Abstract
Do people put their pension savings on the table to promote sustainability? We answer this question in a large-scale field experiment (n = 3,256). The pension fund in our study gave its members a real vote for more or less sustainable investments. A comparison group made the same decision, but hypothetically. We find that 66.7% of the participants favor to invest their pension savings in a more sustainable manner. This choice is driven by social preferences. As a result of these strong social preferences, we find no difference between the real and hypothetical treatment groups. Neither financial beliefs, confusion, nor a lack of information serve as explanation. Institutional investors benefit from taking their clients’ social preferences seriously, with consequences for asset prices and the fulfillment of the United Nations Sustainable Development Goals.

Keywords: field experiment, social preferences, socially responsible investments, sustainable finance, experimental finance

1 Introduction

People often claim to behave in a sustainable manner, but do not back their talk by action. They state to care for animal well-being but buy the cheapest meat in the supermarket (Klink and Langen, 2015). The hypothetical gap is the difference between what people say they do and what they actually do. It is the difference between stated preferences and revealed preferences (List and Gallet, 2001; Carson et al., 2006; Harrison, 2006a; Beshears et al., 2008). We compare sustainable investment decisions with real consequences to hypothetical decisions. Sustainable investments grew in importance over the last years. They comprise more than a quarter of the assets under management worldwide (McKinsey, 2017). The implementation of the 2015 United Nations Sustainable Development Goals further illustrates the societal relevance of sustainable behavior. Consequently, sustainable investment behavior has attracted increased attention from academics (e.g. Hong and Kostovetsky 2012; Krüger 2015; Bialkowski and Starks 2016; Barber et al. 2018; Riedl and Smeets 2017; Hartzmark and Sussman 2018; Krüger et al. 2018).

Understanding why people invest sustainably is not only important to academics, but also to institutional investors who often invest on behalf of individuals. Pension funds alone hold more than half of all assets under management (Willis Tower Watson, 2018). How should pension funds manage their fiduciary duty regarding sustainable investments? How should they decide on behalf of their clients? The European Commission installed a High-Level Expert Group on Sustainable Finance in 2017. On the basis of the experts’ proposal, the Commission intends to introduce a formal requirement that "Investment firms... [should ask retail investors] about their preferences for sustainable investments." We provide a scientifically valid method to elicit these preferences. We conducted a large-scale field experiment (n = 3,256) in cooperation with a Dutch pension fund which had 18.7

(2004); Harrison (2006b); Vermeir and Verbeke (2006); Beshears et al. (2008); Harrison and Rutström (2008); Gracia et al. (2011); FeldmanHall et al. (2012); De-Magistris et al. (2013); Terlau and Hirsch (2015); for an overview see Harrison (2006b); Loomis (2014); for a meta-study see List and Gallet (2001); Murphy et al. (2005).

2 The gap between what people say and what they do has received various names next to the hypothetical gap, namely: the hypothetical bias, the intention-behavior gap, the attitude-behavior gap, normative vs revealed preferences, the value-action gap, the judgment-action gap, or the green gap (without claiming completeness). In this paper, we will refer to it as hypothetical gap.

3 Examples for findings of a hypothetical gap outside the economics literature are Rhodes and de Bruijn (2013) who find a gap between the intention to engage in physical activity (hypothetical) and actual engagement (see also Jennings et al. 2015; Osman and Wiegmann 2017). John et al. (2012) report a gap between reported and actual questionable medical research practices. And the question of moral decision-making has led psychologists and moral philosophers to study the gap between hypothetical and real choices. The judgment-action gap thereby describes the difference between what people say they do when being confronted with a moral decision and what they actually do. FeldmanHall et al. (2012) show that real moral decisions can substantially differ from hypothetical moral decisions.

4 McKinsey (2017) reports that investments according to environmental, social, and governance principles are growing by an annual rate of 17%. In the United States, sustainable investments account for over a third and in Europe for half of all assets (JP Morgan, 2018).

5 According to an estimate by Willis Tower Watson (2018), pension funds worldwide hold USD 45 trillion assets under management.

billion euros of assets under management in 2016. This defined-benefit pension fund invests on behalf of its members. As part of our experiment, the board of the pension fund gave its members a real vote on its future sustainable investment strategy. Participants faced the choice of more or less sustainable investments. The board guaranteed that it will implement the outcome of the voting. Pension savings of the members are at stake, so the choice is relevant. We told participants that sustainable investments not only focus on financial returns but also on societal returns. Our experiment had different treatments. Next to the real choice, another group made a hypothetical choice which was identical, but without consequences.

Our experimental design has three key advantages. First, the consequential vote with only two choices makes our experiment incentive-compatible (Cummings et al., 1995, 1997; Harrison, 2006a; Carson and Groves, 2007). We are not aware of any pension fund that gave its members a consequential vote on the investment strategy of the whole pension plan. Second, the political preferences of our sample are close to the outcome of the last national election in the Netherlands. This is important, because it assures that our sample did not overrepresent voters in favor of sustainable investing (like supporters of the Green Party or the Animal Party), nor underrepresent voters of parties known to be skeptical about sustainability. Third, we published a pre-analysis plan of our study at the Open Science Framework, in which we specified our measures, sampling procedure and analyses.

We find that 65.4% of participants in the hypothetical treatment favor to invest their pension savings more sustainably. Only 9.6% are against it and 25.0% do not have an opinion. Strikingly, hypothetical answers do not differ from real answers. In the real treatment, 67.9% are in favor of investing more sustainably. We also find no difference among those who are against the sustainable expansion (Real: 10.8%; Hypothetical: 9.6%) and a very small difference among those with no opinion (Real: 21.2%; Hypothetical: 25.0%).

Why do we not find a hypothetical gap? We explore three possibilities. First, participants might expect sustainable investments to financially outperform conventional investments and would thus choose more sustainable investments regardless of their treatment. Second, participants could have strong social preferences in favor of sustainable investments in which case hypothetical and real choices would be the same. Take a vegan who chooses a vegetable dish over meat in both a hypothetical and real setting. Third, subjects might have been confused or did not take their real choice seriously. This would render the real choice to be of mere hypothetical nature.

---

8 A choice set with more than two choices opens the door for strategic voting. Imagine a person has to choose from three options A, B, and C and the option chosen by the majority will be implemented. Further imagine the person’s preferences to be \( A \succ B \succ C \). If she expects that option A will be chosen by only very few people, it can be optimal for her to pick option B to at least avoid option C. This would however imply that she did not pick the option which maximized her utility. Therefore, the choice is not incentive-compatible.
9 The lacking incentive-compatibility of stated preferences can be of serious concern as it opens the door for interfering answering motives such as socially desirable answering (e.g. Lusk and Norwood 2009; Grimm 2010; Norwood and Lusk 2011; Klink and Langen 2015).
10 Several studies show that political preferences are a valid proxy for social preferences: Fisman et al. (2017); Kerschbamer and Müller (2017); Almãs et al. (2016); Cohn et al. (2018).
We show that financial beliefs do not drive the choice for more sustainability through two key findings. First, we find a majority voting for the more sustainable option even among those who should be least likely to vote in favor, specifically subjects who expect lower financial returns with more sustainable investments and subjects who are uncertain about the returns. Second, a substantial fraction of participants in the real treatment are willing to give up financial returns in order to invest more sustainably. This question was asked directly after their vote and thus should have made respondents more reluctant to state that they are willing to accept lower returns as they knew that their choice might be implemented. Much rather, we find strong social preferences to drive the choice for more sustainable investments. First, a validated measure of social preferences (Falk et al., 2016) is positively related to the choice for more sustainable investments. Second, we find that people who voted for a political party with a stronger sustainability agenda are more likely to support more sustainable investments by the pension fund. Third, the choice for sustainable investments is not influenced by different defaults. The absence of default effects is another sign of strong preferences. Expectations on the financial performance do not drive our results. We also show that confusion or lack of information do not drive our results.

Our paper makes three main contributions. First, we contribute to the discussion on sustainable investing. Previous findings show that investors value sustainability in their investment decisions (Bollen, 2007; Hong and Kostovetsky, 2012; Barber et al., 2018; Hartzmark and Sussman, 2018). Yet, these aggregate-level studies cannot inform institutional investors how to invest on behalf of their clients. The data do not show what fraction of individuals has strong social preferences. Riedl and Smeets (2017) use individual-level data to show that sustainable investors indeed have strong social preferences. However, in their study individuals invest on their own behalf and their investment decisions cannot simply be generalized to a setting of delegated portfolio management. In particular, if people’s pension is at stake, choices could be very different. We show that social preferences play an important role in delegated investment decisions. Pension fund members are even willing to forego financial returns to invest in a sustainable manner.

Second, we add to the literature on the hypothetical gap. In contrast to most of this literature, we find no hypothetical gap (e.g. Brown et al. 1996; List and Shogren 1998a; Loomis et al. 2009). Previous papers identify different factors that contribute to the existence of a hypothetical gap, such as socially desirable answering (e.g. Lusk and Norwood 2009; Grimm 2010), certainty of choices (Champ et al., 1997; Ethier et al., 2000; Champ and Bishop, 2001), trust (Terlau and Hirsch, 2015), the perceived effectiveness of one’s own choice (Kollmuss and Agyeman, 2002; Fowler III and Close, 2012; Salomon et al., 2017; Berger and Corbin, 1992), the seriousness of the task (De-Magistris et al., 2013), or whether people feel responsible (Blake, 1999). We show that it is also crucial to measure the strengths of people’s preferences. If these preferences are weak, a hypothetical gap is more likely to arise than with strong preferences.

Two of the main drivers responsible for the status quo bias are loss aversion and regret avoidance (Samuelson and Zeckhauser, 1988; Kahneman et al., 1991; Tversky and Kahneman, 1991; Feldman et al., 1999; Nicolle et al., 2011) which should especially matter for choices with real consequences.
In our case, the absence of the hypothetical gap in sustainable behavior can be explained by strong social preferences.

