GUIDANCE DOCUMENT FOR COMPETENT AUTHORITIES FOR THE CONTROL OF COMPLIANCE WITH EU LEGISLATION ON:

and

WITH REGARD TO METHODS OF ANALYSIS FOR DETERMINATION OF THE FIBRE CONTENT DECLARED ON A LABEL

IMPORTANT DISCLAIMER

"This Document has no formal legal status and, in the event of a dispute, ultimate responsibility for the interpretation of the law lies with the Court of Justice"

Note

This document is an evolving document and will be updated to take account of the experience of the competent authorities or of information provided
1. INTRODUCTION

1.1 Scope of this guidance
This document has been prepared to provide guidance to Member States' control authorities and food business operators on the methods of analysis for determination of the fibre content declared on a label with respect to the nutrition labelling or declaration.

1.2 Definition of fibre
The term 'fibre' was defined by Commission Directive 2008/100/EC of 28 October 2008\(^1\) amending Council Directive 90/496/EEC\(^2\) on nutrition labelling for foodstuffs as regards recommended daily allowances, energy conversion factors and definitions as:

'fibre' means carbohydrate polymers with three or more monomeric units, which are neither digested nor absorbed in the human small intestine and belong to the following categories:

- edible carbohydrate polymers naturally occurring in the food as consumed;

- edible carbohydrate polymers which have been obtained from food raw material by physical, enzymatic or chemical means and which have a beneficial physiological effect demonstrated by generally accepted scientific evidence;

- edible synthetic carbohydrate polymers which have a beneficial physiological effect demonstrated by generally accepted scientific evidence."

This definition has been included in Annex 1 of Regulation 1169/2011/EU\(^3\) on the provision of food information to consumers. Regulation 1169/2011/EU will apply from 13 December 2014 and at the same time Directive 90/496/EEC will be repealed.

Furthermore, Commission Directive 2008/100/EC specifies additional information in the following recitals concerning the definition of fibre:

"(5) Fibre has been traditionally consumed as plant material and has one or more beneficial physiological effects such as: decrease intestinal transit time, increase stool bulk, is fermentable by colonic microflora, reduce blood total cholesterol, reduce blood LDL cholesterol levels, reduce post-prandial blood glucose, or reduce blood insulin levels. Recent scientific evidence has shown that similar beneficial physiological effects may be obtained from other carbohydrate polymers that are not digestible and not naturally occurring in the food as consumed. Therefore it is appropriate that the definition of fibre should include carbohydrate polymers with one or more beneficial physiological effects.

(6) The carbohydrate polymers of plant origin that meet the definition of fibre may be closely associated in the plant with lignin or other non-carbohydrate components such as phenolic compounds, waxes, saponins, phytates, cutin, phytosterols. These substances when closely associated with carbohydrate polymers of plant origin and extracted with the carbohydrate polymers for analysis of fibre may be considered as fibre. However, when separated from the carbohydrate polymers and added to a food these substances should not be considered as fibre."

2. METHODS OF ANALYSIS FOR FIBRE

\(^1\) OJ L 285, 29.10.2008, p. 9–12
\(^2\) OJ L 276, 6.10.1990, p. 40–44
\(^3\) OJ L 304, 22.11.2011, p. 18-63
The definition of fibre gives a chemical definition of materials that can be considered as fibre (carbohydrate polymers with three or more monomeric units) and the physiological criteria of being neither digested nor absorbed in the human small intestine. A number of substances fall within this definition. Such edible substances that are naturally occurring in the food as consumed are considered as being fibre. Edible substances meeting the chemical and physiological criteria of the definition which have been obtained from food raw material by physical, enzymatic or chemical means or which are produced synthetically and that have a beneficial physiological effect demonstrated by generally accepted scientific evidence are considered as being fibre as well.

In the scientific literature, a number of suitable analytical methods which can be used to determine fibre substances in food have been described. The analysed content would serve as the basis for nutrition labelling of fibre. The adopted definition of fibre encompasses a large and heterogeneous group of substances for which there is currently no single method of analysis available, therefore, a number of methods to determine the fibre content of foods have been identified.

The Codex Alimentarius Commission, at its 34th session in 2011, adopted a list of methods of analysis of dietary fibre. This list serves as a basis for the methods included in this guidance document.

Table 1 summarises the methods of analysis for fibre. Section 1 of the table includes 2 general methods that measure both the higher (monomeric units >9) and the lower molecular weight fraction (monomeric units ≤9) of fibre and are therefore closer to the definition of fibre than the general methods listed in section 2 of the table that do not include the lower molecular weight fraction (monomeric units ≤9) of fibre. Therefore, if methods of analysis of section 2 of the table are used and the measured value is lower than the declared value, taking into account analytical variation and the tolerances around fibre determination, the possibility that the underestimation of the amount due to a method that does not cover monomeric units between 3 and 9, or higher molecular weight soluble fibres that do not precipitate in alcohol, should be considered.

Section 3 of the table lists methods of analysis for individual specific components. If general methods are combined with methods that measure individual specific components, some fibre components may be measured in more than one method, and this double accounting should when possible be correlated when combining the analytical results.

Section 4 lists other methods that have not been subjected to interlaboratory evaluation under Association of Official Analytical Chemists (AOAC) international guidelines.

**Member States are responsible for ensuring conformity with the definition of fibre as a whole and in particular concerning components not naturally occurring in the food as consumed.**
