The European Union and its Member States (EUMS) would like to submit the following comments:

3.1 Bifenthrin (178)

JMPR confirmed in its response that the MRL is indeed not safe and that there are no alternative GAPs. In the report of the 43rd session of the CCPR it is noted that: "Due to the short term intake concern identified by JMPR, the Committee decided to retain the proposed draft MRL for strawberry at step 4, awaiting data from the manufacturer to support a review of alternative GAP by JMPR in 2014." The EUMS agree with this decision.

3.2 Indoxacarb (216)

JMPR confirmed that there was insufficient data to recommend a MRL based on an alternative GAP for indoxacarb on leafy lettuce. Hence the EUMS are seeking the revocation of the original MRL of 15 mg/kg which is based on EU use.

**Haloxyfop (194)**

The EU submitted a concern form in 2011 on the basis of consumer risks but JMPR has not yet responded to this concern. The EU is requesting JMPR to review this concern due to the exceedance of the ADI driven mainly by the consumption of milk from cattle ingesting feeds containing residues of Haloxyfop. Until this can be clarified the EU is unable to incorporate this CXL into the EU legislation.