Third, we contribute to a growing stream of literature on social preferences in the field (e.g. Frey and Meier 2004; Gneezy and List 2006; List 2006; Gneezy et al. 2010; DellaVigna et al. 2012; Andreoni et al. 2017; Kessler et al. 2018). Specifically, we study how pension funds should deal with the social preferences of their clients. It has become commonplace to acknowledge the influence of time preferences on retirement decisions (O’Donoghue and Rabin, 1998; Carroll et al., 2009; Beshears et al., 2014; Goda et al., 2015). Similarly, several studies show how to elicit risk preferences of pension fund participants (Donkers et al., 2012; Alserda et al., 2016). However, social preferences are not yet considered (EUROSIF, 2016, p. 82). Investment managers often fear that this is too difficult and too costly. Such concerns could lead to a poor execution of the European Commission’s directive. We show a simple, validated way to elicit preferences for sustainable investments. If pension funds take these preferences seriously, this can have a large economic and societal impact.

2 The experimental design

In June 2018, we invited 49,552 active members of Pensioenfonds Detailhandel to participate in our online survey. The survey consisted of three parts. Part 1 briefly familiarized all respondents with the concept of sustainable investments and introduced the United Nations Sustainable Development Goals (SDGs). You can find the instructions and questions we use in Appendix B. In Part 2, we introduced our 2x2 between-subjects experimental design (see Table 1). Respondents were randomly assigned to one of four groups and were unaware of the existence of other treatment groups. The 2x2 design comprised the dimensions (real choice vs hypothetical choice) x (3 SDG default vs 4 SDG default). We explain these treatments in more detail below. Part 3 elicited social preferences and financial return expectations regarding sustainable investments. Further, we asked respondents to provide information on their gender, age, and education; on their financial background; and on their voting behavior in the 2017 Dutch national elections. Part 3 was identical across all treatments.

In Part 1, respondents learned that they would decide on the sustainable investment strategy of their pension fund. The exact framing of the decision depended on the respective treatment

---

13 See, for example, a statement by the BVI, a German investment fund association representing asset managers with over EUR 3 trillion assets under management (https://www.bvi.de/fileadmin/user_upload/Regulierung/Positionen/2018_06_21_BVIs_view-MiFID_II_sustainability_requirements.pdf).

14 For more information, see https://www.un.org/sustainabledevelopment/sustainable-development-goals.
2 The experimental design

Importantly, all respondents learned, irrespective of their treatment, that they would have to state whether their pension fund should focus on three or four Sustainable Development Goals (SDGs). We explained that investing according to an SDG meant that the Pension fund would engage with the companies’ board to assure that the company’s policy and actions are aligned with the respective SDG. We told them that in 2017 Pensioenfonds Detailhandel had spoken with a total of 246 corporate boards to promote sustainability. In addition, we gave them several examples of earlier SDG engagement by the Pension Fund. We explicitly pointed out that focusing on four SDGs would result in more sustainable investment activities than focusing on three SDGs.

3 SDG default vs 4 SDG default

The first dimension of our 2x2 design consists of the difference between a 3 SDG default and a 4 SDG default. Staying with the default option is a widely found phenomenon, also called the status quo bias (e.g., Samuelson and Zeckhauser 1988; Tversky and Kahneman 1991). Two of its main drivers are loss aversion and regret avoidance (e.g., Samuelson and Zeckhauser 1988; Kahneman et al. 1991; Tversky and Kahneman 1991; Feldman et al. 1999; Nicolle et al. 2011) which are significantly more important to respondents in the real treatment than to those in the hypothetical treatment. With the introduction of different defaults, we can account for differences in the status quo effect on real and hypothetical choices.

In the 3 SDG default treatment, we told participants that the pension fund currently focuses on three SDGs, namely: ‘Climate action’, ‘Decent work and economic growth’, and ‘Peace, justice, and strong institutions’. Participants were then introduced to the fourth SDG ‘Responsible consumption and production’. They could choose:

"Do you want Pensioenfonds Detailhandel to add the fourth sustainable development goal ‘Responsible consumption and production’?

a. Yes, add
b. No, do not add
c. I have no opinion regarding this matter"

In the 4 SDG default treatment, we told participants that the pension fund’s future policy will include four SDGs ‘Climate action’, ‘Decent work and economic growth’, ‘Peace, justice, and strong institutions’ and ‘Responsible consumption and production’. Participants could then decide:

"Do you want Pensioenfonds Detailhandel to leave out the fourth sustainable development goal ‘Responsible consumption and production’?

a. Yes, leave it out
b. No, do not leave it out
c. I have no opinion regarding this matter"
Importantly, the question of interest—whether Pensioenfonds Detailhandel should focus on three or on four SDGs—was the same for all four treatments except for the words ‘add’ or ‘leave out’. Respondents could either choose to add (3 SDG default) or to leave out (4 SDG default) the fourth SDG. In addition, respondents always had the answer option ‘No opinion’.

**Hypothetical vs Real**

The second dimension of our 2x2 design consists of the difference between hypothetical vs real choices. Participants of the real treatment learned:

“[...] **Your choice counts. If the majority** of respondents chooses to add (leave out) the fourth sustainable development goal, it will happen. The board of Pensioenfonds Detailhandel guarantees its implementation.”

In this treatment, we explicitly stress the two key characteristics of their consequential choice: (1) their vote counts and (2) the board guarantees that the majority vote will be implemented.

Both these elements are absent in the hypothetical treatment as participants learned:

“[...] Pensioenfonds Detailhandel is genuinely interested in your opinion and may take the results of the survey into account when making a decision.”

We chose the wording “may take into account” as it signals interest while it is clearly not consequential. Consider the following example: John calls his wife and asks her “My dear, where do you want to go for holiday next summer? I am genuinely interested in your opinion and might take your answer into account when booking the flights.” Our participants understood the difference between the hypothetical and real choice as 86.0% in the real and 88.1% in the hypothetical treatment (difference: p-value = 0.0698) correctly answered the following comprehension question (see Question 2 in Appendix D and E):

"If a majority chooses ’Yes, add’ (’Yes, leave it out’), Pensioenfonds Detailhandel... a. guarantees to add (leave out) ’Sustainable consumption and production’ to (of) its socially responsible investment policy as the fourth Sustainable Development Goal. The Board of Pensioenfonds Detailhandel has decided to implement the outcome of this vote. b. cannot guarantee that it will add (leave out) ’Sustainable consumption and production’ to (of) its socially responsible investment policy as the fourth Sustainable Development Goal but may include the results of the survey in its choice.”
The correct answer depended on whether the participant was in the hypothetical (b. is correct) or in the real treatment (a.). In case, the participants incorrectly answered the question, they were made aware of their misperception.

Everything besides the necessary information within each treatment group was exactly the same. The 2x2 design therefore allows us to directly capture the effect of consequentiality on the subject’s choices by taking into account their status quo. The binary nature of the choice is essential as it assures incentive compatibility (see Cummings et al., 1995; 1997; Harrison, 2006a; Carson and Groves, 2007). Providing participants with multiple options, like choosing between adding different SDGs, would have introduced incentives for strategic voting (see Arrow’s impossibility theorem; Arrow 2012). For example, if participants expect that it is unlikely that their first best choice will get a majority vote, they can strategically vote for the second-best option.

3 The data

3.1 The participants

Participants in our study are members of Pensioenfonds Detailhandel, a large Dutch pension fund. The Dutch state requires employees to save for their pension. It is mandatory for participants to contribute to the pension fund through their current employer. Of the invited 49,552 participants, 3,256 (6.6%) answered the question on whether to add or leave out the fourth Sustainable Development Goal and 2,429 (4.9%) completed the survey which took on average 15.3 minutes. Table A.2 presents summary statistics of the respondents. The sample consists of 61.5% women and 38.5% men, with an average age of 46.4 years. Slightly less than a third have a university degree or a degree from a university of applied sciences (29.4%). The average monthly net household income is 2,868 Euro.

Table A.3 shows that our randomization into the real and hypothetical choice treatments worked. We do not find any significant differences between the treatment groups regarding their preferences, demographic characteristics and financial background.

3.2 Representativeness of our sample

Surveys face the risk of a biased response sample. This is of special concern in a setting like ours, where the topic is sustainable investing and people with stronger social preferences might be more likely to participate in the survey. Yet, our sample is fairly representative of the invited population. Our sample contains slightly fewer women (61.5% vs 66.5%) and is slightly older (46.4 years compared to 42.6 years). The yearly income in our sample is 25,832 euro compared to 24,295 euro in the invited sample. As we show below, men, older people, and people with a higher income are less likely to expand sustainable investing. Hence, these differences go against our findings and thus cannot explain our results.
3.2 Representativeness of our sample

Second, we tested whether participants in our study have stronger social preferences than non-respondents, which would likely result in an upward bias in the support for more sustainable investing at the pension fund. We therefore asked participants to provide information on whether they voted in the Dutch national elections in 2017 and, in case they did, to name the party they voted for. Voting behavior is a good proxy for social preferences, because the relation between social preferences and voting behavior has been well-established. Fisman et al. (2017) show that equality-focused subjects were more likely to vote for Barack Obama in 2012 and are also more likely to be affiliated with the U.S. Democratic Party. Kerschbamer and Müller (2017) find that social preferences predict political attitudes. Almås et al. (2016) find conservatives to systematically accept a higher level of inequality than non-conservatives. Hong and Kostovetsky (2012) show that U.S. investment managers who donate to the Democratic Party are more likely to invest in companies which are seen to be socially responsible. Hence, by comparing the voting behavior of our sample to the outcome of the 2017 Dutch national elections, we can observe whether we attracted certain voters more than others resulting in a non-representative distribution of preferences. Table A.4 presents the voting behavior of our sample. 2,647 respondents answered the question of which 139 did not want to state whether they voted. The reported voter turnout was 85.4% which is close to the official turnout of 81.6%. This is a first indication that our sample is close to representative for the voting behavior in the Netherlands. Of the 2,142 respondents who voted, 562 (26.2%) did not want to state the name of the party they voted for. The distribution of votes for the remaining 1,580 respondents resembles the official voting outcome very closely. Importantly, the voter outcome for parties known to strongly advocate sustainability like the green party (GroenLinks) and the animal party (Partij voor de Dieren) is close to the official outcome. This is a strong indicator that we do not have a selection bias of certain preferences which favor sustainable investing. The only clear difference between the reported voting behavior in our sample and the official turnout is the share reporting to have voted for the PVV, a Dutch populist party. Yet, this finding is in line with previous work showing that people refrain from admitting their support for extreme groups (Gingerich, 2010; Bullock et al., 2011).

