of each faecal material and dust sample for analysis; all samples must be analysed separately. The RVA may lift the restrictions
if the flock is not confirmed by this confirmation method. In addition to the sampling, the RVA shall verify the absence of the use of antimicrobials, potentially affecting the result of the analyses of the sampling.

(c) Non-incubated hatching eggs must be destroyed.
However, such eggs may be used for human consumption if they are treated in a manner that guarantees the elimination of Salmonella enteritidis and Salmonella typhimurium in accordance with Community legislation on food hygiene.

(f) Where hatching eggs are still present in a hatchery, they must be destroyed or treated in accordance with Regulation (EC) No. 1774/2002 of the European Parliament and of the Council.

(g) A thorough cleaning and disinfection must be carried out after slaughtering or destruction of poultry from infected flocks, including safe disposal of droppings or litter, in accordance with the relevant RVA instructions.

Preventive measures:
The vaccination shall be carried out in accordance with Commission Regulation (EC) No. 1177/2006.

Live salmonella vaccines for which the manufacturer does not provide an appropriate method to distinguish bacteriologically wild-type strains of salmonella from vaccine strains are prohibited from use in the framework of national salmonella control programmes.

The vaccines used have to have valid registration of the ISCVBM in Brno and must comply with the requirements of Commission Regulation No. 1177/2006. Dosage, application methods and age categories are recommended by the vaccine manufacturer.

All breeding flocks included in the programme must be vaccinated against S. enteritidis.

Vaccination programme against S. enteritidis has to be approved by RVA and RVA carry out control of the vaccination programme.

1.7. National legislation relevant to the implementation of the programmes, including any national provisions concerning the activities set out in the programme.

The legal basis of the disease control and eradication programme consists of the following legal rules:

- Act No 166/1999 concerning veterinary care and amending certain related laws (Veterinary Act), as amended;
- Act No 154/2000 concerning pedigree breeding, breeding and registration of farm animals and amending certain related laws (Breeding Act), as amended;
- Decree No 356/2004 concerning monitoring of zoonoses and zoonotic agents and amending Decree No 299/2003 concerning measures for prevention and eradication of contagious diseases and diseases communicable from animals to man;
- Decree No 296/2003 concerning animal health and its protection, animal movement and transportation and authorisation and professional qualification for performance of certain professional veterinary activities, as amended;
- Decree No 136/2004 specifying in detail identification and registration of animals registration of holdings and persons specified by Breeding Act.

1.8. Any financial assistance provided to food and feed businesses in the context of the programme.

Farmers shall be compensated for costs and losses connected with the detection of a salmonellosis of poultry which have arise as a result of enforcement of emergency veterinary measures pursuant to § 67, §68 and §70 of Veterinary Act.

Farmers shall be compensated for costs of vaccines up to 6,-CZK per 1 vaccinated bird.

It is supposed that laboratory testing will be paid from the state budget for samples taken by operators.

2. Concerning food and feed businesses covered by the programme

2.3. Relevant guidelines for good animal husbandry practices or other guidelines (mandatory or voluntary) on biosecurity measures defining at least:

Hygiene management at farms

Farmers shall draw up and comply with sanitation rules for their holdings, keep records on all disinfections and preventive actions performed.
Measures to prevent incoming infections carried by animals, feed, drinking water, people working at farms, and

According to §3 of Decree No. 296/2003 concerning animal health and its protection, animal movement and transportation and authorization and professional qualification for performance of certain professional veterinary activities:

- keepers must ensure protection of their holdings, in particular by means of prevention of access of free birds to halls by covering windows and ventilation openings by nets;
- feed and water are administered to poultry inside a hall or under a projecting roof sufficiently discouraging free birds and preventing contacts of free birds with feed or water intended for the poultry.

Hygiene in transporting animals to and from farms.

In accordance with §7 of Veterinary Act, for transport of animals only such means of transport and facilities may be used which:

- meet the requirements for animal transport of the species involved as to the construction, arrangement and equipment, do not affect animal health, do not cause any pain or suffering to animals, prevent the animals from escape or falling out and protect them from unfavourable weather effects;
- are protected so that water, feed, litter, faeces or other waste cannot leak or fall out of them;
- are cleaned and disinfected both before and after the transport.

2.4. Routine veterinary supervision of farms.

In accordance with Act No 166/1999, as amended, farmers are responsible for animal health. Routine veterinary supervision shall be performed by a private veterinarian.

The official veterinary supervision of farms and private veterinarians is carried out by official veterinarians of relevant RVA.

The official veterinary supervision consists in clinical examination of individual flocks, inspection of register keeping, records of vaccination, inspection of biosecurity measures and welfare and whether the conditions laid down in programme are fulfilled. All breeding flocks of poultry are checked up at least once per year.

2.5. Registration of farms.

In the Czech Republic the farms are registered in the Database of Farms in accordance with Breeding Act No 154/2000 and corresponding Decree No 136/2004 laying down details for identification of animals and their registration and registration of holdings and person established by Breeding Act.
2.6. Record-keeping at farms.

According to Decree No 136/2004 specifying in detail identification and registration of animals registration of holdings and persons specified by Breeding Act:

For each holding, where a flock is kept of more than 1000 head of poultry or more than 100 head of poultry with the production of hatching eggs, and in the case of domestic fowl a flock of laying hens with production of table eggs to be placed on the market, the keeper of adult poultry shall keep a register of poultry in the holding. The register shall be kept in writing on forms provided by the entrusted person or as a computer database.

2.7. Documents to accompany animals when dispatched.

The breeders are obliged to apply for the veterinary certificate comprising the health attestation issued by a private veterinarian, if the animal to be moved outside the territory of the region. The obligation is laid down in Article 6 of Veterinary Act No. 166/1999 as amended.

The animals to be moved to slaughterhouses must be accompanied by the food chain information referred to in to Regulation (EC) No 853/2004.

In the case of intra-Community trade, the consignment of animals have to be accompanied by the veterinary certificate in accordance with Commission Regulation (EC) No. 599/2004 concerning the adoption of a harmonised model certificate and inspection report linked to intra-Community trade in animals and products of animal origin.