Hence, our sample is close to representative in terms of demographics, financial background, and social preferences. We will show below that small differences in the characteristics of our respondents cannot explain our results but even go against our results.

---

4 Results

4.1 The hypothetical gap

In the hypothetical treatment, two thirds (65.4%) of respondents preferred an increased focus on sustainable investments and chose four SDGs (see Figure 1). Only 9.6% of respondents chose three SDGs, while 25.0% reported to have no opinion. How do respondents choose when their decisions have real consequences? The literature on the hypothetical gap argues that respondents should be less likely to choose four SDGs. In contrast to this expectation, 67.9% of participants in the real treatment favored more sustainable investments and chose four SDGs, which is almost exactly the same as in the hypothetical treatment (p-value = 0.1245). Similarly, choices in favor of three SDGs barely differ between the real and hypothetical choices (10.8% in the real treatment and 9.6% in the hypothetical treatment; p-value = 0.2579). Hence, in contrast to our expectation and the majority of findings in the literature, the difference between real and hypothetical choices is non-existent. Only the difference among those without an opinion is significant, but small in economic terms (real: 21.2%; hypothetical: 25.0%; p-value = 0.0112). It could indicate that respondents in the real choice treatment do not shy away from taking responsibility through voting.

Overall, we find a clear majority of 66.7% of participants across all treatments to favor more sustainable investing. Remarkably, respondents in favor of four SDGs are 6.5 times as many as those against it (four SDGs: 66.7%, three SDGs: 10.3%).

Result 1: 66.7% of respondents are in favor of expanding sustainable investments. Surprisingly, there is no difference between hypothetical and real choices.

Why do we find no hypothetical gap? There are three potential explanations. First, people could decide to invest sustainably as they expect these investments to financially outperform conventional investments. If return expectations are sufficiently high, everybody would opt for more sustainable investments regardless of the consequentiality of their choice. Second, participants can have strong preferences for sustainable investments. People who have strong preferences about their choice are unaffected by whether it is of real or hypothetical nature. A vegan would choose vegetables over meat no matter whether the choice is real or hypothetical. People with weaker preferences, however, tend to sway between real and hypothetical choices. Someone might say that she cares for the environment but if asked to pay the voluntary premium to make her flight CO2 neutral, she passes. Another person might talk a lot about sustainability, but when given the chance to expand sustainable investments using his pension savings, he votes against it. Third, it could be that the real choice in fact looks like a hypothetical choice or that people are confused. Consequently, there would be no difference between real and hypothetical choices.

In the following sections, we show that the absence of a hypothetical gap in our sample is the result of strong social preferences.

\[17\] For now, we do not differentiate between the 3 SDG default and 4 SDG default treatments and look at them jointly. We will get back to this in the next section.
4.2 Financial return expectations

In this section, we explore how expectations about financial performance influence sustainable investment choices. An important design feature is how to introduce costs and benefits of sustainable investments. We told participants that investing according to the Sustainable Development Goals means that not only the financial return counts. For those investments it is also important to consider the impact on the environment and society. We deliberately did not mention absolute costs or benefits of sustainable investments, because these are simply unknown. Several studies show that sustainable investments outperform conventional investments (Derwall et al., 2005; Edmans, 2011), but other studies rather find an underperformance (Hong and Kacperczyk, 2009; Barber et al., 2018; Riedl and Smeets, 2017; Hartzmark and Sussman, 2018). The return expectations of individual investors reflect these ambiguous findings regarding realized returns on sustainable investments. Some studies find investors to expect lower risk adjusted returns (Renneboog et al., 2008; Riedl and Smeets, 2017). Others find investors to expect higher risk-adjusted returns on sustainable investments (Hartzmark and Sussman, 2018).
4.2 Financial return expectations

(a) Distribution of financial beliefs

Figure 2(a) shows the distribution of financial beliefs. Figure 2(b) presents the percentage of participants choosing four SDGs for each return expectation separately. Return expectations were elicited by asking participants to answer the following question: “When do you think the investment return is highest?” Answer options were ‘It is highest with 3 SDGs’, ‘The return is equally high with 3 or 4 SDGs’, ‘It is highest with 4 SDGs’, and ‘I do not know’. The categories shown in Figure 2B refer to the following question: “Do you want Pensioenfonds Detailhandel to add (leave out) the fourth sustainable development goal ‘Responsible consumption and production’?”. Answer options were ‘Yes, add (leave it out)’, ‘No, do not add (leave it out)’, and ‘I have no opinion regarding this matter’. Words in parentheses refer to the different status quo treatments which are looked at jointly here. Both figures present the distribution of real and hypothetical choices separately, which refers to whether answering the above-stated question was consequential or not. In the hypothetical treatment, choices were nonconsequential. In the real treatment, choices were guaranteed to be implemented by the pension fund if more than 50% of respondents would choose in favor of three, respectively four SDGs. Error bars present 95% confidence intervals. Non-overlapping error bars indicate a statistically significant difference at the 5% level between the treatments real and hypothetical within each answer category.

We also asked participants about their financial return expectations when the pension fund would focus on 3 or 4 SDGs respectively. Specifically, we asked participants:

"When do you think the investment return is highest?

a. It is highest with 3 SDGs.
b. The return is equally high with 3 or 4 SDGs.
c. It is highest with 4 SDGs.
d. I do not know."

Figure 2(a) plots the distribution of financial beliefs within our sample. The majority of 56.4% of participants provided a return expectation; 16.3% of participants expect a lower return with four SDGs (answer a), 15.4% expect a higher return, and 24.7% of respondents think that there is no difference in returns between investing in three or four SDGs. Return expectations are clearly not overly favorable toward sustainable investing and are thus unable to explain that two thirds choose to expand sustainable investments at their pension fund.

Figure 2(b) supports this claim. While we find stronger support for four SDGs if return expectations are more positive, the majority is in favor of four SDGs independent of return expectations. The difference between real and hypothetical choices of four SDGs are non-
significant. Two findings are especially noteworthy. First, even among those who expect four SDGs to yield lower returns, 60.8% chose four and only 25.0% three SDGs. Thus, even when people expect to be worse off, they favor the more sustainable option. Second, literature shows that people do not like uncertainty and therefore avoid outcomes which increase uncertainty (e.g. Ellsberg 1961; Mukerji and Tallon 2001; Charness and Gneezy 2010). We find that of the participants who do not know what returns to expect, 62.6% favor four SDGs. While this number has to be treated with caution as the uncertain option depends on the default treatment, we find that the majority of subjects chooses four SDGs irrespective of their default.\footnote{People in the 3 SDG default should consider the choice of three SDGs to be less uncertain as this is the default option while those in the 4 SDG default should consider the choice of four SDGs to be less uncertain. For those who do not have a return expectation for sustainable investments, we therefore expect that the support for four SDGs is lower in the 3 SDG default than in the 4 SDG default. Figure A.1 shows the default effect for those participants who did not know what return to expect (43.6% of the entire population, see Figure 2(a)). As hypothesized, we do find a significant difference where 59.4% of participants in the 3 SDG default and 65.8% of those in the 4 SDG default choose four SDGs (one-sided T-test; p-value = 0.0107). Yet, it is remarkable that even for those who consider choosing four SDGs as the option with higher uncertainty, we find a clear majority to opt for the more sustainable option.} Thus, we can confidently say that the majority is in favor of four SDGs independent of return expectations, even if people do not know what to expect.

Last but not least, we asked participants, who expected similar or higher returns with four SDGs, whether they would be willing to accept lower financial returns in order to expand sustainable investments? This question was asked directly after return expectations were elicited and thus shortly after the main question. Respondents in the real treatment thus were aware of the fact that their choice could have an impact on the investment activities of their pension fund. More importantly, the fund could thus also consider a willingness to accept lower returns as the right to give up financial returns in order to increase the social impact of their investments. Figure 3 shows that 42.4% of participants in the real treatment would go for four SDGs even if it meant lower returns (Hypothetical: 42.1%, difference: p-value = 0.8761). In other words, participants did not only choose the more sustainable option regardless of their return expectations. Almost half of them were even willing to give up financial returns.

All in all, there is no evidence that participants only support more sustainable investments because they see it as a free lunch.

**Result 2:** The majority of respondents chooses to expand sustainable investing irrespective of return expectations. A significant share even accepts lower financial returns in exchange.

In the following subsection, we show that the effect of social preferences on the choice for four SDGs is unaffected when we control for return expectations in a multinomial logit regression.