2.8. Other relevant measures to ensure the traceability of animals.

Each flock must have a unique identification. The identification shall consist of the registration number of the holding, the identification of the flock. More flocks may be placed in the same hall during one year; however, such flocks must bear different numbers.

Farmers shall be responsible for the proper identification of flocks.

The traceability of animals is also based on register keeping at farms.
2. **Historical data on the epidemiological evolution of zoonotic:**

Bacteriological examination (monitoring) of salmonellae (S. enteritidis and S. typhimurium) had been carried out since the year 1996 in the Czech Republic; the monitoring was carried out according to Council Directive 92/117/EEC. As adequate register of poultry keepers and registration of flocks were not available, the examination was carried out according to poultry holdings.

As within the previously performed monitoring reproduction flocks of meat poultry and laying poultry combinations, as well as production flocks of laying hens producing table eggs were not distinguished, no results from the past distinguished in such a way are available.

In the case of proven positive results in breeding flocks and grandparents flocks, slaughtering of poultry or safe disposal thereof by destruction and subsequent processing at rendering plants were applied; in the case of parents flocks of meat poultry and laying poultry combinations, as well as in the case of laying hens producing table eggs, antibiotic treatment based on antibiogramme, followed by use of probiotics or by acidifying of feed or water, were applied.

The monitoring was recorded according to particular sampling criteria. As within the past period changes of territorial arrangement and of recorded codes took place, incomparable data would by compared.

In 2007 the proper monitoring and control programme of Salmonella spp. in breeding flocks has been carried out according to the Regulation (EC) No. 2160/2003 and prevalence of positive adult breeding flocks for S. enteritidis, S. typhimurium, S. infantis, S. hadar and S. virchow at the end of 2007 was 3,1%.

In 2008 prevalence of positive adult breeding flocks for S. enteritidis, S. typhimurium, S. infantis, S. hadar and S. virchow at the end of 2008 was 1,08%.

3. **Description of the submitted programme:**

The main objectives of the programme are monitoring and control of zoonotic Salmonella serotype (S. enteritidis, S. typhimurium, S. infantis, S. virchow and S. hadar) in the poultry breeding flocks. The aim of the programme is to maintain the prevalence of the 5 Salmonella serovars (S. enteritidis, S. typhimurium, S. infantis, S. virchow and S. hadar) to a level of 1% or lower in adult breeding flocks of Gallus gallus comprising at least 250 birds. The main measures are monitoring and control of the poultry in the breeding flocks. The target animal population are breeding flocks Gallus gallus for broiler production and for laying hens as well. The positive cases is lay down on the basis of the bacteriological investigation.

Only named and approved laboratories of the SVIs will carry out the examination and validated methods of bacteriological examination will be used. The testing will be performed in the NRI in SVI Prague and in SVIs in Jihlava and Olomouc. The using of the appropriate
methods will be co-ordinated and under the control of the National Reference Laboratory for salmonella at the SVI in Prague. The NRL for Salmonella will be team up with CRL.

Official checks at the level of poultry flocks are organised and carried out by the relevant Regional Veterinary Administration; the RVA also takes measures in the case of positive results.

Sampling in poultry flocks is carried out by an operator or by a private veterinarian. Official sampling and samples for the confirmation are taken and sent for the examination by an official veterinarian of the relevant RVA.

The requirements of sanitary measures and biosecurity measures are carried out by keeping of technological procedure by the establishments which provide one-day old parent’s chickens.

To reduce the prevalence of the 5 Salmonella serovars (S. enteritidis, S. typhimurium, S. infantis, S. virchow and S. hadar) to a level of 1% or lower by 31 December 2009, obligatory vaccination of poultry against Salmonella enteritidis will be carried out and official checks at the level of poultry flocks will be carried out by the relevant RVA to verify that:

- application of a single introduction of birds is an absolute pre-condition of good farming practice and if after completion of each production cycle, a mechanical cleansing of halls and technologies, followed by subsequent effective disinfection, disinfection and rat extermination is performed;
- obligations laid down in National programme are fulfilled;
- relevant records are kept by farmers.
4. Measures of the submitted programme

4.1. Summary of measures under the programme

Duration of the programme: 5 years
First year: 2010                  Last year: 2015

Control

➢ Testing
➢ Slaughter of positive animals
➢ Killing of positive animals
➢ Vaccination
➢ Treatment
➢ Disposal of product

4.2. Designation of the central authority in charge of supervising and coordinating the departments responsible for implementing the programme:

The central authority competent for supervising and coordinating all activities in veterinary care is the State Veterinary Administration, which performs its powers at the whole territory of the Czech Republic (§ 47, Veterinary Act No 166/1999 Coll. of Acts). SVA of the CR coordinates the activities of Regional Veterinary Administrations. The national monitoring and control programme for Salmonella is laid down on the basis of § 48 point 1, and § 10, Veterinary Act No. 166/1999 as amended, and on regards to Decree No. 356/2004 about monitoring of zoonosis and zoonotics agents.

Ministry of Agriculture of the Czech Republic determines main strategies in a veterinary care and carries out their control as laid down in the Veterinary Act No. 166/1999 Article 44, Point 1a. The Ministry of Agriculture specifies obligatory preventive and diagnostics campaigns in accordance with the Veterinary Act, Article 44: Point 1d, based on the epidemiological situation. Related details are laid down in the “Methodology of Animal Health Controls and Prophylaxis” approved by the Ministry of Agriculture and issued in its Official Journal. According to the legislation (Veterinary Act 166/1999) the SVA CR has the legal power to supervise any action ordered by the “Methodology”. Regional veterinary administrations execute the legal powers as to supervise private veterinarians over their actions in the professional field as ordered by the “Methodology”.
4.3. Description and delimitation of the geographical and administrative areas in which the programme is to be implemented:

The programme shall apply in the whole territory of the Czech Republic.

*This number includes all flocks (flocks in production and rearing flocks) in the country that were sampled in the framework of the national salmonella control programme at least once during the reported year. Flocks sampled more than once are counted only once.
4.4. Measures implemented under the programme

4.4.1. Measures and applicable legislation as regards the registration of holdings

Holdings in the Czech Republic are registered in the Database of Farms in accordance to the provisions of the law No. 154/2000, Breeding Act and corresponding Decree No. 136/2004 laying down details for identification of animals and their registration and registration of holdings and person established by Breeding Act.
4.4.2. Measures and applicable legislation as regards the identification of animals:

The programme will be performed in the birds without individual identification.