### 4.3 Strong social preferences

We measure social preferences using the validated social preferences measure of Falk et al. (2016) "How willing are you to give to good causes without expecting anything in return?". Participants rate their agreement on a 10-point Likert scale from completely unwilling to very
4.3 Strong social preferences

![Figure 3](image)

**Figure 3 – Accepting lower returns.**

This graph presents the answer distribution of respondents to the question “Do you want Pensioenfonds Detailhandel to opt for four SDGs if the return on investment would decrease?”. Answer options were ‘yes’, ‘no’, and ‘I do not know’. The graph presents the distribution of real and hypothetical choices separately. Real and hypothetical refers to whether answering the question “Do you want Pensioenfonds Detailhandel to add (leave out) the fourth sustainable development goal ‘Responsible consumption and production’?” was consequential or not. Words in parentheses refer to the different status quo treatments which are looked at jointly here. The graph presents the distribution of real and hypothetical choices separately, which refers to whether answering the above-stated question was consequential or not. In the hypothetical treatment, choices were nonconsequential. In the real treatment, choices were guaranteed to be implemented by the pension fund if more than 50% of respondents would choose in favor of three, respectively four SDGs. Error bars present 95% confidence intervals. Non-overlapping error bars indicate a statistically significant difference at the 5% level between the treatments real and hypothetical within each answer category.

willing. Higher ratings correspond to higher levels of social preferences. The average level of social preferences in our sample is 6.1 on a 10-point Likert scale (for summary statistics, see Table A.2). We investigate to what extent social preferences predict the support for more sustainable investments. Table 2 presents relative-risk ratios of a multinomial logit regression that regresses the support for four sustainable development goals on our measure of social preferences. The dependent variable takes on three values for the choices ‘3 SDGs’, ‘4 SDGs’, and ‘No opinion’. As baseline, we take respondents who chose three SDGs. To interpret the relative-risk ratios, consider the effect of Gender (female) on the choice for 4 SDGs. If the coefficient equals one, men and women are equally likely to choose 4 SDGs. A coefficient larger than one indicates that women are more likely to choose 4 SDGs. Similarly, a coefficient smaller than one indicates that women are less likely to choose 4 SDGs.

In the first column of specification (1), we study the effect of social preferences on the likelihood to choose four SDGs. A one standard deviation increase in social preferences increases
the likelihood to choose four SDGs by 57.4%. Given that 69.7%\(^\text{19}\) of our sample chose four SDGs, social preferences have a substantial economic impact on sustainable investment decisions. Social preferences are not related to the choice of no opinion. In specification (2), we control for financial beliefs, demographics, and information on participants’ financial background. As anticipated, expecting lower returns decreases the likelihood to choose four SDGs by 76.8% while expecting higher returns increases the likelihood by 84.6%. Remarkably, we find that respondents who do not know what returns to expect are 2.4 times more likely to also report that they have no opinion on whether to choose three or four SDGs. This finding supports the hypothesis that these subjects are ambiguity averse which increases the power of our finding that the majority of these subjects still opts for four SDGs (see rightmost bars in Figure 2(b)).

However, with the inclusion of these controls, the effect size of social preferences does not decrease but, on the contrary, slightly increases ($\beta = 1.6022$) showing that social preferences robustly explain the choice for more sustainable investments.

**Result 3:** Social preferences strongly predict the choice for more sustainable investments and is robust to including financial beliefs. This is consistent with a preference-based explanation for sustainable investments.

Looking more closely at the effects of demographics on sustainable investments in Table 2, we see that women are significantly more likely to choose four SDGs compared to men. Women in our sample also have stronger social preferences than men (F: 6.2 vs M: 5.9; p-value = 0.0079). These results are in line with previous literature findings (see e.g. Bolton and Katok 1995; Eckel and Grossman 1998; Guth et al. 2007; for a meta-analysis see Croson and Gneezy 2009). Remember that our sample has slightly more men compared to the pension fund’s population. The support we find for more sustainable investments therefore is on the conservative side. Noteworthy is that even among men the majority opts for more sustainable investments (68.5%). Second, age is related to the respondents’ choice for sustainable investing. Older people are less likely to choose four SDGs. Each 10 years of age decrease the likelihood to choose four SDGs by 17.0%. Given that our respondents are slightly older than the invited sample and older people are less in favor of sustainable investments, the support for sustainable investments is a lower-bound. Third, education has no impact on whether respondents choose three or four SDGs. Not surprisingly, highly educated respondents are 46.3% less likely to have no opinion. And finally, people with a higher income are slightly less likely to choose four SDGs.

### 4.4 Default effects

In contrast to real choices, hypothetical choices have no consequences. The status quo bias should thus be stronger in the real choice treatment and could hide people’s actual preferences.

\(^{19}\)The actual percentage of 69.7% differs from the otherwise stated 66.7% as some subjects answered the main question whether to add a fourth SDG but dropped out of the survey before giving a prediction. Among those, who give a prediction, the percentage of accepting 4 SDGs is slightly higher.
This table presents relative-risk ratios of a multinomial logit regression where the dependent variable takes on three values for the choices '3 SDGs', '4 SDGs', and 'I have no opinion regarding this matter'. Baseline are respondents who chose three SDGs. Social preferences are elicited by asking respondents to rate the question “How willing are you to give to good causes without expecting anything in return?” on a 10-point Likert scale from completely unwilling to completely willing (see Falk et al. 2016). Financial beliefs were elicited by asking participants to answer the following question: "When do you think the investment return is highest?" Answer options were 'It is highest with 3 SDGs', 'The return is equally high with 3 or 4 SDGs', 'It is highest with 4 SDGs', and 'I do not know'. For summary statistics, see Table A.2, and for definitions of the other variables, see Table A.1. Significance levels show the difference from one and are indicated by *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$.

</table>

(e.g. Samuelson and Zeckhauser 1988; Tversky and Kahneman 1991). Consider receiving investment advice, where the default option is to not focus on sustainable investments. Those who prefer to invest sustainably but fear that returns will be too low stay with the default and do not reveal their actual preferences – which they would in case of a hypothetical survey with the same default. With our different treatments, we are able to differentiate between status quo effects and the consequentiality of choices.
Table 3 shows that the status quo does not affect the choice for more sustainable investments. We again use a multinomial logit regression where the dependent variable takes on the three values ‘3 SDGs’, ‘4 SDGs’, and ‘No opinion’. If a status quo bias were present, we would expect respondents in the 4 SDG default treatment to be more likely to support four SDGs than respondents in the 3 SDG default. Accordingly, the coefficient of ‘4 SDG default’ in the first column of specification (1) should be significantly greater than one. The non-significance of the coefficient shows that this is clearly not the case. Framing has no effect on the choice between three or four SDGs. In specification (2), we control for all four treatment groups individually. Given that the status quo effect should be stronger in the real choice treatment, the coefficient of the independent variable ‘4 SDG default & Hypothetical’ should be the largest of the three treatment variables and significantly greater than one. The coefficient is indeed the largest ($\beta \approx 1.18$) but not significantly different from one nor from the other treatment variables.

The non-significance of all coefficients confirms that framing has no effect on the choice to expand sustainable investing. In specification (3), we include financial beliefs, demographics, and information on the financial background as controls. As a consequence of including financial beliefs, the coefficient of ‘4 SDG default & Hypothetical’ turns marginally significant (difference from one: p-value = 0.095). This is the result of a statistical difference in return expectations as there are slightly more respondents in the hypothetical treatment who expect higher returns with three SDGs (Hypothetical: 17.9% vs Real: 14.8%; p-value = 0.0270). Thus, this effect does not capture an actual hypothetical gap.

More importantly, the effect size and the significance level of social preferences is not affected by including treatment effects which indicates that strong preferences drive the decision to invest sustainably. An individual with strong preferences for sustainable investing will choose more sustainable investments, irrespective of what the default option is, and whether it is a real or hypothetical choice.

**Result 4:** Respondents’ choice of expanding sustainable investments does not depend on how their choice is framed (no status quo dependency). The support for more sustainable investments is always high, consistent with strong preferences.

4.5 External validation: voting behavior and sustainable investments

To test for external validity of our results, we explore the relation between the support for more sustainable pension investments and voting behavior in the last national parliamentary elections. We construct respondents’ preferences for sustainable policies by evaluating the stance on sustainability of the political party they voted for. We use the official voting guide for the 2017 Dutch national elections.²⁰ Five of the 30 questions posed in this voting guide deal with issues related to sustainability. All questions are posed such that they can be answered

²⁰ See https://tweedekamer2017.stemwijzer.nl.
4.5 External validation: voting behavior and sustainable investments

with ‘agree’, ‘disagree’, or ‘neither of the two’. A party receives one point for each question for which they choose the more sustainable option. If a party chooses ‘neither of the two’, it receives half a point. For example, consider the statement “All coal-fired power stations may remain open for the time being.” If a party agrees to this statement, it receive zero points; if it disagrees it receive one point; and if it says neither of the two, they receive half a point. Each political party thus receives a score between zero and five. The entire construction of the score is presented in Table A.5.

Table 3 – The effects of consequentiality and status quo dependency on sustainable investing.

This table presents relative-risk ratios of a multinomial logit regression where the dependent variable takes on three values for the choices ‘3 SDGs’, ‘4 SDGs’, and ‘I have no opinion regarding this matter’. Baseline are respondents who chose three SDGs. For summary statistics, see Table A.2. Social preferences are elicited by asking respondents to rate the question “How willing are you to give to good causes without expecting anything in return?” on a 10-point Likert scale from completely unwilling to completely willing (see Falk et al. 2016). 3 SDG default and 4 SDG default refer to two different status quo treatments to which participants were randomly assigned. In the 3 SDG default, participants were told that the pension fund currently focuses on three SDGs. Participants were introduced to the fourth SDG ‘Responsible consumption and production’ and could choose: “Do you want Pensioenfonds Detailhandel to add the fourth sustainable development goal ‘Responsible consumption and production’?” Answer options were ‘Yes, add’, ‘No, do not add’, and ‘I have no opinion regarding this matter’. In the 4 SDG default treatment, it was communicated that the pension fund’s future policy will include a fourth SDG ‘Responsible consumption and production’. Participants could then choose: “Do you want Pensioenfonds Detailhandel to leave out the fourth sustainable development goal ‘Responsible consumption and production’?” Answer options were ‘Yes, leave it out’, ‘No, do not leave it out’, and ‘I have no opinion regarding this matter’. Real and hypothetical refers to whether answering the question “Do you want Pensioenfonds Detailhandel to add (leave out) the fourth sustainable development goal ‘Responsible consumption and production’?” was consequential or not. Words in parentheses refer to the different status quo treatments. In the hypothetical treatment, choices were nonconsequential. In the real treatment, choices were guaranteed to be implemented by the pension fund if more than 50% of respondents would choose in favor of three, respectively four SDGs. For definitions of the other variables, see Table A.1. Significance levels show the difference from one and are indicated by *** p<0.01, ** p<0.05, * p<0.1.

</table>
Table A.6 shows that voters of political parties with a stronger preference for sustainable policies show more support for four SDGs. Especially, voters of the green party (GroenLinks) and the animal party (Partij voor de Dieren) favor four SDGs (89.8% and 88.9% respectively). On the other side, voters of parties like the Volkspartij voor Vrijheid en Democratie (VVD) or the Partij voor de Vrijheid (PVV) with a sustainability score of zero show one of the lowest acceptance rates for four SDGs. Nevertheless, across voters for all political parties more than 50% choose four SDGs (except for the party ‘Forum voor Democratie’). Even among those who report to not have voted in the last national elections, 61.7% is in favor of four SDGs. Among those who do not state the party they voted for, the majority of 66.9% chose four SDGs.

The first specification in Table 4 shows that a respondent who voted for a party with a one standard deviation stronger preference for sustainable policies is 57.9% more likely to also choose the more sustainable option in our experiment. When we include control variables in specification (2), the effect size slightly decreases to 40.1% but stays highly significant. These results show the external validity of the support for four sustainable development goals. Participants took their choice seriously and chose more or less sustainability in line with how they evaluated political parties on sustainability in the last national election. Remarkably, even when we control for participants’ preferences for sustainable policies, the effect size of social preferences barely changes compared to Tables 2 and 3. This underlines the importance of strong social preferences as explanation for the choice to invest more sustainably.

Result 5: Respondents who voted for a party which cares for sustainability are more likely to expand sustainable investing. This finding provides external validity consistent with a preference-based explanation for sustainable investments.

4.6 Confusion and misunderstanding do not explain our results

The absence of a hypothetical gap could be explained by respondents being confused or lacking information. We address this by re-analyzing our results, excluding: (1) Respondents who started to vote, but dropped out of the survey before finishing; (2) Respondents who did not understand the treatment and failed our comprehension question (see section 2); (3) Respondents who report that they would have liked to receive more information before deciding on whether to choose three or four SDGs.

We successively exclude each of the three types. The results are presented in Figure 4. The first bar represents the choice distribution of all participants, without exclusion. The second bar shows the choice distribution when respondents are excluded who did not complete the survey. The dropout rates between the real (26.9%) and the hypothetical treatment (23.8%; p-value = 0.0433) are statistically different. Yet, the effect size of 3.1 percentage points is small, and the difference is likely to be significant because of our large sample size. The third bar shows the choice distribution excluding participants who did not understand the treatment they were in. This is the case for 14.0% in the real and 11.9% in the hypothetical treatment (p-value = 0.0698). The fourth bar shows the distribution of choices excluding participants who
Table 4 – The effect of voting behavior on sustainable investing.

This table presents relative-risk ratios of a multinomial logit regression where the dependent variable takes on three values for the choices ‘3 SDGs’, ‘4 SDGs’, and ‘I have no opinion regarding this matter’. Baseline are respondents who chose three SDGs. For summary statistics, see Table A.2. Social preferences are elicited by asking respondents to rate the question “How willing are you to give to good causes without expecting anything in return?” on a 10-point Likert scale from completely unwilling to completely willing (see Falk et al. 2016). Preferences for sustainable policies is a score which is constructed by evaluating Dutch parties on their stance on sustainability using the official voting guide for the 2017 Dutch national elections (https://tweedekamer2017.stemwijzer.nl). Five of the 30 questions shown deal with sustainable issues. All questions are posed such that they can be answered with ‘agree’, ‘disagree’, or ‘neither of the two’. A party receives one point for each question for which they choose the more sustainable option. If a party chooses ‘neither of the two’, it receives half a point (see Table A.5). 3 SDG default and 4 SDG default refer to two different status quo treatments to which participants were randomly assigned. In the 3 SDG default, participants were told that the pension fund currently focuses on three SDGs. Participants were introduced to the fourth SDG ‘Responsible consumption and production’ and could choose: “Do you want Pensioenfonds Detailhandel to add the fourth sustainable development goal ‘Responsible consumption and production’?”. Answer options were ‘Yes, add’, ‘No, do not add’, and ‘I have no opinion regarding this matter’. In the 4 SDG default treatment, it was communicated that the pension fund’s future policy will include a fourth SDG ‘Responsible consumption and production’. Participants could then choose: “Do you want Pensioenfonds Detailhandel to leave out the fourth sustainable development goal ‘Responsible consumption and production’?”. Answer options were ‘Yes, leave it out’, ‘No, do not leave it out’, and ‘I have no opinion regarding this matter’. Real and hypothetical refers to whether answering the question “Do you want Pensioenfonds Detailhandel to add (leave out) the fourth sustainable development goal ‘Responsible consumption and production’?” was consequential or not. Words in parentheses refer to the different status quo treatments. In the hypothetical treatment, choices were nonconsequential. In the real treatment, choices were guaranteed to be implemented by the pension fund if more than 50% of respondents would choose in favor of three, respectively four SDGs. For definitions of the other variables, see Table A.1. Significance levels show the difference from one and are indicated by *** p<0.01, ** p<0.05, * p<0.1.

5 Additional findings

5.1 Social signaling

Grimm (2010) finds that people often give socially desirable answers in a prosocial context. Paulhus (1984) defines social desirability as consisting of two components, self-deception and impression management. Impression management is also referred to as ‘other-deception’ and refers to managing the impression that others have of oneself. Socially desirable answering can be explained by the desire for social esteem and a positive self-image (see e.g. Bénabou and
5.2 Pivotal voting

There is a possibility that subjects in our experiment did not perceive their choice to be consequential. They might believe that their vote is unlikely to be pivotal. In that case, the real choice could simply be perceived as a hypothetical choice, which in turn could explain the large support for more sustainable investments and the absence of a hypothetical gap. Several aspects render it unlikely that this potential concern is driving our results.

First, voting theory shows that the use of a voting mechanism with a simple majority rule is incentive-compatible if the choice is binary, consequential, and if subjects care about the outcome (Cummings et al., 1997; Harrison, 2006a). The first two conditions are met as part of the experimental setup. Further, we can expect that the third condition is met by the fact that people’s pension money is at stake. Thus, the choices selected by our participants maximize their personal utility function which implies that they report their preferences honestly.

Second, the paradox of voting predicts that rational people do not vote as their expected benefits of casting the pivotal vote are lower than their expected costs (Downs, 1957). For

---

21 Multi-item scales for social desirability include Reynolds (1982), Reynolds (1982), or Stöber (2001). These comprise at least eleven survey questions, which was too long to fit our survey.
example, Mulligan and Hunter (2003) find that only one of every 89,000 votes casted in U.S. Congressional elections, and one of 15,000 in state legislator elections were pivotal\textsuperscript{22}. Nevertheless, turnout rates in political elections are usually quite high, which makes it at least difficult to justify that voters do not care about their vote when it is unlikely to be pivotal.

Third, even though theory and field evidence suggest that people take voting seriously, it is possible that in our experiment this was not the case. We therefore distinguish between participants who expected to be more pivotal and those who expected to be less pivotal. If participants only supported more sustainable investments when they perceived their vote not to be pivotal, this would cast doubt on our finding that a majority prefers more sustainable investments. Also, if people only voted for more sustainable investments because they felt they were not pivotal, we would observe a hypothetical gap for participants who expected to be more pivotal. We tackle this concern in two different ways. First, we asked participants to estimate the percentage of participants who would choose three SDGs, four SDGs, or opt for ‘no opinion’.\textsuperscript{23} Subjects who predicted that the share of those in favor of four SDGs is close to 50% should perceive their vote to be more pivotal than subjects with a prediction far away from 50%. Following the just outlined expectation, we would expect a hypothetical gap to arise for subjects with a prediction close to 50%. We define “pivotal” voters as those who predict the share of respondents choosing four SDGs to be between 40% and 60%. This leaves us with 458 “pivotal” subjects in the real and 454 in the hypothetical treatment (32.0% of the entire sample). We find no hypothetical gap as 73.6% of subjects in the real and 72.9% in the hypothetical treatment chose four SDGs (p-value = 0.8186).\textsuperscript{24} Second, we asked subjects to estimate how many of the 25,000 invited people would participate in the experiment.\textsuperscript{25} The median estimate was 10,000 participants. We define a ‘pivotal’ voter as someone who estimates that less than 10,000 would participate (meaning that the voter has a relatively higher probability to be pivotal). This leaves us with 586 “pivotal” subjects in the real and 605 in the hypothetical treatment. Again, we do not find a hypothetical gap as 72.5% in the real and 71.4% in the hypothetical treatment choose four SDGs (p-value = 0.6672).\textsuperscript{26}

As additional check, we look at the two above-mentioned definitions of a “pivotal” voter jointly. There are 192 subjects in the real and 205 subjects in the hypothetical treatment who predict the share of respondents choosing four SDGs to be between 40% and 60% while at the same time estimating less than 10,000 would participate in the survey. We again find no hypothetical gap (Percentage choosing four SDGs: Real 71.9% vs Hypothetical 75.6%; p-value = 0.3990).

\textsuperscript{22} A pivotal vote in this case means that the candidate of that specific election tied for first or won by a single vote.

\textsuperscript{23} Predictions of respondents in the real and in the hypothetical treatment are treated jointly as they do not differ.