4.4.3. Measures and applicable legislation as regards the notification of the disease:

Designated laboratory shall send results of examination of samples taken and sent within implementation of this programme to the relevant RVA; the copy thereof shall be sent to a farmer or a private veterinarian. The farmer must provide on request reports on examinations to the RVA.

In accordance with § 11 of Veterinary Act

(1) The keeper, persons employed by the keeper in keeping, transporting, gathering and selling animals and other persons coming into contact with animals and animal products who, with regards to their profession, qualification and experience, are able to recognize signs suggesting a suspicion of presence of a dangerous contagious disease or a disease communicable from animals to man shall be obliged to notify the Regional Veterinary Administration without delay of such suspicion or to ensure that it is notified.

(2) The obligation of the persons to notify shall become void as soon as the official veterinarian or private veterinarian are notified of the suspected presence of a dangerous contagious disease or a disease communicable from animals to man.

4.4.4. Measures and applicable legislation as regards the measures in case of a positive result:

(a) Performance of epidemiological inquiry in the holding, aimed at detection of source of the infection and, where appropriate, bacteriological examination of feed and water.

Antimicrobials shall not be used as a specific method to control salmonella in poultry.

The use of antimicrobials (in exceptional cases) is subject to authorization and supervision of RVA and is based, wherever possible, on the results of bacteriological sampling and of susceptibility testing.

(c) All poultry in the positive flock must be slaughtered or destroyed so as to reduce as much as possible the risk of spreading salmonella. Slaughtering must be carried out in accordance with the legislation on food hygiene. Products derived from such birds may be placed on the market for human consumption in accordance with Community legislation on food hygiene. If not destined for human consumption, such products must be used or disposed of in accordance with Regulation (EC) No 1774/2002 of the European Parliament and of the Council of 3 October 2002 laying
down health rules concerning animal by-products not intended for human consumption.

(d) In order to exclude false-positive initial results from the samples taken by operator, the official veterinarian from the relevant RVA shall carry out official sampling for confirmation of the infection. The confirmation method shall be carried out

The confirmation method will be based on the technical specifications referred to in Article 5 of Commission Decision 2004/665/EC (seven samples); however, a sub-sample of 25 grams must be collected of each faecal material and dust sample for analysis; all samples must be analysed separately. The RVA may lift the restrictions if the flock is confirmed by this confirmation method. In addition to the sampling, the RVA shall verify the absence of the use of antimicrobials, potentially affecting the result of the analyses of the sampling.

(e) Non-incubated hatching eggs must be destroyed.

However, such eggs may be used for human consumption if they are treated in a manner that guarantees the elimination of Salmonella enteritidis and Salmonella typhimurium in accordance with Community legislation on food hygiene.

(f) Where hatching eggs are still present in a hatchery, they must be destroyed or treated in accordance with Regulation (EC) No. 1774/2002 of the European Parliament and of the Council.

(g) A thorough cleansing and disinfection must be carried out after slaughtering or destruction of poultry from infected flocks, including safe disposal of droppings or litter, in accordance with the relevant RVA instructions.

(h) RVA shall take swab samples for laboratory check on efficacy of disinfection.

4.4.5. Measures and applicable legislation as regards the different qualifications of animals and herds:

The flocks are defined in accordance with the Council and Parliament Decision No 2160/2003/EC.

4.4.6. Control procedures and in particular rules on the movement of animals liable to be affected or contaminated by a given disease and the regular inspection of the holdings or areas concerned:

The breeders are obliged to apply for the veterinary certificate comprising the health attestation issued by a private veterinarian, if the animal to be moved outside the territory of the region. The obligation is laid down in Article 6 of Veterinary Act No. 168/1999 as amended.

The animals to be moved to slaughterhouses must be accompanied by the food chain information referred to in to Regulation (EC) No 853/2004.

In the case of intra-Community trade, the consignment of animals have to be accompanied by the veterinary certificate in accordance with Commission Regulation (EC) No. 599/2004 concerning the adoption of a harmonised model certificate and inspection report linked to intra-Community trade in animals and products of animal origin.
Positive result for S. enteritidis, S. typhimurium, S. infantis, S. hadar, S. virchow shall be recorded into the veterinary certificate/food chain information/intra-Community trade veterinary certificate.

4.4.7. Measures and applicable legislation as regards the control (testing, vaccination, ...) of the disease:

All breeding flocks included in the programme must be vaccinated against Salmonella enteritidis.

Vaccination of all pre-laying pullets is performed during their rearing period, so as to the vaccination and re-vaccination is completed prior to the planned start of their laying period.

Vaccination shall be carried out in compliance with Art. 3 Commission Regulation 1177/2006 of the European Parliament and of the Council as regards requirements for the use of specific control methods in the framework of the national programmes for the control of Salmonella in poultry.

Vaccination programme against S. enteritidis has to be approved by RVA and RVA carry out control of the vaccination programme.

Live salmonella vaccines for which the manufacturer does not provide an appropriate method to distinguish bacteriologically wild-type strains of Salmonella from vaccine strains are prohibited from use in the framework of national salmonella control programmes.

The vaccines used must have valid registration of the Institute for the State Control of Veterinary Biologica and Medicaments in Brno and must comply with the requirements of Commission Regulation No. 1177/2006. Dosage, application methods and age categories are recommended by the vaccine manufacturer.

Farmers shall be compensated for costs of vaccines from the state budget up to 6,- CzK per one pullet.

4.4.8. Measures and applicable legislation as regards the compensation for owners of slaughtered and killed animals:

The farmers will be compensated by Ministry of Agriculture for costs and losses arisen in consequence with enforcement of emergency veterinary measures in accordance with the Act No. 166/1999 concerning veterinary care and amending certain related laws, as amended (Veterinary Act).

Farmers shall be compensated for the costs connected with vaccination and revaccination against Salmonella enteritidis (i.e. the price of vaccine used).