\textsuperscript{24} This finding is robust to altering the definition of a “pivotal” voter. We also do not find a hypothetical gap when we look at those who predict the share of respondents choosing four SDGs to be between 45% and 55% as well as between 35% and 65%.

\textsuperscript{25} We gave 25,000 as reference point as one half of the 50,000 invited members was allocated to the real choice treatment and the other half to the hypothetical choice treatment.

\textsuperscript{26} This finding is robust to altering the definition of a “pivotal” voter. We also do not find a hypothetical gap when we look at those who estimate that less than 8,000 (bottom 45%) as well as less than 11,000 (bottom 65%) would participate.
5.3 Exclusion of non-sustainable companies

Investing according to the SDGs offers different approaches. While our question on adding a fourth SDG focused on engagement, we also elicited participants’ preferences for exclusion policies. We told participants that exclusion means that the pension fund will refrain from investing in non-sustainable companies. It was explicitly mentioned that the questions on the exclusion policy in this part of the survey were of hypothetical nature but that the pension fund is interested in learning about their opinion. Thus, respondents were no longer grouped into real and hypothetical treatments. Specifically, respondents were asked to choose from a list of topics. Multiple answers were allowed. Each item they could choose indicated that they would want to exclude companies which relate to this item. For example, respondents could state that they want their pension fund to exclude companies which produce tobacco or alcohol (for a full list, see Table A.1). Respondents could also choose to not exclude any company.

Table A.7 presents the answer distribution of the exclusion question. Column (1) shows the average answer over all respondents. In columns (2) to (4), respondents are split into the three answer categories ‘4 SDGs’, ‘3 SDGs’, and ‘no opinion’ which correspond to whether they chose three or four SDGs or did not have an opinion. It shows that the willingness to exclude companies is in general high. Across all three answer categories, respondents chose to exclude companies on seven of nine items with more than 50%. We observe the highest rates of approval for exclusion due to corruption (86.9%), child labor (85.8%), and human rights violations (85.3%).

Importantly, this table also shows that people do not simply choose more sustainable investments whenever given a choice. Only a minority is in favor of excluding companies that produce alcohol (17.4%) and tobacco (44.2%). Even among those who chose four SDGs, those numbers are with 18.6% and 47.5% clearly below the threshold of 50%. Given the strong pressure that is currently being put on pension funds to divest from tobacco, it is remarkable to see that these pension fund members decide to still keep their tobacco investments. Participants take a strong stance against excluding tobacco and alcohol companies, even in a hypothetical setting, where the costs of giving socially desirable answers are low.

6 Conclusion

The United Nations Sustainable Development Goals (SDGs) created societal and political pressure for companies and investors to promote sustainability. How much are individuals willing to support investments based on the SDGs? Are they willing to put their pension money on the table to invest sustainably? We ran an experiment with a pension fund which granted its members a real vote. We find that 66.7% of the participants are in favor of investing their pension savings more sustainably which is driven by strong social preferences. We can rule out
financial beliefs, confusion, a lack of information, and social concerns as explanation for the large support of sustainable investing.

Social preferences have a significant influence on many economic decisions. They are a key to understanding what incentivizes people (Fehr and Fischbacher, 2002; Bandiera et al., 2005), can decrease free riding problems (Fehr and Gächter, 2000), and explain why people are willing to sacrifice resources to increase social welfare (Fehr and Schmidt, 1999; Bolton and Ockenfels, 2000; Charness and Rabin, 2002). While European investment managers elicit clients’ risk preferences, most of them ignore social preferences (EUROSIF, 2016, p. 82). This raises a simple question: Why the reluctance towards social preferences? While previous research shows the importance of social preferences for some investors, it has been hard for institutional investors to use these findings when deciding on behalf of their clients. For instance, Bollen (2007); Barber et al. (2018); Hong and Kostovetsky (2012) and Hartzmark and Sussman (2018) show that investors value sustainability. Yet, consider a pension fund manager: with aggregate-level data, he will have trouble to identify the preferences for sustainable investments of his clients. And even with findings on the individual level, the pension fund manager would not know what to do. Take the findings of Riedl and Smeets (2017) who show that 16% of their sample holds a sustainable mutual fund. The pension fund manager could now say that the majority does not want to hold sustainable mutual funds. Case closed. Yet, Beshears et al. (2008) show that inertia often keeps people from acting according to their true preferences. Thus, fund managers have to elicit the social preferences of their clients themselves and act accordingly.

We offer a simple toolbox for institutional investors to cater to the social preferences of their clients. We demonstrate that individuals are indeed willing to put their pension savings on the table to promote sustainability, in both a hypothetical and real choice.

The absence of the hypothetical gap does not imply that all institutional investors can elicit true preferences for sustainable investments with hypothetical survey questions. Choices in our experiment were identical in the hypothetical and real treatment, because participants have strong social preferences. In other cases, social preferences might be weaker, and a hypothetical gap could arise. For example, in countries where people have weaker social preferences. Yet, importantly, our findings are not driven by specifically looking at people with strong preferences. As the Netherlands are known for their large share of assets invested sustainably (EUROSIF, 2016), it could be that the Dutch population just has particularly strong social preferences which drive sustainable investments and limit the generalizability of our findings. However, that is not the case. Falk et al. (2018), whose question on social preferences we used in our survey, study the global variation of social preferences. They find that the social preferences of the Dutch population are 0.19 standard deviations below world average. At the same time, Germany (−0.05) and the UK (+0.03) are close to the world average while the US (+0.41) ranges clearly above. In other words, even though the Netherlands are one of the most sustainable investors in the world, they show below-average levels of social preferences. Given the even stronger
social preferences in countries like the US, there is substantial growth potential for sustainable investments in these markets.

Outside of the investment industry, our proposed method can inform decision-makers who decide on behalf of others. Politicians could elicit social preferences to address key sustainable policy questions such as a ban on plastic bags or creating restricted zones in inner cities which cannot be accessed by cars. If politicians were to rely on real preferences, this could not only help to objectively make better decisions but also can create a wider public support for the outcome—even if it is costly. *But for that to be true, politicians have to get real!*

This table presents the distribution of votes in the 2017 Dutch parliamentary elections within our sample and compares it to the official election results. 2,647 respondents answered the question “Did you vote in the last national parliamentary election?”. Respondents were given the answer options ‘Yes’, ‘No’, and ‘I do not want to say’. The last option was chosen by 139 respondents while 2,142 respondents reported to have voted. As a follow-up question, respondents were asked to name the party they voted for. They could also choose to keep this information private (‘I do not want to say’) which 562 (26.2%) respondents did. The voting distribution of the remaining 1,580 respondents is reported below. The official 2017 parliamentary election results can be found online at https://www.verkiezingsuitslagen.nl/verkiezingen/detail/TK20170315.

This table presents the preference for sustainable policies which is a score which is constructed by evaluating Dutch parties on their stance on sustainability using the official voting guide for the 2017 Dutch national elections (https://tweedekamer2017.stemwijzer.nl). Five of the 30 questions shown deal with sustainable issues. All questions are posed such that they can be answered with ‘agree’, ‘disagree’, or ‘neither of the two’. A party receives one point for each question for which they choose the more sustainable option. If a party chooses ‘neither of the two’, it receives half a point. The score is calculated for each of the parties shown in Table A.4.

Table A.6 – Voting behavior, preferences, and sustainable investing.

This table presents the distribution of preferences and the choice on sustainable investing of respondents who are grouped according to their reported voting behavior in the Dutch national elections 2017. The reported voting behavior refers to the question “Did you vote in the last national parliamentary election?”. Respondents were given the answer options ‘Yes’, ‘No’, and ‘I do not want to say’. As a follow-up question, respondents were asked to name the party they voted for. They could also choose to keep this information private. Preferences for sustainable policies is a score which is constructed by evaluating Dutch parties on their stance on sustainability using the official voting guide for the 2017 Dutch national elections (https://tweedekamer2017.stemwijzer.nl). Five of the 30 questions shown deal with sustainable issues. All questions are posed such that they can be answered with ‘agree’, ‘disagree’, or ‘neither of the two’. A party receives one point for each question for which they choose the more sustainable option. If a party chooses ‘neither of the two’, it receives half a point (see Table A.5). The distribution of choices ‘4 SDG’ and ‘3 SDG’ refers to the following question: “Do you want Pensioenfonds Detailhandel to add (leave out) the fourth sustainable development goal ‘Responsible consumption and production’?” Answer options were ‘Yes, add (leave it out)’, ‘No, do not add (leave it out)’, and ‘I have no opinion regarding this matter’. Words in parentheses refer to the different status quo treatments which are looked at jointly here as are real and hypothetical treatment.

**Table A.7 – Approval ratings for various exclusion policies.**

This table compares the approval ratings of respondents regarding exclusion policies. Exclusion refers to the following question: “Pensioenfonds Detailhandel wants to know which companies it should exclude from its investments (multiple answers possible). Companies... a. producing tobacco; b. producing controversial weapons (e.g. cluster bombs and landmines); c. producing alcohol; d. producing weapons (weapons other than controversial weapons); e. violating human rights; f. using forced labor; g. having a bad influence on the environment; h. involving in corruption, extortion or bribery; i. allowing the use of child labor; j. I do not want to exclude companies.” Respondents who choose to not exclude any company could not select any of the answer options ‘a’ through ‘i’. Column (1) shows the average of all respondents who answered the exclusion question. The categorization of respondents in columns (2) to (4) is done according to how they answered the question: “Do you want Pensioenfonds Detailhandel to add (leave it out) the fourth sustainable development goal ‘Responsible consumption and production’?”. Answer options were ‘Yes, add (leave it out)’, ‘No, do not add (leave it out)’, and ‘I have no opinion regarding this matter’. Words in parentheses refer to the different status quo treatments which are looked at jointly here. Respondents are categorized into those who choose four SDGs, those who choose three SDGs, and those who report to have no opinion.