It is supposed that laboratory testing will be paid from the state budget for samples taken by operators.
5. General description of the costs and benefits:

1€ 27469 CzK (on the date 31 March 2009)

It is estimated that the programme will cost 44886 200,- CzK (1 634 067,49- €) in the year 2010.

The price involves laboratory testing for detection of Salmonella spp., serotyping, flagotyping, detection of the inhibition substance, testing for distinguishing between “field” and vaccination strains, compensation for destruction of positive breeding flocks (including costs for animals, slaughter and destruction of animals, transport costs, salaries, cleaning and disinfection) and costs for vaccines.

Testing carried out in the framework of official testing:

We estimate 4 000 bacteriological tests (cultivation) for detection of Salmonella spp.in samples of faeces, butt swabs; 50 bacteriological tests (cultivation) in feedingstuffs and water. 55 tests for serotyping, 50 tests for flagotyping, 30 tests for control of distinguishing between “field” and vaccination strains, 50 tests for detection of the inhibition substances.

It is estimated that 100 000 heads of animals will be positive for S. enteritidis /S. typhimurium/S. hadar/S. infantis/S. virchow in the framework of confirmation of the programme and it is estimated that 100 000 heads of animals will be destroyed in 2010.

It is estimated that cost for official testing will be 2 635 700,- CzK (95 951,80- €).

Estimated cost for destruction of positive flocks of breeding hens will be 15 150 000,- CzK (551 530,62- €).

Vaccination:

It is expected that in total 531 flocks of breeding poultry will be vaccinated against Salmonella enteritidis. It is supposed that in total 20 000 000,- CzK (728 093,49- €) will be compensated for vaccines.

Testing carried out in the framework of samples taken by operators:

We estimate 11 200 bacteriological tests for detection of Salmonella spp. in swabs from internal wall of transport boxes, fallen chicks, samples of pooled samples, samples of faeces. 50 tests for serotyping, 20 tests for flagotyping.

It is estimated that cost for testing carried out by operators will be 7 100 500,- CzK (258 491,39- €).

It is supposed that testing of samples taken by operators will be fully/partly compensated from the state budget.

The competent authority wishes 50% of co-financing of the total cost to be considered by the Commission.

The financial contribution by the Community of the programmes shall be for:

(a) the destruction of flocks of breeding hens or the difference between the estimated value of breeding poultry and the income from the sale of the heat-treated
meat obtained from such poultry, destruction costs, transport costs, cleaning and disinfection costs and salaries costs;

(b) the costs of diagnostics tests performed in the frame of the programme

(c) the costs of vaccine

Detection method

The detection method recommended by the Community Reference Laboratory (CRL) for salmonellae in Bilthoven, the Netherlands, shall be used. That method is described in the current version of draft Annex D of ISO 6579 (2002): “Detection of Salmonella spp. in animal faeces and in samples of the primary production stage”. In that detection method, a semi-solid medium (modified semi-solid Rappaport-Vassiladis medium, MSRV) is used as the single selective enrichment medium. Methods used in the examination will be performing in accordance with Annex of Commission Regulation (EC) No 1093/2005.

Serotyping

At least one isolate from each positive sample shall be serotyped, following the Kaufmann-White scheme.

Fagotyping

Fagotyping shall be carried out in accordance with the HPA Colindale, London in one isolate from each positive sample for Salmonella enteritidis.

Testing for inhibition substances

To verify the absence of the use of antimicrobials, potentially affecting the result of the analyses of the sampling.

Tests for distinguishing between “field” and vaccination strains shall be carried out when it is appropriate.

20. Other measures for the traceability of animals ..................................... 19
1. Legal basis of the programme

- Act No 166/1999 concerning veterinary care and amending certain related laws (Veterinary Act), as amended;

- Act No 154/2000 concerning pedigree breeding, breeding and registration of farm animals and amending certain related laws (Breeding Act), as amended;

- Decree No 356/2004 concerning monitoring of zoonoses and zoonotic agents and amending Decree No 299/2003 concerning measures for prevention and eradication of contagious diseases and diseases communicable from animals to man;

- Decree No 296/2003 concerning animal health and its protection, animal movement and transportation and authorisation and professional qualification for performance of certain professional veterinary activities, as amended;

- Decree No 136/2004 specifying in detail identification and registration of animals registration of holdings and persons specified by Breeding Act.
2. Objectives and duration of the programme

The target of the programme:
The target of this national programme is established in accordance with the Community target pursuant to Article 4(1) of Regulation (EEC) No 2160/2003 aimed at the reduction of the prevalence of Salmonella enteritidis, Salmonella typhimurium, Salmonella infantis, Salmonella hadar, and Salmonella virchow in adult breeding flocks of Gallus gallus as specified by Regulation (EC) No 1003/2005, as amended.
a) From 1 January 2010 target shall be a reduction to 1% or less of the maximum percentage of adult breeding flocks of Gallus gallus remaining positive for Salmonella enteritidis, Salmonella typhimurium, Salmonella infantis, Salmonella hadar, and Salmonella virchow (the relevant Salmonella serotypes).
b) For Member States with less than 100 adult breeding flocks of Gallus gallus target, from 1 January 2010, shall be that no more than one such flock may remain positive for the relevant Salmonella serotypes per year.
The programme will be applied for 5 years from 1 January 2010 to 31 December 2014.

3. Frequency and status of sampling

a) Farmers shall ensure taking samples from environment of each breeding flock according to an established schedule.
b) Samples shall be taken by trained persons, i.e. by farmers, veterinarians, or other persons designated by farmers. The training shall be performed and certificates on the training issued by the relevant Regional Veterinary Administration (hereinafter referred to as the "RVA").
c) Official samples shall be taken by inspectors from the relevant RVA.