</table>
The graph presents the percentage of participants choosing four SDGs if they answered ‘I do not know’ to the following question: “When do you think the investment return is highest?” Answer options were ‘It is highest with 3 SDGs’, ‘The return is equally high with 3 or 4 SDGs’, ‘It is highest with 4 SDGs’, and ‘I do not know’. 3 SDG default and 4 SDG default refer to two different status quo treatments to which participants were randomly assigned. In the 3 SDG default, participants were told that the pension fund currently focuses on three SDGs. Participants were introduced to the fourth SDG ‘Responsible consumption and production’ and could choose: “Do you want Pensioenfonds Detailhandel to add the fourth sustainable development goal ‘Responsible consumption and production’?” Answer options were ‘Yes, add’, ‘No, do not add’, and ‘I have no opinion regarding this matter’. In the 4 SDG default treatment, it was communicated that the pension fund’s future policy will include a fourth SDG ‘Responsible consumption and production’. Participants could then choose: “Do you want Pensioenfonds Detailhandel to leave out the fourth sustainable development goal ‘Responsible consumption and production’?” Answer options were ‘Yes, leave it out’, ‘No, do not leave it out’, and ‘I have no opinion regarding this matter’. The real and hypothetical choice treatments are look at jointly. Error bars present 95% confidence intervals. Non-overlapping error bars indicate a statistically significant difference at the 5% level.
Figure A.2 – The effect of social signaling on sustainable investing.

This graph presents the distribution of real and hypothetical choices for respondents with a high desire for social signaling. Social signaling is elicited by asking respondents to rate the question “How likely is it that you will talk to your friends about this survey?” on a 10-point Likert scale from very unlikely to very likely (see Riedl and Smeets, 2017). Respondents are reported to have a high desire for social signaling if they rated this question with a 3 or higher (55.1% of the sample). The categories shown in the graph refer to the following question: “Do you want Pensioenfonds Detailhandel to add (leave out) the fourth sustainable development goal ‘Responsible consumption and production’?” Answer options were ‘Yes, add (leave it out)’, ‘No, do not add (leave it out)’, and ‘I have no opinion regarding this matter’. Words in parentheses refer to the different status quo treatments which are looked at jointly here. The graph presents the distribution of real and hypothetical choices separately, which refers to whether answering the above-stated question was consequential or not. In the hypothetical treatment, choices were nonconsequential. In the real treatment, choices were guaranteed to be implemented by the pension fund if more than 50% of respondents would choose in favor of three, respectively four SDGs. Error bars present 95% confidence intervals. Non-overlapping error bars indicate a statistically significant difference at the 5% level between the treatments real and hypothetical within each answer category.
Welcome!

Pensioenfonds Detailhandel invests your pension savings in a sustainable way. In doing so, Pensioenfonds Detailhandel strives to achieve continuous improvements.

[Real treatment] That is why Pensioenfonds Detailhandel has decided to ask you about our investment policy.

[Hypothetical treatment] Pensioenfonds Detailhandel is genuinely interested in your opinion on how we invest.

Of the people who participate in this survey, 25 randomly selected individuals will receive a VVV Gift Voucher worth 25 euros. Additionally, one randomly selected participant will receive a VVV Gift Voucher worth 250 euros.

You will be entered in the prize draw if you complete the whole survey. Maastricht University and Pensioenfonds Detailhandel guarantee that all payments will be made.

This survey takes around fifteen minutes to complete. Pensioenfonds Detailhandel will make the results available in Autumn.

Thank you in advance for your participation!
Yours sincerely, Maastricht University and Pensioenfonds Detailhandel.

[Part 1]

What is socially responsible investment?

1. Are you familiar with the United Nation’s Sustainable Development Goals?
   
   (a) Yes
   
   (b) No

[Answer if yes or no:] The United Nation’s Sustainable Development Goals focus on seventeen goals relating to the environment, the climate, poverty, and other themes. The next page explains how Pensioenfonds Detailhandel uses these Sustainable Development Goals.
6. When do you think that the investment return is the highest?

[Info button: Investment return is the degree to which an investment earns money when taking the level of risk into account. In other words, more money results in a greater return. However, an investment that takes a greater risk to earn a certain amount results in a lower risk-adjusted return.]

(a) The investment return is highest for three sustainable development goals.

(b) The investment return is highest for four sustainable development goals.

(c) The investment return remains the same for three or four sustainable development goals.

(d) I don’t know

7. Would you want Pensioenfonds Detailhandel to opt for four Sustainable Development Goals even if this decreased the risk-adjusted return?

(a) Yes

(b) No

(c) I don’t know

8. Predict which percentage of Pensioenfonds Detailhandel’s participants would also opt for four Sustainable Development Goals even if this decreased the risk-adjusted return.

(a) ___ percent
[Part 2]

The following questions aim to clarify your opinion of investing in a socially responsible way.

As opposed to previous questions, your answers in this part may not lead to Pensioenfonds Detailhandel taking direct action but can help us make decisions in the future.

**How does Pensioenfonds Detailhandel currently make decisions regarding socially responsible investments?**

Pensioenfonds Detailhandel now implements its socially responsible investment policy in two ways:

i. by excluding companies
ii. by entering into discussions with companies.

The next question concerns excluding companies as a method of investing in a socially responsible way.

9. Pensioenfonds Detailhandel would like you to list which types of companies you think it should exclude from investments (several answers possible). Companies that...

   (a) produce tobacco
   (b) produce controversial weapons such as cluster bombs and landmines
   (c) produce alcohol
   (d) produce weapons (other than controversial weapons)
   (e) infringe on human rights
   (f) use forced labour
   (g) have a negative impact on the environment
   (h) are involved in corruption, extortion or bribery
   (i) allow child labour
[Part 3]

We would also like to ask you some background questions.

10. How willing are you to give to good causes without expecting anything in return?
   completely unwilling 1—10 very willing

11. I am...
   (a) Male
   (b) Female
   (c) Other

12. In what year were you born?
   (a) Year of birth

13. What is the highest level of education you have completed?
   (a) Preparatory secondary vocational education (VMBO) or lower general secondary education (MAVO or MULO)
   (b) Higher general secondary education (HAVO)
   (c) Pre-university education (HBS, HAVO, VWO) or pre-university education with Latin and/or Greek (Gymnasium)
   (d) Intermediate vocational education level 1 (MBO)
   (e) Intermediate vocational education level 2 (MBO)
   (f) Intermediate vocational education level 3 (MBO)
   (g) Intermediate vocational education level 4 (MBO)
   (h) Higher professional education (HBO)
   (i) University (WO)
   (j) Other: ___
   (k) I did not follow any of the above types of education

14. Did you vote in the last national parliamentary elections?
   (a) Yes
   (b) No
   (c) I prefer not to answer
15. If ‘Yes’ in previous question: Did you vote in the last national parliamentary elections?

(a) VVD
(b) CDA
(c) D66
(d) ChristenUnie
(e) PVV
(f) GroenLinks
(g) SP
(h) PvdA
(i) Partij voor de Dieren
(j) 50PLUS
(k) SGP
(l) DENK
(m) Forum voor Democratie
(n) Other, specifically: ___
(o) I prefer not to answer

We have a few questions regarding your financial situation. We understand that this information is sensitive and you can decide to skip these questions. However, as your answers to these questions are very valuable, we hope you will answer them. We will handle your data with due care.
16. What is your household’s net monthly income?
   [Info button: net = your and your partner’s income combined (if applicable) minus taxes and contributions.]
   
   (a) Less than €930
   (b) Between €930 and €1,500
   (c) Between €1,500 and €2,000
   (d) Between €2,000 and €2,500
   (e) Between €2,500 and €3,000
   (f) Between €3,000 and €4,000
   (g) Between €4,000 and €7,000
   (h) Between €7,000 and €10,000
   (i) Over €10,000
   (j) I don’t know
   (k) I prefer not to answer

17. How likely are you to discuss this survey with friends?
   completely unlikely 1—10 very likely

18. We asked approximately 25,000 participants to complete this survey. How many people
   do you think will complete the survey? ___

19. If you win a VVV Gift Voucher, we will contact you by e-mail. If you want to win the
   prize, please tick the box.
   □ I want to win the prize.

20. If you would like to receive an e-mail with information about the results of this survey,
   please tick the box.
   □ I would like to receive information.

21. Please fill in your e-mail address below.

   __________________________________________

   Thank you for participating.
   Yours sincerely, Maastricht University and Pensioenfonds Detailhandel.
D Treatment ’3 SDG Default’ (real and hypothetical)

Pensioenfonds Detailhandel currently focuses on three of the United Nations’ 17 Sustainable Development Goals. These three Sustainable Development Goals are:

1. **Climate action:**
   e.g. taking urgent action to combat climate change such as by ensuring that businesses emit less CO2

2. **Decent work and economic growth:**
   e.g. full employment for all women and men

3. **Peace, justice, and strong institutions:**
   e.g. eradication of corruption and bribery

For more information on the Sustainable Development Goals, please click here: http://www.sdgnederland.nl/sdgs/

**What does it mean to invest according to the United Nations’ Sustainable Development Goals?**

Pensioenfonds Detailhandel uses its influence in the companies in which it invests. In 2017, the pension fund spoke with a total of 246 company boards to promote sustainability.

**Royal Dutch Shell case:**

Working in collaboration with other parties, Pensioenfonds Detailhandel has contacted Shell on a number of occasions and made it clear that Shell has a lot of work ahead of it to achieve the objectives of the Paris Climate Agreement (to become CO2 neutral by 2015) and that it is urgent to do so.

**The example of the diesel scandal in 2015:**

Pensioenfonds Detailhandel contacted managers at Volkswagen (VW) in the aftermath of the diesel scandal. Pensioenfonds Detailhandel’s involvement helped VW focus more on its long-term emissions strategy.
D Treatment ’3 SDG Default’ (real and hypothetical)

[Real treatment]
You have been selected!
Pensioenfonds Detailhandel has decided to give you a say in how it determines its socially responsible investment policy.