Sampling by farmers
Taking of samples from environment shall be performed in each flock according to the following schedule:
a) Day-old chicks: 10 swabs from internal surfaces of at least 10 boxes or baskets used for
the transport of day-old chicks. The swabs shall be taken after the arrival of the chicks to the holding, prior to their unloading. All swabs must be pooled into one sample. When the chicks come from two different hatcheries, a separate pooled sample shall be prepared for each hatchery. When the chicks are delivered within several days, samples are taken each day according to the above mentioned scheme;
b) Carcasses of chicks found after arrival of a veterinarian (acceptance of chicks). A sample from the entire consignment of chicks (at most 60 birds) is concerned that is, if appropriate, combined to form a pooled sample;
c) 2 weeks prior to laying phase—taking of pooled faecal sample;
d) Each 2 weeks during the laying phase—taking of pooled faecal sample.

Official sampling
a) In age of 4 weeks—pooled faecal sample;
b) In 4 weeks from the start of laying phase—pooled faecal sample;
c) After 20 weeks of laying phase—pooled faecal sample;
d) 4 weeks prior to the end of laying phase—pooled sample.
e) Based on positive results in one flock, others flocks are officially sampled.
f) Each time when the Regional Veterinary Administration considers it necessary.

Samples shall be taken in accordance with one of the following methods:

Pooled faecal samples:

- Separate samples of fresh faeces each weighing not less than 1 g shall be taken at random from the number of sites indicated in the following table:

<table>
<thead>
<tr>
<th>Number of birds in the flock</th>
<th>Number of faecal samples to be taken from the flock</th>
</tr>
</thead>
<tbody>
<tr>
<td>250 - 349</td>
<td>200</td>
</tr>
<tr>
<td>350 - 449</td>
<td>220</td>
</tr>
<tr>
<td>450 - 599</td>

</tr>
<tr>
<td>600 - 999</td>
<td>260</td>
</tr>
<tr>
<td>1 000 and more</td>
<td>300</td>
</tr>
</tbody>
</table>

Faeces may be pooled for analysis up to a minimum of two pools.
A. Five pairs of boot swabs:

Boot swabs used shall be sufficiently absorptive to soak up moisture. Tubegauze "socks" are also acceptable. The surface of the boot swab shall be moistened using appropriate diluent (e.g. 0.8 % sodium chloride, 0.1 % peptone in sterile deionised water, or sterile water). Walking around shall be done in a manner which will sample representatively all parts of the sector, including littered and slatted areas where slats are safe to walk on. All separate pens within a house shall be included in the sampling. On completion of sampling, boot swabs must be removed carefully so as not to dislodge adherent material. The boot swabs may be pooled for analysis into a minimum of two pools.

B. Sampling in cage flocks:

In cage breeding flocks, sampling may consist of naturally mixed faeces from dropping belts, scrapers or deep pits, depending on the type of house. Two samples of at least 150 g shall be collected to be tested individually:

- droppings belts beneath each tier of cages which are run regularly and discharged into an auger or conveyor system;
- droppings pit system in which deflectors beneath the cages are scraped into a deep pit beneath the house;
- droppings pit system in a step-cage poultry house when cages are offset and faeces fall directly into the pit.

There are normally several stacks of cages within a house. Pooled faeces from each stack shall be represented in the overall pooled sample. Two pooled samples shall be taken from each breeding flock as described in the following third to sixth subparagraphs.

In systems where there are belts or scrapers, these shall be run on the day of the sampling before sampling is carried out.

In systems where there are deflectors beneath cages and scrapers, pooled faeces that have lodged on the scraper after it has been run, shall be collected.

In step-cage poultry house systems where there is no belt or scraper system it is necessary to collect pooled faeces from throughout the deep pit.

Droppings belt systems: pooled faecal material from the discharge ends of the belts shall be collected.
4. General data

a) Prevalence of *Salmonella enteritidis*, *Salmonella typhimurium*, *Salmonella infantis*, *Salmonella hadar*, and *Salmonella virchow* in breeding flocks

The national salmonella control programme is in the Czech Republic applied from 1 January 2007. The programme is applied within the entire territory of the Czech Republic and covers all registered breeding flocks. The results obtained during monitoring in the framework of "Methodology of Animal Health Control" in accordance with Article 4 of Directive 2003/99/EC were considered as an initial rate of prevalence. The initial value of prevalence was 3.7% of positive holdings.

Prevalence values of the salmonella serotypes targeted in the salmonella control programmes obtained in the framework the programme are presented in tables 1, 2.

**Table 1.: Number of flocks positive for targeted serotypes**

A flock, as defined in Regulation (EC) No 2160/2003, shall be an epidemiological unit.
"Flock" means all poultry of the same health status kept on the same premises or in the same
enclosure and constituting a single epidemiological unit; in the case of housed poultry; this
includes all poultry sharing the same airspace.

c) Structure and organisation of competent authorities

The State Veterinary Administration of the Czech Republic (hereinafter referred to as the
"SVA CR") is the central authority responsible for supervising and coordinating all
activities in the field of veterinary care. The SVA CR shall, in accordance with § 47 of Act
No 166/1999 concerning veterinary care and amending certain related laws, as amended
(Veterinary Act), enforce its powers in the entire territory of the Czech Republic and shall
coordinate activities of RVAs as well. The national monitoring programme is established on
the basis of § 48(1) and § 10 of Veterinary Act and with regard to Decree No 356/2004
concerning the monitoring of zoonoses and zoonotic agents and amending Decree No
299/2003 concerning measures for prevention and eradication of contagious diseases and
diseases communicable from animals to man.

The Ministry of Agriculture of the Czech Republic (hereinafter referred to as the "MA")
shall, in accordance with § 44(1)(a) of Veterinary Act, establish the principal trends and tasks
in the field of veterinary care and control their implementation and shall specify, on the basis
of animal health situation, compulsory preventive and diagnostic actions in accordance with
§ 44(1)(d) of Veterinary Act as well. Detailed rules are laid down by the "Methodology of
Animal Health Control and Ordered Vaccination" (hereinafter referred to as the
"Methodology"), approved by the MA and published in the Official Journal of the MA. The
SVA CR shall be, in accordance with the legislation in force (Veterinary Act), empowered to
perform supervision on all activities imposed by the Methodology; RVAs shall perform
supervision on activities of farmers and private veterinarians provided by the Methodology.