But how does this work?

1. You can let Pensioenfonds Detailhandel know whether you agree with the current policy that focuses on three Sustainable Development Goals, or whether you would like to add a fourth one.

2. Your choice counts. If the majority of respondents chooses to add a fourth sustainable development goal, it will happen. The board of Pensioenfonds Detailhandel guarantees its implementation.

[Hypothetical treatment]
Pensioenfonds Detailhandel would like to know what your preferences are for socially responsible investment.

But how does this work?

1. You can let Pensioenfonds Detailhandel know whether you agree with the current policy that focuses on three Sustainable Development Goals, or whether you would like to add a fourth one.

2. Pensioenfonds Detailhandel is genuinely interested in your opinion and may take the results of the survey into account when making a decision.

Below, you find the fourth Sustainable Development Goal that you can add to the current policy.

Sustainable consumption and production: This Sustainable Development Goal ensures that parties, such as Pensioenfonds Detailhandel, are obliged to do the following: e.g. actively work against child labour, guarantee fair wages.
**Please note:** implementing Sustainable Development Goals means that financial returns are not the only factor that is taken into consideration. Making investments with this in mind means that it is important to take the impact on the environment and wider society into account.

**The influence of your choice**

If Pensioenfonds Detailhandel focuses on four Sustainable Development Goals, this means that it will contact companies to discuss their sustainable business practices more often. The fund will also enter into discussions with companies about the fourth Sustainable Development Goal, in addition to the discussions it has about the other three Sustainable Development Goals.

As it is important that you understand this explanation, we will ask you a short question to test your understanding on the next page.

On the next page you will be asked the following:

*Do you want Pensioenfonds Detailhandel to add the fourth sustainable development goal ‘Responsible consumption and production’?*

(a) Yes, add  
(b) No, do not add  
(c) I have no opinion regarding the matter

**Which of the following statements is correct?**

2. If a majority chooses ‘Yes, add’, Pensioenfonds Detailhandel

(a) guarantees to add ‘Sustainable consumption and production’ to its socially responsible investment policy as the fourth Sustainable Development Goal. The Board of Pensioenfonds Detailhandel has decided to implement the outcome of this vote.  

(b) cannot guarantee that it will add ‘Sustainable consumption and production’ to its socially responsible investment policy as the fourth Sustainable Development Goal but may include the results of the survey in its choice.
[Real treatment]

If a: That is correct. Pensioenfonds Detailhandel guarantees that it will add ‘Sustainable consumption and production’ to its socially responsible investment policy as the fourth Sustainable Development Goal if the majority of participants chooses ‘Yes, add’. The Board of Pensioenfonds Detailhandel has decided to implement the outcome of this vote.

If b: Your answer is incorrect. Pensioenfonds Detailhandel guarantees that it will add ‘Sustainable consumption and production’ to its socially responsible investment policy as the fourth Sustainable Development Goal if the majority of participants chooses ‘Yes, add’. The Board of Pensioenfonds Detailhandel has decided to implement the outcome of this vote.

[Hypothetical treatment]

If a: Your answer is incorrect. Pensioenfonds Detailhandel cannot guarantee that your choice will lead to ‘Sustainable consumption and production’ being added as the fourth Sustainable Development Goal, but the fund is interested in your opinion.

If b: This is correct. Pensioenfonds Detailhandel cannot guarantee that your choice will lead to ‘Sustainable consumption and production’ being added as the fourth Sustainable Development Goal, but the fund is interested in your opinion.

Please note that this is your choice. When considering your decision, please do so carefully.

3. Do you want Pensioenfonds Detailhandel to add the fourth sustainable development goal ‘Responsible consumption and production’?
   (a) Yes, add
   (b) No, do not add
   (c) I have no opinion regarding the matter

4. Would you have preferred receiving more information to make a decision regarding the development goals?
   (a) Yes
   (b) No

5. Please indicate below which percentage of participants of this survey will choose which answer regarding the question of adding the fourth Sustainable Development Goal.
   (a) Yes, add: ___ percent
   (b) No, do not add: ___ percent
   (c) I have no opinion regarding the matter: ___ percent
Pensioenfonds Detailhandel currently focuses on three of the United Nations’ 17 Sustainable Development Goals. These three Sustainable Development Goals are:

1. **Climate action:**
   - e.g. taking urgent action to combat climate change such as by ensuring that businesses emit less CO2

2. **Decent work and economic growth:**
   - e.g. full employment for all women and men

3. **Peace, justice, and strong institutions:**
   - e.g. eradication of corruption and bribery

The future policy also includes this fourth goal

4. **Sustainable consumption and production**

For more information on the Sustainable Development Goals, please click here: [http://www.sdgnederland.nl/sdgs/](http://www.sdgnederland.nl/sdgs/)

**What does it mean to invest according to the United Nations’ Sustainable Development Goals?**

Pensioenfonds Detailhandel uses its influence in the companies in which it invests. In 2017, the pension fund spoke **with a total of 246 company boards to promote sustainability**.

**Royal Dutch Shell case:**
Working in collaboration with other parties, **Pensioenfonds Detailhandel has contacted Shell** on a number of occasions and made it clear that Shell has a lot of work ahead of it to achieve the **objectives of the Paris Climate Agreement** (to become CO2 neutral by 2015) and that it is urgent to do so.

**The example of the diesel scandal in 2015:**
**Pensioenfonds Detailhandel contacted managers at Volkswagen (VW) in the aftermath of the diesel scandal.** **Pensioenfonds Detailhandel’s involvement helped VW focus more on its long-term emissions strategy.**
[Real treatment]
You have been selected!
Pensioenfonds Detailhandel has decided to give you a say in how it determines its socially responsible investment policy.

But how does this work?

1. You can let Pensioenfonds Detailhandel know **whether you agree with the future policy** that focuses on four Sustainable Development Goals, or whether you would like to leave out the fourth one.

2. **Your choice counts. If the majority** of respondents chooses that the fourth sustainable development goal must be left out, it will happen. The board of Pensioenfonds Detailhandel guarantees its implementation.

[Hypothetical treatment]
Pensioenfonds Detailhandel would like to know what your preferences are for socially responsible investment.

But how does this work?

1. You can let Pensioenfonds Detailhandel know **whether you agree with the future policy** that focuses on four Sustainable Development Goals, or whether you would like to leave out the fourth one.

2. Pensioenfonds Detailhandel is **genuinely interested in your opinion** and may take the results of the survey into account when making a decision.

Below, you find the fourth Sustainable Development Goal that you can leave out from the future policy.

**Sustainable consumption and production:** This Sustainable Development Goal ensures that parties, such as Pensioenfonds Detailhandel, are obliged to do the following: e.g. actively work against child labour, guarantee fair wages.
Please note: implementing Sustainable Development Goals means that financial returns are not the only factor that is taken into consideration. Making investments with this in mind means that it is important to take the impact on the environment and wider society into account.

The influence of your choice
If Pensioenfonds Detailhandel focuses on four Sustainable Development Goals, this means that it will contact companies to discuss their sustainable business practices more often. The fund will also enter into discussions with companies about the fourth Sustainable Development Goal, in addition to the discussions it has about the other three Sustainable Development Goals.

As it is important that you understand this explanation, we will ask you a short question to test your understanding on the next page.

On the next page you will be asked the following:

Do you want Pensioenfonds Detailhandel to leave out the fourth sustainable development goal ‘Responsible consumption and production’?

(a) Yes, leave it out
(b) No, do not leave it out
(c) I have no opinion regarding the matter

Which of the following statements is correct?

2. If a majority chooses ‘Yes, leave it out’, Pensioenfonds Detailhandel

(a) guarantees to leave out ‘Sustainable consumption and production’ of its socially responsible investment policy as the fourth Sustainable Development Goal. The Board of Pensioenfonds Detailhandel has decided to implement the outcome of this vote.

(b) cannot guarantee that it will leave out ‘Sustainable consumption and production’ of its socially responsible investment policy as the fourth Sustainable Development Goal but may include the results of the survey in its choice.
[Real treatment]

If a: That is correct. Pensioenfonds Detailhandel guarantees that it will leave out ‘Sustainable consumption and production’ of its socially responsible investment policy as the fourth Sustainable Development Goal if the majority of participants chooses ‘Yes, leave it out’. The Board of Pensioenfonds Detailhandel has decided to implement the outcome of this vote.

If b: Your answer is incorrect. Pensioenfonds Detailhandel guarantees that it will leave out ‘Sustainable consumption and production’ of its socially responsible investment policy as the fourth Sustainable Development Goal if the majority of participants chooses ‘Yes, leave it out’. The Board of Pensioenfonds Detailhandel has decided to implement the outcome of this vote.

[Hypothetical treatment]

If a: Your answer is incorrect. Pensioenfonds Detailhandel cannot guarantee that it will leave ‘Sustainable consumption and production’ out of its socially responsible investment policy as the fourth Sustainable Development Goal, but the fund is interested in your opinion.

If b: This is correct. Pensioenfonds Detailhandel cannot guarantee that it will leave ‘Sustainable consumption and production’ out of its socially responsible investment policy as the fourth Sustainable Development Goal, but the fund is interested in your opinion.

Please note that this is your choice. When considering your decision, please do so carefully.

3. Do you want Pensioenfonds Detailhandel to leave out the fourth sustainable development goal ‘Responsible consumption and production’?
   (a) Yes, leave it out
   (b) No, do not leave it out
   (c) I have no opinion regarding the matter

4. Would you have preferred receiving more information to make a decision regarding the development goals?
   (a) Yes
   (b) No
5. Please indicate below which percentage of participants of this survey will choose which answer regarding the question of adding the fourth Sustainable Development Goal.

(a) Yes, leave it out: ___ percent
(b) No, do not leave it out: ___ percent
(c) I have no opinion regarding the matter: ___ percent