5. Official checks at other stages of the food chain

Microbiological checks at different stages of food chain shall be performed by the following
organisations:
In accordance with Act No 110/1997 concerning foodstuffs and tobacco products and amending and supplementing certain related laws, as amended, the SVA CR shall establish rules for regular microbiological monitoring of poultry carcases at slaughterhouses and during their further processing in establishments manufacturing meat products. Threshold value for poultry carcases: absence of *Salmonella* spp. in 25 g of pooled neck skin sample taken from carcases after chilling. In the case of positive results, slaughterhouse operators shall take all measures necessary for the improvement of hygiene conditions and check HACCP system at the same time.

In accordance with Act No 146/2002 concerning the Czech Agriculture and Food Inspection Authority and amending certain related laws, as amended, the Czech Agriculture and Food Inspection Authority (hereinafter referred to as the "CAFIA") shall perform checks on foodstuffs of plant origin at their production and placing on the market, as well as on trade in foodstuffs.

In accordance with Act No 20/1966 concerning public health care, as amended, Public Health Protection Authorities (authorities of the Ministry of Public Health) shall act in the field of catering. In the case of any suspicion on food-borne infection, they shall inform the SVA and CAFIA thereof.

6. Approved laboratories

Laboratories performing testing for *Salmonella* spp. within this programme shall be designated in accordance with Article 12 of Regulation (EC) No 2160/2003.

All samples taken in the framework of the control programme shall be tested only in approved laboratories. Testing in these laboratories is mandatory for samples taken by the operator and for official samples.

Samples taken within this programme shall be examined in laboratories of the State Veterinary Institutes (hereinafter referred to as the "SVIs"); activities of the laboratories shall be co-ordinated by the National Reference Laboratory (hereinafter referred to as the "NRL") and the laboratories shall be linked with the Information System of the SVA CR as well. The laboratories concerned are the following:

- SVI Prague – NRL
- SVI Jihlava
- SVI Olomouc
7. Examination of samples

Transport and preparation of samples

Samples shall preferably be sent by express mail, courier or transport service of SVIs to the laboratories referred to in Articles 11 and 12 of Regulation (EC) No 2160/2003, within 24 hours after collection. If not sent within 24 hours, they shall be stored refrigerated. Transportation can be at ambient temperature as long as excessive heat (over 25°C) and exposure to sunlight are avoided. At the laboratory samples shall be kept refrigerated until examination, which shall be started within 48 hours following receipt and within 96 hours after sampling.

a) The pairs of boot swabs and dust sample shall be carefully unpacked to avoid dislodging adherent faecal material or loose dust material and placed in 225 ml of BPW which has been pre-warmed to room temperature. The boot swab shall be fully immersed in BPW to provide sufficient free liquid around the sample for migration of salmonella away from the sample and therefore more BPW may be added, if necessary. Where five pairs of boot/sock swabs are pooled into two samples, each pooled sample must be placed in of 225 ml of BPW, or more if necessary. The sample shall be swirled to fully saturate it and culture shall be continued by using the detection method referred to in this programme.

b) The faeces samples shall be pooled and thoroughly mixed and a 25 g sub-sample shall be collected for culture. The 25 g sub-sample shall be added to 225 ml of BPW which has been pre-warmed to room temperature. The culture shall be continued by using the detection method referred to in this programme.

Detection method

The detection of the relevant Salmonella serotypes shall be carried out according to Amendment 1 of EN/ISO 6579-2002/Amd1:2007. “Microbiology of food and animal feeding stuffs – Horizontal method for the detection of Salmonella spp. – Amendment 1: Annex D: Detection of Salmonella spp. in animal faeces and in environmental samples from the primary production stage”.

The boot swabs samples, dust samples and other faecal material samples the incubated BPW enrichment broth for future culture may be pooled. To do so, incubate both samples in BPW. Take 1 ml of incubated broth from each sample and mix thoroughly, then take 0.1 ml of the mixture and inoculate the modified semi-solid Rappaport-Vassiliadis (MSRV) plates.
The samples in BPW must not be shaken, swirled or otherwise agitated after incubation as this releases inhibitory particulates and reduces subsequent isolation in MSRV.

**SEROtYPING**

At least one isolate from each positive sample shall be serotyped, following the Kaufmann-White scheme.

**Storage of strains**

At least one isolated strain of the relevant *Salmonella* serotypes from sampling as part of official controls per house and per year shall be stored for possible future phagetyping or antimicrobial susceptibility testing, using the normal methods for culture collection, which must ensure integrity of the strains for a minimum period of two years. If the competent authority decides so, isolates from sampling by food business operators shall also be stored for these purposes.

**8. Results and system of reporting**

Designated laboratory shall send results of examination of samples taken and sent within implementation of this programme to the relevant RVA; the copy thereof shall be sent to a farmer or a private veterinarian. The farmer must provide on request reports on examinations to the RVA.
The RVA shall record results of sampling in the Information System.
The SVI in Prague - NRL for *salmonellae* shall retrieve and summarise records on performed laboratory examinations for all laboratories in the Czech Republic monthly; summarised reports divided according to particular regions shall be provided to the SVA CR also monthly.

A breeding flock shall be considered positive for the purpose of ascertaining the achievement of the Community target, when the presence of the relevant *Salmonella* serotypes (other than vaccine strains) has been detected in one or more samples taken in the flock, even if the relevant *Salmonella* serotypes is only detected in the dust sample, or when the confirmatory sampling as part of official controls does not confirm the detection of relevant *Salmonella* serotypes but antimicrobials or bacterial growth inhibitors have been detected in the flock.
This rule shall not apply in exceptional cases where the initial Salmonella positive result from sampling at the initiative of the food business operator has not been confirmed by the sampling as part of official controls.

A positive breeding flock shall only be counted once regardless of how often the relevant Salmonella serotypes has been detected in this flock during the production period or whether the sampling was carried out at the initiative of the food business operator or by the competent authority. However, if sampling during the production period is spread over two calendar years, the result of each year shall be reported separately.

Reporting shall include:

- A detailed description of the options implemented for the sampling scheme and the type of samples taken, as appropriate;
- The total number of adult breeding flocks comprising at least 250 birds which were tested at least once during the year of reporting;
- The results of the testing including:
  - the total number of breeding flocks positive with any Salmonella in the Member State;
  - the number of breeding flocks positive with at least one of the relevant Salmonella serotypes;
  - the number of positive breeding flocks for each Salmonella serotype or for Salmonella unspecified (isolates that are untypeable or not serotyped);
- The number of cases where the initial Salmonella positive sample from sampling at the initiative of the food business operator was not confirmed by the sampling as part of official controls;
- Explanations of the results, in particular concerning exceptional cases.

9. Official controls at the level of feedingstuffs

Supervision on foodstuffs in the Czech Republic shall be performed by the following organisations:

- State Veterinary Administration of the Czech Republic (SVA CR);
- Central Institute for Supervising and Testing in Agriculture (CISTA);
- Institute for the State Control of Veterinary Biologicals and Medicaments (ISCVBM).
Official controls on feed safety (where the production and placing on the market of feedingstuffs are concerned) shall be performed by the CISTA, in accordance with Act No 9/1996 on feedingstuffs, as amended.

The SVA CR performs, by means of the relevant RVA, examination of feedingstuffs intended for farm animals for the detection of salmonella, in accordance with Regulation (EC) No 1774/2002. The relevant RVA shall take samples in establishments producing compound feedingstuffs; samples of finished feedingstuffs before dispatch shall be taken, at a volume proportionate to the manufacturer’s throughput.

The ISCVBM shall perform official controls on medicated feedingstuffs.

10. Official controls at other stages of food chain

The SVA CR shall perform monitoring on the presence of salmonella at poultry slaughterhouses. 15 neck skin samples shall be taken there monthly by a person specifically trained for the purpose.

11. Measures taken following the detection of S. enteritidis and/or S. typhimurium in faecal samples

a) Measures taken following the detection of S. enteritidis and/or S. typhimurium in faecal samples taken by a farmer

In the case of the presence of S. enteritidis, S. typhimurium in faecal samples taken by a farmer, an official sampling shall be performed by an official veterinarian from the RVA in each positive flock, in order to exclude false positive initial result from the sample taken by operator. The confirmation method shall be carried out according to Annex II, D, 4 (b) (i) of Commission Regulation No 2160/2003. The confirmation method will be based on the technical specifications referred to in Article 5 of Commission Decision 2004/665/EC (seven samples);

The confirmatory sampling shall be performed as follows:
- 5 pairs of boot swabs (1 pair = 1 sample);
- 2 dust samples collected from multiple places throughout the house (2 x 250 ml)

A sub-sample, weighting 25 g and prepared from each faecal and dust sample, shall be used for the analysis; all samples shall be analysed separately.
In the case of a suspicion on the presence of inhibitory substances, the laboratory shall perform a confirmatory test, in order to exclude the use of antibiotics likely to affect the results of the confirmatory analysis.

Pending the completion of the confirmatory examination, the RVA shall impose at least the following measures:

- bacteriological analysis of feeds and water, if necessary, for the detection *Salmonella spp.*;
- in the case of a positive result of the detection of *S. enteritidis* and/or *S. typhimurium*, hatching eggs shall be suspended pending the completion of the confirmatory analyses;
- a thorough mechanical cleansing and disinfection of the house, as well as other premises (e.g. stores of feeds and litter), shall be performed. A thorough mechanical cleansing of hails and technologies, followed by disinfection and safe disposal of faeces or litter shall be performed on completion of each production cycle.

In the case of a negative result of the confirmatory examination the flock shall be considered negative.

b) Measures taken in the case of positive official samples and positive confirmatory examinations for *S. enteritidis* and/or *S. typhimurium*.

The RVA shall perform an epidemiological investigation in the holding, aimed at the detection of the possible source of the infection and shall impose at least that:

a) Bacteriological examination of feeds and water for the detection *Salmonella spp.* is performed, if necessary;

b) All birds, including day-old chicks, in the positive flock must be slaughtered or destroyed so as to reduce as much as possible the risk of *Salmonella* spreading. Slaughtering must be carried out in accordance with Community legislation on food hygiene. By-products derived from such birds and not intended for human consumption, must be disposed in accordance with Regulation (EC) of the European Parliament and of the Council No 1774/2002 laying down health rules concerning animal by-products not intended for human consumption;

c) Non-incubated eggs must be destroyed;
d) Where eggs for hatching are still present in a hatchery, they must be destroyed or treated in accordance with Regulation (EC) of the European Parliament and of the Council No 1774/2002;

e) After slaughtering or destruction of birds from infected flocks, a thorough cleansing and disinfection, as well as disposal of faeces or litter, must be performed in accordance with the instructions of the relevant RVA;

f) The relevant RVA performs the supervision on the efficacy of the disinfection carried out by the farmer; the checks on the efficacy of the disinfection shall be performed by means of bacteriological testing of swabs, in accordance with the method specified by the NRL;

g) All other flocks at the holding are officially sampled.

12. Use of antimicrobials

- Use of antimicrobials shall be governed by Regulation (EC) No 177/2006;

- Only antimicrobials registered by the Institute for the State Control of Veterinary Biologicals and Medicaments (hereinafter referred to as the "ISCVBM") may be used for the treatment;

- Antimicrobials may be used only after the authorisation by and under the supervision of the relevant RVA and they may be applied only in poultry showing clinical signs of the disease suggesting that an excessive suffering of the birds could occur. Results of bacteriological examination and anti-microbial susceptibility test must be available prior to the treatment;

- In exceptional cases, antimicrobials may be applied prior to the results of bacteriological examination and anti-microbial susceptibility test are available, provided that samples are taken by the official veterinarian prior to the application;

- Requirements for the use of antimicrobials shall not apply to substances, microorganisms, and preparations authorised as feed additives pursuant to Article 3 of Regulation (EC) No 1831/2003 of 22 September 2003 on additives for use in animal nutrition (e.g. probiotics, acidifiers).
13. Vaccination

Vaccines shall be selected by the private veterinarian in charge, provided that the following conditions are complied with:

a) Vaccination of poultry against Salmonella enteritidis shall be obligatory within this programme.

b) Vaccines used must have valid registration issued by the ISCVBM Brno and must comply with requirements of Commission Regulation (EC) No 1177/2006. Dosage, application method and use in various age categories are established by the vaccine manufacturer. Live attenuated vaccines against salmonellas may not be used within the National Programme unless the manufacturer provides adequate method for distinguishing between “field” and vaccination strains.

c) According to this programme, vaccination of pre-laying pullets shall be performed during their rearing period, so as to the vaccination and re-vaccination are completed prior to the planned start of their laying period.

d) Live attenuated vaccines may not be used in laying hens during the laying period.

e) Live attenuated vaccines may not be used during moulting before the next producing period.

f) Vaccination of poultry for export is not obligatory. Farmers shall not be reimbursed (by state) the costs connected with vaccination and revaccination of poultry intended for export.

14. Compensations for farmers

Farmers shall be reimbursed (by state) the costs connected with vaccination and revaccination against salmonelloses (i.e., the price of vaccine used).
Farmers shall be reimbursed the costs and losses arisen in connection with performance of emergency veterinary measures in accordance with § 67, § 68, § 69 and § 70 of Veterinary Act.

15. Instructions for good farming practice

Hygiene management in holdings:
Farmers shall draw up and comply with sanitation rules for their holdings, keep records on all disinfections and preventive actions performed. The sanitation rules must include checks on efficacy of disinfection, as well as on other preventive measures:
Operation rules covering all farming procedures from day-old chicks to the dispatch of birds to a slaughterhouse must be drawn up for all holdings with breeding flocks. Records pursuant to Breeding Act must be kept in all holdings.
In order to implement the principles of good farming practice properly, it is necessary to apply "all in/all out" system. Mechanical cleansing of halls and technologies, followed by subsequent efficient disinfection, disinsectisation and rat extermination, shall be performed on completion of each production cycle.
The relevant RVA shall perform the supervision on efficacy of disinfection carried out by farmers.

16. Routine veterinary supervision on holdings

In accordance with Act No 166/1999, as amended, farmers are responsible for animal health. Routine veterinary supervision shall be performed by a private veterinarian.

17. Registration of holdings

Each holding keeping breeding flocks shall be assigned, by the entrusted person, by a registration number of the holding, and all farmer’s records shall be kept in accordance with Breeding Act and Decree No 136/2004, as amended.
18. Record keeping in poultry holdings

Record keeping in holdings shall be performed in accordance with Regulation (EC) No 852/2004. Such records must include at least the following information:

- The date of receipt of the poultry;
- The origin of the poultry;
- The number of the poultry;
- Performance data;
- Death rate;
- Feed suppliers;
- Types and duration of the use of feed additives, withdrawal periods;
- Monitoring of feed and water intake;
- Performed examinations and diagnoses established by the veterinarian in charge, together with results of laboratory testing, if necessary;
- Types of medicaments used (in particular antimicrobials), start and end of application thereof;
- The date of vaccination and the type of vaccine used;
- Results of all previous health checks of poultry from the flock concerned;
- The number of birds intended for slaughtering;
- Estimated date of slaughtering;
- The date of slaughtering and results thereof (back report from the slaughterhouse on veterinary examination);
- Results of checks on disinfection efficacy;
- Results of routine sampling of poultry feeds and water for the purpose of checks on compliance with withdrawal periods;
- Results of checks for the detection of salmonellae performed in accordance with the requirements of Regulation (EC) 2160/2003 of the European Parliament and of the Council, i.e. the National Programme.
19. Documents accompanying animals

Within a region, a farmer shall hand over to a consignee (in the case of another holding) written information on results of laboratory testing of the flock for monitored *Salmonella* serotypes, i.e. the date of the last sampling and its results, as well as the results of all testing of the flock concerned (positive/negative).

Veterinary certificate for the movement of animals intended for further keeping outside the territory of a region, or food chain information for the movement of animals for slaughtering (or health attestation) must contain, in addition to other data, the results of all laboratory testing of the flock for monitored *Salmonella* serotypes performed during the life cycle of the flock (negative/positive), as well as the date of the last sampling and its results.

In the case of intra-Community trade, a consignment of animals must be accompanied by a veterinary certificate pursuant to Commission Regulation (EC) No 599/2004 of 30 March 2004 concerning the adoption of a harmonised model certificate and inspection report linked to intra-Community trade in animals and products of animal origin.

20. Other measures for the traceability of animals

Each flock must have an unique identification. The identification shall consist of the registration number of the holding and the identification of the flock; e.g. in the following format: "CZ 12345678-02/2009". More flocks may be placed in the same hall during one year, however, such flocks must bear different numbers; e.g. 02/2009 and 06/2009. Farmers shall be responsible for the proper identification of flocks.

The identification of a flock must be indicated in application form for laboratory examination, in the relevant documents accompanying the animals at their movement, and in all other records.
CZ: Annex of National Salmonella Control Programme (SCP) in breeding flocks of Gallus Gallus applied from 1 January 2010

1) Frequency of sampling

2) Reporting of results

We confirm that reporting of results in the control programme is in accordance with Commission Regulation (EC) 1003/2005. Annual report includes total number of breeding flocks tested in the framework of SCP and total number of breeding flocks infected with 5 targeted serotypes of Salmonella spp. All other serotypes are reported too. The breeding flock is considered as infected with Salmonella enteritidis and Salmonella typhimurium when the presence of Salmonella is detected in official sample or when the initial positive result of operator sampling is confirmed by positive result of official sample taken in order to exclude the false positive result of operator sampling. The confirmation method is based on technical specifications referred to in Article 5 of Commission Decision 2004/665/EC (5 pooled faeces samples and 2 pooled dust samples separately analysed).

Possible false positive result of operator sampling must be excluded by positive result of official sampling. In compliance with national legislation the emergency veterinary measures can be imposed only when suspicion of presence of the contagious disease is confirmed by positive results of official sampling. The farmer can ask for a compensation of costs and losses only in consequence of emergency veterinary measures.

4) Production of feed

As regards production and placing on the market of feedingstuffs official controls on feed safety are performed by the CISTA (Central Institute for Supervising and Testing in Agriculture), in accordance with Act No 91/1996 on feedingstuffs, as amended.

The feedingstuffs are produced mainly in specialised firms and bought by farmers.
